a) Providing a technology and infrastructure; It should have ICT equipment and infrastructure that up to date and adequate. Appropriate and flexible technology and space for various activities such as using technology to work together as a team, for creative work, or in professional presentations courses. There are many forms of knowledge activities: individual, subgroups, and workshops for example.

b) Providing pedagogical and technical support; The staff is available to provide technical advice and the use of ICT in teaching and learning. The students can consult both individually and in group.

c) Providing variety training and activity; The exchange of ICT usage from faculty members and outsiders to help participants learn about obstacles and solutions through the experience of others. Providing students with examples of innovative use and information technology education in a variety of situations, which will open up the world widen the horizon and motivate students to use innovative and informative information technology in a useful and creative way.

2. **Stakeholder component:** Stakeholders with the studio TEACH are classified into 3 groups:

a) Undergraduate student should attend meeting and sharing to increase their ICT knowledge and skills on their own and with other learners (self and group study). Also, pre-service teacher should allocate time to practice hours, meeting and sharing, and self and group study.

- b) Instructor should provide out-class activities involved ICT usage and should be a role model.
- c) Institute and Partnership component: Education institutions should have a short-and long-term ICT policy and planning, especially in the budget planning, in terms of procurement and personnel budgets to be able to provide sufficient services and modern ICT infrastructure. Moreover, partnerships both public and private organizations, who come to cooperate in promoting and supporting the production and development of students and teachers in policy or resource support the developed skills and abilities of students and instructors. Compliance with the requirements of the establishment of the 21st century organization or institution and also the sustainable development of the studio TEACH.

Applying the studio TEACH to succeed priority must be given to the management policy. The studio TEACH should bring the vision, mission and goals of producing graduates to the schools, faculties and curricula especially in setting goals and indicators of success. In order to facilitate the planning and budgeting of the agency, it should also study patterns of cooperation or partnerships with external organizations, both public and private. To achieve a concrete cooperation in the development of students in the use of innovation and information technology education is sustainable and in line with the needs of the society.

Discussion

For studio TEACH model, the researcher developed the analysis of the needs, skills needed for learners, principles of learning management for teachers of the 21st century society which includes synthesizing papers on problems and barriers. The guidelines and factors could promote the development of information technology skills in education for students and teachers. To obtain the guidelines and scope of the study, as well as to study the opinions of the experts to study the suitability and the possibility of a concrete action. The results of the study found that the main goal of the studio TEACH is to help two target groups: a) students in the profession field, and b) students in various fields. Considering the individual components, it was found that varied training and activities, and regular staff with technical knowledge and teaching methods are the elements that the students agree at the highest level that could be helps to promote the students' ability to use ICT in education. Students also agree on a high level with the exchange learning experience activities. (Pheeraphan, 2017) Corresponding to the study of Reading and Doyle (2013), it was found that teachers came to learn and live as a learner. They get involved in learning and reflect on what has been learned. These can help students improve their skills in using ICTs as well as the availability of materials and infrastructure. The implementation of the studio TEACH has provide technology and infrastructure services, technical support and teaching methods, and various training and activities. It cloud be help to solve the problems (Lim and Khine, 2006) about: a) no number of courses involved ICT in education, b) lack of ICT laboratory, c) the large classroom, and d) lack of the motivation and awareness to use ICT for their teaching in the future.

The possibility of implementing the Studio TEACH, in terms of the internal components of all three components. All institutions can be deployed to enable students in all fields to enhance the use of ICT in education. Due to the fact that each faculty or department involved in educational technology can develop and implement it, but the elements that will drive the studio TEACH for the enhanced use of ICT in education to be sustainable and effective are a) Management in educational institutions; the internal components of the three elements need to be supported in terms of policy, personnel, budget, location and materials. So, if the executive, especially the executive at the faculty level, establishes a clear policy, such as developing a learning environment for students and teachers and assists the annual budget for educational information technology support. It requires regular staff to provide counseling and technical education and teaching methods. Corresponding to Goktas, Yildirim, and Yildirm (2009) suggested that the institution has a clear ICT policy that promotes the atmosphere and encourages teachers and learners to use ICT in a concrete way. b) Partnership or cooperation network; Institutions often have limited budgets and the criteria for procurement of materials include knowledge about new materials, equipment or technologies. The Studio TEACH will be able to develop the curriculum and to organize learning activities or training to be more effective and to meet the needs of society. Students in various fields can use the Studio TEACH not only for benefit their learning, but also to enhance the learning of others appropriately in line with the needs of a 21st century society.

Suggestion

1. Suggestions for the use of research results.

- a) University level executives and stakeholders at policy level can use the results as a basis for policy and planning and budget allocation to develop the studio TEACH model to take place concretely both in the university and the faculty. To be a source of learning, all students will be encouraged to have the skills in using ICT as a tool for learning and seeking self-knowledge and working with others. This will prepare students to work in the real world of the 21st century.

b) The faculty of Education and related agencies at the policy level can use the results as a basis for policy and planning both budget and man power. There is a learning resource for the use of effective ICT in education. Undergraduate students and pre-service students could be improved the ability to use ICT as a tool to present, develop and create knowledge with group or individually. Furthermore, it can also be used as a learning resource for the development of instructors to be able to use ICT in teaching and learning effectively. This is to encourage instructors and pre-service students to be sufficient in ICT competency, accordance with professional standards as the teacher has conducted in another way.

2. Suggestions for the next research.

a) Study partnerships or hands-on networks should be studied between educational institutions and outside agencies, both public and private, to produce and develop learners in ICT skills.

b) Modular training courses should be developed so that the curriculum is up-to-date with changes in technology and principles of the 21st century learning.

c) The research should be conducted on the professional community to promote and develop teachers to use ICT in education, so that teachers' organizations can use this model as a guideline for establishing partnerships or cooperation networks with educational, supervisory, school and private sectors in order to develop teachers continuously and systematically.

d) Education should be designed to assess the performance of using ICT in education for new students and before their graduation, and to study the effectiveness of this model in the field of management, utilization, and worth to continue.

Abstract

The major aim of this research is to propose a team-based internal supervision model for secondary schools in Thailand. Since supervision is an academic management to control the quality of education, a team-based internal supervision model has to be developed to improve the supervisory process. Researchers employed a mixed mode design using a combination of quantitative and qualitative methods to collect data. After reviewing the related literatures, researchers identified five main components and 17 sub-components. The five identified main components were principles, aim, process, results, and feedback as the foundation to develop the team-based internal supervision model. This is followed by testing the suitability of the model components to seven experts using an evaluation form. The developed supervision model was then tried out in three research schools. A focus group interviews were carried out to the supervisors after using the team-based internal supervision model. Quantitative results revealed that the seven experts evaluated the team-based supervision model as most appropriate levels for all the five components and 17 sub-components. Subsequently, qualitative results from the school supervisors have provided several comments to improve the model.

Keywords: *Internal supervision; secondary schools; supervisor; team-based internal supervision model*

Introduction

Thailand Education Development Plan of Ministry of Education No. 12 (2017 to 2021) focusing on developing quality Thai citizen through education system. This is because quality education system will provide effective learning process for development of potential learner (Ministry of Education, 2017). This is in line with National Education Act of 1999 (Article 6) indicating that an educational organization has to responsible to produce future human capital to be perfect in physical, mental, intellectual aspects. Internal supervision is considered as an academic management to help to control the education quality.

It is an essential working process of school administrator in order to enhance students' learning achievement (Tubsuli, Julsuwan, & Tesaputa, 2017). Tubsuli et al. further commented that there are several problems concerning supervision such as the Office of Educational Service Area failed to support the teaching and learning supervision, supervisors are lacking of knowledge, and school administrators are not aware of the significance of supervision. This may lead to teachers develop a negative attitude towards the supervision and are not prepared to be supervised (Ueawong, 2013).

Teamwork concept can make the supervision operation becomes more effective because team members feel themselves as parts of the organization will make an effort to achieve the supervision's aims. Therefore, a team-based internal supervision model is using the technique to improve and enhance efficiency of the supervision mission as the school internal supervision and teamwork would be supplementary to each other (Senior, 2002). Team members not only have to recognize each other, having good communication but also being cooperative to make a decision under the common aims (McGourty & Demeuse, 2001).

Research Aims

The major aim of this research is to propose a team-based internal supervision model for secondary schools in Thailand. To achieve this aim the following specific objectives were formulated to guide the research:

- i. To identify the main components and sub-components of team-based internal supervision model.
- ii. To evaluate the suitability of components and sub-components of team-based internal supervision model.
- iii. To investigate the developed draft team-based internal supervision model in term of its practicality for improvement and modification purpose.

Method

Researchers employed a mixed mode design to collect the quantitative and qualitative data using multiple ways to evaluate and modify the developed team-based internal supervision model. It is referred as a combination of different modes of collecting data for a single research. Researchers begin to review literatures to identify the components of the team-based internal supervision. After reviewing the related literatures, researchers identified

main components and its sub-components. The identified main components would be the foundation to develop the team-based internal supervision model. This is followed by testing the suitability of the model components to seven experts using an evaluation form. The developed supervision model was then tried out in three research schools. A focus group interviews were carried out to the supervisors after using the team-based internal supervision model.

Purposeful sampling technique was employed to select the seven experts and three groups of supervisors in this study to ensure the identification and selection of information-rich cases for the most effective use of limited resources (Patton, 2002). This involves identifying and selecting individuals that are especially knowledgeable or experienced with this phenomenon of interest (Cresswell & Plano Clark, 2011). In addition to knowledge and experience, Bernard (2002) noted the importance of availability and willingness to participate, and the ability to communicate experiences and opinions in an articulate, expressive, and reflective manner.

The research instruments used were evaluation form and focus group interview guide. Both instruments were administered in Thai language to ensure that the respondents were clear about the statements. The evaluation form was constructed to enquire the appropriate level of the components of the team-based internal supervision model to the seven experts who acted as respondents. Furthermore, respondents' responses towards the appropriate level of the supervision model components, a five-point Likert scale was utilized, ranged from most, very, moderate, low, and lowest appropriate levels. On the other hand, a focus group interview guide included a series of probes and clarification questions to maintain the consistency in questioning across participants.

Researchers refer to Srisa-ard's (2013) interpretation of opinions toward appropriate level of the suitability of the team-based internal supervision components to evaluate the suitability of its components. As a result, researchers determined its appropriate level as shown in Table 1. Data was analyzed using descriptive statistics include mean score and standard deviation.

Table 1: Interpretation of mean range

Mean range	Interpretation
1.00 – 1.50	Lowest level of appropriateness
1.51 – 2.50	Low level of appropriateness
2.51 – 3.50	Moderate level of appropriateness
3.51 – 4.50	Very appropriate level
4.51 – 5.00	Most appropriate level

Focus group interviews were conducted to three groups of supervisor from three selected who have using the developed team-based internal supervision model for the past six months. The selected participants are experienced supervisors who have more than 10 years of supervising experiences. Participation in the research was voluntary. Participants were invited to indicate their willingness to participate in focus group interviews (Dawson, Dimitrov, Meadows, & Olsen, 2013). The duration of the focus group interview was one and a half hours.

The focus group interviews were audio recorded and partially transcribed, then coded using a theme analysis approach (Miles & Huberman, 1994). During coding, key themes related to research questions were identified, such as concrete comments to modify the team-based supervision components and also comments on the supervision procedures. After the first round of coding, similar themes were grouped into larger categories (Strauss & Corbin, 1990). Exact quotes representing each frequently occurring theme were then fully transcribed based on the audio recordings. To ensure participant anonymity, participants' quotes are identified only by symbol G.

Results

The initial result is the descriptive results related to the identification of the main components and their sub-components of the team-based internal supervision model that derived from the evaluation form. This is followed by qualitative results from focus group interviews about the improvement and modification of the team-based internal supervision model in secondary schools. Finally, the modified team-based internal supervision model is presented.

Descriptive results of the components

After reviewing literatures, researchers identified five components and 17 sub-components to develop a team-based internal supervision model. The five main components were principle, aim, process, result, and feedback. The principle component was comprised of four sub-components namely (i) aim of teachers to change their behavior in a better way; (ii) changing the teachers' behavior comes from them; (iii) teachers' change of teaching behavior requires social support, and (iv) teacher is the key of the teaching development. The second component is aim that consisted of three sub-components such as (i) to provide opportunities to the team to apply the principles of linking content to the supervisory process; (ii) to provide the opportunities to the team the approach how to comply to the target, and (iii) to provide opportunities to the team to use the coaches at a positive concept.

The third component is the process component which covered six sub-components that are (i) study the current

problems and the need for internal supervision; (ii) creating a team-based internal supervision team; (iii) educating the team about internal supervision; (iv) teaching the internal supervision activities (coaching); (v) reflecting on the team's internal supervision, and (vi) evaluation of internal supervision among the team members.

The fourth component is result component which encompassing three sub-components namely (i) the team understands the process of internal supervision; (ii) the team can be supervised internally by team-based teams, and (iii) the supervisors and supervisee are satisfied with the use of the team-based internal supervision model. The final component is feedback that has only one sub-component that is the obstacles using team-based internal supervision model.

Results of evaluation on suitability of the components

Results of the seven experts' evaluation on the components and its sub-components of the team-based internal supervision model revealed that they evaluated all the five components and 17 sub-components as the most appropriate components to include in the team-based internal supervision model. The details are shown in Table 2.

Table 2: Evaluation results on the suitability of the team-based internal supervision model

Component	Sub-components	\bar{x}	SD	Level
Principle		4.82	0.25	Most
	Aim of teachers to change their behavior in a better way.	5.00	0.00	Most
	Changing the teachers' behavior comes from them.	4.71	0.49	Most
	Teachers' change of teaching behavior requires social support.	4.57	0.53	Most
	Teacher is the key of the teaching development.	5.00	0.00	Most
Aim		4.71	0.46	Most
	To provide opportunities to the team to apply the principles of linking content to the supervisory process.	4.86	0.38	Most
	To provide the opportunities to the team the approach how to comply to the target.	4.57	0.53	Most
	To provide opportunities to the team to use the coaches at a positive concept.	4.71	0.49	Most
Process		5.00	0.00	Most
	Study the current problems and the need for internal supervision.	5.00	0.00	Most
	Creating a team-based internal supervision team.	5.00	0.00	Most
	Educating the team about internal supervision.	5.00	0.00	Most

Result		4.81	0.30	Most
	The team understands the process of internal supervision.	4.86	0.38	Most
	The team can be supervised internally by team-based teams.	4.57	0.53	Most
	The supervisors and supervisee are satisfied with the use of the team-based internal supervision model.	5.00	0.00	Most
Feedback		5.00	0.00	Most
	Obstacles using team-based internal supervision model.	5.00	0.00	Most
Total average		4.86	0.20	Most

Qualitative results of focus group interviews

Results of focus group interviews are presented according to the components of the team-based internal supervision model. The following results are the summary of suggestions derived from the three groups of supervisor.

(i) Principle component

Generally, all the three groups of supervisor suggested that internal supervision must be achieved through cooperation between supervisors and supervisors. It is the development of colleagues to have higher knowledge. Internal supervision aims to develop teachers to change teaching behavior and the performance is even more effective.

(ii) Aim

All the three groups of supervisor stated that supervision helps teachers to develop teaching and learning as well

as their performance. It aims to promote professional advancement. This is a great way to make a difference.

(iii) Process

It can be said that supervision process is a plan between supervisors and supervisees. Generic supervision tools were created and the supervision of learning by subject and how to supervise. Supervise the implementation of the project as set out in the annual action plan. Assessment and reflection are the results of joint supervision.

(iv) Result

Supervisors and supervisees work together. They exchange the learning between each other. Supervision emphasizes harmony and help. It depends on the development of the teaching process.

(v) Feedback

Supervisors and supervisees take the lesson, share knowledge of teaching and learning together. The problem would be detected from the supervision for future improvement. The supervisors and supervisees reflect the performance to find out how to supervise. Let everyone participate and work as a team.

Development of team-based internal supervision model

The end product of this research was the development of team-based internal supervision model as shown in Figure 1.

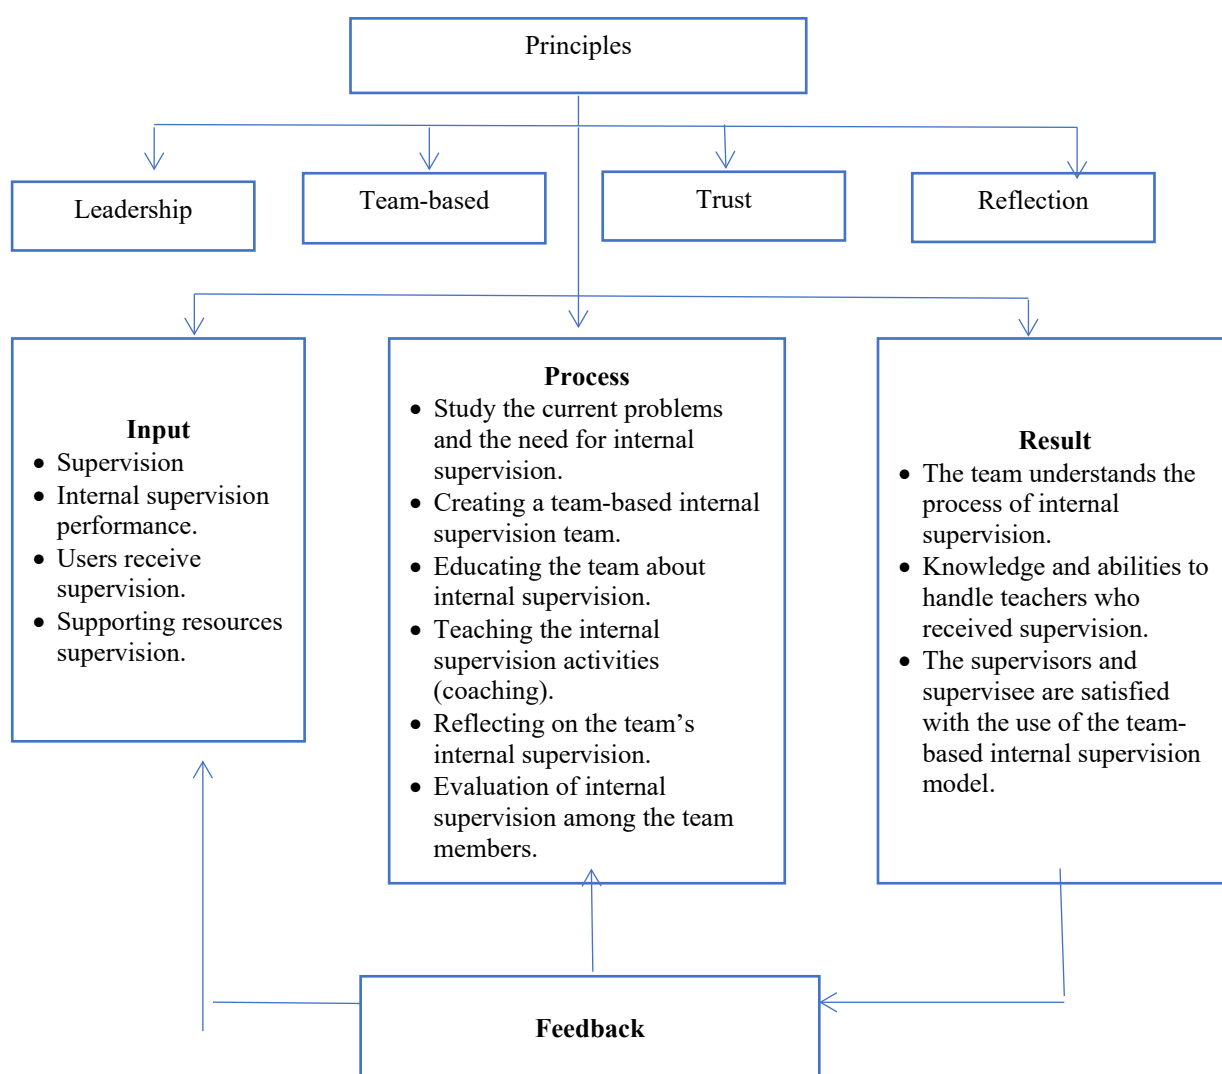

Figure 1: Team-based internal supervision model

Discussion And Conclusion

The components namely principle, aim, process, result, and feedback are found suitable to be included into the team-based internal supervision model according to the seven experts' evaluation reports. The result was in accordance with Richard and James (2006), Sukanan's (2007), and Tubsuli et al.'s (2017) studies. Richard and James emphasized that an effective supervision consisted of growth, support, teamwork, honoring others,

expectation for excellence, responsibility, inspection, possession, and support for relations. In addition, Sukanan found that there were eight important components of internal supervision namely strategic planning, supervision technique, roles and duties, evaluation, network creation, development, supervision media and instrument, and human relation. Tubsuli et al. found that team-based internal supervision has to include components such as internal supervisors and their ability, supervisees, supporting resources, supporting environment, and teamwork management as input of the supervision model.

The team-based internal supervision model was evaluated by the seven experts about the suitability of the components and turned up to be most appropriate components to be included. The result was in accordance with the study by Kanjanawasee (2002) who described the four standards for evaluation namely utilization, possibility, appropriateness, and accuracy. Since the three groups of supervisor also satisfied with the practicality of the team-based internal supervision model, researchers would like to suggest to Educational Service Area Offices and all secondary schools in Thailand to implement a systematic development for teachers by utilizing this supervision model. Finally, implication of this research is encouraging the policy level agencies to focus on supervision through managing a motivation system for supervisors, school administrators, and senior secondary school teachers who can conduct effective supervision.

Abstract

This paper was aimed to study the elements of empowerment program to improve the quality of life and physical activities of daily living for elderly people. After reviewing the related literatures, researchers identified four main elements and 15 sub-elements. A total of 376 samples aged between 60 to 69 years old who lived at Udonthani province were selected. Researchers utilized the formula Modified Priority Needs Index to measure the priorities of the required needs. Research results indicated that the need assessment of the empowerment elements were as follows: (i) the status quo was at a moderate level ($\bar{x} = 2.84$, $SD = 0.21$); (ii) the necessary conditions was at the 'much' level ($\bar{x} = 4.41$, $SD = 0.59$); (iii) the overall of priority needs index (PNI) = 0.55, with self-efficacy as the highest priority needs, followed by meaning, attitude and competence, and finally determination by critical thinking.

Keywords: Daily living; elderly people; empowerment program; physical activities; quality of life

Introduction

Thailand country report (2007) at the 5th ASEAN & Japan High Level Officials Meeting on Caring Society showed that world population has increased rapidly during this century in the last 30 years and population density has increased more than twofold over 65 years. According to the data of United Nation, Thailand entered into the period of 'the ageing society' in 2005. The number of elderly people in Thailand is expected to rise significantly over the next 25 years. A critical issue for Thailand is very high pace of growth of its ageing population.

The term of elderly people refer to ages nearing or surpassing the life expectancy of human beings, and is thus the end of human life cycle (American Psychological Association, 2009). The distinguishing characteristics of elderly age are both physical and mental. As a society population structure changes, the elderly people are a phenomenon occurring globally throughout the world until it becomes an issue that has received attention because of a widespread impact in the sector. Currently, Thailand is ranked the third most rapidly ageing population in the world (Most Rapidly Ageing: Countries, 2012). This shows that a total of eight million Thai people aged 60 and above, accounting for 13 percent of the population. By 2040, Thailand's aging population is expected to increase to 17 million, accounting for 25 percent of the population. This means that out of every four Thais, one will be a senior citizen (UN Department of Economic and Social Affairs, Population Division, 2001).

According to the World Health Organization, quality of life can be conceptualized as a generic, multidimensional parameter, describing an individual's subjective perception of his or her physical and psychological health, as well as his or her social functioning and environmental and general life status (Figueira, Figueira, & Figueira, 2010). Barcaccia (2013) defined quality of life as the general well-being of elderly people either individuals or societies, outlining positive and negative features of life. It observes life satisfaction, including everything from physical health, family, wealth, safety, security to freedom, religious beliefs, and the environment.

Conceptual Framework

The elderly issue has a direct impact to the changes in the economic and social of the country. Therefore, quality of life was measured by their physical health, psychological, economical, and social environmental aspects and also their abilities to perform daily activities. In this study, daily activities consisted of a routine such as feeding, grooming, transfer, toilet use, mobility, dressing, stairs, bathing, bowels, and bladder. The process of empowerment is considered as the way to help people be able to modify their own behavior, quality of life in a sustainable manner. The proposed conceptual framework is shown in Figure 1 below:

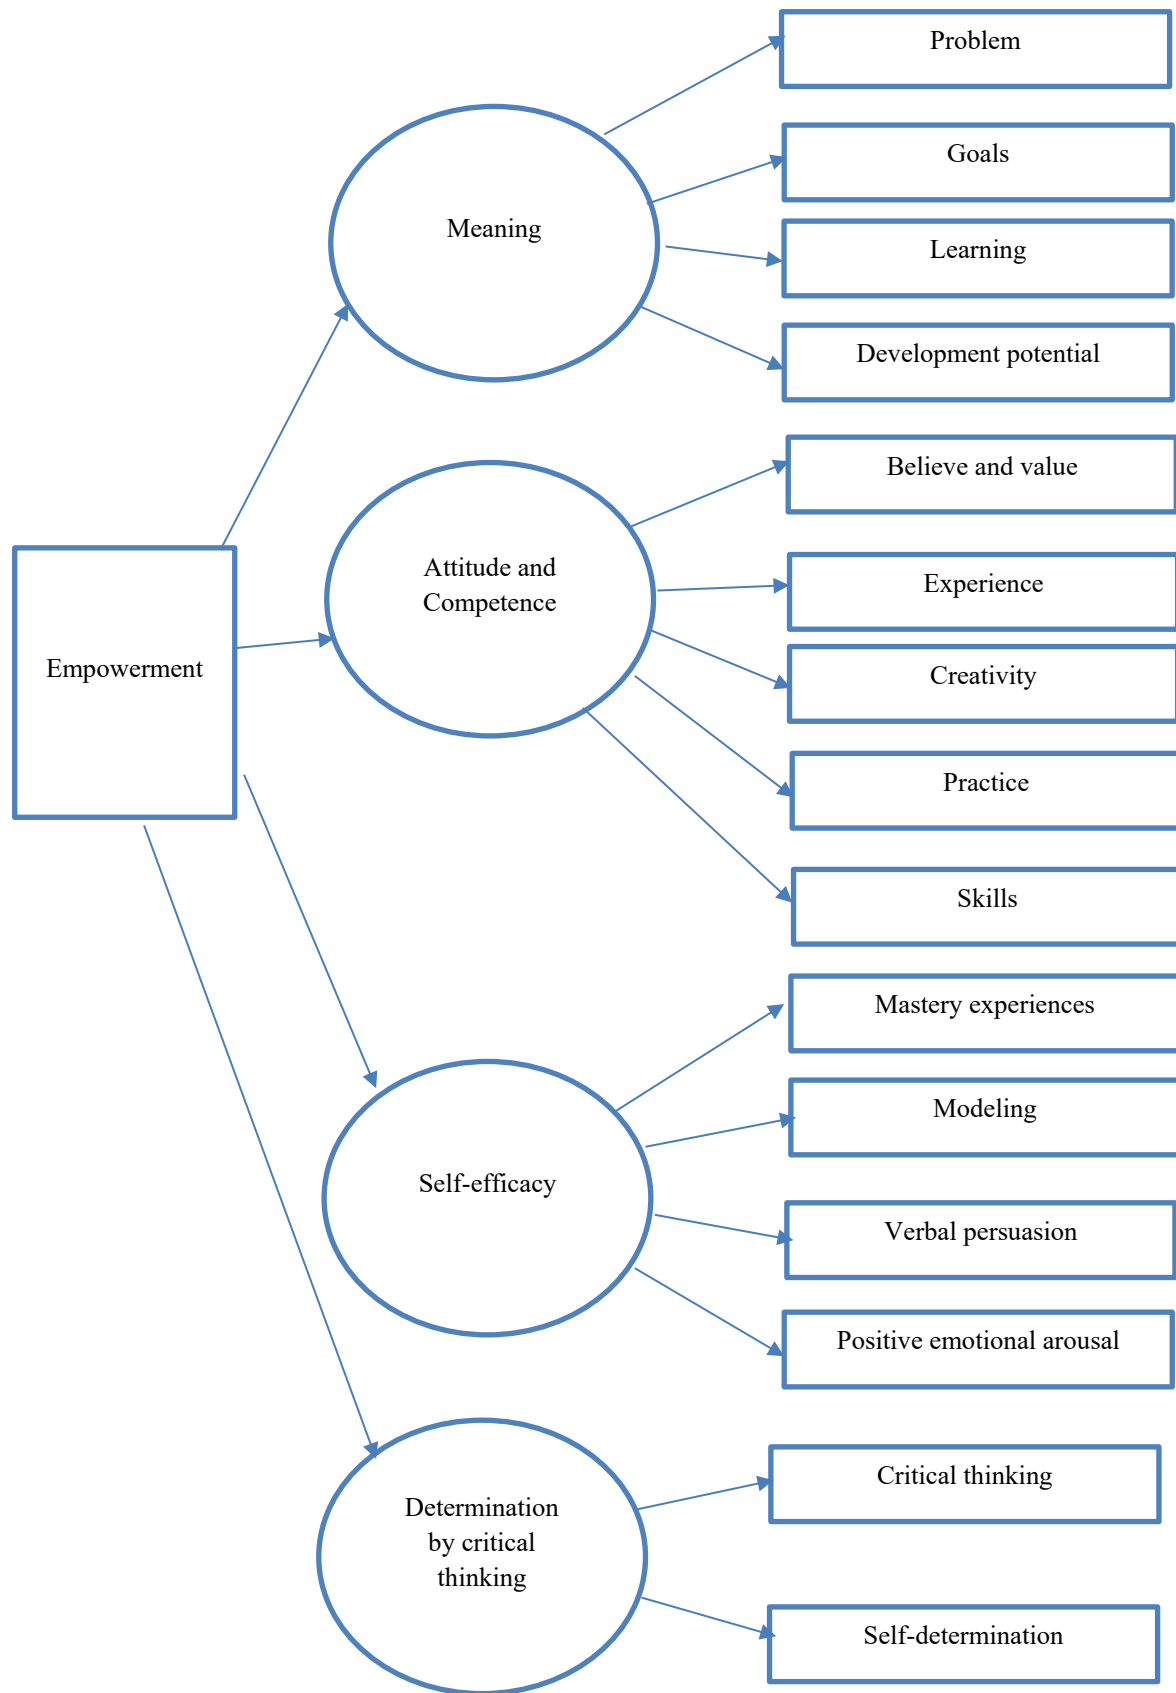

Figure 1: Conceptual Framework

The four main elements were meaning, attitude and competence, self-efficacy, and determination by critical thinking. The meaning element was comprised of four sub-elements namely problem, goals, learning, and development potential. The attitude and competence consisted of five sub-elements such as believe and value, experience, creativity, practice, and skills. The self-efficacy elements covered four sub-elements that were mastery experiences, modeling, verbal persuasion, and positive emotional arousal. The final element was determination by critical thinking including two sub-elements namely critical thinking and self-determination.

Hongthong, Somrongthong, and Ward (2015) aimed to assess level of quality of life and factors influencing quality of life among rural Thai elderly people in Phayao district. A total of 400 elderly people participated in their study. Their findings showed that approximately one-fifth (20.5%) reported current smoking and 31.7% reported ever drinking during previous year. Following univariate analysis, nine factors namely gender, age, education, working, income, present illness, drinking, activity daily life, and participating in elderly club were identified as being significantly related with quality of life at significance level <0.05 . Multivariate analysis revealed that there are four factors predictive of quality of life among elderly people, namely activity daily life, income, alcohol drinking, and present illness at $p < 0.01$.

Boonchun, Ucharattana, Punsakd, and Meehardsai (2011) conducted an action research to develop an empowerment program to increase self-care agency in elderly people with uncontrollable hypertension and to examine the effects of the program. A total of 78 elderly people involved in Boonchun et al's study were found to be significantly different in term of their pre- and post-program at $p < 0.05$ level. Their content analysis results revealed that elderly people were not aware of high blood pressure, lacked of knowledge, and depended on physicians' orders. After the empowerment program, the elderly people's self-care behavior were positively changed, for example, increased awareness of diet control and daily exercise, increased participation in elder's group activities for reducing stress and consistently self-monitoring in medication use.

On this line of reasoning, empowerment has been conceptualized as a framework for understanding the process and consequences of efforts to exert control and influence over the decisions that affect one's life, including perception of personal control as well as behaviors to realize the control (Shearer, Fleury, Ward, and O'Brien, 2012).

Method

A survey design was employed by researchers using questionnaire as a method of quantitative data collection. A total of 6,270 population of this study who are elderly people whose age between 60 to 69 years old with a combination of male and female were selected as samples of this study. The criteria of selecting samples were the samples are consciously not to mess up the fuzzy information and willing to participate in the study. They live in the six sub-districts from the three main districts of Udonthani province, Thailand. Researchers utilized multistage random sampling to determined 376 samples out of the 6,270 population.

The research instrument used was a questionnaire and administered in Thai language to ensure that the samples were clear about the statements. The instrument consists of two sections. Section 1 of the questionnaire was intended to gather information regarding demographic factors of the samples which included information pertaining to their personal background such as gender, age, income and so on. Section 2 was specifically designed by researchers to gauge the perceptions about the current conditions and the needs required conditions of the empowerment elements. To measure the samples' responses towards the needs of the empowerment elements, a five-point Likert scale was used, ranged from most, much, moderate, less, and least.

According to Chueachot, Srisa-ard and Srihamongkol's (2013) interpretation of comment, researchers determined its level as shown in Table 1. Data was analyzed using descriptive statistics include percentage, mean score, and standard deviation. This is followed by the analysis and priorities the needs required by the formula of Modified Priority Needs Index (PNI_{Modified})

Table 1: Interpretation of mean range

Mean range	Interpretation
1.00 – 1.50	The least level of comments
1.51 – 2.50	The less level of comments
2.51 – 3.50	The moderate level of comments
3.51 – 4.50	The much level of comments
4.51 – 5.00	The most level of comments

Results

The initial result is the descriptive results related to the characteristics or backgrounds of the samples that derived from the Section 1 of the questionnaire. This is followed by results about the current and the needs required conditions as well as the PNI reading on empowerment elements.

Descriptive results

The characteristics of the sample showed that majority of the samples are female. All the samples were almost equally distributed into two age range namely 60 to 64 years old and 65 to 69 years old. More than 90 percent of them graduated at elementary school level. Furthermore, more than 85 percent of them are still staying with their spouse. Majority of them have monthly income from 10,000 to 49,999 baht per year. A total of 57 percent of them are employed as part-time workers, 32 percent of them quitted from their jobs, and 11 percent of them still have full time jobs. Besides, almost 90 percent of them do not have any diseases or critical health problems and only 10 percent of them are having health problems. Among the 10 percent who have health problems, most of them did not or only sometimes do their annual medical checking to monitor their diseases or health problems. Only 12 percent of the samples do regular physical activities and 97 percent of them are taking care for themselves or their spouse for physical activities of daily lives. There are only six percent of them doing exercise regularly and also 10 percent of them are joining community's activities. Majority of them that is 90 percent of them only do at some time basis.

Results about current and the needs required conditions

Results of the study revealed that the overall needs of empowerment program was necessary to fix as PNI = 55. Although the current conditions were found to be at moderate level (mean score = 2.84, SD = 0.21), but it also needs required condition to increase (mean score = 4.41, SD = 0.59). When researchers separated each main elements and sub-elements, results showed that there is a necessary requirement in descending as follows:

- Self-efficacy element (PNI = 76) was found to be mostly demand that providing confidence of powers, particularly on the sub-elements such as mastery experiences. This is followed by verbal persuasion, positive emotional arousal, and finally modeling.
- Meaning element (PNI = 71) was found to be the second highest empowerment element. It consists of goals problem, development potential, and learning in descending order.
- Competence and attitude element (PNI = 68) was found to be the third highest empowerment element. It contains sub-elements like practice, experience, believe and values, creativity, and skills.
- The least capacity empowerment element was determination by critical thinking (PNI = 21) and its sub-elements such as self-determination and critical thinking do not have the requirements needed to solve.

Table 2 below shows the mean score and standard deviation of the current and the needs required conditions as well as the priorities need index for each empowerment element.

Table 2: Current and the needs required conditions

Empowerment elements	The current conditions			Needs required conditions			Priorities needs index
	Mean	SD	Level	Mean	SD	Level	PNI _{Modified}
Meaning	2.58	0.25	Moderate	4.41	0.60	Much	0.71
Problem	2.55	0.33	Moderate	4.36	0.69	Much	0.71
Goals	2.57	0.32	Moderate	4.47	0.57	Much	0.74
Learning	2.61	0.31	Moderate	4.36	0.61	Much	0.67

determination							
Overall	2.84	0.21	Moderate	4.41	0.59	Much	0.55

Discussion And Conclusion

Quality of life is an important concept in the field of international development particularly to Thailand elderly society since it allows development to be analyzed on a measure broader than standard of living. Results of this study revealed that empowerment elements are urgently to build their confidence which resulting in their attitudes and ability to solve problems with their self-efficacy. Within development theory, however there are varying ideas concerning what constitutes desirable change for a particular society, and the different ways that quality of life is defined by elderly people therefore shapes how the Thai society and community work for its improvement as a whole. The results of this study correspond to Boonchun et al.'s (2011) and Hongthong et al's (2015) studies. Boonchun et al.'s study indicated that there are positive improvements after the 78 elderly people attended the empowerment program. Hongthong found that over two-third of elderly people had quality of life in Phayao province where is one of the top ten provinces with the highest index of Thai aging. The vast majority (96%) had high scores for activity daily living.

In conclusion, physical function, health status and financial were the predictor of quality of life among the elderly people in Thailand. Hence, healthy life style should be considered as key areas in attempts to promote quality of life among elderly people in Thailand. In addition, the use of empowerment program by considering the main elements and sub-elements can increase quality life and physical activities of daily living for elderly people. Therefore, the empowerment program should be applied in primary health care setting to empower the elderly people to have quality life and physical activities in their daily living.

Abstract

This research aims to develop the science skills assessment instrument performance skill on elasticity in 11th grade Senior High School, the which is useful as a valuation instrument in accordance with the 2013 curriculum. This research method is a Research and Development with ADDIE development model that consists of five stages: analysis, design, development, implementation, and evaluation. This research was conducted at State University of Jakarta, Indonesia, and instrument test at Islam PB Sudirman Senior High School Jakarta with 32 respondents on September until December 2017. Validity test use product moment, 38 items tested to students and Obtained 30 valid items and 8 invalid items. Student performance assessment instrument developed has a 100% eligibility rate to the level of content based on the validation of the instrument construction 87%, 88% elastic material, and the language of 88% with a very good interpretation. In terms of construct validity, student performance assessment instruments developed have 38 points are valid with the level of reliability of the instrument at the 5% significance level of 0.860 or very high category. Based on these results, the performance assessment instrument developed on elasticity materials feasible to be used to measure students' science process skills.

Keywords: *Assessment instruments, science process skills, Elasticity*

Introduction

The aim in 2013 is to prepare the curriculum of Indonesian people to have live ability as individual and citizens who believe, productive, creative, innovative, and affective and able to contribute to society, nation, state, and world civilization.

Assessment is an integral part of the learning process and determine the quality of learning. The assessment also should be used to determine the strengths and weaknesses in the learning process. A meaningful learning process requires a good assessment system, planned and sustainable. Assessment of physics learning consists of three important aspects. They are cognitive, psychomotor, and affective. The assessment principles of learning outcomes set out in the Regulation of the Minister of Education and Culture No. 23, 2016 are valid, objective, equitable, integrated, open, holistic and continuous, systematic, accountable, and educative.

The assessment process requires a good instrument to match the valuation principles. Assessment instrument that designed properly and in accordance with the level of thinking skills and improve science process skills. Practical activity is one of the integral part in learning physics. Learners not only learn the theory and calculations using various formulas in the classroom but also carry out practical work to deepen or find a physics concepts. This activity aims to familiarize students in finding their own knowledge, in the process of finding a concept required a process skills.

Science process skills as the skills needed to acquire, develop and apply the concepts, principles, laws and theories of science, whether it be mental skills, physical skills, and social skills. These skills must be trained in the learning process at school. These skills also support the achievement of the curriculum in 2013 is the science process skills.

Some teachers have difficulty in making instruments on student performance assessment. Assessment more widely used on cognitive aspects. Students more accustomed to count about but rarely applied into cases relating to the environment and technology (Pertiwi, Muliwati, & Serevina, 2016). In addition, students are also accustomed to working on the problems in accordance with the example given by their teachers. Based on the received answers from high school teachers, one of the factors that lead teachers have difficulty in making student assessment instrument is the time of making a relatively long assessment instruments.

Instruments that already used have not been able to describe the ability of students science process skills are perfect. Therefore, according to Akinbobola, it is due to the approach of science process skills, then learning will be more meaningful in everyday life (Akinbobola, 2010). From the results of questionnaires that have been in had about the need for teachers to assessment of performance assessment instrument based on science process skills for elasticity material in senior high school, obtained the following results and showed in this diagram.

Diagram 1: The result of questionnaires

The diagram above can be explained by the following statements:

1. From the population of questionnaires, 50% said that the there are no appraisal instrument of the science process skill performance on the Elasticity and students do not need performance appraisal skills process science.
2. From the population of questionnaires, 44% said that the assessment instrument of the science process skill in the material can be used an alternative to the existing psychomotor assessment.
3. And then, 6% said that appraisal instrument of the science process skill performance is more needed for harmonic vibration in Physics for Senior High School.
4. The appraisal instrument of the science process skill performance is more suitable for other materials.

Based on the above background described, it is necessary to conduct research on the development of performance appraisal instruments based on the skills of science processes on the elasticity of 11th grade Senior High School.

Literature Review

Performance Assessment

Instrument is something that can be used to facilitate a person in performing the task or achieve goals more effectively and efficiently (Arikunto S. , 2006, p. 40). Scientific skills assessment tool instrument is one type of cognitive assessment that can be measured through tests. (Arikunto S. , 2006, p. 53). Instrument development steps include (a) reviewing the curriculum and textbooks, both extensively and profoundly, (b) formulating specific instructional objectives; (c) making a grid of assessment tools; (d) composing and writing lattice-based questions -the grid has been created, (e) create and determine the key answer questions.

Several advantages and disadvantages of this performance assessment hown in the table below.

Table 1. Advantages and Disadvantages

Advantages	Disadvantages
Assess competencies in the form of skills.	Not all subject matter can be done this assessment
Used to match the appropriateness between knowledge of the theory and skills in practice, so that the assessment information becomes complete.	Value depends on work performance results
In the implementation there is no chance of learners to cheat	If the number of learners of many lecturers difficulties to perform this assessment.
Lecturers can know more about the characteristics of each learner	Limited time to assess all learners

Motivate learners to be active	Underprivileged learners will feel inferior
The ability of learners can be optimized	Requires complete facilities and infrastructure. It should be full and complete
Train the courage of learners in facilitating the excavation of ideas.	It takes a long time, it costs a lot, and is boring.

(Kunandar, 2013, p. 265)

Performance assessment is an alternative assessment method for assessing students in advance and providing important information to teachers so as not to "lose data" as they make daily lessons (Ainsworth, 2016, p. 57). Performance-based assessment describes one or more approaches to measure student development, skills and achievement (Cohen, 2013, p. 165). Performance assessment are a type of assessment that requires students to show what they have, master skills, and special competencies by doing activities to reveal what they can do (Arhin, 2015, p. 109).

Fastre and van Merriënboer (2009) suggest that students need more practice to improve their skills assessment. Teachers usually focus on preparing presentation materials such as lesson plans and student portfolios to evaluate their performance appraisals. Most teachers focus their performance appraisal on teaching manual presentations rather than actual process and teaching outcomes (Tungkitwanich, 2012).

Assessment has an important role in managing problems in educational administration (Uttaramart, 2015, pp. 228-238). Performance-based assessment and criteria are a necessity to guide the learning process of students (Fastré G. M., 2010, pp. 517-532).

Based on expert opinion, it can be synthesized instrument performance assessment is a set of assessment is needed to measure the skills and abilities of students.

Science Process Skills

In the performance appraisal students should make answers, produce products, or perform an activity (Darling&Adamson, 2010, p. 83). When students perform an activity, then the activity will look special skills that students have. One skill that can be observed is the skill of the science process. Zeidan and Majdi (2015) argue that science process skills are a necessary tool for generating and using scientific information, to conduct scientific research, and solve problems. Scientific process skills are a very important skill in teaching how to achieve knowledge (Farsakoğlu, 2012).

According to Sevilay Karamustafaoğlu (2011, p. 26), the skill of the process of science is an inseparable skill in the practice of conceptual understanding that is involved in the learning and application of science. Feyzioglu, Demirdag, Akyildiz and Altun (2012) suggest that science process skills consist of sub-dimensions such as, observing, classifying, measuring, communicating, summarizing, predicting, formulating hypotheses, identifying variables, organizing data, and interpreting, designing investigations, data. Ozgelen (2012, pp. 283-292) suggests that students' science process skills exist within the framework of the cognitive domain.

Scientific process skills are primarily classified as basic skills and integrated process skills, which first involve observing, quantifying, classifying, using relationship numbers, predicting, drawing inferences, communicating and the latter involves identifying and controlling variables, formulating and testing hypotheses, describing operational, experimenting, and commenting on the variables (Kanlı, 2008).

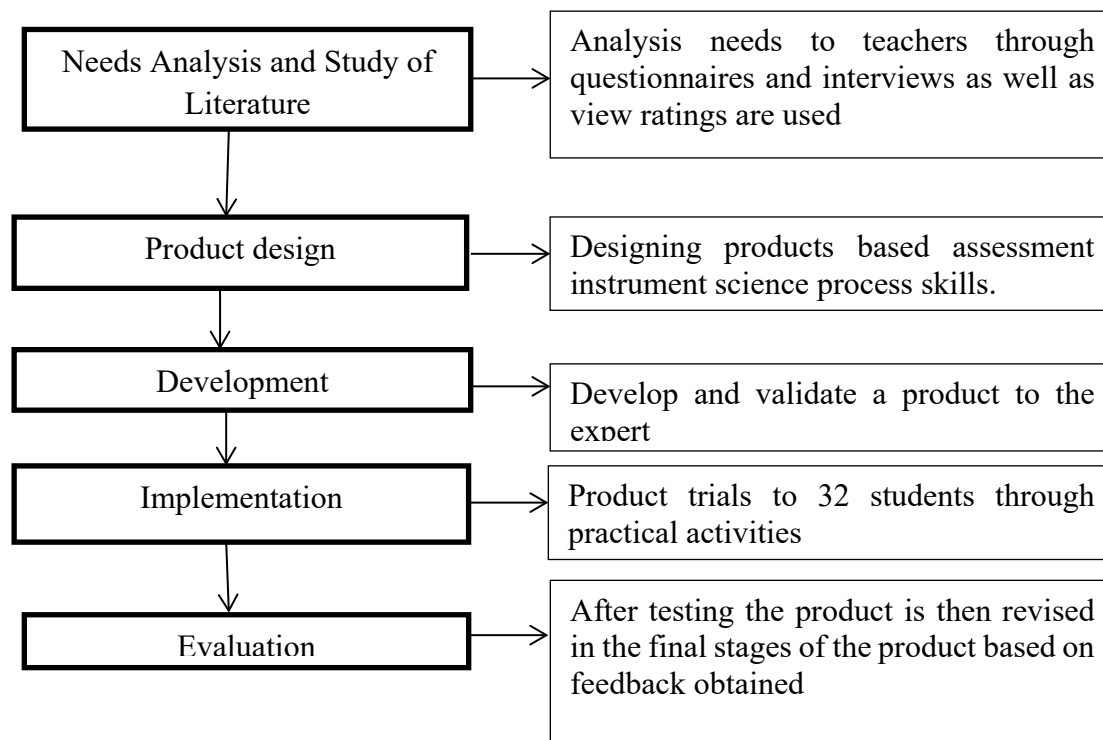

Scientific process skills are the basic skills of facilitating learning in science, enabling students to be active, developing a sense of responsibility, improving learning sustainability and providing research methods (Gürses, 2014, p. 645). Scientific process skills enable students to experience direct involvement with science materials when solving problems using a practical approach (Abungu, 2014, p. 359).

From the above explanation, it can be synthesized that the science process skill approach is a knowledge-processing skill to discover, develop facts and concepts in learning.

Methodology

This study developed a performance assessment instrument based on material science process skills elasticity with practical methods. Research conducted in UNJ and SMA Islam PB Sudirman Jakarta. The research was carried out development of September until November 2017.

This type of research is research and development. Research and development (Research & Development) is designed to obtain a product of physics performance assessment instruments in the material elasticity as an instrument to measure students' science process skills. The study design development to adapt the physics instrument on the model of research and development ADDIE (Analyze, Design, Develop, Implementation and Evaluation). The steps of ADDIE showed by picture 1 research design.

**Picture 1 Research design**

Before making instruments material science process skills, the lattice must be arranged first. Below there was the table that showed Instruments lattice material science process skills Elasticity.

Table 1 Instruments lattice material science process skills Elasticity

Scientific stages	Indicator	Item number	Item No.
Observe	Preparing tools	3 problems	1,2,3
	Using the senses of sight to observe the movement of oscillation in the spring	1 question	4
	Using the senses of sight to observe the vibration oscillation movement springs in series	1 question	5
	Using the senses of sight to observe the vibration oscillation movement springs are arranged parallel	1 question	6
Hypothesize	Asking questions related to the knowledge level of the experiment	2 questions	7,8
	Asking Questions Rate Application / Analysis related experiments conducted	2 questions	9,10
Plan your experiment	Designing tools and materials to be used carefully Hooke's Law	3 problems	11,12,13
	Determine what would be observed in experiments Hooke's law	3 problems	14,15,16
	Determining the Working Procedures	1 question	17
Experimenting	Carry out trial work procedures Hooke's law	4 questions	18,19,20, 21
	Hooke law collecting experimental data with the appropriate procedure	3 problems	22,23,24
Analyzing Data	Bentuh display data in tables, charts or graphs	2 questions	25,26

Interpret	Determining patterns in experiments Hooke's law	4 questions	27,28,29,30
	make conclusions	3 problems	31,32,33
Applying the concept of	Applying the concept of the new situation	1 question	34
Communicate	Reported the results of experiments with the appropriate procedures	2 questions	35,36
	Mempresantasikan results of the experiment with interest	2 questions	37,38

There were eight scientific stages with indicator, the problem or question item, and the item numbers. The total of item were 38 numbers.

Results

Products produced in this research is student performance assessment instrument based on material science process skills elasticity. These instruments appraised the 8 indicators of the science process skills to observe, hypothesize, design, experiments, conduct experiments, analyze data, interpret, apply concepts, and communicate.

The first prior of the initial product tested was feasibility of the instrument. The feasibility test carried out using a sheet review to determine the extent of grain developed ratings eligible for use in student performance assessment instruments developed. The results of the validation by experts in the assessment tool in the form was feedback, corrections, and suggestions instrument ratings as shown below.

Table 2 Results Validation with 5 Experts Instrument Rating

No.	Expert	Input Suggestions
1	Expert 1	1. Back view of the shape-betuk or expert validation tables so that students scoring can be done more easily. 2. The materials are in accordance with the experiment for the level of student performance assessment At 3. Use kaedah writing and use good language
2	Expert 2	On science process skills Fourth why not mention Hooke's law in series and parallel.
3	Expert 3	1. Do not use question words in declarative sentences (news) 2. Sentence in point to 20 and 26 repaired
4	Expert 4	Some items are made even more detailed instruments related to what was observed and the student will be obtained from this experiment
5	Expert 5	1. Coupled experimental combinations (series and parallel) 2. The number of springs in series and parallel circuits need to be in specified

As for the assessment was based on self-assessment questionnaire, it was found that a revised assessment instruments have reached an average of 87.73%, so it can be used to carry out tests of learning.

Validation grading scale based on the level of assessment are shown in the table below:

Table 4 : Criteria for scoring

Value	Predicate
> 80	Very good
75-79	Good
60-74	Less
<59	Very less

(Sugiyono, 2012)

Based on the table above, aspect and predicate of performance assessment instrument by questionnaire shown in the table below:

Table 5 Validation Expert Performance Instrument Assessment

No.	Aspects	Average	Predicate
1	Construction Instruments	87	Very good
2	Elasticity Material	88	Very good
3	Language	88.2	Very good
Average		87.73	Very good

And from the table, the validity result can be presented in chart below.

**Chart 1. Validity Result**

Validation of the expert had be function for the criticisms and suggestions as improvements to the quality of performance assessment based science process skills. Performance assessment instrument can be revised based on comments and suggestions that have been given. The revised assessment instruments, in tested to 32 students at Islam PB Sudirman Senior High School Jakarta when practical work with worksheets and teacher-assisted assess the performance of students with assessment instruments have been developed. The following documentation shown in the three pictures.

**Picture 2 Implementation phase**

Picture 3 Tested in School

Picture 4 Presented at the State University of Jakarta, December 2017

Based on instruments used in the implementation phase (testing) then did the validation constructs. To determine the validity of the performance assessment instruments developed can used the technique Pearson product moment correlation between grain score and total score, namely:

$$r_{xy} = \frac{n \sum XY - (\sum X)(\sum Y)}{\sqrt{\{n \sum X^2 - (\sum X)^2\} \{n \sum Y^2 - (\sum Y)^2\}}} \dots\dots\dots (1)$$

Information:

r_{xy} = the correlation coefficient between the variables X and Y, two variables were correlated

N = number of respondents

X = Scores are looking validity grain

Y = Total score

The results of the performance assessment instrument validity test compared with r_{tabel} to determine the validity of the item. If $r_{xy} > r_{tabel}$ with a level of 5% signifikansinya gauge declared invalid.

After the instrument tested to 32 students, further analysis will be conducted to test the validity (validity) by using the formula of product moment. Pearson. From the 38 items tested in a large group then obtained 30 valid items and 8 items were declared invalid. Because the value of R-count was greater than R-table, otherwise reliable. The results of calculations every point assessment of construct validity of the test to students can be seen in the table below:

Table 3 Data Test Results Validity Construction of Large Scale Trial Rate

Item number	r-count	r-table	Information	Item number	r-count	r-table	Information
1	0.0154	0.3494	Invalid	20	0.6768	0.3494	Valid
2	0.9400	0.3494	valid	21	0.7731	0.3494	Valid
3	0	0.3494	Invalid	22	0.4480	0.3494	Valid
4	0.3783	0.3494	valid	23	0.5656	0.3494	Valid
5	0.7368	0.3494	valid	24	0.3467	0.3494	Valid

6	0.5885	0.3494	Valid	25	0.3920	0.3494	Valid
7	0.4119	0.3494	Valid	26	0.6226	0.3494	Valid
8	0.6032	0.3494	Valid	27	0.3890	0.3494	Valid
9	0.5699	0.3494	Valid	28	0.5009	0.3494	Valid
10	0.5149	0.3494	Valid	29	0.3727	0.3494	Valid
11	0.3920	0.3494	Valid	30	0.8827	0.3494	Valid
12	0.1962	0.3494	Invalid	31	0.6140	0.3494	Valid
13	0	0.3494	Invalid	32	0	0.3494	Invalid
14	0.3584	0.3494	Valid	33	0.9530	0.3494	Valid
15	0.5655	0.3494	Valid	34	0	0.3494	Invalid
16	0.5110	0.3494	Valid	35	0.1974	0.3494	Invalid
17	0.8830	0.3494	Valid	36	0	0.3494	Invalid
18	0.7077	0.3494	Valid	37	0.3618	0.3494	Valid
19	0.8442	0.3494	Valid	38	0.6768	0.3494	Valid

To measure the level of reliability assessment instruments can be done by using the formula *cronbach alpha*, according to (Sugiyono, 2012) that is:

$$r_{11} = \frac{n}{n-1} \left[1 - \frac{\sum \sigma_i^2}{\sum \sigma_t^2} \right] \dots\dots\dots (2)$$

So that the reliability value of the performance assessment instrument was 0.860 where r_{table} 0.334.

The following is a table of instrument reliability level criteria

Table 4: Criterion level of reliability of the instrument

No.	Interval	Criteria
1	<0.200	Very low
2	0.200 to 0.399	Low
3	0.400 to 0.599	Enough
4	0.600 to 0.799	High
5	0.800 to 1.000	Very high

(Arikunto, 2013)

Thus obtained that whole grains existing assessment in student performance assessment instruments developed declared invalid by the level of reliability of the instrument in the criteria for Very High.

After going through several revisions and evaluation, obtained based performance appraisal science process skills such as in Table 6.

After through validity and reliability, final performance assessment instrument can be seen in table below.

Table 5 Final Performance Assessment Instrument

No.	Item Ratings
1.	Students observe the functioning state of the spring
2.	Students observe oscillations spring with the eye position perpendicular to the point of balance
3.	Students observe oscillations spring in series with the eye position perpendicular to the load on the spring balance point
4.	Students observe oscillations spring are arranged parallel to the eye position perpendicular to the load on the spring balance point
5.	Students asked questions relating to the events / times / places experiments must be done properly and correctly
6.	Students asked questions relating to the work steps in the experimental procedure
7.	Students ask the question relating to the practical process properly

8.	Students write a hypothesis about Hooke's law
9.	Students determine the tools and materials used in the experiments Hooke's law of springs
10.	Students determine the things to be observed in experiments Hooke's law of springs
11.	Students determine the things to be observed in experiments Hooke's law in the spring in series
12.	Students determine the things to be observed in experiments Hooke's law in the spring are arranged parallel
13.	Students arrange work step experiment
14.	Students assemble the tools and materials used in accordance with the experimental procedure Hooke's law
15.	Students assemble the tools and materials used in accordance with the experimental procedure Hooke's law stacking two springs in series
16.	Students assemble the tools and materials used in accordance with the experimental procedure Hooke's law stacking two springs in parallel
17.	Students put the tools and materials used safely and not endanger other students
18.	Students determines the equilibrium point oscillations of the spring before the start of trial
19.	Students measure the length of the initial spring
20.	Students measure the length of a spring after a given load
21.	Students present the experimental results in tabular form
22.	Students present the experimental results in graphical form
23.	Students find the relationship between the mass and the length of spring
24.	Students compare the results of the length between the spring in series and are arranged parallel stacking
25.	Students discover patterns of relationship data obtained from the experimental results
26.	Students calculate the spring constant obtained from experimental results
27.	Students make conclusions based on the graph created
28.	Students mentioning the reasons for differences in the results of the experiment and the spring constant reference
29.	Students present the results of experiments using a language that is easily understood
30.	Students respond to questions with logical and rational

Conclusions

From results of research and discussion, we can conclude that student performance assessment instrument base on science process skills developed already qualified and can be used as an assessment of the performance of Physics for high school students. Student performance assessment instrument developed has a 100% eligibility rate to the level of content based on the validation of the instrument construction 87%, 88% elastic material, and the language of 88% with a very good interpretation. In terms of construct validity, student performance assessment instruments developed have 38 points are valid with the level of reliability of the instrument at the 5% significance level of 0.860 or very high category.

Diffusion Of Twitter In Turkey

Prof.Dr. Aytekin İŞMAN

Communication Faculty, Sakarya University, TURKEY isman@sakarya.edu.tr

Engin DAĞDEVİREN

Student at Media and Communication Studies MA Program, Sakarya University, TURKEY

Abstract

Since its penetration in people's lives, Web 2.0 has become a rapid success in terms of diffusion. Social networking, which is among what Web 2.0 offers, is one of the top activities of millions of people on the Internet. Twitter is one of the most used microblogging platforms. It was first founded in 2006; however, was introduced in Turkey in 2011 after the addition of Turkish language support., It became one of the most used platforms in Turkey in a relatively short time. The aim of this study is to explain how Twitter has diffused and become a success in Turkey using Rogers's diffusion theory (2010). The diffusion of Twitter in Turkey is carefully analyzed using the four main elements of Rogers's theory which are the innovation, communication channels, time, and social system.

Key Words: *Diffusion; Twitter; Turkey; social media; Web 2.0*

Digital Technologies And Postgraduate Student Role Transition: Perceptions Held By New Masters Degree Students

Dr. Hazel BEADLE

Senior Lecturer Leadership and Management Institute of Education
University of Chichester Upper Bognor Road
Bognor Regis

Abstract

This exploratory study draws on data collected at three stages during the first module of a Master of Science (MSc) degree in Human Resource Management (HRM) delivered largely at distance using digital technologies. Noting from the literature that the significance of the transition to the postgraduate student role appears to be generally underplayed, and thus giving voice to those students, the research focuses on the students' described experience at an early point in that transition. Drawing on rich description gathered from interviews and online surveys, data gathered at three points and across two cohorts of students over a 16 month period, the student experience of 'stepping up' to the postgraduate student role is highlighted. This is a role influenced by factors including; the adoption of a postgraduate persona, a requirement for self-responsibility with regard to learning, and the need to challenge the existing mindset by engaging with critical analysis. These are factors which are perceived by the participating postgraduate students to be influenced by the use of digital technologies. Student anxiety is identified to arise from the use of those technologies despite technology enhancing the flexibility of learning around the demands of the students' professional role and of the students knowing, ahead of enrolment, that digital technologies play a significant role in the delivery of the programme.

Keywords: *Digital technologies, Postgraduate, Masters Student, Student voice, Transition, Human Resource Management*

Introduction

Starting a new level or phase of education inevitably presents challenges for the student. This challenge is compounded when the respective individual is trying to juggle other commitments such as a full time work role and family commitments (Mescher et al, 2010). As Tobbell and O'Donnell (2013, p.124) highlight, despite the argument that 'postgraduate students, by definition, have been successful undergraduates and so there is an implicit assumption of competence in negotiating and performing in the HE environment', many postgraduate students are considerably older than their undergraduate colleagues, are actively engaged in their chosen professional discipline - often in senior positions - and have other demands upon their time.

Aided by the ready availability of digital technologies, students are perceived as becoming more discerning in their selection of learning provider and the method of learning provision. In the United Kingdom (UK), this ability to be discerning has been facilitated by the Quality Assurance Agency for Higher Education (QAA), an independent body advising on standards and quality, specifically outlining in the preface to their 'Masters Degree Characteristics' publication (QAA, 2010 p.2) that 'the landscape for master's degrees in the UK is flexible and diverse' and going on to identify that 'there are no nationally agreed definitions of types [of Masters degrees and that] awards with similar titles can vary in nature both between institutions and across disciplines' (QAA, 2010 p.3). This 'flexible landscape' has influenced higher education institutions to revise their offering and the use of digital technologies has played a significant role (Firat et al, 2016). Postgraduate courses are acknowledged to be an appropriate avenue for the development of professional expertise (Macpherson, 2010; Black and Bonner, 2011), with limited evidence identified within the literature that postgraduate studying is undertaken solely for the purpose of self-fulfilment. This raises the question as to how higher education providers may maximise their effectiveness in responding to the needs of potential postgraduate students in the presence of digital technologies.

This paper provides an account of student perceptions relating to their experience of beginning to study for a Master of Science (MSc) degree in Human Resource Management (HRM) delivered largely at distance using digital technologies. The studied group is distinctive in that the management of the organisational human resource (the students' professional role) also embraces consideration of the development of that resource. In short, the students are both called upon to consider the application of transitioning arrangements within their workplace as well as to transition to the role of a postgraduate student. However, despite the potential for professional role and learning to positively influence one other, practitioners are not always seen to model the learning practices with which they encourage others to engage. This is referred to as the 'knowing-doing gap' (Sanders et al, 2008 p.1976).

Literature Review

This section focuses on three sections, firstly the literature relating to transitioning of students to postgraduate study. Secondly, the literature relating to student motivation, observation, and the influence of digital technologies.

Finally, before clarifying the gap in the literature which this paper contributes towards filling, focus is placed on the challenging of existing understanding.

Transitioning to postgraduate study

There is acknowledgement in the literature that limited research has been conducted into the transitioning of students to postgraduate study (Masterman and Shuyska, 2012; Tobbell and O'Donnell, 2013; Spearing, 2014). Indeed, where related research has taken place, this has attracted the claim of having 'broken new ground' (Jespen and Neumann 2010, p. 465). Some argument has been presented that this limited focus is one consequence of the attention that other educational transitions have attracted and, furthermore, that postgraduate study is little more than a natural progression from undergraduate studies (Watson et al, 2005; Tobbell and O'Donnell, 2013; Masterman and Shuyska, 2012). This progression is acknowledged to be one which often entails movement to a different higher education establishment (Spearing, 2014), where 'existing knowledge [i.e. that gained as an undergraduate] may be resituated in the new context' (Tobbell et al, 2010 p.262).

The context of postgraduate study is, however, noted to be different to that encountered as an undergraduate. One base point is that as graduates, postgraduate students 'are expected to have developed the ability to recognise and address their own learning needs and have pre-learned core intellectual skills such as problem-solving, critical thinking and research skills' (Spearing, 2014 p.89); that they might otherwise be termed 'expert students' (Tobbell et al, 2010 p.263). Whilst postgraduate studies offers a mechanism to redress the reduction of the advantage provided by undergraduate degrees - the result, as Wakeling (2005, p.506) terms it, of undergraduate degrees becoming 'ubiquitous' and, as a consequence, providing diminishing advantage in the labour market (Masterman and Shuyska, 2012) - the associated advantage often requires students to have successfully wrestled with a different set of issues. Tobbell and O'Donnell (2013, p.126) provide some examples, including those issues which are a consequence of 'relationships, university imperatives and government policy', although it is the former, specifically the 'form[ing of] family units, buy[ing of] houses and progress in careers' which is carried through from Tobbell et al's (2010, p.265) earlier writing in this area. It is in this context that digital technologies are used to facilitate learning.

Motivation, observation and the influence of digital technologies

There is acknowledgement in the literature of the independence associated with the undertaking of postgraduate studies. Tobbell and O'Donnell (2013, p.124) appear to link this independence to isolation, highlighting the risk that it might 'undermine confidence'. A number of writers (e.g. Littleton and Whitelock, 2005; Masterman and Shuyska, 2012) place emphasis on students comparing their own performance against that which they observe occurring around them; acknowledging the overarching fear of being negatively judged (Johnson, 2012). This offers a contrast to the more supportive undergraduate context where students are often regarded to be part of one or more socially cohesive groups (Menzies and Baron, 2014) and where the expectation of collaborative working may be central to module assessment. Social support theory (House, 1981) presents an argument that social cohesion (such as that cited in the literature as being experienced during undergraduate studies) offers protection against the effect of stress on health. However, there is little evidence in the literature that a similar effect is enjoyed by postgraduate students.

When there are skills to be developed or refined, some pre-existing skills can become redundant. Masterman and Shuyska (2012 p.349) use the example of 'the movement of the lecturer's hand across the blackboard as he or she dynamically constructs an ephemeral representation to explain a new concept', going on to suggest this 'may exercise greater pedagogic power than a 'still' slide in a digital presentation preserved for posterity in the [Virtual Learning Environment] VLE'. The literature details the efforts which have been made to link technology-based learning contexts to historically used skills (Cigdem and Ozturk, 2016). However this literature appears to be silent on what factors might preclude value from being derived.

Whilst not all postgraduate provision is linked to an expectation of progression to doctoral studies, or related to fulfilment of professional development needs (QAA, 2010), provision facilitated by the use of digital technologies is acknowledged to be one mechanism for responding to the time constraints encountered by working professionals. As Tobbell et al (2010) highlight, student lives are not now limited to that which occurs within the university setting and, reflecting that release from geographical constraint, is time-related flexibility. Digital technologies give the student opportunities to plan their studying around their other commitments.

In the light of these flexibilities, perhaps it should not be surprising that the effective use of provision is regarded to have the potential to support higher education institutions to both retain and enhance their 'client' base. Higher education institutions can, for example, use digital technologies to extend their reach. The movement towards active use of those technologies in the higher education context is not, however, seen as having enjoyed a smooth transition. There is, for example, acknowledgement of the need to overcome the influence of reified practices constructed over an extended time period (Tobbell and O'Donnell, 2013) and some reluctance to acknowledge the power of digital technologies in the development of the learning context is argued to remain (Masterman and Shuyska, 2012).

The student's first experience of learning facilitated by the use of digital technologies is acknowledged to provide an additional burden. Specifically, there is an acknowledgement of the need to learn how to embrace the discipline associated with that method of provision (Blount and McNeill, 2011). Engagement is reasoned to hinge upon students perceiving, and identifying with, the value of that mechanism for learning and to move from an initial excitement associated with their new challenge to a state where they are successfully performing within their new context (Menzies and Barson, 2014). It is acknowledged that there are issues associated with this performance task (Kanuka and Garrison, 2004; McCormack, 2004; Zhu, 2006). Even when there is a general familiarity with digital technologies, this has been identified as failing to equate to an immediate ability to transpose those skills to other contexts (Beadle, 2016). Indeed, the overarching process of engagement is acknowledged to be part of a larger framework of interconnected activities, what Tobbell and O'Donnell (2013, p.126) describe using the 'mesosystem connections' terminology.

Challenging of understanding

Whilst it has already been acknowledged that a base point for graduates, and therefore a prerequisite for postgraduate study, is the ability to engage in a process of critical thinking (Spearing, 2014) and there is indication that students wish to understand the expectations of their assessors (O'Donovan et al, 2001), the task of responding is acknowledged to be problematic. In part this is identified to be a consequence of relying on perceptions (Nelson, 2012); what one party to a learning relationship thinks the other requires, for example by way of explanation. The perceptions which are held by students are acknowledged to be subject to multiple influences (Ozgur, 2015). One example is the pressure which emanates from personal relationships and the effect this has on engagement with the studying task. As Tobbell et al (2010, p.270) highlight, 'There is psychological work involved in making shifts between being a student and fulfilling [other roles]'. If there is a difficulty in making the required shift, then this is likely to impact upon the student's understanding of what is expected of them in the role of a postgraduate student.

Critical analysis is a central tenant of academic writing and is noted by Swanwick et al (2014, p.158) to include 'openness to inquiry and adapting practice and a commitment to experimentation as a learning process' as well as the ability to 'creatively synthesise multiple perspectives'. However, this is a task highlighted to require a 'tolerance of uncertainty and unpredictability and preparedness to get it wrong' (Swanwick et al, 2014 p.158). Whilst the literature demonstrates a wealth of material relating to the need to adopt a critiquing approach (e.g. Firth and Martens, 2008; Von Der Heidt and Lamberton, 2011), even within the focal subject discipline (e.g. Kamoche et al, 2011; Ackers, 2014), it offers less input with regard to how the required ability to engage in critical analysis might be developed. It is here, however, that there are identified links to communities of learning practice (Brown, 1992; Handley et al, 2006) and the value of collaborative learning (Vance, 2004; Guerin and Green, 2013) albeit that this, in turn, fuels the aforementioned potential for comparison to arise as a result of observation.

In providing an account of postgraduate student perceptions relating to their experiences of beginning to study for a Master of Science (MSc) degree delivered largely at distance using digital technologies, and specifically the issues relating to progression to the Masters Student role, this paper provides a contribution at two levels. Firstly, it responds to what Tobbell and O'Donnell (2013, p.127) refer to as 'the identified paucity of research representing postgraduate experience', specifically within the context of provision facilitated by digital technologies. Secondly, mindful of what Masterman and Shuyska (2012, p.336) identify as the neglect of taught postgraduates in 'learner voice' studies despite 'the burgeoning literature on the learner experience of e-learning' more broadly, the study seeks to give voice to students engaged with one postgraduate programme.

Method

A three stage approach was taken to gathering the data. Firstly, all students participating in the first module of the MSc in HRM during the 2015-2016 academic year were invited to participate in the research interviews. Students received this invitation shortly after they had submitted the first of their three assessment activities, at a point when they had been a participant on the module for approximately two months. The purpose of the enquiry was to explore the student's perceptions of transitioning to postgraduate education delivered using digital technologies with the intention to identify whether additional support was perceived to be necessary and, if so, the nature of that support. The timing of that invitation was purposeful as it is known that some students fail to robustly engage with the course or assessment resources until immediately preceding an assessment deadline (Whitworth and Wright, 2015).

Of a population of 85 module students, 17 students (20%) who identified themselves to have had no previous experience of studying at a postgraduate level responded to the request for participants and ultimately took part in the study. Each of these 17 students was invited to participate in a 1-2-1 interview with a member of the teaching team. The interviews each lasted between 60 and 90 minutes and were undertaken remotely using the online meeting/tutorial portal used as part of the degree programme, Skype and, in three cases, the telephone. Each interview was recorded, transcribed and the resulting qualitative data was subsequently analysed using an inductive open coding approach. The interview questions were designed to focus upon the feelings, emotions, and

experience the student perceived they had encountered, and the understanding that they had acquired, in transitioning to this, their first, postgraduate module.

The interviews took place over a three month period, up to and including the period during which the second of the three assessment activities was submitted, but before those students sat the summative end of module examination. The students did not receive any direct benefit (e.g. course credit) for having participated, but a number of the students identified that they had enjoyed the experience and considered they had benefited from taking this supported reflective opportunity.

Secondly, the same cohort of 85 students was invited to participate in a questionnaire evaluating the module as a whole. This questionnaire was issued when those students reached the end of the module and, whilst taking a broader focus than the first stage study, the data gathered was interrogated for further detail with regard to what the student cohort considered to be the key issues they had encountered during the first module on the programme. 20 students (23.5%) responded to this questionnaire, which provided both qualitative and quantitative data.

The subsequent cohort of students, those participating in the first module of the MSc in HRM during the 2016-2017 academic year, were provided with an optional and newly devised standalone online learning resource which focused on academic writing skills including essay planning, formulating conclusions, critical analysis and referencing practice. This resource had been developed using the feedback from the first stage study and became available approximately one month after the 2016-2017 intake commenced their postgraduate student role. It took the form of description and explanation, illustrative scenarios and associated activities. On average the resource took 90 minutes to complete and students were notified about the availability of the resource through a series of online messages.

The third stage of data collection exercise amounted to interrogation of the reflective comments provided by the 8 students who both engaged with that online teaching resource and subsequently responded to an online evaluative survey which was accessed through a link provided at the end of the teaching resource. This evaluative survey captured both qualitative and quantitative data. Since the online teaching resource did not record the total number of students who engaged with it, it was not possible to identify the percentage of 2016-2017 cohort students who participated, nor the extent to which those who participated chose not to engage with the evaluation. Anecdotal evidence suggests, however, that fewer than one half of the students who used the teaching resource contributed to the subsequent evaluation.

The data for each of the three stages was initially analysed as a self contained unit in response to the desire to maintain student ownership of the perceptions and in order to ensure the meeting of practical/operational objectives. However the framework derived from the inductive approach used for stage 1 was subsequently also applied to both stages 2 and 3 in term in order to maximise the interrogation of the gathered data.

Findings And Discussion

This findings and discussion section highlights the issues which the new postgraduate students who commenced a course delivered largely at distance using digital technologies highlight, through the three stage data collection method, as being the most significant to their transitioning experience. This significance has, in large part, been identified on the basis of the frequency with which the issues were highlighted across the three data collection stages, and thus the two student cohorts. However, consideration has also been given to where there was a body of consensus within any one stage and this is highlighted within the text. The participating students were numbered consecutively across the three stages. The three themes discussed are, in turn, the commencing of the studying task, the postgraduate persona, and the issues surrounding the process of critiquing.

Commencing the studying task

The research identified that commencing the studying task was central to igniting a postgraduate student mindset. This task was reasoned to exhibit the discipline associated with the postgraduate student role. Participant 43 suggested, for example, that they were 'suffering from studying paralysis' and that they had engaged with the standalone online teaching resource in the hope that it would help them 'to get started; to put [them] in the right mindset'. It is unlikely that this student had failed to undertake any studying of the module content by this point, however use of the 'get started' phraseology indicated that they had yet to become accustomed to their new role.

The need, as Participant 14 termed it, 'to knuckle down' to undertake the postgraduate work task was indicated to be, in part, a legacy of the students' experience of undergraduate studying. This legacy was also highlighted to contribute to the difficulties which the students highlighted that they had encountered with regard to producing the assessed work; work which was submitted through an online portal. Some of the participants identified a preoccupation with completion of the assessment tasks as opposed to acknowledging that those tasks marked the end of a period of learning. Many of the students, largely reflecting argument in the literature (e.g. Watson et al, 2005; Tobbell and O'Donnell, 2013; Masterman and Shuyska, 2012) that postgraduate study represents a natural progression from undergraduate studying, described having assumed they would 'naturally' adjust to meet the more encompassing learning expectations.

Contributing to what Participant 8 referred to as the 'magnitude of the studying task', was the influence of other demands upon the student's time. The literature (e.g. Tobbell and O'Donnell, 2013) identifies that postgraduate students are often called upon to wrestle with a different set of life issues to those faced at an undergraduate level. Here there is an assumption that most undergraduate students undertake their first degree shortly after leaving compulsory schooling, whereas postgraduate studies often commence many years later. The influence of other demands was seen to equally apply to the participating students. Indeed, the data revealed the effect of those influences. It also identified the potential for those influences to undermine the assuredness that some of the students expressed having felt at the point when they had enrolled for their postgraduate degree. The Stage 3 participants, who expressed their views a little ahead of their first assignment submission, unanimously highlighted that in advance of engaging with the standalone online learning resource they had awoken to the magnitude of the task with which they were faced and how ill-equipped they had considered themselves to be in order to deliver work of the required standard. Whilst those participants were only part of that year's cohort, a common factor was that in the face of decreasing confidence, each of those students had taken the initiative to engage with the optional learning resource.

The postgraduate persona

The requirement to use digital technologies was identified to compound the issues which the postgraduate students identified they were, using the phraseology of Participant 7, 'wrestling with' in relation to 'commencing the postgraduate studying task' and adopting the 'postgraduate persona'. Providing a contextually applied example of Tobbell et al's (2010) observations regarding the impact of contextual change, the data revealed that some participants drew attention to the extra demands which resulted from endeavouring to learn whilst making use of the digitally facilitated provision. Whether the demands faced by the cohort of students examined exceed those encountered by other postgraduate students can be questioned. Nevertheless, the ability to attribute demand to the use of the digital technologies served to illustrate voice being given to the student perspective. That voice highlighted that the majority of the Stage 1 participants identified how use of the digitally facilitated learning resources contrasted with their previous (face-to-face) educational experiences. Indeed some participants went so far as to indicate that the emphasis on using digital technologies compounded the challenge of what Participant 9 termed the 'stepping up' to meeting the needs of postgraduate work and adoption of the postgraduate persona. This was despite the participants having pre-existing practical experience in the studied discipline.

The data revealed that many of the participants regarded the effort they invested in using the digital resources required direct acknowledgement. The underpinning reasoning might well be attributed to the relationship between isolation and confidence which Tobbell and O'Donnell (2013) highlight. Indeed, echoing the commonly felt perspective, Participant 17 suggested that acknowledgement of the effort deployed should take the form of a positive contribution to the assignment marks. Here historical practices are seen to have the potential to constrain perceptions surrounding the application of digital capabilities.

Indeed, failure to have the efforts that were made in the student role directly acknowledged was noted by some participants to have the potential to generate the desire to take a 'short cut' approach to assessment completion. Participant 6 talked about this in terms of 'achieving compensation'. Whether that desire for compensation was ultimately pursued could not be determined from the data. However, many of the participants did acknowledge their primary focus on completion of the assessment tasks with the intention that this would lead to course credit, as compared with acknowledging the breadth of the learning potential which existed or, indeed, any other benefits which might be derived from engaging with the postgraduate learning programme more broadly. Furthermore, there was indication that for a number of the students the reward offered by the assessment tasks had the potential to fill a motivational void.

The first stage of the research exercise took place shortly after the students had submitted the first of their three summative assessment activities. At this point they had had the opportunity to engage with no less than three online tutorials, as well as a series of asynchronous tasks in an online forum. Some participants suggested that they had not regarded any of this online provision as a valued opportunity for active learning. Participant 15, for example, indicated that they were reluctant to engage with tasks in the presence of their peers. The data revealed that the participants considered themselves to be influenced by how they perceived postgraduate students were expected to behave, regardless of whether any additional encouragement might have been received from those facilitating the online activities and outweighing any learning which might have the potential to result. Specifically, and again drawing from the contribution of Participant 15, there was mention of the feeling that 'postgraduate students ought to always know the answer to questions posed by the tutor facilitating the online activities' and that there was an assumption that where others either did not participate or demonstrated limited participation (for example by finding a reason to avoid speaking in an online discussion group) that this was a consequence 'of those students already possessing the level of understanding which [the student] sought to achieve'. The effect provides a parallel to emphasis within the literature (e.g. Littleton and Whitelock, 2005; Masterman and Shuyska, 2012) of the tendency towards students comparing their own performance to that of

others. Here it was evident that postgraduate provision using digital technologies contributed to a compounding of the 'learning burden' (Blount and McNeill, 2011).

The issues surrounding critique

The data revealed the participants to have noted that the postgraduate role requires evidence of engaging in the process of critical analysis. The data also revealed there to be issues associated with the need to move away from simply recounting material. Participants 22 and 26 both highlighted their developing awareness of perspectives within arguments and the importance of actively 'weighing up' the material presented. The participants were identified as paying focus to the contrast between requirements for critique at a postgraduate level, as compared with the expectations which they had retained from their experience of undertaking undergraduate studies. The accuracy of those recollections was not seen to be questioned. Participant 39, for example, emphasised how postgraduate writing contrasted with the approach to writing that they had learnt in the past, going on to specifically identify that 'critical analysis had not been a particular requirement of [their] undergraduate degree'. Several participants identified that they struggled to manage the feeling that the material which had been published ought to be accepted at face value, with a number of these participants making specific mention of the 'peer review process'. The emphasis conveyed suggested that if a writer's academic colleagues had accepted the material then the postgraduate student ought to defer to their understanding.

Participant 45, who suggested that they had engaged with the standalone teaching resource after commencing writing their first piece of assessed material, acknowledged that that first draft of their assignment had not included any critical analysis. However, as the module progressed, they indicated that they had developed confidence in the requirement to engage with critique, arguably demonstrating the psychological shift to which Tobbell et al (2010) refer. Participant 20 (reflecting the perspective of more than half of the Stage 2 participants who suggested that their engagement with the module had heightened their understanding of how to relate theory to practice) highlighted, for example, how he felt more confident saying what he thought; of potentially challenging the published material.

Despite this suggestion of a development in confidence, some of the participating postgraduate students openly challenged the need to engage with critique; favouring a prescribed approach. There was suggestion that in being forced to derive their own conclusions students were not receiving the input that they desired and which a number of participants either directly highlighted, or alluded to, 'paying' to receive. Participant 35, for example, drew attention to the influence of digital technologies in 'decreasing and removing face-to-face input'. There was clear indication that this student linked the use of digital technologies to a process of 'teaching [them]self'. Appearing to echo Participant 35's comments, Participant 36 questioned how the ability to critique could be developed through education facilitated using digital technologies. This participant highlighted how the 'online format no longer suited [their] needs' and how their experience had left them 'wanting to be in a traditional classroom environment'.

Conclusion

This study has responded to the 'the identified paucity of research representing postgraduate experience' (Tobbell and O'Donnell, 2013, p.127), giving 'voice' to students on one postgraduate programme; a MSc in HRM. The study focused on an early part of the postgraduate experience; the move - or what was spoken about as a 'stepping up' - to the postgraduate student role. That experience has been identified to be influenced by numerous factors including the adoption of a postgraduate persona, a requirement for self-responsibility with regard to learning, and the challenging of the existing mindset by engaging with the process of critical analysis. The study revealed that all of these factors were perceived by the participating postgraduate students to be influenced through the use of digital technologies.

Through the lens of the participating postgraduate students, the study has revealed how those students perceived the postgraduate learning offering where it was facilitated using digital technologies and how this offering contrasts with more traditional mechanisms for delivery. Also revealed is the potential for provision using digital technologies to exacerbate the anxiety of the student when transitioning to a postgraduate student role, although whether this is specific to students within the studied discipline is unknown. Furthermore, whether these anxieties will diminish when digital technologies fulfil a greater role in postgraduate provision - assuming that they will - is also a matter of conjecture. The anxieties were noted despite the merits of a digital approach enhancing, for the student alone, flexibility around their professional role demands and the students knowing, ahead of enrolling for the programme, that digital technologies play a significant role in module delivery. The study revealed that even in the presence of digital technologies, the significance of the transition to the postgraduate student role appears to be generally underplayed and that this, in turn, influences the student perspective. Whether this underplaying has the potential to add value to the learning provider, for example with regard to the identified assumption that individuals will naturally adjust to meeting more encompassing learning expectations, is worthy of further exploration.

Inevitably this research has limitations. The study was exploratory and whilst it purposefully sought the perceptions of the participants and gave voice to their perspectives, not all of the students who were new to

postgraduate studying participated and, furthermore, there was a risk that the more vocal (and not necessarily representative) students will have participated at more than one stage of the data collection exercise. It was intended that data from the second cohort (the third stage of the data collection exercise) would mitigate this effect. However, many students informally revealed that they benefited from the Stage 3-associated online teaching resource without contributing to the respective third stage data collection exercise.

This study does, however, offer insight into what students new to a MSc HRM study undertaken using digital technologies highlight as being issues with regard to that progression, despite this having the potential to not be an exhaustive listing. Furthermore, findings from this study can be used both from a practical perspective, for example with regard to future learning provision, as well as contributing detail to further transitioning research activities.

Digitization Processes And Training Needs: The Case Of The Supply Chain And The Framelog Project

Marco GIANNINI

Department of Economics and Management University of Pisa Italy

marco.giannini@unipi.it

Abstract

Organizations are experiencing a process of digital transformation. This is often assessed only from a technological point of view but it should also be considered from a cultural point of view. As a result, today and in the future, personnel are required different skills to the past and, at the same time, it is difficult to identify suitable candidates for digital skills.

This paper aims to show the existence of a cognitive gap between what the world of work and digital transformation requires and the skills possessed by current and future workers. Subsequently, it wants to highlight the need to promote an educational vision able to follow the evolution of the world of work and the process of digital transformation. This through the definition of a concrete plan indicating the skills required to the current or future worker. In particular, this theme is addressed in the Supply Chain. It is a sector where the digital transformation process is very evident and showing as a possible action plan the European research project, Framelog.

Introduction

Today, organizations operate within a process of digital transformation that is involving all sectors.

This means talking about digitalization not only under a technological dimension because it risks neglecting the cultural aspect. In fact, digital transformation is not just technological investments, but it requires personnel with specific knowledge in the digital field. Thus, this knowledge is destined to become important components in every activity (Brynjolfsson et al., 2013).

This implies an evolution of professional profiles in the world of work and it reflects on the skills required by companies also for young people entering the world of work. In this context, the difficulty of finding suitable candidates for knowledge and ability to tackle digital transformation in selection processes is emerging in many companies (Conrad, 2016). This is highlighted by the European Union, it indicates significant deficiencies in the dissemination of digital knowledge in the adult population and it estimates digital knowledge will be required in 90% of occupations in the next decade.

The digital transformation involves:

- many existing professional figures need to adapt their skills through updates and continuing education
- the appearance of new professional figures and new companies linked to the same digitization
- the development of digital knowledge in young people entering the labor market and that they will have to continuously develop and update.

All this makes us reflect on the importance of renewing training paths in a digital perspective at all levels, from secondary schools to universities and professional institutions. In addition to promoting a new educational vision where the school is intended not only as a physical place but as an open space for learning. The goal is to establish the best conditions to allow students to learn the skills required today and in the next future by the world of work. This process faces several challenges: methodological-didactic challenges for teachers and organizational challenges for school leaders. But the challenge also invests all the realities, like companies that intend to build innovative experiences with the world of education.

In this process, it is essential to define the skills that young people need. This means starting from the skills appropriate to current labor market needs and especially from a future point of view. The possible professional skills required in the next future must consider scenarios unimaginable until a few decades ago.

The competition in the international market will rely on the system of relationships and consequently on the ability to meet customers' demand through the coordination of a complex and extensive series of information and streams and searching for both horizontal and vertical collaboration (McKinsey & Company, 2015).

If on one hand, the evolution of digital technologies will allow companies greater interconnection and cooperation along the entire value chain by promoting and improvement in terms of efficiency of their systems and competitiveness, on the other side, the automation of the production process will support in the reduction of the impact of material and physical work of the staff, while increasing the demand for increasingly qualified human capital (Nanry et al., 2015)

So, we highlight that, in a rapidly changing labor market, even the way people work, and skills are bound to evolve.

This means that companies have and will increasingly need collaborators with adequate technical knowledge, professional languages and able to dominate new technologies but, at the same time, adequate soft skills. Soft skills are transversal skills that are a mix of personal skills and qualities determined by the rapid evolution of the

context in which companies operate and who ask people to change how they work and manage relationships. The World Economic Forum (World Economic Forum, 2016) has identified the most requested soft skills by 2020: cognitive flexibility, negotiation skills, judgment and decision making, emotional intelligence (recognizing, understanding and managing emotions), ability to coordinate with others, ability to problem solving, creativity, proactivity, critical thinking, communication and interpersonal skills, ability to work in a team (Monden, 2011). Therefore, in addition to adequate basic training, a young graduate is also required linguistic, computer and digital skills and a mix of the personal characteristics described above necessary to be able to deal with the reality of work.

From all this, there is the need to seek a closer integration between the business world and the academic-educational world. This is essential to counter the appearance of the Digital Mismatch, it is the gap between what is required by companies and the knowledge that young people demonstrate to possess when they enter the world of work.

A more effective dialogue between these two worlds can, on the one hand, improve the preparation of skills that we know today and on the other hand, encourage the development of skills for continuous learning to build skills that are not yet known (Porter & Heppelmann, 2015). The challenge of identifying and developing these skills is the key factor in promoting innovation and competitiveness.

The Digitalization Of The Supply Chain

In our paper we focus on a sector where digital transformation plays a fundamental role and significant evolutionary lines are expected in the future. In the Supply Chain, digitization allows companies to reduce costs and improve their ability to satisfy customers. This solution, in fact, allows companies to optimize logistics solutions in terms of speed, effectiveness and efficiency. In this perspective, the exploitation of the opportunities offered by digitalization promotes the activation of a significant process of sharing information along the entire supply chain (Reeve, 2017).

If technologies are indispensable tools, even the digitalization of the Supply Chain requires a coherent professional preparation of the workers concerned. In fact, change is not just technological, but it passes through people who need skills that are able to face the challenge of digitization in companies. The use of increasingly digitized systems requires professional figures, both at managerial level and operational level, with specific knowledge and adequately trained to be able to transform technological opportunities into new business opportunities (Khan et al., 2016).

This leads us to assess the need for professional skills, trying to adapt the relative training programs for people are working in the company and for young people who are approaching the labor market in the sector.

In these terms, it is possible to evaluate the necessary professional skills, distinguishing the professional figures in two groups: operational workers and managers.

The first table (Table 1) represents the first group and we essentially find figures with operational responsibility for managing the execution of activities in SCM processes.

[Table 1]

In the second table (Table 2), we find the managers who play a leading and controlling role within a well-defined functional area of the company's supply chain. For this second group we identified a basket of necessary skills.

[Table 2]

The changes in the role of logistics necessarily imply changes in the skill required.

This emerges from the experience of some European countries where the evolution of logistics required the design of training programs to increase the technical and managerial preparation of professional resources already exist and those to be included in the different organizations.

With reference to the latter aspect, it is necessary to reflect on the content and methods of basic training for young people, in order to give them the tools necessary to positively enter the world of work.

From business reality emerges the profile of a person with appropriate professional training and a range of personal qualities. We can speak of a set of knowledge: technical, legal (ex. contracting, European regulations, etc.), business administration (ex. budgeting, cost analysis, etc.), organizational, industrial economic (ex. analysis of the sector, etc.), statistics (ex. forecasting techniques, etc.), international economics, language, etc.

The Framelog Project

In this context the Framelog Project appears, a project co-funded by the European Union. It started from the analysis of:

- the experience of some European countries where the evolution of the logistics required the design of the training programs to increase the technical and managerial
- the existence of several gaps in terms of skills to effectively operate in the different industrial and

management areas in the logistics sector

- the difficulty of defining, as I said previously, in such a complex context the most effective skills and knowledge in the future labor market.

From this project, we support the importance of cooperation between all the actors involved, in what we define the triangle of knowledge. In fact, this project has objectives:

- Enhance the cooperation between high education, research and companies (the "knowledge triangle") in the logistics sector following the European recommendations
- Evaluate the existence of a qualification / certification system of the professional figures in the logistics area with the important contribution of the trade associations
- Provide tools and guidelines to harmonize the training offer and professional qualification requirements
- Contribute to improving the quality of university education by reviewing academic programs
- Develop an analytical approach linked to the actual needs emerging from the labour market to encourage an increase in the employment opportunities of young graduates in this sector
- Defining a European reference framework in the development of skills in the sector in order to outline, at a European level, training policies and operational methodologies able to support the important role that logistics and supply chain management can play.

In this way, the project is meant to contribute in enhancing the quality of educational offer in the Supply chain and Logistics area.

Conclusion

It has been clear that the activation of synergies, in particular for the digitalization process, between education, academic training, research and business is a real need for the Supply chain and Logistic area. That is why working on developing the right competences, with the most correct and effective educational contents, methods and instruments, will be the right foundation for the stimulation of conjoint activities between all the key players of this strategic area, in order to evolve with the changing world, the development of technologies in the workplace and build a self-maintaining competitiveness.

Job/Figure	Competences
Inventory Control Administrator	Administer inventory, supply and capacity data
Warehouse Administrator	Ensure correct follow up of warehouse/logistics administrative matters
Traffic Administrator	Administer the shipping of goods within defined guidelines
Buyer/Purchaser	Timely placement of purchase orders and delivery of materials to meet customer order requirements and maintain stock inventory levels within approved guidelines
Customer Service Representative	Provide customer service support by obtaining and executing the order information in a timely manner
Supply Chain Analyst	Analyse product delivery, logistics or supply chain processes to identify and recommend improvement actions
Supply Chain Systems Analyst	Support the systems that form the foundation for the execution of the supply chain business process
Planner (alternative role: Inventory Controller)	Evaluate current inventory and ensure appropriate allocation of free and obsolete inventory
Warehouse Supervisor	Oversee warehouse operations
Transport Specialist/Transport Supervisor	Ensure the shipping of goods, respecting quality, legal and cost parameters
Senior Buyer	Develop, negotiate and administer contracts and agreements. Negotiate specifications and statement of works
Customer Service Supervisor	Provide effective management and leadership of a team of customer service representatives, ensuring service and efficiency targets are achieved and maintained
Supply Chain Re-Engineering Manager (alternative roles: Supply Chain Project Manager, Continuous Improvement Manager)	Design logistics processes, technology and/or infrastructure to support the efficient and cost-effective management of the supply chain

Table 1: The professional skills required for operational workers on the SCM processes. In the first column identifies the professional roles, while in the second column describes a basket of essential skills assigned to each job.

Job/Figure	Competencies
Supply Chain Project Manager	Develop and deliver projects to provide business benefits: sales growth, margin improvement, supply cost reduction and inventory optimization
Planning Manager (alternative roles: S&OP Manager, Demand Planning Manager, Inventory Manager)	Ensure the development of the master material plan and the production plan to meet the agreed delivery requirements, optimizing asset utilization
Warehouse Manager	Develop and manage warehouse operations to control effectively the receipt, storage, picking and dispatch of products, systems and services to customers
Transportation Manager	Develop and manage logistics operations to control effectively inbound and outbound shipping of products, systems and services to customers
Sourcing Manager (alternative roles: Purchasing Manager, Procurement Manager, Sourcing Manager)	Develop, negotiate and administer contracts and agreements to meet agreed improvements in cost and quality
Customer Service Manager	Develop and implement order management activities to control effectively order taking, order allocation and invoicing of products, systems and services to customers
Supply Chain Re-Engineering Lead/Supply Chain Project Director	Design logistics processes, technology and/or infrastructure to support the efficient and cost-effective management of the supply chain
Supply Chain Change Management Lead	Initiate and manage the supply chain transformation programme
Planning Director (alternative roles: Director of Supply Chain Planning, Head of Logistics, Head of Supply Chain)	Develop strategic and operating plans to ensure that the company has the appropriate resources to support current forecasted and projected growth
Head of Logistics	Manage and ensure the correct logistics process flow of information and products in order to achieve defined targets for the customer service level, operational costs and inventory levels
Director of Sourcing (alternative roles: Head of Procurement, Procurement Director)	Provide a complete procurement function for all the company expenditures, with external suppliers at the forefront regarding implementation and the development of procurement strategies
Director of Customer Service	Establish the customer service strategy for the company, setting the agenda for how the company interacts with customers

Table 2: The professional skills required for managers on the SCM processes. In the first column identifies the professional roles, while in the second column describes a basket of essential skills assigned to each job.

Dijital Oyunları Eğitim Amaçlı Kullanımına İlişkin Öğretmen Adaylarının Görüşleri

Mehmet RAMAZANOĞLU

Bilgisayar ve Öğretim Teknolojileri Eğitimi Siirt Üniversitesi Eğitim Fakültesi

Özet

Bu çalışmanın amacı, dijital oyunların eğitim amaçlı kullanımına ilişkin Bilgisayar ve Öğretim Teknolojileri Eğitimi bölümü öğretmen adaylarının görüşlerini ortaya koymaktır. Araştırmada nitel araştırma yöntemi benimsenmiştir. Araştırma grubunu 2017-2018 eğitim-öğretim yılı Siirt Üniversitesi, Eğitim Fakültesi, Bilgisayar ve Öğretim Teknolojileri Eğitimi bölümünde öğrenim gören toplam 20 öğretmen adayı oluşturmaktadır. Araştırmanın örnekleme, kolay ulaşılabilir durum örnekleme yöntemine göre belirlenmiştir. Araştırma verileri, yarı yapılandırılmış görüşme forumu ile elde edilmiştir. Araştırmada veriler içerik analizi yöntemine göre analiz edilmiştir. Elde edilen bulgulara göre öğretmen adaylarının dijital oyunların eğitim amaçlı kullanımına yönelik bazı olumlu ve olumsuz görüşlere sahip oldukları belirlenmiştir. Ayrıca öğretmen adaylarının dijital oyunları iyi bir öğrenme aracı olarak tanımladıkları ve bununla birlikte dijital oyunların, sınıf içi performansı, motivasyonu, akademik başarıyı ve kalıcılığı artırarak, öğrenmede ilgiyi sürdürmek, öğrenci gelişimini desteklemek, öğrenmeyi kolaylaştırmak, soyut kavramları somutlaştırmak ve zaman tasarrufunu sağlamak gibi birtakım özelliklere sahip olduğu yönünde görüş bildirdikleri görülmüştür.

Anahtar Kelimeler: *Dijital oyun, eğitsel dijital oyun, eğitimde dijital oyun.*

Giriş

Günümüz eğitim ortamlarında kullanılan teknoloji destekli uygulamalardan biri de oyunlardır. Oyunlar, öğrenenlerin süreç içerisinde aktif rol alarak öğrenme yaşantılarını destekleyen en doğal ortamlardır (Bottino, Ferlino, Ott ve Travella, 2006; Dickey, 2003; Ebner ve Holzinger, 2007). Gelişen teknolojilerle birlikte oyun bileşenleri ile öğrenme olguları arasındaki dengeler sonucunda dijital oyun kavramı ortaya çıkmıştır (Nussbaum ve Beserra, 2014). Dijital oyunlar öğrenenler açısından çekici, eğlenceli ve etkili ortamlar olarak belirtilmektedir (Gee, 2003).

Dijital oyunların ortaya çıkışından itibaren eğlence amacıyla kullanıldığı görülmektedir. Ancak zaman geçtikçe oyunlar eğitim amaçlı kullanılmaya başlanmış ve giderek yaygınlaşmıştır. Dijital oyunlara yapılan en önemli eleştirilerden birisi de oyunların sadece vakit geçirme aracı olarak görülmesidir. Ancak bu görüşün geçerliliğini yitirdiği söylenebilir. Dijital oyunların; motive edici, eğlendirici, ilgi çekici ve zor konuların kolaylaştırılmasına yönelik birçok alanda öğrenme aracı olarak kullanıldığı görülmektedir. Dijital oyun kavramına bakıldığında; teknolojik araçlar yardımıyla hazırlanan, bilişsel, sosyal, davranışsal veya duygusal boyutlara sahip, belirli bir hedefe yönelik öğrenmeyi sağlayan oyunlar olarak tanımlanmaktadır. Özetle, öğrencilerin karşılıklı etkileşim yoluyla öğrenmelerini destekleyen, hızlı dönütlere alabildikleri, grafik, ses, animasyon veya şekiller yardımıyla derse olan ilgilerini ve motivasyonlarını arttırmayı hedefleyen dijital araçlar olarak tanımlanabilir.

Literatür incelendiğinde dijital oyunların bilişsel gelişime ilişkin katkı sağladığı da görülmektedir. Dijital oyunlar; odaklanma, karar verme, işbirliği, yaratıcılık, problem çözme ve bilişim teknolojisi becerilerin gelişimine katkı sağlamaktadır (Aguilera ve Mendiz, 2003). Dijital oyunlar öğrenenlere yaparak-yaşayarak öğrenme şansı sunmaktadır (Rickard & Oblinger, 2003). Bu yönüyle dijital oyunlar eğitimde güçlü bir öğrenme aracı olarak değerlendirilmektedir. Ayrıca dijital oyunların bireylerin hayal güçlerini desteklemek (Dormann & Biddle, 2006) ve öğrenme içeriğini anlamlandırmak gibi fonksiyonlarından da söz etmek mümkündür (Shaffer, 2006). Yine literatür incelendiğinde, dijital oyunların öğrenenlerin performansını ve öğrenme çıktılarının değerlendirilmesi için kullanılabileceği belirtilmektedir (Hays & Singer, 1989).

Bu sebeple, öğrenen ve öğretenler için cezbedici olan dijital oyunların eğitim amaçlı kullanılmasına ilişkin görüşlerinin belirlenmesi önemli görülmektedir. Eğitimde oyunların kullanıldığı pek çok araştırmaya rastlamak mümkündür, ancak oyunların öğrenme-öğretme sürecindeki etkililiğinin ve verimliliğinin ortaya konulması da önemlidir (Dondlinger, 2007). Dijital oyunların eğitim amaçlı kullanılmasına ilişkin yapılan çalışmalara incelendiğinde çoğunlukla öğrenme başarısı, derslere ilişkin motivasyon, problem çözme ve yaratıcı düşünme becerisinin belirlenmesi veya etkilerine yönelik araştırmalara rastlanmaktadır. Bununla birlikte Bilgisayar ve Öğretim Teknolojileri Eğitimi öğretmen adaylarının dijital oyunların eğitim amaçlı kullanımına yönelik görüşleri

üzerine yeterince çalışmaya rastlanmamıştır. Buradan hareketler bu çalışmanın amacı, dijital oyunların eğitim amaçlı kullanımına ilişkin Bilgisayar ve Öğretim Teknolojileri Eğitimi bölümü öğretmen adaylarının görüşlerini ortaya koymaktır. Bu doğrultuda aşağıdaki araştırma sorularına yanıt aranmıştır:

1. Öğretmen adaylarının dijital oyun kavramına ilişkin görüşleri nelerdir?
2. Öğretmen adaylarının sınıf içi öğrenmede dijital oyunların katkılarına ilişkin görüşleri nelerdir?
3. Öğretmen adaylarının dijital oyunların eğitimde kullanılmasına ilişkin görüşleri nelerdir?

Yöntem

Dijital oyunların eğitim amaçlı kullanımına ilişkin Bilgisayar ve Öğretim Teknolojileri Eğitimi bölümü öğretmen adaylarının görüşlerini ortaya koymayı amaçlayan bu çalışmada, nitel araştırma desenlerinden durum çalışması yaklaşımına yön verilmiştir. Örneklemde, amaçlı örneklem yöntemi kullanılmıştır. Bu örneklem, genellenebilirliği diğer örneklem türlerine göre düşük olsa da örneklemeye ulaşmakta zorluk olduğu durumlarda iyi bir çözümdür (Yıldırım ve Şimşek, 2011). Bu örneklemenin güçlü özelliği ise erişimin kolay olması nedeni ile istenilen detay ve kapsamda veri elde etmeye imkan vermesidir. Ayrıca katılımcıların gönüllü olması verilerin güvenilirlik ve geçerliliğini arttırmaktadır.

Çalışma grubu, 2017-2018 eğitim-öğretim yılında Siirt Üniversitesi, Eğitim Fakültesi, Bilgisayar ve Öğretim Teknolojileri Eğitimi bölümünde 4. Sınıfta öğrenim gören toplam 20 öğretmen adayı oluşturmaktadır. Çalışmada yarı yapılandırılmış görüşme türünde tasarlanmış, görüşmeler yarı yapılandırılmış görüşme formu kapsamında gerçekleştirilmiştir. Bu formda 2 uzman görüşü doğrultusunda 3 soru maddesi yazılmıştır. Verilerin kaydında çalışma etiği çerçevesinde katılımcıların ismi kullanılmamış, öğretmen adayları alfa nümerik olarak kodlanmıştır (Ö1, Ö2, Ö3...). Öğretmen adaylarının dile getirdiği ifadeler, çalışma içeriğinde doğrudan alıntı olarak kullanılmıştır. Araştırma kapsamında nitel veriler elde edilmiştir. Bu verilerin çözümlemesi bilgisayar destekli gerçekleştirilmiştir. Araştırmada veriler içerik analizi yöntemine göre analiz edilmiştir.

Bulgular

Öğretmen adaylarının; dijital oyun kavramı size neyi ifade etmektedir? Sorusuna vermiş oldukları cevaplar tablo 1’de özetlenmiştir.

Tablo 1: Öğretmen adaylarının dijital oyun kavramına ilişkin ifadeleri ve frekans değerleri

Kategoriler	İfadeler	F
Öğrenme aracı	Oyun tabanlı Öğrenme	18
	Kolay öğrenme	16
	Eğlenceli öğrenme	15
	Kalıcı öğrenme	15
	Eğitici	13
	Yaratıcı düşünme	12
	Öğretici	11
	İşbirliğine dayalı öğrenme	10
	Plan yapma	10
	Yaparak yaşayarak öğrenme	10
	Yenilik öğrenme	9
	Araştırma	9
	Etkileşim sağlama	9
	Gelişim sağlam	7
	Rekabetçi öğrenme	6
	Uygulama	5
Bağımlılık	Oyun bağımlılığı	12
	Asosyalite	9
	Sağlık sorunları	6
	Sinirlilik	5
	Yalnızlık hissi	4
	Stres	4
	Yapay değer algıları	3
	Dikkat sorunu	3
	Şiddet eğilimi	3
	Psikolojik bağımlılık	2

	Özgüven sorunu	2
	Akıllı Telefon	14
	Bilgisayar	13
	Sanal ortam	12
	Teknolojik aletler	11
	Grafik	4
	Elektronik sistem	2
Teknoloji Aracı	Animasyon	2
	İnternet	2
	Bilişim teknolojileri	1
	Algoritma	1
	Tepegöz	1
	Akıllı tahta	1
	Tabletler	1

Tablo1’de görüldüğü gibi öğretmen adayları görüşlerinde dijital oyun kavramını üç farklı kategoride (öğrenme aracı, bağımlılık, teknoloji) kavramlaştırdıkları tespit edilmiştir. Öğrenme aracı kategorisinde öğretmen adayları dijital oyunlar en çok oyun tabanlı öğrenme (18), kolay öğrenme (16), eğlenceli öğrenme (15) ve kalıcı öğrenme (15) kavramlarını ifade etmişlerdir. En az ise uygulama (5) kavramını ifade ettikleri belirlenmiştir. Bağımlılık kategorisinde öğretmen adayları dijital oyunların en çok oyun bağımlılığı (12) ve asosyalite (9) kavramlarını ifade etmelerine karşın en az psikolojik bağımlılık (2) ve özgüven sorunu (2) kavramlarına ilişkin ifadelerde bulunmuşlardır. Teknoloji aracı kategorisinde ise öğretmen adayları dijital oyunu en çok akıllı telefon (14) ve bilgisayar (13) kavramını ifade ederken birer öğretmen adayı; bilişim teknolojileri, algoritma, tepegöz, akıllı tahta ve tablet kavramlarını ifadede bulundukları belirtilmiştir. Aşağıda bulguları örnekleme açısından bazı öğrenci ifadelerine yer verilmiştir.

Ö1: “Dijital oyun kavramı benim için; oyun tabanlı öğrenme, bilgisayar, teknoloji ve asosyalite ifade etmektedir.”

Ö2: “Dijital oyun kavramı; sanal ortam, akıllı telefon, yalnızlık hissi ve sağlık sorunudur.”

Ö3: “Dijital oyun; kolay öğrenmedir, eğlenceli öğrenmedir, Kalıcı öğrenmedir, yaparak yaşayarak öğrenme ve strestir”

Öğretmen adaylarının, dijital oyunların sınıf içi öğrenme ortamlarını desteklemeye yönelik sağlayabileceği katkıları nelerdir? Sorusuna vermiş oldukları olumlu cevaplar tablo 2a’de ve olumsuz cevaplar tablo 2b’de özetlenmiştir.

Tablo 2a: Öğretmen adaylarının dijital oyunların sınıf içi öğrenme ortamlarını desteklemeye yönelik sağlayabileceği olumlu katkılara ilişkin kategori, tema ve kodlar

Kategori	Tema	Kodlar
Olumlu katkılar	Kolay öğrenme	Eğlenerek öğrenme
		Öğrenmeyi kolaylaştırma
		Soyut kavramları somutlaştırma
	Yapılandırıcı öğrenme	Kalıcı öğrenme
		Etkili öğrenme
	Öğrenme süreci	Motivasyon artırma
		Yeni yöntem,
		Aktif öğrenme
		DeneySEL ve probleme dayalı öğrenme
		Öğrenme sürecini zenginleştirme
		Zamandan tasarruf
Olumsuz katkılar	Etkileşim	Bilişim teknolojilerinin kullanımını ve önemini artırma
		Sınıf içi performans artırma,
		İlgi çekici,
		Dikkat çekme,
		Derse katılım,
		Sıkıcılığın aşılması
	Beceri	Öğretmen ve öğrenciler arasında olumlu ikili ilişki
		Etkinliklerde çeşitlilik
		Yaparak-yaşayarak öğrenme

El-göz koordinasyonunu
Bağımsız-eleştirel düşünme
Yaratıcı düşünme
Zekâ
Problem çözme
Bireysel öğrenme

Tablo 2a’da görüldüğü gibi öğretmen adaylarının, dijital oyunların sınıf içi öğrenme ortamlarını desteklemeye yönelik sağlayabileceği katkıları nelerdir? Sorusuna ilişkin görüşlerinde olumlu katkılar kategorisinde 5 tema ortaya çıkmıştır. Kolay öğrenme temasına ilişkin alt kodlar; eğlenerek öğrenme, öğrenmeyi kolaylaştırma ve soyut kavramları somutlaştırmadır. Yapılandırıcı öğrenmeye ilişkin alt kodlar; kalıcı öğrenme ve etkili öğrenme olarak belirtilmiştir. Öğrenme süreci temasına ait alt kodlar; motivasyonu artırır, yeni yöntem, aktif öğrenme, deneysel, probleme dayalı öğrenme, öğrenme sürecini zenginleştirme, zamandan tasarruf, bilişim teknolojilerinin kullanımını ve önemini artırır şeklindedir. Etkileşim teması altında; sınıf içi performans artırma, ilgi çekici, dikkat çekme, derse katılım, sıkıcılığın aşılması, ikili ilişki ve etkinliklerde çeşitlilik alt kodları mevcuttur. Beceri temasını ise; yaparak-yaşayarak öğrenme, el-göz koordinasyonunu, bağımsız-eleştirel düşünme, yaratıcı düşünme, zeka, problem çözme ve bireysel öğrenme alt kodlarından oluşmaktadır. Aşağıda bulguları örneklemesi açısından bazı öğrenci ifadelerine yer verilmiştir.

Ö4: “Eğlenerek ve yaparak bir eğitim olacağı için olumlu olacaktır. Çünkü görsel ağırlıklı bir eğitim daha kalıcı olur. Aynı zamanda çocuklar severek yapacakları için eğitim daha verimli olur.”

Ö5: “Derste işlenen konuların soyut kavramlardan somut kavramlara geçmesini sağlar ve öğrenciler açısından öğrenmeyi kolaylaştırır. Bütün sınıfın dikkatini çekebilmesi ve tek bir noktaya uzun süre odaklanmalarını sağlar. Bilginin kalıcı olmasını sağlar ve oyunlarda ilerleyebilmek için ön bilgileri çağırma öğrenirler. Dijital oyunlar el-göz koordinasyonunu geliştirir.”

Ö6: “Dijital oyunlar dersi destekleme amacıyla kullanıldığında dersin daha verimli, daha keyifli ve eğlenceli geçmesini sağlayacak, öğrencilerin öğrenirken eğlenmesine olanak sağlayacak verimli uygulamalar haline gelecektir.”

Tablo 2b: Öğretmen adaylarının dijital oyunların sınıf içi öğrenme ortamlarını desteklemeye yönelik sağlayabileceği olumsuz katkılara ilişkin kategori, tema ve kodlar

Kategori	Tema	Kodlar
Olumsuz katkılar	Bağımlılık	Bağımlılık
		Oyuna dalma
		Zihninde hayal
		Oyun oynama süresini kontrol kaybı
		Diğer etkinliklere karşı ilgi kaybı
		Dikkatsizliğin artması
	Sosyal ilişki	Sabırsız davranışlar sergileme
		Sosyal ilişkiler üzerinde olumsuz yönde etki,
		Sosyallikten uzak bir nesil ve
	Sağlık	Şiddet eğilimi
		Psikolojik ve Fizyolojik rahatsızlıklar
	Eğitim-Öğretim aksaklıkları	Sağlık sorunları
		Eğitim amaçlı kullanılmama
		Problem çözme becerileri kısıtlama
		Sınıf yönetiminde zorluk
		Dersten uzaklaşma
		Oyunların amaca uygun hazırlanmaması
		Grup çalışmasından kaçınma
		Agresif hareketler sergileme
		Öğrenmeyi güçleştirme

Tablo 2a’da görüldüğü gibi öğretmen adaylarının Dijital Oyunların Sınıf İçi Öğrenme Ortamlarını Desteklemeye Yönelik Sağlayabileceği Katkıları Nelerdir? Sorusuna ilişkin görüşlerinde olumlu katkılar kategorisinde 4 tema ortaya çıkmıştır. Bağımlılık temasına ilişkin alt kodlar; bağımlılık, oyuna dalma, zihninde hayal, oyun oynama süresini kontrol kaybı, diğer etkinliklere karşı ilgi kaybı, dikkatsizliğin artması ve sabırsız

davranışlar sergilememiştir. Sosyal ilişkiler teması; sosyal ilişkiler üzerinde olumsuz yönde etki, sosyallikten uzak bir nesil ve şiddet eğilimi alt kodlarına sahip. Sağlık temasında; psikolojik, fizyolojik ve sağlık sorunları alt kodları mevcuttur. Eğitim-Öğretim aksaklıkları temasında ise; eğitim amaçlı kullanılmama, problem çözme becerileri kısıtlama, sınıf yönetiminde zorluk, dersten uzaklaşma, oyunların amaca uygun hazırlanmaması, grup çalışmasından kaçınma, agresif hareketler sergileme ve öğrenmeyi güçleştirme alt kodlarını içermektedir. Aşağıda bulguları örnekleme açısından bazı öğrenci ifadelerine yer verilmiştir.

Ö7: “Çocuk ve gençlerin aşırı internet kullanımı psikolojik, fizyolojik ve sosyal ilişkiler açısından olumsuz etki yaratır. Oyun bağımlılığına sebebiyet verir”

Ö8: “Sosyal çevreyi olumsuz etkiler. Kişide bağımlılık yapabilir. Sağlık Açısında başta göz olmakla beraber birçok rahatsızlığa neden olabilir.”

Öğretmen adaylarının, oyunların eğitimde kullanılmasına ilişkin görüşleriniz nelerdir? Sorusuna vermiş oldukları cevaplar tablo 3’te özetlenmiştir.

Tablo 3: Öğretmen adaylarının dijital oyunların eğitimde kullanılmasına ilişkin kategori, tema ve kodlar

Kategori	Tema	Kodlar
Eğitimde kullanma	Öğrenmeye etkisi	Öğrenmeyi kolaylaştırma
		Kalıcı öğrenme
		Etkili öğrenim
		Öğrenmede yeni yaklaşım
		Eğlenceli öğrenme
		Yaparak yaşayarak öğrenme
		Zamandan tasarruf
		Ders içeriği zenginleşir
		Modern eğitim
		Maliyeti aza indirmek
Eğitimde kullanma	Öğrenci başarısı	Materyal çeşitliliği
		Öğrenci başarısını artırma
		Hazırbulunurluk
	İlgi sürdürme	Motivasyon,
		Derslere ilgi artırma
		Öğrenci dikkatini çekme
		Derse odaklanma
		Derse katılımı
		Merak uyandırma
		Öğrenci aktifleşme
	Öğrenci gelişimi	Bireysel öğrenme
		Öğrencilerin gelişmesi
		Teknoloji kullanımı
		Problem çözme
		Bilişsel gelişim
		Öğrenci özgüveni

tablo 3’te görüldüğü gibi öğretmen adaylarının Dijital oyunların eğitimde kullanılmasına ilişkin görüşleriniz nelerdir? Sorusuna ilişkin 4 temaya (Öğrenmeye etkisi, Öğrenci başarısı, İlgi sürdürme, Öğrenci gelişimi) ve 26 alt koda ulaşılmıştır. Öğrenmeye etkisi teması; öğrenmeyi kolaylaştırma, kalıcı öğrenme, etkili öğrenim, öğrenmede yeni yaklaşım, eğlenceli öğrenme, yaparak yaşayarak öğrenme, zamandan tasarruf, ders içeriği zenginleşir, modern eğitim, maliyeti aza indirmek ve materyal çeşitliliği alt kodlarından oluşmuştur. Öğrenci başarısı teması; öğrenci başarısını artırma ve Hazırbulunurluk üzerinde olumlu etki al kodlarına sahiptir. İlgi sürdürme teması; motivasyon, derslere ilgi, öğrenci dikkatini çekme, derse odaklanma, derse katılımı, merak uyandırma ve öğrencilerin aktifleşmesi alt kodlarını içermektedir. Öğrenci gelişimi teması ise; bireysel öğrenme, öğrencilerin gelişmesi, teknoloji kullanımı, problem çözme, bilişsel gelişim ve öğrenci özgüveni alt kodları mevcuttur. Aşağıda bulguları örnekleme açısından bazı öğrenci ifadelerine yer verilmiştir.

Ö9: “Dijital oyun uygulama gerektiren, Bilişim ve soyut derslerde kalıcılığı artırmak için kullanılmalıdır.”

Ö10: “Dijital oyunlar derste kullanılarak maliyeti aza indirmek, zamandan tasarruf gibi pek çok konu da yarar sağlayabilir. Öğrenciler yaparak yaşayarak öğrenmelerde daha fazla kalıcılığı sağlayabiliyor.”

Ö11: “Dijital oyunlar eğitimde kesinlikle kullanılmalı. Çünkü görselliklerle dijital oyunlarla dersi zenginleştirmek kalıcılığı ve bilginin daha kolay yapılanmasına yardımcı olur.”

Sonuç ve Öneriler

Araştırma bulgularında ortaya çıkan sonuçlara genel olarak bakıldığında öğretmen adaylarının dijital oyunları, kolay, eğlenceli ve kalıcı öğrenmeyi sağlayan iyi bir öğrenme aracı olarak tanımladıkları sonucuna ulaşılmıştır. Benzer şekilde Annetta (2008) yaptığı çalışmada dijital oyunların, 21. yy. becerileri ve farklı eğitim amaçları için güçlü bir öğrenme aracı olarak değerlendirildiği sonucuna varmıştır. Literatür incelendiğinde araştırmanın bu sonucunu destekleyen birçok araştırmaya rastlamak mümkündür (Mayo, 2009; Prensky, 2001; Gee, 2003; Bransford, Brown, ve Cocking, 2000). Aynı zamanda öğretmen adaylarının, dijital oyunlarda akıllı telefon ve bilgisayar kullanıldığından teknolojik araç olarak gördükleri ve bununla birlikte dijital oyunların; bağımlılık, asosyalite, yalnızlık hissi ve psikolojik alışkanlık oluşturmalarından dolayı bağımlılık yaratan araçlar olarak görüldüğü tespit edilmiştir. Griffiths (2002), Gee (2007) ve Steinkuehler (2010) tarafından yapılan araştırma sonuçları bu sonucu destekler niteliktedir.

Araştırma sonucuna göre dijital oyunların sınıf içi öğrenme ortamlarını desteklemeye yönelik sağlayabileceği katkılara yönelik görüşlerin olumlu olduğu tespit edilmiştir. Dijital oyunların; kolay öğrenme, eğlenerek öğrenme, soyut kavramları somutlaştırma, kalıcı öğrenme, aktif öğrenme, probleme dayalı öğrenme, öğrenme sürecini zenginleştirme, zamandan tasarruf, sınıf içi performans, dikkat çekme, derse katılım, sıkıcılığın aşılması, yaparak-yaşayarak öğrenme, el-göz koordinasyonu, bağımsız-eleştirel düşünme, yaratıcı düşünme, problem çözme, bireysel öğrenme, yapılandırıcı öğrenme, etkileyici ve etkileşim niteliği sayesinde öğrencilere sınıf içi iyi bir öğrenme ortamı sağladığı söylenebilir. Literatürde yapılan pek çok çalışmada benzer şekilde öğrenmeyi destekleyici ortamlar olarak değerlendirildiği görülmektedir (Çatak, 2011; Mayo, 2009; Annetta, 2008; Bransford, Brown, ve Cocking, 2000). Ayrıca geleneksel ortamlara göre daha eğlenceli ve daha etkili olduğuna ilişkin araştırma sonuçlarına ulaşmak da mümkündür (Prensky, 2001; Griffiths, 2002; Gee, 2003). Buna karşın dijital oyunların oyun oynama süresinde kontrol ve ilgi kaybı, dikkatsizliğin artması, sabırsız davranışlar sergileme, sosyal ilişkiler üzerinde olumsuzluklar, asosyalite, şiddet eğilimi, sağlık sorunları, problem çözme becerilerini kısıtlama, sınıf yönetiminde zorluklar, dersten uzaklaşma, grup çalışmasından kaçınma ve agresif hareketler sergileme gibi olumsuz yönlerinin de olabileceği görüşü ortaya çıkmıştır. Bavelier (2012) yaptığı çalışmada, dijital oyunların standart olmadığı, iyi ya da kötü kalitede eğitsel oyunların da olabileceği yönündeki görüşü bu sonucu destekler niteliktedir.

Yine araştırma sonuçlarına göre dijital oyunların öğrenmeyi kolaylaştırdığı, kalıcılığı artırdığı, etkili öğrenmeyi sağladığı ve öğrenmeyi eğlenceli hale getirdiğine yönelik görüşlerin ağırlık kazandığı görülmüştür. Bununla birlikte yaparak yaşayarak öğrenme, zamandan tasarruf, maliyeti azaltmak, materyal çeşitliliğini ve öğrenci başarısını artırdığı yönünde görüş ortaya çıkmıştır. Ayrıca dijital oyunların motivasyonu artırmak, derse odaklanmak, derse katılımı artırmak ve merak uyandırmak gibi avantajlarından dolayı problem çözme ve bilişsel gelişme önemli katkılar sağladığı görüşü ortaya konulmuştur. Bavelier (2012) yaptığı çalışmada dijital oyunların dikkat ve görsellik gibi dinamiklerin beynin gelişmesine yardımcı olacağını, Dondlinger (2007) ise dijital oyunların birtakım becerilerin geliştirilmesi için önemli olduğunu belirtmişlerdir. Bu sonuçlar araştırma sonucuyla örtüşmektedir. Sonuç olarak, dijital oyunların eğitim amaçlı kullanımı genel olarak değerlendirildiğinde, dijital oyunların motivasyon, kalıcılık, sınıf içi performans ile etkililiği artırarak öğrenmeyi kolaylaştırdığı ve zamandan tasarruf sağladığı yönünde bir görüş birliğinin olduğu söylenebilir. Araştırmanın bu sonucu, Ülker, Acar ve Bülbül (2017) tarafından yapılan araştırma sonuçlarıyla örtüşmektedir. Günümüz dijital oyunların eğitim amaçlı kullanılmasının önemini ortaya koymak adına bundan sonra yapılacak araştırmalarda, dijital oyunların planlanması ve öğrenme kazanımlarıyla örtüştürülmesi sürecine yönelik araştırmaların yapılması önerilebilir.

Dinlerde Güvenlik Algısı Üzerine Kavramsal Bir Analiz

Prof. Dr. Münir YILDIRIM¹

Prof. Dr. Asım YAPICI²

Özet

İnsanlık tarihi boyunca “güvenlik olgusu” her dönem önemli bir sorun olmuştur. Güvenlik kavramı hakkında ortak bir tanımlama olmamakla beraber, genellikle güvensizlik ihtimallerinin ortadan kaldırılması durumunu anlatmak için kullanılır. Güvensizlik ihtimalleri ise, şiddete maruz kalma, yokluk ve yoksullukla karşılaşma ihtimalleridir. İnsanlar kendilerini güvensiz hissetmeleri durumunda, güvenli duruma geçebilmek için, şiddet, terör, savaş gibi tepkiler verebilmektedir. Bu tepkiler verilirken insan, karşdakine haklılığını ispatlama ihtiyacı duyar ve bunun için haklarının yendiği, tehdit altında olduğu veya hayati riski gibi gerekçeler sunar. Filhakika insanlar açısından güvenlik olgusuna sebep olabilecek yaşam hakkı, ekonomik haklar, din ve vicdan özgürlüğü gibi birçok tehdit ve risk vardır.

Güvenlik algısı bağlamında din tabiri de kullanılarak “din özgürlüğünün ihlali, din savaşları, dini terör ve dini şiddet” gibi isimler altında tepkiler verilebilmektedir. Bu tepkiler haklı gerekçe oluşturma bilmek maksadıyla kutsal metinler de kaynak gösterilmektedir.

Bu çalışmada dinlerin güvenlik algısı üzerinde kısmi anlamda kavramsal analiz üzerinde durulacaktır.

Kavramsal Analiz

Güvenlik toplum yaşamında yasal düzenin aksamadan yürütülmesi, kişilerin korkusuzca yaşayabilmesi durumudur. Güvenlik kavramı genellikle şiddete maruz kalma, yokluk ve yoksullukla karşılaşma vb. güvensizlik ihtimallerinin ortadan kaldırılması durumunu anlatmak için kullanılır. Ayrıca bu kavram tehditlerden uzaklığı, sahip olunan değerlere karşı saldırı korkusunun yokluğu gibi parametrelerle de ölçülebilmektedir.

Güvenlik tanımlarında korku, tehlike ve tehditlerden özgür hissetme hali gibi durumlardan bahsedilirken güvenliğin hem fiziksel hem de psikolojik boyutu olduğuna vurgu yapılmaktadır. Güvenliğin psikolojik boyutu yeme ve barınma gibi fiziksel ihtiyaçlardan sonra ikinci önemli basamak olarak görülmüştür. Maslow, insan ihtiyaçlarını aşamalı bir yapı içinde görür ve insanların alt basamaktaki ihtiyaçları karşılanınca üst basamaktakilere yöneleceğini kabul eder. Bu basamaklar şunlardır:

Fizyolojik ihtiyaçlar: Yeme, içme, barınma vb,

Güvenlik ihtiyaçları: Kendini güven içinde ve tehlikeden uzak hissetmek,

Ait olma ve sevgi ihtiyaçları: Başkaları ile ilişki kurmak, kabul edilmek ve bir yere ait olmak,

Değer ihtiyaçları: Prestij, takdir, başarı, yeterli olmak ve başkalarının benimsenip tanınmak,

Kendini gerçekleştirme ihtiyaçları: Kişinin amacını gerçekleştirmesi ve potansiyelini ortaya çıkarması, kişisel tatmin, kişisel başarı, bilimsel buluşlar.

Güvenlik ihtiyacı görüldüğü gibi insanın yaşaması için gerekli yeme, içme, nefes alıp verme, barınma gibi temel ihtiyaçlardan hemen sonra gelen önemli bir ihtiyaçtır. İnsan kendi güvenliğini tehdit altında hissettiği zaman tehdidi ortadan kaldırmak isteyecek ve güvenlik duygusuna ulaşmadan diğer ihtiyaçlara yönelemeyecektir.

Geleneksel güvenlik anlayışında egemen devlet en önemli aktördür. Devletin topraklarının korunması en önemli amaçtır. Güvenlik olgusundan söz edilebilmesi için varlığın korunmasını ve devam ettirilmesini etkileyen bir içsel ve dışsal tehdit ya da tehditlerin bulunması veya bu tür algılamaların bulunması gerekmektedir.

Güvenlik algısı, insanlar için ilk önce bireysel güvenlik anlamına gelir. İnsanların temel kaygıları öncelikle kendileri ve yakınlarının can ve mal güvenliğinin sağlanmasıdır. Bireysel olarak bakıldığında güvenlik duygusu, bireyin varlığına ve sahip oldukları şeylere ilişkin endişeler veya kaygıların bütünüdür ifade eder. Güvenlik kavramı en genel anlamıyla tehditlerden, korkulardan ve tehlikelerden uzak olmak ya da tehdit ve tehlikelerden en az zarar görme çabasıdır. Dolayısıyla güvenlik, değer ve önem atfedilen şeylerin tehdit ve tehlikelere karşı korunması ihtiyacı ve çabasıdır.

¹ Çukurova Üniversitesi İlahiyat Fakültesi Dinler Tarihi ABD

² Çukurova Üniversitesi İlahiyat Fakültesi Din Psikolojisi ABD

Tehdit, Risk, Savunma, Saldırı ve Barış

Güvenlik olgusunu bağlamında tehdit, risk ve savunma kavramlarına da değinmek gerekmektedir. Gözdağı karşılığında kullanılan tehdit kavramı, gerçek olgu ve olaylara dayandığı gibi algı ve tahminler de söz konusudur. Bir tehdidin gerçek tehlike olup olmadığı, tehdidin gerçekleşmesi ile ortaya çıkar.

Risk kavramı güvensizlik ihtimallerinden kaynaklanır; riskler güvensizliğin gerçekleşme yakınlığı endişe ve korku yaratır, her korku ve endişe tehlikeli kabul edilir ve tehdit olarak kabul edilir. Güvenlik tehditleri, çatışma alanları, hassasiyetler ve risklerin algılanması analizcinin dünya görüşleri ya da geleneklerine ve siyasa-yapıcıların zihniyetlerine bağlıdır.

Güvenlik ile ilgili bir diğer kavram savunma ise devletlerin sınırlarının dış tehditlere karşı korunması anlamındadır ve devletler sınırlarının belirlenmesinde savunma faktörünü ön planda tutmuşlardır. Güvenlik ve savunma girişimleri bir ideoloji ya da değerler adına yapıldığı ileri sürülse de genellikle ekonomik ve siyasal amaçlara ulaşmak için yapılmaktadır.

Tarih boyunca güvenlik algısı tanımları, tehdit ve risklere göre değişkenlik gösterse de uzun süre uluslararası literatürlerde kavramsal olarak “Güvenlik nedir?” sorusuna ortak bir cevap verilememiş ve tartışmaların önüne geçememiştir. Yaşamsal bir zorunluluk olan güvenlik; çocuğun güvenliği, ailenin güvenliği, binanın güvenliği, şirketin güvenliği, devletin güvenliği gibi ele aldığımızda bireysel ve toplumsal yaşamın her alanında bir ihtiyaçtır.

Güvenlik Algısı ve Din

Modern dünyada dini kaynaklı yapıldığı düşünülen şiddet olaylarının kutsal metinleri dayanak alıp almadığı tartışmaları yapılır. Kutsal metinlerdeki bazı imge ve emirlerin şiddete yol açan mesaj olarak algılanması bazı din mensuplarını şiddeti meşrulaştırma çabalarına sürükleyebilir. Ancak şiddet algısına neden olan bu pasajlarda barış, merhamet, uzlaşma ve sevgi içeren ilke ve prensipler de vardır (Albayrak, 2016, s80).

Dini uygunun oluşumunda kutsal metin ve yorum ilişkisinde birçok etken vardır. Bu etkenler dört temel anlayıştan kaynaklandığını belirtmektedir. Bu dört anlayışı şöyle sıralayabiliriz:

Bireysel ilişkiler ve duygular gizem boyutlu bir anlayıştır. Bu anlayışı güdüleyen bireyler rasyonellik, kurumlar ve dini otoritenin görüşleriyle ilgilenmez sadece tek geçerli yorum kutsal metnin kendisidir.

Dinsel yaklaşımın çoğulculuğuna izin veren bireysel tercihlerin tanrısal olan ve diğer bireylerle ilişkiler çerçevesinde şekillendiği tutumdur. Kutsal metinlerin farklı toplumlarda ve ihtiyaçlara göre farklı anlamları olabilmektedir. Yorum çok önemli değildir ve onun amacı evrensel ölçüde kabul edilmese bile birey için rehber olması yeterlidir.

Rasyonellik, sistem ve kurumlarla ilgilenmez. Bu bireyler duygu ve ilişkilerle az ilgilenir; gizemi ve irrasyonel fenomenleri ya reddeder ya da bunlara şüphe duyular. Kutsal metinler soyut ve analitik okunabilir ve buna bağlı sonuç çıkartılabilir.

Sonuncusu ise ilk üçü arasında dengeyi sağlamaya yönelik insan tecrübesini dikkate alan anlayıştır. (Albayrak, 2016, s83).

Dokuzuncu Sınıf Fen Lisesi Matematik Ders Kitabının Geometrik Düşünme Alışkanlıkları Çerçevesinde Değerlendirilmesi

Zeynep Bahar Erşen
Afyon Kocatepe University
zbersen@zku.edu.tr

Özet

Düşünme alışkanlığı, bireylerin bir problemi çözüm sürecinde onu nasıl çözeceğine karar vermesinde etkili olan düşünme yaklaşımıdır (Costa ve Kallick, 2000). Geometrik düşünme alışkanlığı ise; bireyin bir geometri problemiyle karşılaştığında, problemi çözmeye yönelik sahip olduğu repertuar şeklinde tanımlanabilir. Geometrik düşünme alışkanlığı kavramı literatüre Goldenberg (1996) in Habits of Mind: As an Organizer for the Curriculum isimli çalışmasıyla girmiştir. Bu çalışmada geometrik düşünme alışkanlığına sahip olan bireylerin özellikleri sıralansa da; geometrik düşünme alışkanlıklarının en kapsamlı biçimde ele alındığı araştırma; Driscoll, Wing DiMatteo, Nikula ve Egan (2007) tarafından bir proje sonucunda ortaya konmuş Fostering Geometric Thinking: A Guide for Teachers, Grades 5-10 başlıklı çalışmadır. Driscoll ve diğerleri (2007) geometrik düşünme alışkanlığına sahip olan bireylerin dört temel alışkanlığı olduğunu belirtmektedir. Bu alışkanlıklar; ilişkilendirme alışkanlığı (reasoning with relationships), geometrik fikirlerin genelleştirilmesi alışkanlığı (generalizing geometric ideas), değişmezleri araştırma alışkanlığı (investigating invariants) ve keşfetme ve yansıtma alışkanlığıdır (balancing exploration and reflection).

Öğrencilerin geometrik başarılarını etkileyen en önemli faktörün öğretmen olduğu düşünülürse; öğretmenin derste kullandığı ders kitapları önem arz etmektedir. Bu nedenle, matematik ders kitabında yer alan soruların, problemlerin, alıştırmaların geometrik düşünme alışkanlıkları boyutunda incelenmesinin; geometrideki başarısızlığın gerekçelerinin belirlenmesinde alanyazına katkıda bulunacağı düşünülmektedir.

Bu çalışmada veriler, nitel araştırma veri toplama yöntemlerinden doküman incelemesi tekniği kullanılarak toplanmıştır. Araştırmadan elde edilen bulgular, 9. sınıf fen lisesi için hazırlanan matematik ders kitabının geometri konularını içeren ünite örneklerinin; öğrencilerin genellikle ilişkilendirme ve keşfetme ve yansıtma alışkanlıklarını kullanmalarını gerektiren türde sorular olduklarını göstermektedir.

Educated Human Figure In School Mottos Of Korean High School

Kiseob CHUNG, Sunpil YOON, Eunkyung JUNG

Department of Education Inha University South Korea

kschung@inha.ac.kr, dagwood74@naver.com, 93247023@naver.com

Abstract

This study intends to derive the figure of the educated human beings embedded in Korean high school mottos. School mottos could be the educational policy of the school which intends to raise human who acquired the key virtues. Therefore, school mottos contain educational policy, idea and philosophy of the school. And it can be understood that school mottos reflect the virtues required by society and the future human figures acquired. In this study, collection of school mottos and conducting frequency analysis on 124 high schools located in Incheon Metropolitan City are done with the research question of what are the educated human figures implied in the school mottos of Korean high school. As a result, we found that school mottos consist of 1 to 4 words. And school mottos change from word to sentence. The most frequently used school motto was 'sincerity', regardless of whether it was a boys' or girls' school, or school establishment period. This suggests that the human figure shown in school mottos of Korean high school can be said to be a true, reliable human being who endeavors to realize humanity. If the purpose of education is to aim for a human being, then school mottos in terms of personality formation are still important today. It is also important to make sure that school mottos are settled in the course of practical education.

Introduction

In Korean schools, stone or wooden boards engraved with the school mottos are located the place where everyone can see. Students who spend a long time in school every day are exposed to the school mottos consciously or unconsciously. And the school mottos are reflected in school songs which sing in chorus at school events such as graduation ceremony and entrance ceremony. Placing the school mottos in a well-visible place and singing the school song in chorus are educational efforts to make the students to be aware of and practice the school mottos as lifelong guides. According to the Korean glossary of educational terms, the definition of school motto is "a motto that concisely expresses key virtues for the purpose of educating all the students in school to learn main behavior patterns, attitudes and values necessary for their daily lives". School mottos could be educational policy of the school which intends to raise human who acquired the key virtues. Therefore, school mottos contain educational policy, idea and philosophy of the school, which can be understood in relation with social-historical-cultural context. Therefore it can be understood that school mottos reflect the virtues required by society and the future human figures acquired. It is no wonder because schools are considered to be the main institution of socialization.

The Study

Does school motto really work as an educational policy in Korean schools? It seems that it does not. Nowadays, teachers and students seem to be indifferent to school mottos compared to previous generations. One of the reasons is the educational reality of school dominated by the competitive education centered on the university entrance examination. At this atmosphere, school mottos emphasizing human virtues but lacking the relevance to the academic achievement, for example test score, are getting out of concerns. This phenomenon means that the educational philosophy of the school and the process of educational practice are not organic and the educational philosophy exists only formally. In other words, it means that various teaching-learning activities in school are being performed functionally without sharing the ideas which lie in the essential meaning of education.

From these problems, this study intends to derive the figure of the educated human beings embedded in Korean high school mottos. The educated human figures implied in the school mottos set the ideal human figure from the experience of the Korean life. So it can be a criterion to diagnose the present school education reality.

Research question of this study is, what are the educated human figures implied in the school mottos of Korean high school?

In this study, collection of school mottos and conducting frequency analysis on 124 high schools located in Incheon Metropolitan City are done. It is found that according to the founding body, there are 1 national, 90 public, and 33 private schools. And depending on student's gender, there are 47 coeducational, 41 boys', and 36 girls' schools. Collection of school mottos is done through the school homepage. And hermeneutical methods are used to inductively derive educational idea from educational reality.

Findings

1. Number of words in the school mottos

As a result of analyzing the number of words in school mottos, we found that school mottos consist of 1 to 4 words. There were 66 schools with one-word school motto, 19 schools with two-word school motto, 38 schools with three-word school motto, and 2 schools with four-word school motto. Also, schools established in the late 1990s and early 2000s show a tendency to use sentence-based school mottos compared with existing word-based school mottos. About 50% schools which are established between 2000 and 2010 were taking sentence-based school mottos. This tendency seems to consider the generation of students who are unfamiliar with Chinese characters, unlike previous generations.

2. Frequency of the school mottos

The analysis of the frequency of high school mottos shows that 'sincerity' was the most common with 53 schools (43%). Then, followed by creativity with 23 schools (19%), cooperation with 12 schools (10%), (voluntary) service with 9 schools (7%), diligence and thrift with 8 schools (6%) in order. Three schools established since 2000 included the expression "world", which had never existed before, in school motto. This seems to reflect the tendency of globalization and internationalization in education. We can verify through the frequency of school mottos that school mottos are distributed to the intellectual area (e.g. wits, wisdom, intelligence), the emotional area (love, beauty, bright mind, etc.), the volitional or will area (autonomy, diligence, cooperation, training, healthy mind and body, etc.), the physical area (health, mind and body training, physical and mental health, etc.). School mottos contains at least one of the four areas, and some schools include more than one. There is a difference in the frequency among areas that the school mottos contain. In high schools, there were relatively more school mottos related to will area than school mottos related to intellectual and physical area. In elementary and middle schools, it is easy to find school mottos related to the physical area, which is not easy to find in high school. It seems to reflect the characteristics of the development stage of high school student ages or the recognition of the characteristics of high school curriculum. The frequency of the school mottos is shown in **Table 1**. as below.

Table 1: Frequency of the school mottos

Rank	Coeducational schools	Boy's schools	Girl's schools	Total
1st	Sincerity (20)	Sincerity (16)	Sincerity (17)	Sincerity (53)
2nd	Creativity (8)	Creativity (13)	Voluntary service (4)	Creativity(23)
3rd	Love (3), Challenge (3), Honesty (3)	Cooperation, Collaboration (3)	Diligence (3), Love (3), Intelligence (3), Cooperation (3), Beauty (3),	Cooperation, Collaboration, Unity(12)
4th	Autonomy (3), Diligence, Thrift, Frugality (3)	Volunteer (4)	Wits, Wisdom (3)	volunteer (9)
5th	Justice (2), Devotion (2), Cooperation (2), Passion (2)	Diligence (2), Practice (2), Truth (2), Faith (2), Unity (2), Passion (2), Challenge (2), Quest (2), Will (2)	Truth (2), Kindness (2), Religion (2), Passion (2), Creativity (2)	Diligence, Thrift, Frugality (8)

Others	Self-realization, Local patriotism, Nature, Peace, Coexistence, Volunteer, Correct, Trust, Truth, Goodness, Beauty, Hope, Consideration, Self-virtue, Virtue, Dream, True and wit. New every day. Dreams are high, hearts are wide, actions are beautiful. Best effort, best future. A competent mature human being. Mind is big, thought is deep, action is right. Myself, together, and truly. Cherish the great vision, challenge the Future. Self-love, and passion. Wise and enterprising person. The world with the heart and the future with the intelligence.	Honor, Patience, Health, Intelligence, Leap, Love, Self-help, Mind and body training, Conscience, Ability, Rightly and wisely, Blue dream and bright heart. Right thinking, honest behavior, leading skills. Intelligence for action, conscience for action. Life is honest, dream is great, mind and body is healthy. Let us be wise. Let's learn and act rightly by myself. Open up the world with intelligence and creativity. Let's fly high with dream, passion and challenge. Knowledge is the lantern of society, conscience is the salt of the people. Nurturing healthy person with wise and considerable. New and right. Global person, cultured person and creative person.	Love (7), Honesty, Truth (7), Passion (6), Challenge (5), Autonomy (5), Intelligence (4), Wits, Wisdom (3), Devotion (2), Quest (2), Mind and body training (1), Justice (2), Faith (2), Kindness (2), Beauty (2), Religion (2)
---------------	---	--	--	--

3. Comparison of school mottos between boys' and girls' school

There is a subtle difference in the school mottos between boys' and girls' schools. In boys' schools, school mottos related to the virtues necessary for social and organizational life are ranked high. On the other hand, in girls' schools, school mottos show that, except for sincerity, the words such as service, diligence, love, intelligence, cooperation, beauty, wisdom, and faith are evenly distributed.

This phenomenon seems to reflect the perception of traditional roles between men and women in Korean society until a certain period of high school establishment.

4. School mottos according to school establishment period

Even when considering the period of school establishment, 'sincerity' is an overwhelming school motto. Other virtues seem to reflect the demands of the times. For example, virtues such as cooperation, diligence, and frugality found in the school mottos of schools established before the 1980s seem to reflect historical trajectory of economic development to escape poverty in Korea. **Table 2.** shows the schools mottos of high school by establishment period.

Table 2: School mottos according to school establishment period

Period	1st	2nd	3rd	Notes
~ 1945	Sincerity (5)	Cooperation (2)	Creativity (2)	8 schools
1946~1960	Sincerity (3)	Thrift (3)	Diligence (2)	8 schools
1961~1970	Sincerity (2)	Religion (2)	-	5 schools
1971~1980	Sincerity (9)	Cooperation (4)	Creativity (3)	20 schools

1981~1990	Sincerity (10)	Creativity (5)	Love, Intelligence, Cooperation, Diligence, Autonomy	15 schools
1991~2000	Sincerity (11)	Creativity (10)	-	26 schools
2001~2010	Sincerity (4)	Volunteer (3)	Creativity (3)	31 schools
2010~Now	Sincerity (4)	Passion (4)	Creativity (3)	12 schools

Conclusion

Focused on school mottos of high schools in Incheon Metropolitan City, South Korea, the most frequently used school motto was 'sincerity', regardless of whether it was a boys' or girls' school, or school establishment period. In Korean, the word meaning 'sincerity' is 'seongsil'. And 'seongsil' is Sino-Korean word. Here, 'seong' originates from 'earnestness' in Chinese, and 'sil' originates from 'fruit' in Chinese. So 'sincerity' means the attitude of life that earnestness and fruit, that is, try to harvest good fruit with earnestness. In other words, sincerity includes genuine efforts to complete himself as a human being, authenticity in relationships with others, authenticity in his own language and behavior, and authenticity in all things. This can be interpreted as related to the Confucian tradition, which emphasizes the keeping of the human nature that is granted from heaven. Therefore, the human figure shown in school mottos of Korean high school can be said to be a true, reliable human being who endeavors to realize humanity. If the purpose of education is to aim for a human being (one who is humane), then school mottos in terms of personality formation are still important today. It is also important to make sure that school mottos are settled in the course of practical education.

Effect of Combinations of Lectures and Group-Discussions on Learning of Mammalian Physiology by Undergraduate Students: A Preliminary Report

E. K. Asem¹ and B. Rajwa¹,

² ¹Department of Basic Medical Sciences, College of Veterinary Medicine, and ²Bindley Bioscience Center, Purdue University, West Lafayette, Indiana, USA

A study was conducted to assess the impact of an "active learning" strategy employed alone or in combination with the traditional stand-and-deliver-lecture method on the learning outcomes in an undergraduate mammalian physiology course in Veterinary Nursing Program at Purdue University. The impact of three different teaching strategies were investigated, namely: (1) traditional stand-and-lecture, (2) group discussions alone, and, (3) combination of traditional lectures and group discussions. For all three teaching strategies, the students were assigned reading materials in a specified textbook and were required to complete written homework before each class. Every student led the discussion of at least one randomly assigned topic during each group session. The students did not have access to the textbook or notes during group discussions. Three mid-term examinations assessed the students' knowledge of basic principles and concepts of the physiology of specific organ systems. In addition, a comprehensive examination that tested knowledge acquired during the entire course was administered at the end of the semester. The ANOVA analysis of all the examination scores (from the mid-term and the end-of-semester tests) showed that the students' knowledge of the physiology topics (quantified by the examination scores) was influenced by the teaching modality employed to introduce the topics (effect size, generalized $\eta^2 = 0.07749165$). The post hoc analysis using Dunnett test demonstrated that although the discussion-only learning style did not produce significantly better or worse results than traditional lectures (adjusted $p = 0.55$), the combined lecture-and-discussion environment produced a significantly better outcome (adjusted $p = 0.00325$) than the lecture-only method. The Kendall rank correlation test demonstrated that the performance of students in examinations that cover the lecture-only portion of the course was positively correlated with their performance in examinations that cover the discussion-only portion ($p = 0.0005668$). However, the performance of students in examinations from lecture-and-discussion modality did not correlate significantly with their performance in lecture-only portion. These preliminary results indicate the potential benefit of combining traditional lectures with group discussions which aim at turning the students into active participants, but question the benefit of purely group discussion-driven learning activities when used in teaching physiological sciences to undergraduate veterinary nursing students.

Effect Of Self-Esteem On School Life Satisfaction Of Adolescents With Disabilities: Focused On The Mediating Effect Of Evaluation On Their Own Human Rights

SinsilGu, Jackook PARK
Dept. of Special Education
Pusan National University South Korea
minkyong901@hanmail.net

Minkyong KIM
Dept. of Special Education
Pusan National University
South Korea

Abstract

The purpose of this study was to investigate the predictive factors that can increase the school life satisfaction for the adolescents with disabilities in the integrated education field and to provide basic data for constructing the educational program to help the adaptation of school life by raising self-esteem and human rights awareness. Data of 143 adolescents with disabilities who responded fully were collected from the "Korean National Youth Policy Institute(2015)" from NYPI. The Results of this study was as follows. First, as a result of analyzing the correlation between self-esteem, school life satisfaction, evaluation on their own human rights, it was found that the higher self-esteem, the higher satisfaction of school life and evaluation on their own human rights. Also, the higher evaluation on their own human rights, the higher school life satisfaction was found. Second, As a result of the regression analysis, it was confirmed that the evaluation on their own human rights partially mediated the relationship between self-esteem and school life satisfaction. As a conclusion of this study, it was suggested that constructing various practical plans that to build an integrated education site recognized as a 'Ddadeutan(warm) educational community'.

introduction

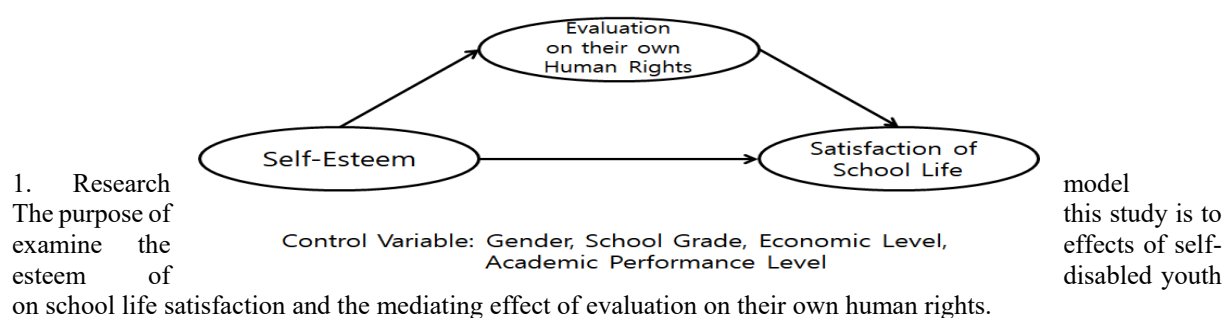

Adaptation to school life is a very important part of the growth of adolescents, and external environmental factors and internal personal factors can work together to influence it. In a number of previous studies, social relations, self-esteem, and resilience have been found to be highly correlated(Bronfenbrenner, 2005; Oh & Lee, 2006). Among these factors, self-esteem is a psychological competence that must be included in self-value as perceived by individual as beliefs about his own values and abilities and at the same time essential for adaptation to the environment(Baek & Hwang, 2005). In general, students with higher self-esteem are more likely to have high adaptability to school life because they perform their tasks with confidence and patience(Kim, 2017).

In 2007, the revised "The Special Education Law of Individuals with Disability" provided legal basis for pursuing curricular integration beyond physical integration. In addition, Researches and practices are actively being carried out about the key conditions for integrated education are the promotion of interaction between students with disabilities and general students, support for the achievement of students with disabilities and general students, administrative support, team collaboration, modification of teaching environment and curriculum(Kim, Jung, & Jung, 2014; Lee, 2010). Nevertheless, due to the environment that prioritizes physical integration, adolescents with disabilities who are receiving integrated education are experiencing human rights violations in various forms such as direct discrimination or indirect discrimination in the school and abroad. Human rights violations against students with disabilities may cause problems such as limiting the participation of students with disabilities in school, causing maladjustment in school life, and impeding integration into the community after graduation(Kim & Park, 2014; Lee, 2013).

The purpose of this study was to investigate the predictive factors that can increase the school life satisfaction for the adolescents with disabilities in the integrated education field and to provide basic data for constructing the educational program to help the adaptation of school life by raising self-esteem and human rights awareness. Specific research issues are as follows.

1. What is the relationship between self-esteem, school life satisfaction, and evaluation on their own human rights of adolescents with disabilities?
2. How does the self-esteem of adolescents with disabilities affect school life satisfaction and the mediating effect of evaluation on their own human rights?

Method

[Figure-1] Research model

2. Research subjects

For the purpose of this study, the "Korean National Youth Policy Institute(2015)" from NYPI was used. The purpose of this survey was to provide basic data on policy making for the promotion of human rights for children and adolescents by identifying the actual situation and changes in the human rights of Korean children and adolescents. 143 students with disabilities who answered all the questions for the purpose of this study were selected.

<Table-1> Characteristics of research subjects (N=143)

Characteristics		n	%
Gender	Male	121	84.6
	Female	22	15.4
School Grade	Elementary school	29	20.3
	Middle school	46	32.2
	High school	68	47.6
Economic Level	High	63	44.1
	Middle	57	39.9
	Low	23	16.1
Academic Performance Level	High	28	19.6
	Middle	69	48.3
	Low	46	32.2

3. Data analysis

The SPSS 23.0 program was used to analyze the following. First, the demographic characteristics of the research subjects were examined by frequency analysis. Second, through the correlation analysis, the relationship between self-esteem, school life satisfaction and evaluation on their own human rights were examined. Lastly, In order to investigate the effect of self-esteem on the school life satisfaction and the mediating effect of evaluation on their own human rights, the mediating regression method of Baron and Kenny(1986) was used. Sobel test was used to verify the mediating effect.

Results

1. The relationship between self-esteem, school life satisfaction, and evaluation on their own human rights of adolescents with disabilities

There was a statistically significant correlation between self-esteem and school life satisfaction, self-esteem and evaluation on their own human rights, evaluation on their own human rights and school life satisfaction of adolescents with disabilities at the significance level of .01. The results showed that the higher self-esteem, the higher school life satisfaction and evaluation on their own human rights, and also the higher evaluation on their own human rights, the higher school life satisfaction.

<Table-2> Correlation between self-esteem, satisfaction of school life, evaluation on their own human rights

variable	Self-Esteem	School Life Satisfaction	Evaluation on their own Human Right
Self-Esteem	1		
School Life Satisfaction	.227**	1	
Evaluation on their own Human Rights	.276**	.428**	1

**p<.01

2. The effect of self-esteem of adolescents with disabilities on school life satisfaction and mediating effect of evaluation on their own human rights

Multiple regression analysis was conducted to confirm whether the effects of self-esteem of adolescents with disabilities on school life satisfaction were mediated by evaluation on their own human rights. First, the influence of the independent variable on the mediator was confirmed. Self-esteem of evaluation on their own human rights and the explanatory power of the control variables were statistically significant at 9.6%, self-esteem, as an independent variable, was found to have a significant influence on the evaluation on their own human rights ($\beta=.276$, $p<.01$). Therefore, the influence of the independent variables on the mediator variables was confirmed to be significant, and the requirements of the first step of the mediating effect verification were established.

As a stage 2, the influence of independent variables on dependent variables was examined. The explanatory power of independent variables and control variables on dependent variables was statistically significant as 9.7%, and it was confirmed that self-esteem had a significant influence on school life satisfaction ($\beta=.166$, $p<.01$). Therefore, the influence of the independent variables on the dependent variables was confirmed to be significant, and the requirements of the second step of the mediating effect verification were established.

In the stage 3, the influence of independent variables was controlled and the influence of mediator variables on dependent variables was confirmed. To do this, self-esteem and evaluation on their own human rights were all applied as independent variables, and self-esteem, evaluation on their own human rights and control variables were statistically significant at explanatory power of 25%. Also, evaluation on their own human rights was found to have a significant influence even when self-esteem was controlled ($\beta=.395$, $p<.001$). Therefore the higher evaluation on their own human rights, the higher school life satisfaction was confirmed.

The R^2 value and the F value of the stage 2 were increased from .096 and 2.384 to the stage 3 to .097 and 2.419 respectively. The independent variable was decreased from .227 ($p<.01$) to .118 ($p<.01$), so the direct effect of self-esteem on school life satisfaction was significant. Evaluation on their own human rights has been found to mediate the relationship between self-esteem and school life satisfaction in part.

Overall, the control variables did not have a significant effect, but in the stage 2 and stage 3, school life satisfaction was significantly influenced by gender.

<Table-3> Analysis of the mediating effect of evaluation of their own human rights

Dependent Variable Variable		Stage 1 (Independent Variable →Mediating Variable)				Stage 2 (Independent Variable →Dependent Variable)				Stage 3 (Independent Variable · Mediating Variable →Dependent Variable)			
		<i>B</i>	<i>S.E</i>	β	<i>t</i>	<i>B</i>	<i>S.E</i>	β	<i>t</i>	<i>B</i>	<i>S.E</i>	β	<i>t</i>
Control Variable	Gender 1	.122	.149	.070	.816	.286	.139	.167	2.054*	.286	.139	.167	2.054*
	School Grade 1	.175	.149	.129	1.172	.230	.146	.135	1.573	.017	.109	.013	.158
	School Grade 2	.237	.147	.187	1.613	.138	.146	.104	.945	.189	.142	.153	1.335
	Economic Level	.015	.077	.017	.193	.068	.076	.079	.894	.069	.074	.081	.928
	Academic Performance Level	.036	.077	.040	.460	.010	.075	.011	.128	.010	.075	.011	.128
Independent Variable	Self- Esteem	.344	.101	.276	3.396**	.203	.111	.227	2.752**	.270	.100	.118	2.712**
Mediating Variable	Evaluation on their own Human Right	-	-	-	-	-	-	-	-	.387	.078	.395	4.992***
(Constant)		4.268				6.365				4.729			
R^2		.096				.097				.250			
Adjusted R^2		.056				.057				.211			
F		2.384*				2.419*				6.373*			

* $p<.05$, ** $p<.01$, *** $p<.001$ 4.992***

These results confirmed that evaluation on their own human rights was mediated partly to the relationship between self-esteem and school life satisfaction. As a result of the Sobel test, the Z value was 2.80, which was significant at the level of $p < .001$. Thus, evaluation on their own human rights was found to have mediating effects between self-esteem and school life satisfaction.

<Table-4> Sobel test for mediating effect validation

Sobel Test	z	p
Self-Esteem → Evaluation on their own Human Right → School Life Satisfaction	2.807	.000

Conclusions

First, as a result of the correlation analysis of self-esteem, school life satisfaction, and evaluation on their own human rights of adolescents with disabilities, the higher self-esteem, the higher school life satisfaction and evaluation on their own human rights. Also, the higher evaluation on their own human rights, the higher school life satisfaction was confirmed.

Second, the regression analysis was conducted to confirm whether the effects of self-esteem of adolescents with disabilities on school life satisfaction were mediated by evaluation on their own human rights. As a result, it was confirmed that evaluation on their own human rights partially mediated the relationship between self-esteem and school life satisfaction, and it was confirmed by Sobel test at last.

The suggestions based on the results of this study are as follows.

In order to establish an integrated education field recognized as a 'Ddadeutan(warm) educational community, it is necessary to improve the school life satisfaction by preparing plans and programs to enhance the self-esteem and evaluation on their own human rights of adolescents with disabilities. In addition, various approaches such as institutional support to prevent violation of human rights of students with disabilities, special education services, and development of self-protection programs to raise the evaluation of evaluation on their own human rights of students with disabilities and parents of students with disabilities are needed.

Effective Communication English Education In Artificial Intelligent Era: An Essay Through Drawing Pictures

Shinhee JUNG
Hannam University South Korea
stellajsh@hnu.kr

Abstract

This paper aims to search ways to enhance effective communicative English education in college in Korea. In Artificial Intelligence Era it is easy to neglect learning English or other languages. Because most people have smartphones which can be connected with internet, whenever or wherever, they can be access to internet and search meanings of the language which they hear. Accordingly, the importance of learning English tends to be weak. Therefore, this paper is to seek how to encourage students to learn English and communicate others through the educational theories of Immanuel Kant and Martin Heidegger.

Introduction

Today is the Fourth Industrial Revolution era. Accordingly, AI(Artificial Intelligence threatens English Education in class. Klaus Schwab indicated in his book, *The Fourth Industrial Revolution*, that the Fourth Industrial Revolution changes our identities as well as our life patterns. As the educational environments in Korea have become rapidly globalized, the significance of students' intercultural communication competence (ICC) along with the linguistic ability has been increasing (Sunyoung Choi).

Heidegger mentioned that "language is the home of existence." The language of existence is a general term for all of the experiences we experience, that is-see, or hear in the process of realizing something. Only through these experiences can a being be revealed as some being, and a being (or human being) himself can exist by doing so (Heidegger and Education 229).

Kant's humanism notion: The aesthetic ability of the human subject.

Whether objective or entirely intelligent, it is an undeniable fact that all representations inside us can ultimately be combined with pleasure or pain. (KU, B 129)

It is only in aesthetic manner that the experiential self-consciousness and the transcendental self combine widely.

Kant's practical education: Being skilled, world wisdom, morality

World wisdom which he thinks is the skill that our well-trained skills are applied to others, that is, the skill using others for our purpose (*Kant's education theory* 266). Also Kant's most important education is personality education, especially enhancement of rationality. But it also raises the question of the nature of human existence faster than expected (Schwab 156). Effect that Some particular technique like the Internet and smart phones affect us relatively has been realized properly and has been extensively discussed (Schwab 159). It causes students a kind of social empathy shortage. In this environment, communicative English education grows hard and hard. Students get used to search the Internet and get the answers to their problems in the Internet, and they are prone to indulge in disillusionment. So, we teachers need to seek for the new way to invite them into conversation with classmates or teachers, etc. The way I sought is drawing and writing. That is to form empathic relationships. This way may sounds flat and stale, but it is very effective. Through this presentation, I would like to introduce you to implement the way.

The Study

Group 1

- The first year students of University
 - : The basic Class in The Art Educational Course
 - : There have a variety of majors in the class, and the number of the students is 39.
- The title of Text: World Link 2

Group 2

- The third year students of University
 - : English Fiction in Department of English Language & Literature
 - : The number of students is 30.
- The title of Text: *Never let me go* by Kazuo Ishiguro

Findings

Cognitive apprenticeship:

This term means that a process in which learners gradually gain expertise through interaction with professionals or adults, older colleagues and colleagues who are superior to themselves. This is, "Apprenticeship is made by experience."

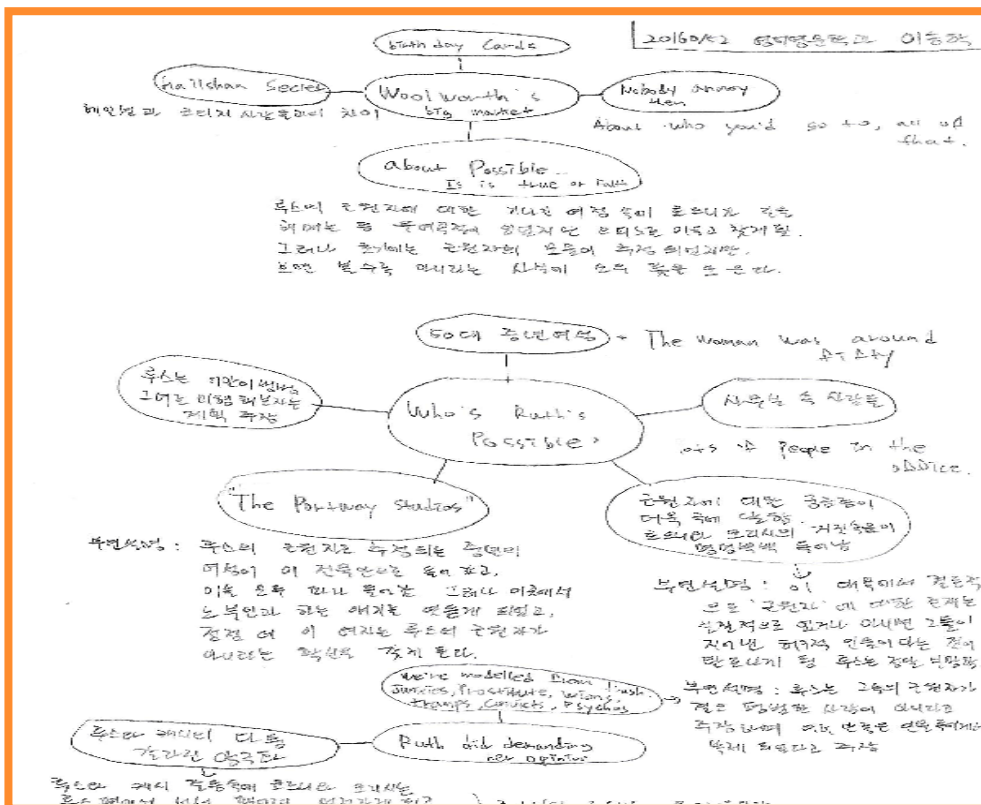

Students feel free to draw the things that they see, besides, they write the feeling about that briefly. After finishing them, they describe their works themselves to others and have time to communicate each other. Therefore, they learn to understand other people and have the opportunities to be close to others.

(Figure 1)

(Figure 2)

(Figure 3)

Conclusions

Students learn by interacting with adults and better peers than themselves. Listening is not meant to be heard by the ear. It means being in talking to oneself, being one with it. Man exists by communication. Education is a unique form of existence for humans, who become united through dialogue, just as communication is a unique form of existence for humans who are verbal beings. In the Fourth Industry Revolution Era, thanks to machines or robots, we get comfortable but also may be in danger. Human must be central in this era.

Abstract

The increased accessibility to higher education, coupled with the heightened aspirations for lifelong learning among working professionals have significantly raised the demand for postgraduate degrees in the country. Stiff competition among institutions of higher learning has driven education providers to run universities as structured business entities, where the postgraduate programmes offered in the respective institutions are adaptively designed, skillfully packaged and tenaciously marketed. This paper examines the basic prerequisites of expectations and perceptions of potential students for enrolment in the University's postgraduate programmes, with the aim of acquiring a better understanding of the students' perception and expectations as a first step in fostering effective branding of the University. A simple online survey was conducted for data collection over a short period of a week, to gauge the response for a number of basic questions. Considering that the University is relatively young in terms of provision of postgraduate programmes (20 years), the survey was necessary to identify the salient aspects in outlining an effective recruitment strategy for sustained enrolment of postgraduate students. Besides, the means by which respondents prefer to explore the University and the programmes available was identified, along with their preferred choices of tokens upon registration as new students at the University. In a nutshell, the survey shed light on the general recognition and identification of the University, as well as the potentially effective outreach channel and manner to improve the chances of successful new postgraduate student recruitment. A close-loop marketing and recruitment model was also proposed in support of a greater sustainable student enrolment system.

Keywords: *Higher education, accessibility, recruitment, marketing strategy*

Introduction

The boom of knowledge economy since the 80's has been propelling expansion in higher education to enhance the accessibility to university degrees via mass delivery systems (Marginson, 2015). As with everything else, the higher education sector has been overridden by the relentless waves of internet and IT technological advancement ushering in creative and innovative ways of promotion, advertising, delivery and above all, connectivity with the global economy. As rightly foreseen by Brown et al. (2001), high-skilled and high-valued workers would increasingly be in demand to maintain competitiveness of business enterprises and to meet the rising living standards. In this chaotic fast-paced highway of development, the job market for graduates has become remarkably more and more globalised and competitive (Brown et al., 2010), and interestingly, higher education remains the key to upkeep the societal balance in terms of engagement, tolerance and trust (McMahon, 2010).

At the same time, the open market trend has since spilled over to the higher education industry, with widespread deregulation almost a decade ago increasing the competition within the public sector as well as between the public and private sectors in a market-driven environment, consequently raising the heat among higher education providers to attract and train students to meet the market's demand (Gibbs, 2008). Barney (1991) suggested that to steer clear of competition, universities should centre on identifying their strength and niche while emphasizing their difference and specialty. The traditional efforts in student recruitment which often focus on providing

universal access to a higher degree with disregard for excellence and talents (Aamodt & Kyvik, 2005) have apparently grown less relevant with time.

To remain in the mainstream of training and providing high-skilled and high-valued workers, universities need to go back to the drawing board for a reconditioning of the quality of services and repositioning in the aggressive market to maintain a competitive edge (Stimac, 2012). In other words, universities are called upon to think and function like a business entity with adoption and implementation of business as well as marketing strategies (Padlee et al. 2010), and to build a notable image of distinction for establishing a solid footing in the competitive higher education market (Nga, 2009). An interesting parallel development is the intensive endeavour to recruit international students by universities, either by setting up shop in other countries (Batalova, 2007), offering attractive scholarships (Scott, 2007), or introduction of new government policies (Knight & Morshidi, 2011). All these indicate the global market-driven trend of higher education in general, encompassing the fundamental economic elements such as finance, workforce, value, new age education and branding.

This paper describes a quick pulse-checking of the prospective market and students for postgraduate programmes at the University. Using a simple online survey, the perceptions and expectations of potential postgraduate students for enrolment in the University's postgraduate programmes were examined as basic prerequisites forming the first step towards effective branding of the University.

Quick Survey

Branding the University by making a definitive articulation of the compelling uniqueness of the institution to ensure it stands out from the competitors in its own class is a first crucial step towards effective and successful marketing. The approach channels adopted for branding purposes should be multi-prong, extending from basic public exhibitions and events to strategic merchandising, social media, alumni network as well as industrial linkages, among others. The branding exercise seeks to establish connection and engagement with prospective students, through targeted advertisements and promotional activities to strongly advocate the University by nudging it onto centre stage without glossing over the less-than-satisfactory features. The survey was used a quick tool to gauge the basic parameters for the purpose.

The survey was simply divided into background questions and outreach tools, requiring respondents to answer either 'YES' or 'NO' for capturing the first impression with little or no premeditation. In the former section, respondents were asked of their current employment status, general and iconic recognition of the University as well as interest to know the University better; while the latter section explores the respondents' preferred channel of advertisement and engagement for the University to literally 'make an impression' and attract them for enrolment. The questions asked in the survey are as follows:

- | | |
|--|------------------------|
| Question 1: What is your current status of employment? | } Background questions |
| Question 2: Do you know UTHM? If YES, go to Question 3. If NO, go to Question 4. | |
| Question 3: What is the first image that comes to mind when you think of UTHM? | |
| Question 4: Would you like to get to know UTHM? | } Outreach tools |
| Question 5: What is the most iconic feature at UTHM? | |
| Question 6: What is your preferred choice of medium to learn more about UTHM? | |
| Question 7: What would you like to have as a souvenir upon registration at UTHM? | |

Results And Discussions

Following are the analysis and discourse based on the responses acquired from 104 respondents over a period of one week in the online survey.

Background Questions

Status of respondent

Figure 1 shows the status of the respondents in the categories of students in either UTHM or other universities, as well as employees in the government or private sectors. Almost one-third (29.1%) of the respondents were government employees, indicating the tendency of public servants to seek out public universities as potential places to pursue a postgraduate degrees. This is perhaps not surprising as the University does have a good track record of pre-arranged cohorts of employees from the public sector enrolling for the various master's programmes, including those from local community colleges and vocational training institutions. In addition, the fact that a quarter (25.2%) of the respondents hail from private companies suggests the relatively lower tuition fees compared to private institutions and other more established public universities to be an attractive factor. On the other hand, 28.2% of the respondents were existing UTHM students, while the remaining 17.5% came from other institutions of higher learning (IHLs).

Recognition of UTHM

Considering that UTHM is relatively young in terms of establishment as a public university in the country, 86.4% respondents reported knowing the University seems an encouraging trend (Figure 2). This is indicative of the University visibility and good name in the higher education sector. Nonetheless, this number could also be inflated by the 28.2% existing students who took on the survey (see Figure 1). The recognition of the University can be attributed to promotional efforts in education fairs, revised website, Facebook and other outreach conduits. Indeed, a separate survey conducted found Facebook to be the most common way potential students get to know about the University, where traditional advertisement via printed media like newspapers saw the lowest report of usage and reference for this purpose.

First image that comes to mind

This particular question was asked to gauge the most prominent feature of the University that captures the respondents' attention, namely the main buildings on campus, academic programmes offered and others (Figure 3). Note that 'aeroplane' refers to the replica erected in the courtyard of the campus as a representation of the new aeronautics programme developed and offered by the University. It was only answered by respondents who were affirmative in Question 2. The library being the landmark of the University clearly gained the most hits at 26%, followed by the University's logo (20%). These are positive signs that the University is prominent geographically where the respondents could relate the library architecture with UTHM. It is also suggestive of a reminder of University's role as a respectable institution of higher learning, centralized and represented by the primary repository in the University, i.e. the library. However it is a little puzzling considering the 17% who claimed to not know of anything to be associated with the University as a first image. A plausible explanation is that the respondents concerned have never set foot in the campus or the town of Parit Raja, Batu Pahat.

Getting to know UTHM

Referring to Question 2 and Figure 2, respondents who answered in negative were directed to Question 4, which responses are presented in Figure 4. 86.7% of the respondents were keen to learn more about the University: a positive sign of the interest UTHM raised in them. On the contrary, the 13.3% who did not express wishes to get to know the University were probably having no plans for furthering their studies in the near future, or lacks the motivation to make further enquiries due to various factors, such as location, programmes and environment deemed unsuitable for their preferences. Of course, possibility of the unkindled interest could include lack of the desired amenities yet to be afforded by the University, especially for international students of various backgrounds and needs. These could include international schools, accommodation, communities of the relevant ethnicity or nationality, suitable food availability and proximity to larger cities (e.g. in approximation, southbound Johor Bahru is over an hour's drive away, while northbound Bandaraya Melaka is 1.5 hours' drive away, and the nation's capital Kuala Lumpur is 3.5 hours' drive away).

Figure 1: Status of respondents.

Figure 2: Recognition of UTHM.

Figure 3: First image that comes to mind.

Figure 4: Getting to know

Outreach Tools

Iconic features

Figure 5 compiles the responses on the iconic feature associated with UTHM. Irrespective of the large portion of the respondents who did not appear to give much thought on the matter, an almost equal number of respondents considered the library (15%) and third prime minister of Malaysia (14%) to be the icons of the University. Note that the University is named after the third prime minister, Tun Hussein Onn who hailed from Batu Pahat where UTHM is located. Choice of the library as the University's icon corresponded with the first image conjured when the University is mentioned (see Figure 3), further highlighting the significance of the structure in association with the University. The historical connotation also hints at the unique brand of the University, i.e. the only public university in the country named after a former prime minister.

Medium of interface

This question aims to extract information on the preferred medium of outreach by the respondents, and the results are presented in Figure 5. Perhaps not surprisingly, nearly half the respondents (46.6%) considered the website to be the most convenient and accessible medium for information on the University. 35% of the respondents learned about UTHM via Facebook, another ubiquitous and popular web-based social platform. Other medium of outreach were seemingly less attractive to the respondents, including the conventional printed media. This is just another sign of the World Wide Web, internet access and extensive global network dominating the mainstream non-face-to-face communications and interaction, which is especially useful for foreign students to obtain information about the University. Indeed, the diminishing impact of information dissemination and advertisement on higher education provision has seen the University cutting back on expenses for such purposes over the years. The latest advertisement by the Centre for Graduate Studies, for instance, covered the space of just a quarter page with only essential information and a QR code that directs readers to the relevant website. This approach was not only more economical, but kept pace with the web-based resources accessibility trend adopted by almost all sectors now.

Preferred souvenirs

It is customary that new registered students are given a token or souvenir. When the question was posted with a list of popular items as choices, 70.9% of the respondents wanted a laptop or tablet. Not surprising, as postgraduate students certainly require a laptop or tablet for their studies, though an expensive token to ask for really. Along the same line 13.6% of the respondents would like to have an external hardisk as a souvenir, most probably for storage of work and references accumulated in their postgraduate studies then. The responses clearly point towards the practicality of gifts preferred by the potential students, who could put the IT gears into good use in the duration of their postgraduate studies at UTHM. Nonetheless it is common knowledge that the 'gifts' are really funded partially by the students' tuition fees. Hence giving out expensive tokens would inadvertently raise the tuition fees and this may not be favourable in maintaining competitiveness in terms of the costs of study.

Marketing Strategy: Philosophy And Outline

While acknowledging the survey to be setting out feelers for the ‘likes’ and ‘dislikes’, as well as ‘knowns’ and ‘unknowns’ of the public to lay the grounds in marketing strategy design, it is important to have an comprehensive marketing plan to ensure closing of the loop even after the ‘clients’ are roped in. Figure 7 shows the close-loop marketing and recruitment exercise proposed for a greater sustainable student enrolment system of the University. As can be seen, the survey results and analysis are relevant and useful for the initial outreach tool design stage to attract the outliers either unlikely or contemplating to consider UTHM as their choice of institution for pursuing a postgraduate degree. Following are the descriptions of the proposed model.

The proposed model consists of 6 stages of actions for 5 evolving categories of people. The actions include outreach, attract, convince, capture, deliver and engage in sequential manner, and self-recycle from the end in a continuous loop. At the *outreach* stage, primarily internet-based and mobile advertisement campaigns are carried out via platforms like Facebook, Instagram and Youtube for a greater contact radius with the outliers especially. Once contact is made and the attention commanded, efforts are expended to *attract* and transform the prospective students. The key areas to maintain a competitive edge in the race for new recruits encompass tuition fees, amenities and facilities as well as a conducive and supportive learning or research environment. Next, drawing the prospective students into campus would require concentrated efforts of the marketing team of direct and indirect nature, substantiated by the good reputation and standing of the University in the *convincing* act. Once a new student is ‘*captured*’ and registers, enrolment is notched and the recruitment mechanism is technically completed. Induction of newly registered students into the University would involve taking into account the welfare of the freshmen to avoid early withdrawals due to various reasons, such as financial problem, ill-suited adaptation process (especially for international students) and others. Nonetheless as mentioned earlier, the proposed model constitutes part of a larger University’s agenda to not just raise the enrolment number but to ensure a viable system for long term growth of the institution with relation to number and quality of students as well as graduates. Hence the proposed model extends beyond student recruitment as elaborated in the following paragraph.

In order to ensure students receive value for money in the pursuit of a postgraduate degree, the University must *deliver* what is promised to meet the expectations of a responsible and accountable higher education provider. It is imperative to put in place well developed instructional design and delivery templates to be implemented by both the academic and supporting arms of the University. The wellbeing and needs of the active students should be constantly monitored alongside the basic teaching, learning and research support provided throughout their study at the University. Satisfaction of the services given and forging of a good relationship that lasts beyond graduation would *engage* and keep the graduates as ambassadors for the University in future promotional exercises. The sense of gratitude and loyalty instilled in the graduates, buoyed by remembrance of the nurture, cultivation and assistance received at the University would encourage the graduates to spread good words of their alma mater. Having alumni speak highly of their alma mater is arguably the most positive representation of the institution’s worth, and make honest promotional outreach for those keen or half-keen on signing up for a postgraduate programme at UTHM.

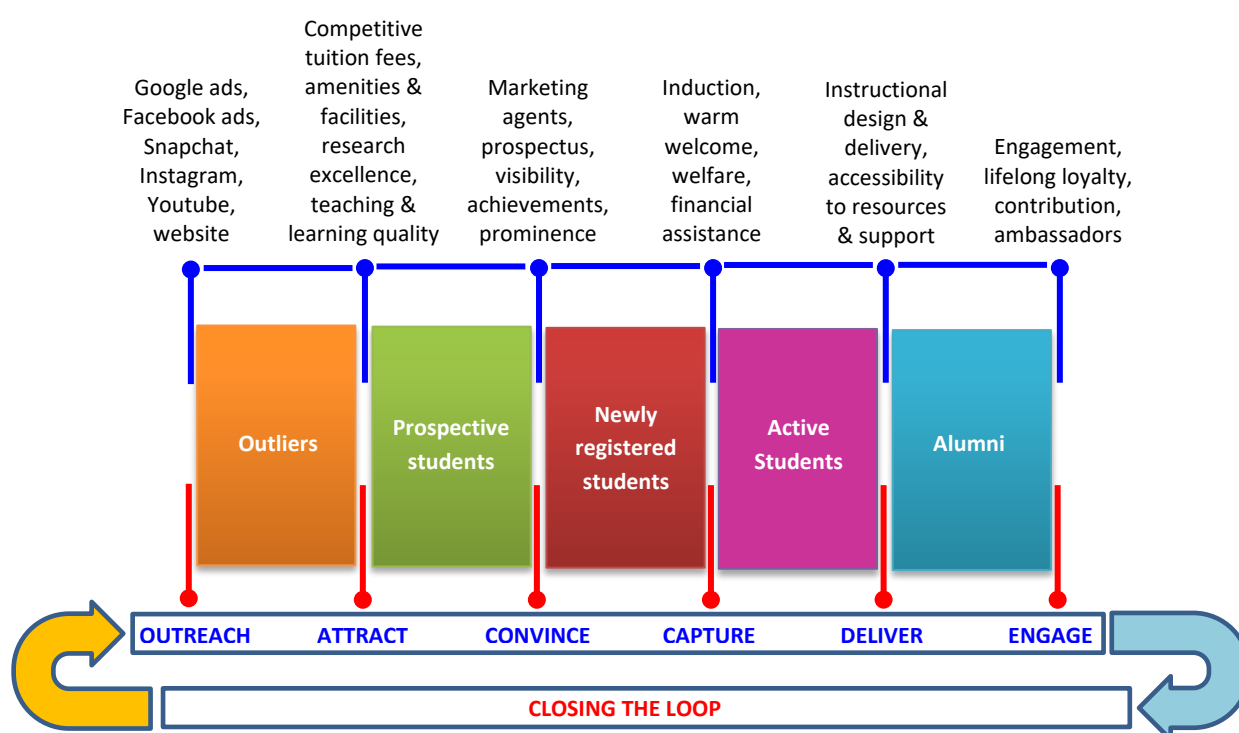

Figure 7: Close-loop marketing and recruitment process.

Conclusions

The study shed light on the prerequisites to be taken into consideration when laying effective marketing strategy for the University's postgraduate programmes. The good mix of respondents from among students and employees points to certain attraction UTHM holds for the potential new recruits, while a good many of the respondents (>80%) already have an idea of what and where UTHM is. Besides, recognition of the University's library and logo suggests an encouraging level of established standing among institutions of higher learning in the country, despite the University's rather young age. In exploring the outreach tools, the library remains the most popular iconic feature favoured by the respondents, and the website and Facebook are the most preferred channel for information retrieval on the University and postgraduate programmes offered. When asked what they would like to receive as souvenir upon registration, laptops / tablets and external harddisk clearly led the race as these are useful IT gears for the potential students' studies. Finally, based on the survey results analysis, a close-loop marketing and recruitment strategy was proposed: with a comprehensive multi-channel outreach approach to attract new students, followed by meet-the-promises delivery of teaching, learning and research support in a conducive academic environment, and concludes with the engagement of graduates as lifetime promotional ambassadors for the University in the cycle.

Acknowledgement

The presented work was partially funded by Centre for Graduate Studies, UTHM.

Effects Of Fake News About Syrian Refugees : Case Study With Kindergarten Teachers

Necmi Emel Dilmen
Assoc. Prof., Marmara University

Seda Gökçe Turan
PhD, Bahçeşehir University,

Abstract

After civil war in Syria, most of the refugees come in Turkey and start living here. Related to this migration, Turkey is face off with both economical and sociological problems originating from Syrian Refugees. Add to this, there are also so much fake news spread from Internet especially social media about Syrian Refugees such as; "Syrian Refugees could vote for the elections", "Syrian Refugees could go University without any exam", "Syrian Refugees could get salary from government without working" etc. In social media also there are some hash tags showed up time to time such as; #Syrian Refugees Go Back Your Home; #We Don't Want Syrian Refugees In Turkey. Authorities and journalists warn and try to take attention to the problem that consequences of fake news in social media Turkish people have a grudge against Syrian Refugees.

Although academicians begin to conduct studies and projects about Syrian Refugees, in literature, there is still a dearth of quantitative studies about Syrian Refugees and perception of kindergarten teachers in Turkey. This study attempts to bridge this gap with particular attention to the thoughts and perception of kindergarten teachers using a quantitative research framework. The aim of present study is to examine the relationship between fake news about Syrian Refugees and perception of kindergarten teachers' toward them in terms of digital media literacy. The study was conducted at Bahçeşehir University North Campus and 11 kindergarten teachers participated the study. Each meeting were lasted approximately 15 minutes and each teacher participated the study face to face. Teachers' were asked about their digital media literacy skills and then were showed fake news that spread on social media. Participants did not informed about the news were fake. All questions was prepared by researchers and included questions such as: "When you share a news from social media, do you crosscheck the news?", "What do you think about hate-speech on social media?" etc.

According to the results of the study only 3 teacher called into doubt of the news. These teachers also noted that when they read or share a news from social media they always look another resources from Internet and crosscheck the news. All participants of the study stated that hate speech on social media is something "foolish"; but when they saw the fake news about Syrian Refugees, they discoursed hate speech against them such as; "We do not want them in Turkey", "They are bad and guilty people", "The crime proportion has increased since they arrived" etc.

As a conclusion, it could be said that digital media literacy is an effective tool for protect people to believe fake news. Although 3 teachers questioned the correction of the news, they used words includes hate speech. Preventing hate speech, it is highly recommended that workshops and in-service trainings against hate-speech would be effective.

Introduction

With the raising Internet and other digital communication devices, social media became a vital part of peoples' lives (Davison, 2015; Hongi 2011). Basically, Social Media defined as " Web 2.0 or the Internet based platform in which web applications and content is collaborative and participatory" (Kaplan & Haenlein, 2009; p:61). The most popular and most preferred social media platforms include Facebook, Twitter, Google, Youtube and Wikis, also popular blogs and other forms of interactive social media platforms as well (Davison, 2015).

According to the American Academy of Pediatrics (2011) using social media platforms is most common activity among children and adolescences. Using social media sites have some benefits on children and youths by enhancing their communication skills, social interaction or their technical skills (American Academy of Pediatrics, 2011). Social media platforms provide an enjoy environment with growing popularity but it also bring into the open new ethical issues such as cyber-bullying, hate speech or surveillance (Bauer, 2014). Mondal (2017) argues that, although by using social media platforms users could reach millions of people with an inexpensive way; social media platforms such as Facebook or Twitter drastically changed the way of users communicate each other and share content. As a result of this change, at this platforms anyone could publish content no matter it is appropriate or inappropriate, also anyone interested in content could reach it (Mondal, 2017). Researchers stated that there should be more privacy and anonymity for users social media profiles in order to preserve their rights for freedom of speech without any fear from governments or other authorities such as their bosses or colleagues in work places. But, this privacy or anonymity can lead to abusive behaviors such as cyber-bullying, hate speeches or trolling (Grant, 2012; Mondal, 2017). Especially for vulnerable groups such as children, adolescences, handicapped people or minorities social media includes some risks (hate speech, cyber-bullying, trolling etc.).

It now seems self-evident that social media have revolutionized the way people experience feelings, lifestyles, perceive their social environment and share experiences (Laer, 2014; McElroy & Shevlin, 2014). A large body of research indicate that people increasingly rely on computer-based communication under the relative anonymity of

Internet as they contact with others (Christie & Dill, 2016). At the midst of this novel medium and way of communication an increase in hostility and aggression within cyberspace and social media has been noticed by numerous researchers and been subject to academic investigation and research (Christie & Dill, 2016). It has been proposed that exposure to violent media is a prime contributor to increased cyber-aggression. Krahe & Möller (2010) noted that there is meta-analytic evidence between violent media consumption and tendency to engage in aggression. Exposure to mass media violence such as hate speech, violent video games and cyber bullying alter cognitive, emotional and behavioral processes and possibly lead to desensitization towards violence. Supporting this notion, the landmark study by Molitor and Hirsch (1994) and subsequent studies confirmed that viewing violent video images increased tolerance for violent behavior.

Nevertheless, there is still substantial a gap in our understanding between longitudinal effects of media violence, cyber harassment and politics. Alava et al. (2017) noted that, online extremism or violent radicalization had grown in recent years and this growing was related with Internet and social media. After rising bomb attacks by Isis and other radical terrorist groups, peoples perception changed on social media platforms and most of the users have negative bias toward Muslims.

In terms of Muslims, there is a reality that, a substantial number of immigrants from different backgrounds are living in various countries in Europe or USA. Successful integration of these immigrant populations into the social and cultural environment of the host countries is a painful process that require extensive data and long term social planning. Such attempts are further complicated by the ever-changing and volatile environment of cyber and social media that is particular influential on younger generation. Moreover, According to Gamez-Guadix & Gini (2016), youth who reported high levels of justifications of aggressive behaviors, were more likely to engage in reactive aggressive behaviors toward peers. With regard to cyber-harassment, there are researches that shows there is a relationship between justification of aggression have positively associated with cyber- bullying perpetrators. When this subject is analyzed under the lights of immigrants or refugees it could be more clear that on social media cyber-bullying most of the time used as a tool toward them. According to Esses et al (2013) dehumanization of immigrants and refugees can serve to justify inhumane treatment toward them. Moreover, on media hate speeches or fake news toward immigrants could exacerbate this tendency. Awan (2014) noted that after Woolwich attack, which was a tragic event that Michael Adebowale and Michael Adebolajo murdered British soldier Lee Rigby in Woolwich, south-east London and occurred in May 2013, police forces reported a dramatic surge in the number of reported hate crimes against Muslims. Awan and Zempi (2015) argued that these virtual and real violence are engaged to each other. They noted that anti-Muslim hate crime is most of the time evaluated as physical attacks toward Muslims but it also actualized in cyber-context.

Due to Internet is limitless platform for data sharing, it is so easy to spread hate speech or online violence whole world (Guiora & Park, 2017). Most of the time hate speech spread through fake news. Moreover, if the target people are sensitive about the issue, fake news spread more rapidly. Intolerant, discriminatory and prejudiced discourse toward Syrian Refugees at social media sites could seriously damage in lives of refugees. Especially when Turkish people believe fake news there would be serious incidents in daily lives.

According to the literature review about cyber-harassment, hate-speech and fake news about Syrian Refugees, present research was conducted in order to understand kindergarten teachers perception toward Syrian Refugees and fake news about them.

Aim Of The Study

The main aim of the present study is to explore and examine the relationship between fake news about Syrian Refugees and Perception of kindergarten teachers toward these news. Also, researchers saw the dearth of studies in the field. There is insufficient amount of research conducted in this particular area that takes into account about fake news toward Syrian Refugees. It is crucial that this study highlights the role and impact of fake news on people's perception toward refugees as well as teachers' digital media skills which is very important for their role-model status.

Research Questions

The research questions central to study are:

- Are kindergarten teachers qualified digital media literate?
- What factors impact upon kindergarten teachers' perception toward news about Syrian Refugees?
- Is there a relationship between kindergarten teachers' digital media skills and trust to fake news?

The overall objective of this study is to provide in-depth exploration of kindergarten teachers' perception toward hate speech and their digital media skills.

Method

Present study was conducted as in-depth interview. Totally 11 kindergarten teachers participated to study. Each interview were lasted approximately 15 minutes and all interviews conducted by face-to-face as directed

conversations. Firstly, kindergarten teachers were asked following questions about their digital media literacy skills and digital citizenship:

1. How old are you? How long have you been working actively?
2. Do you trust your searches on internet web-sites?
3. How often do you follow the news on social media?
4. Do you read the social media commentary on the news? What do you think about these comments? Do you actively comment? Do you think you are writing aggressive comments?
5. Do you share news on the social media? Do you often cross-check the accuracy of your shares? How?
6. Do you know what digital footprint is?

After got their answers, researchers showed them some news about Syrian Refuges and asked the opinions of participants. The news were fake news and spread Internet so much. Some of the Internet sources declared that the news were not true.

Results

The sample of the study is not so diverse. 2 of teachers were 21 years old, 1 of the teachers 20 and the rest of them were 22 years old. They have been working as a kindergarten teacher mostly 2-4 years. All of the teachers were said they are not trust all the information at Internet. Only one teacher said: "Actually sometimes some web-sites had a useful and scientific information. I try to follow they web-sites and specialists' personal social media accounts". All teachers stated that they follow news very often on social media. Only 3 teachers stated that they are cross-check the news on social media. These teachers also do not believe the fake news and ask questions about the news. None of the teachers know the meaning of digital footprint.

According to the interview results, unfortunately only 3 kindergarten teachers called into doubt about the news. 8 kindergarten teachers definitely behaved like the news were true and they said there were really so much unfairness toward Turkish citizens.

Fake news images were as following:

1. Image

This images is about speech freedom. According to the news, when Turkish Citizens write or share video, image or news about Syrian Refugees on social media they would be tried in jail up to the 3 years. For this image only 1 kindergarten teacher said: "I cannot believe this news, because the source of news is unclear". This teacher also noted that she always cross-check the news. Other 10 teachers express their ideas like; "Maybe it is possible", "Syrian Refugees are more valuable than us", "Some expressions about Syrian Refugees are include hate speech, so this regulation is necessity".

2. Image

This news says, at Bursa Syrian Refugees a horse by hitting a hard object in his head. And also says: "God damn you and those who allowed you to enter this country". 2 kindergarten teachers said they saw this news on facebook and it is fake news, not related with Syrian Refugees. 9 Teachers, when they saw the images began to talk about their unpleasant experiences with refugees especially with beggars. Most of them said, the beggars are very dangerous for the society and after Syrian Refugees came to Turkey, the beggars were much more visible. They noted that, they are not only afraid for their safety but also for the society.

3. Image

It is the most believed news and it claimed that "Syrian Refugees could enter university without any entrance examination". 3 teachers said they saw this news before, and it is the fake news. 8 teachers were very angry with news. They said it was really unfair for the Turkish citizens, university entrance exam was very difficult they worked very hard but Syrian Refugees could enter university without any exam. 8 of them always impress the word: it is unfair.

Conclusion

When the results were analyzed, it could be easily seemed that all the kindergarten teachers have not enough digital media skills. Actually, it is not effective ones. They believed all the fake news about Syrian Refugees and only 1 of them asked the source of the news. 3 of the teachers said they read the fake news about the university entrance exam and they knew that this news is not true. All participants of the study stated that hate speech on social media is something "foolish"; but when they saw the fake news about Syrian Refugees, they discoursed hate speech against them such as; "We do not want them in Turkey", "They are bad and guilty people", "The crime proportion has increased since they arrived" etc.

As a conclusion, it could be said that digital media literacy is an effective tool for protect people to believe fake news. Although 3 teachers questioned the correction of the news, they used words includes hate speech. Preventing hate speech, it is highly recommended that workshops and in-service trainings against hate-speech would be effective.

Abstract

One of the main objectives of education policy is to improve educational outcomes. If resources are used inefficiently they will fail to maximise those outcomes. In this paper we survey and discuss conceptual and methodological issues related to the measurement and analysis of efficiency focusing on European higher education. Using the latest data available we apply Data Envelopment Analysis and calculate technical efficiency of public spending on education for EU-28. We identify the most efficient countries and also countries for which real efficiency improvements are possible. We also use a novel set of variables to highlight more appropriately the distinctiveness of the higher education sector and the relationship between input and outputs. The advantage of using Data Envelopment Analysis is that it identifies the best performing decision making units and not the averages. In today's competitive economies countries cannot afford to have average education systems. Obtaining information about the efficiency of public spending on education is of relevance to many parties. This information can be used to formulate policy proposals, promote 'yardstick' competition in the areas where the lack of market mechanisms is most evident and to improve the monitoring of education.

Key words: *Efficiency, Higher Education, Public Spending, Data Envelopment Analysis, European Union*

Introduction

Higher education (HE) plays an essential role in an economy, by fostering economic growth, increasing productivity and contributing to social cohesion. Many countries in the world finance their higher education systems from public funds and the European Union (EU) is not an exception. In the interest of accountability and in light of the economic crisis of 2008 it is becoming crucial to evaluate the efficiency with which these funds are being utilised. Efficiency concerns are even more serious when we look at some of the trends in European HE.

In the EU-28 there has been a steady increase in the number of students in tertiary education. According to Eurostat (2017) in 2015 there were 19.5 million students in tertiary programmes and approximately 4.7 million students graduating from tertiary education. The share of persons aged 30-34 with completed tertiary education increased, from 23.6% in 2002, to 39.1% in 2016 in EU-28 (Eurostat, 2017). Germany had the highest number of tertiary education student in 2015, about 3 million, or 15.2% of EU-28 total. Following Germany is France with 12.4% of EU-28 total, the United Kingdom (11.95%), Spain (10.1%), Italy (9.4%) and Poland (8.5%). In all EU countries more students were enrolled on Bachelor's degrees than on any other level of tertiary education. This is especially the case for Greece where 84.4% of students were studying for Bachelor's degrees. One of the targets of the Europe 2020 strategy is to have at least 40% of persons aged 30-34 with completed higher education by 2020.

Most of the EU countries have a significant share of their HE financed from public sources. In the EU-28 (excluding Greece and Croatia), public expenditure on tertiary education was equivalent to 1.3% of GDP in 2014 (Eurostat, 2017). This ratio ranged from 0.5% of GDP in Luxembourg, to 1.3% in Germany and 2.4% in Denmark in 2014. With above mentioned increases in the number of people participating in HE and the already stretched out public resources, the issues of efficiency, effectiveness and accountability are being evoked more often in discussions and national planning documents.

In many EU Member States there is a growing feeling that the current systems of higher education are not organized in an efficient way and a large number of empirical studies to date have attempted to define and measure

this (in)efficiency in an HE framework. These studies used a variety of techniques to identify ‘efficient’ decision-making units (students, HEIs, departments, universities, countries) and compare them with ‘inefficient’ ones.

The efficiency concepts currently dominant in economics originate from engineering relationships where a technical process is considered efficient when the desired mix of outputs is maximised for a given level of inputs or when inputs are minimised for a desired mix of outputs. When transposed to the field of economics (of education) it seems there is no general consensus about how to define and measure efficiency. The foundation of the theory of efficiency and its measurement was laid out by Farrell (1957) who used three main measures of efficiency (overall, technical and price efficiency). Technical efficiency was defined as the ability of a firm to achieve maximum output from a given set of inputs. Fried et al. (2008) provide a more detailed analysis of the efficiency concepts in neoclassical economics. Concepts of efficiency and how they related to higher education will be examined in more detail in the next section.

With the development of non-parametric techniques in the 1970s such as Data Envelopment Analysis (DEA) (Charnes et al, 1978; Banker et al, 1984), Stochastic Frontier Analysis (SFA) (Aigner et al, 1977), and others there has been a thriving literature on efficiency across various settings, including education. A recent survey of this general literature focusing on the most widely used method, DEA, can be found in Emrouznejad and Yang (2017). Surprisingly, only about 3.5% of studies using Data Envelopment Analysis were dedicated to the higher education issues (Gatouffi et al., 2010) and even smaller share is dedicated to cross-country comparisons (noted in Thanassoulis et al., 2016).

Given the importance of higher education and the limited research in this area the focus of this paper is the analysis of efficiency in the context of higher education. Using Data Envelopment Analysis we estimate technical efficiency of public spending on education for EU-28 using the latest available data. We also use a novel set of variables to highlight more appropriately the distinctiveness of the HE sector and the relationship between input and outputs. The advantage of using DEA is that it identifies the best performing DMUs and not the averages. In today’s competitive economies countries cannot afford to have average education systems. Technical efficiency estimates serve to inform education policy-makers about the effects of changes in the production of educational services on outputs, hence they can learn more about the consequences of different procedures and methods in education. Without such information they would solely rely on past practices and traditional approaches. As emphasised in Pausits and Pellert (2007), with the increasing size of HE the complexity of the system increases and HEIs are themselves becoming more performance oriented, and specifying goals and strategies to achieve them. Hence, examining the efficiency of an HE system is of great importance as a means of obtaining relevant information about the way HE functions.

The structure of his paper is as follows. In Section 1 we discuss conceptual and methodological issues related to the analysis and estimation of efficiency in the context of higher education. A brief overview of methods for estimating a production function for HE is presented and the advantages and disadvantages of various methods are highlighted. A brief overview of studies on efficiency in HE is also presented. In Section 3, we present our model and discuss the variables. Section 4 presents the results. Concluding remarks are in Section 5.

Measuring Efficiency In Higher Education: Theory And Practice

The higher education sector has important characteristics separating it from other levels of education. In HE there are multiple stakeholders, multiple objectives and multiple outputs (Dixit, 2002). Contemporary HEIs are diverse, have multiple inputs and carry out a number of activities sometimes extending further than the customary teaching and research work (Cohn and Cooper, 2004). Furthermore, most educational outcomes are not sold at market prices, thus making it difficult to attach a market value to these outcomes. These distinguishing features of HE need to be taken into consideration when estimating the production function and measuring its efficiency. An overview of literature on the efficiency of various levels of education can be found in Johnes et al (2017).

The term production function can simply be defined as producing the maximum output feasible with given inputs. In a mathematical form a production function illustrates how a DMU generates a vector of outputs using a flow of inputs and some available technology. When estimating efficiency in HE, several distinctive techniques have developed in the literature. We will briefly discuss their main features and introduce an approach that will be followed in this paper. Three most widely used approaches in efficiency estimation are the statistical, econometric approach that mostly uses regression analysis, the Stochastic Frontier Estimation and the DEA.

A statistical approach is often parametric and assesses how DMUs produce educational outcomes similar to firms producing outputs. Economic principles from the neoclassical theory of the firm (Baumol et al 1982) are applied to model educational production. This method provides estimates of parameters whose significance can be tested.

However, there are problems with model misspecification and, more importantly, this approach cannot handle multiple inputs and outputs. That is a serious shortcoming when estimating HE efficiency.

The Stochastic Frontier Analysis was pioneered by Aigner et al (1977). Here a functional form is established between the set of explanatory variables and the dependent variable. The analysis provides parametric estimates of efficiency. The main difference between SFA and the traditional parametric regression is that the error term in SFA is composed of two parts: a normally distributed error term, and a second term capturing the remaining error (i.e. technical inefficiency). Given the presence of normally distributed error terms, the tools of statistical inference can be employed which is seen as an advantage of this approach. However, a particular distributional form for the error terms needs to be imposed by the researcher that gives rise to misspecifications in the efficiency measure. Additionally, SFA uses data on costs and prices which according to which may introduce additional measurement errors (Worthington, 2001). Finally, SFA is not easily extended for multiple input and output settings.

The third approach in estimating efficiency is the DEA. It was originally developed for efficiency evaluation of 'not-for-profit entities participating in public programs' where prices are not clearly observed (Charnes et al., 1978). It is a non-parametric method which assigns a set of weights to selected outputs and inputs. Efficiency estimates are then obtained as the maximum of a ratio of weighted outputs to weighted inputs, subject to certain restrictions such as monotonicity and convexity. This approach amounts to constructing an efficiency frontier over the data so that the actual input/output quantities are either on or in the interior of this frontier. The efficiency frontier defines the maximum combinations of outputs that can be produced by a given set of inputs. DEA assigns a score of 1 to a DMU which lies on the frontier. That unit in comparison with other units shows no evidence of inefficiency. An efficiency score less than 1 implies that a linear combination of other units from the sample could produce the same output using less inputs. However, the method does have some downsides. Being a nonparametric technique, statistical inference cannot be used to examine the possible bias resulting from measurement error or omitted variables. Furthermore, DEA only estimates relative efficiency scores but cannot offer insights on the performance of DMUs in comparison to the global best-practice. Some of the advantages of DEA is that it can handle multiple inputs and multiple outputs, it requires no assumptions on the functional form relating inputs to outputs and the DMUs are directly compared to one another. All of this makes it an appealing choice for measuring the efficiency in HE. Comparing these three different approaches, DEA stands out as a valuable tool in measuring efficiency in an HE setting as can be noted from the following research on efficiency in HE.

Relevant research

Existing studies on efficiency in HE have focused mostly on specific countries and their HEIs as the main DMUs (some of the exceptions are Johnes 2006a, Barra and Zotti 2016, and Thanassoulis et al. 2017). The UK has a particularly long tradition in the efficiency analysis of HE (see, among other studies, Glass et al. (1995), Athanassopoulos and Shale (1997), Sarrico et al. (1997), Sarrico and Dyson (2000), Johnes (2006b,c). Most of these studies have shown the efficiency of the UK's HEIs to be quite high. Australian HE system and its universities have also been widely examined (see in Abbott and Doucouliagos, 2003; Worthington and Lee, 2008). Studies on efficiency in HE can also be found for Italy (Agasisti and Dal Bianco, 2006, Abramo et al. 2008), Germany (Kempkes and Pohl, 2010) and more recently for Greece (in Thanassoulis et al, 2017).

Only a small number of studies analyses HE efficiency for several European countries. Some of the examples are Joumady and Ris (2005) for 209 HEIs in eight European countries, Bonaccorsi et al (2007) for six European countries (Italy, Spain, Portugal, Norway, Switzerland, and the UK), Agasisti and Johnes (2009) for Italy and England, Agasisti (2011) for 18 countries, and finally, Wolszczak-Derlacz and Parteka (2011) for seven European countries (Austria, Finland, Germany, Italy, Poland, Switzerland and the UK).

All of the above studies focus on country specific data or use a small sample of DMUs in cross-country comparisons. This is understandable given the problem of obtaining micro data on HE that can then be used for country comparison. The DMUs are mostly universities or HE staff and not the whole country. The exception is the study by Agasisti (2011) who used countries as DMUs enabling an assessment of the overall performance of the HE system and their cross country comparison. Some of the variables used in that research are the total resources for HEIs as a percentage of GDP – this is the input variable. And for the outputs, the author planned to use employment rates for the population aged 25-64 and tertiary graduation rates which were later dropped from the model due to missing data. The variables for DEA are for a selection of European countries in the period from 2000-2003. A similar approach will be followed here. To the best of our knowledge this will be the first study to examine the efficiency of public spending on HE for all 28 countries of the European Union using the most recent variables.

The next section therefore presents an application of DEA in measuring the efficiency of public spending on HE and attempts to address some of its downsides.

Dea Model

This research will use DEA in measuring the efficiency of public spending on education. It identifies optimally performing DMUs and assigns them a score of one (or 100). These DMUs will serve us to identify an efficiency frontier against which all other DMUs are compared. A fundamental step in DEA is the selection of appropriate inputs and outputs (Thanassoulis, 2001). These variables need to satisfy the condition of exclusivity and exhaustiveness i.e. the inputs and they alone must influence the output levels, and only of the outputs used in estimation. Furthermore, to have adequate discriminatory power for the DEA model, the number of DMUs should exceed the number of inputs and outputs by more than a few times (Cooper et al., 2007). The DMU's used in this research are the 28 countries of the European Union.

The efficiency frontier in DEA will differ depending on the scale assumptions of the model. Two scale assumptions are commonly used in DEA: constant returns to scale (CRS), and variable returns to scale (VRS). Variable returns to scale assumption allows the production technology to exhibit increasing, decreasing and constant returns to scale. Given the nature of HE, i.e. that outputs will not change by the same proportion as inputs, VRS is better suited to examining the efficiency. Furthermore, we use an output orientation approach which is also common when examining efficiency in education. The output orientation is a logical choice given the nature of higher education financing. The objective is to maximise the output production while not exceeding the actual input level.

We use one input and two outputs related to country's higher education system (Table 1).

The input used is the public expenditures on tertiary education as a percentage of GDP. This serves as a proxy for all inputs in public HE and allows easier cross-country comparisons as discussed in the research by Afonso and St Aubyn (2005, 2006). This indicator is available for all countries in the sample. However, countries may still have a different education production technology that is not best expressed through the use of public expenditures. However, given to data limitations on the more precise indicators of education production in each country we opted to use this indicator as an input and focusing on EU-28 we have a collection of countries with similar policy objectives in HE.

The two outputs are the share of graduates in HE per 1000 inhabitants and the employment rates of people aged 20-34 with completed tertiary education. In comparison to the work by Agasisti (2011) this is a valuable improvement in data availability. The output variable on employment rates is available for population aged 20-34, which gives a better indication of the short-term effects of HE. These two indicators serve as a proxy for the quality of HE delivered and capture, to some, extent, private returns to HE.

Table 1: Variable names and definitions

Variable	Category	Description	Year
Public expenditures (%GDP)*	Input	Public expenditures on tertiary education as a percentage of GDP	2012
Graduates in HE (per 1000 of population)	Output	Graduates in tertiary education per 1000 of population	2015
Employment rates (%)	Output	Employment rates of young people not in education and training with completed tertiary education level one to three years beforehand aged 20 to 34	2016

The data used in this research is from one source, Eurostat. For the two outputs we use the latest data available which was updated in May and June, 2017. This allows us to present a fresh perspective on the efficiency of European HE. For the share of graduates the latest data available was for the year 2015, and for employment rates the data is for 2016.

For the input variable, public expenditures, we decided to use the data for 2012, although the most recent data is for the year 2014. Our motivation is the following. Public expenditures being spent on HE (including students) in one year are assumed to have a full effect when that cohort of students graduates or looks for employment several years after. Here we are trying to follow, as much we can, the same cohort of student as they progress through

their studies towards graduation and employment. In all EU countries in 2015, more students were studying for Bachelor's degrees than any other level of tertiary education (Eurostat, 2017). We use the term cohort loosely; we actually follow the whole HE system being funded in one year and its outputs several years later. This approach is drawing some of its insight from the window analysis technique in DEA pioneered by Charnes et al. (1997) which measures efficiency changes over time. Given the characteristics of our variables that change very slowly over time we used the above mentioned approach. This allows a stronger functional link to be established in our model between the input and the outputs.

Results

The model was estimated using the Performance Improvement Management Software (PIMDEA) developed by A. Emrouznejad and E. Thanassoulis. The results are discussed in the next section. First we present summary statistics for our variables in Table 2.

Table 2: Summary statistics

	Mean	Sum	St.dev.	Variance	Min	Max	Range
Public expenditures (%GDP)	1.26	35.22	0.44	0.2	0.45	2.25	1.8
Graduates in HE (per 1000 pop)	72.5	2030	19.22	369.4	27.4	126.8	99.4
Employment rates (%)	82.62	2313.3	9.39	88.18	55	97	42

The highest share of public expenditures on HE was recorded in Denmark (2.5% GDP), followed closely by Finland (2.13%) and Sweden (2.01%). These are the only counties with public expenditures on HE over 2% of GDP. The lowest public expenditures are in Luxembourg (0.45%) and a fairly better situation is in Bulgaria (0.66%), Romania (0.78%), Hungary (0.82%), Italy (0.83%) and Portugal (0.85%). The latter group is formed of countries with public expenditures less than 1% of GDP. The average public expenditures on HE in the EU in 2012 are 1.26%.

The greatest number of graduates from tertiary education per 1000 of population is in Ireland (126.8), followed by Denmark (102.9), France (96.5) and Poland (96). However, if we only use the data on the number of graduates from tertiary education, Ireland and Denmark are not the leading countries. The greatest population of tertiary graduates is in France (752,068 graduates), the UK (740,276) and Poland (516,675). The smallest number of graduates per 1000 inhabitants is in Luxembourg.

The employment rates for recent graduates are calculated for the age group 20–34 and concerns those who had successfully completed their highest level of education one to three years beforehand. The minimal employment rate is in Greece (55%) and the highest in Malta (97%), followed by the Netherlands (94.2) and Germany (93.1). We proceed to the results of our DEA model.

Table 3: DEA results

Country	Technical efficiency
Austria	95.62
Belgium	93.78
Bulgaria	100
Croatia	85.3
Cyprus	82.53
Czech Republic	95.72
Denmark	96.03
Estonia	82.9
Finland	87.46
France	87.51
Germany	90.14

Greece	59.5
Hungary	100
Ireland	100
Italy	73.39
Latvia	96.78
Lithuania	97.37
Luxembourg	100
Malta	100
Netherlands	98.24
Poland	98.17
Portugal	89.35
Romania	90.37
Slovakia	93.89
Slovenia	88.27
Spain	87.42
Sweden	94.23
United Kingdom	94.61

The average technical efficiency of public expenditures on HE for EU-28 is 91.4%.

Five countries stand out as 100% efficient. These are Bulgaria, Hungary, Ireland, Luxembourg and Malta. We might argue that Luxemburg and Malta stand out as efficient because of their size and that perhaps they should be dropped from the analysis. We decided not to remove them from our sample to report a complete picture of efficiency in public spending for EU-28. The Netherlands, Poland, Latvia, Lithuania and Denmark are close to the efficiency frontier with an efficiency score over 96.

The least efficient country is Greece (59.5). Given the recent economic crisis in Greece this inefficiency in public spending was an expected result. As previously mentioned in an output-oriented model, an inefficient unit is made efficient through an increase in its outputs, while the input proportions remain the same. For Greece this would imply an increase in the share of graduates and an improvement in the employment rates.

These results of DEA provided a form of ranking for countries, from best to worst. This ranking is easier for inefficient countries. However, the countries on the efficiency frontier all have the same efficiency score equal to 1 (or 100) and it is difficult to establish which countries stand out as best examples.

We also decided to include in our results the benchmarks for each of the individual countries. These are the countries that can potentially serve as role models for inefficient countries. These results are in Table 4.

Table 4: Benchmarks

Name	Bulgaria	Hungary	Ireland	Luxembourg	Malta
(Frequencies)	5	12	22	7	18
Austria	0	0	1	0	1
Belgium	0	0	1	0	1
Bulgaria	1	0	0	0	0
Croatia	1	0	1	1	0
Cyprus	0	1	1	0	1
Czech Republic	0	1	1	0	1
Denmark	0	0	1	0	1

Estonia	0	1	1	0	1
Finland	0	0	1	0	1
France	0	1	1	0	1
Germany	0	1	0	1	1
Greece	0	0	1	0	1
Hungary	0	1	0	0	0
Ireland	0	0	1	0	0
Italy	1	0	1	1	0
Latvia	0	1	1	0	1
Lithuania	0	1	1	0	1
Luxembourg	0	0	0	1	0
Malta	0	0	0	0	1
Netherlands	0	0	1	0	1
Poland	0	1	1	0	1
Portugal	1	0	1	1	0
Romania	0	1	1	1	0
Slovakia	0	1	1	1	0
Slovenia	0	1	1	0	1
Spain	1	0	1	0	0
Sweden	0	0	0	0	1
United Kingdom	0	0	1	0	1

The efficient countries are in the first row and all of the other countries are compared to them. Efficient countries are their own “benchmarks” while inefficient countries have several benchmarks. For example, Romania has Hungary, Ireland and Luxembourg as benchmarks, while Austria has Ireland and Malta as best practice examples or peers. This means, to become efficient Austria must use a combination from both Ireland and Malta. Those two countries have the highest frequencies in the table as they are peers to 22 and 18 countries respectively (including themselves).

The next issue is how to calculate what combination of efficient peers must an inefficient country use to become efficient. So for Austria the question would be, should it attempt to ‘become more’ like Ireland or more like Malta. The answer is in the λ (lambda) weights. For example, Austria should look up more to Malta ($\lambda=0.77$) than to Ireland ($\lambda=0.23$). These results uncover interesting relationships between countries that would merit a more detailed analysis. That is, however, out of scope for this paper, hence these results can be obtained from the authors.

We now focus on the estimation of efficient targets for our input and outputs. In Table 6 target input and output levels are prescribed for each country. These targets would allow countries to gain full efficiency. A detailed formulation for the calculation of these target values can be found in Thanassoulis and Dyson (1992). However, we should caution that some of these target values and improvement options may not be practical for policy makers in HE. We present them here to offer more insight into the efficiency of public spending on HE and as a source for potential future research in the area.

Table 5: Efficient targets for input and outputs

	Input			Output			Output		
	Public spending			Graduates in HE			Employment rates		
	Value	Target	Gain(%)	Value	Target	Gain(%)	Value	Target	Gain(%)
Austria	1.88	1.46	-22.4	75.6	79.06	4.58	90.5	94.64	4.58
Belgium	1.48	1.44	-2.51	79.3	84.56	6.63	87.9	93.73	6.63
Bulgaria	0.66	0.66	0	70.3	70.3	0	78.5	78.5	0

Croatia	0.93	0.93	0	70.4	82.54	17.24	74.7	87.58	17.24
Cyprus	1.17	1.17	0	57.6	69.79	21.17	76.4	92.57	21.17
Czech Republic	1.05	1.05	0	74.3	77.62	4.47	86.3	90.16	4.47
Denmark	2.25	1.38	-38.79	102.9	107.15	4.13	86.4	89.97	4.13
Estonia	1.06	1.06	0	59.4	71.65	20.62	75.5	91.07	20.62
Finland	2.13	1.41	-33.74	83.4	95.36	14.34	80.4	91.93	14.34
France	1.27	1.27	0	96.5	110.27	14.27	77.3	88.33	14.27
Germany	1.37	1.37	0	55.9	62.02	10.94	86.4	95.85	10.94
Greece	1.48	1.42	-4.03	54.9	92.28	68.08	55	92.44	68.08
Hungary	0.82	0.82	0	55.3	55.3	0	90.5	90.5	0
Ireland	1.32	1.32	0	126.8	126.8	0	86.7	86.7	0
Italy	0.83	0.83	0	58.2	79.31	36.26	61.3	83.53	36.26
Latvia	1.01	1.01	0	63.2	65.3	3.33	88.4	91.34	3.33
Lithuania	1.4	1.4	0	80	82.16	2.7	91.1	93.56	2.7
Luxembourg	0.45	0.45	0	27.4	27.4	0	89	89	0
Malta	1.5	1.5	0	64.9	64.9	0	97	97	0
Netherlands	1.7	1.48	-12.9	70.3	71.56	1.8	94.2	95.89	1.8
Poland	1.15	1.15	0	96	97.79	1.86	87	88.62	1.86
Portugal	0.85	0.85	0	66.8	74.76	11.92	77.8	87.07	11.92
Romania	0.78	0.78	0	52.7	58.31	10.65	80.7	89.3	10.65
Slovakia	0.95	0.95	0	78.3	83.4	6.51	82.5	87.87	6.51
Slovenia	1.23	1.23	0	77.5	87.8	13.29	80.2	90.86	13.29
Spain	1.02	1.02	0	88.4	101.12	14.39	72.3	82.97	14.76
Sweden	2.01	1.5	-25.37	59	64.9	10	91.4	97	6.13
United Kingdom	1.47	1.43	-2.83	84.7	89.52	5.69	87.9	92.9	5.69

In a VRS, output-oriented model the objective is to maximize the output production (tertiary graduates and employment rates) while not exceeding the actual input level (public spending). DEA calculates for each country the amount and category that needs to change in order for country to reach efficiency frontier. For inefficient countries an increase in outputs is suggested. In some cases, a decrease in public spending is also an option. All the efficient countries have the same targets and values for input and outputs, and gain equal to zero. Countries that were far from the efficiency frontier (Greece, Italy, Cyprus, Estonia, Croatia) have to make substantial changes in their outputs in order to become efficient. For example, Greece will need to increase graduates and employment rates by 68 percentage points and Italy by 36 percentage points. Countries which were close to the frontier (e.g. Netherlands, Poland, Lithuania, Latvia) have a smaller magnitude of changes suggested. Only 1.9 percentage point increase in outputs is suggested for Poland, and a 2.7 percentage points increase in outputs for Lithuania.

With target values for outputs, a decrease in public spending is suggested for eight countries (Austria, Belgium, Denmark, Finland, Greece, Netherlands, Sweden and the UK). An interesting example is Denmark; with a cut in public spending of almost 40 percent and an increase of 4 percentage points in employment rates and share of graduates, it can achieve full efficiency. Bearing in mind the limitations of DEA, in the time of economic crisis this might present an interesting issue for further investigation.

Conclusion

This paper presented new information on the efficiency of public spending in EU-28 in the recent years. It also adds to the literature on efficiency in HE; a level that has been underrepresented in efficiency evaluations. The goal of this paper was to connect the additional information generated in this research with the general discussion by European policy makers. With more information on performance and efficiency, policymakers can be in a better position to develop effective HE strategies. Nevertheless, the key responsibility for generating reforms in HE lies with individual Member States.

Using DEA and the latest data available, this research managed to compare 28 European countries. We identified the most efficient countries and also countries for which real efficiency improvements were possible. Benchmark countries and target values were also presented and discussed.

Results in this research need to be interpreted with caution. Although great care was taken in the selection of variables, and current literature was consulted, measuring the efficiency of public spending on HE is still a challenging undertaking. From the overview of the research in this area there is still a lot of room for improvement. There are often data limitations preventing researchers from making functional cross-country comparisons. There are also well-documented limitations of methods being used to calculate efficiency i.e. DEA is good at estimating relative efficiency of DMUs, but it converges slowly to absolute efficiency, it is also very sensitive to changes in the data, and the hypotheses testing is still not available.

Efficiency analysis is valuable in informing policy makers and providing a better understanding of the education system. As Monk (1992) argues, the production function can be viewed as a model which connects conceptually and mathematically outcomes, inputs, and the processes that transform the latter into the former in educational institutions, thus, production functions can be important as a means of identifying ways of improving both technical and allocative efficiencies.

Although there are severe problems in estimating efficiency in an HE system, it remains important to develop reliable estimates, especially considering the emphasis currently given to issues of accountability, value-for-money and cost effectiveness. European HE system needs to contribute to Europe's prosperity Finding the most productive benchmarks and eliminating waste in resources dedicated to HE represents a good starting point. Research in this area is of great consequence because if inputs are used inefficiently they will fail to produce the maximum improvement in educational outcomes and may fail to promote economic growth effectively.

Eğitim Fakültesi Öğretim Elemanlarının Bilgi ve İletişim Teknolojilerinin Öğrenme Süreçlerinde Kullanımın Beklentileri

Hurşit Cem Salar
hursitcs@gmail.com

Özet

Bilgi ve iletişim teknolojilerindeki (BİT) gelişmeler hayatın diğer alanlarında olduğu gibi eğitsel süreçlerde de kendine geniş yer bulmaktadır. İçerik oluşturma, depolama ve öğrencilere sunum gibi birçok konuda BİT'den yararlanılabilmektedir. BİT'nin öğretmen adayları ve öğretmenler tarafından kullanımı, BİT'nin öğrenme öğretme süreçlerinde etkili olmasında en önemli faktörlerden biridir. Bu nedenle Türkiye'deki eğitim fakültelerinde öğretmen adaylarının BİT'nin gerek günlük hayatta gerekse öğrenme öğretme süreçlerinde kullanımının sağlanmasına dönük dersler yer almaktadır. 2018-2019 yılından itibaren geçerli olacak olan Öğretmen Yetiştirme Lisans Programlarında da ilgili derslerin yer aldığı görülmektedir. Ancak Eğitim fakültelerinde farklı bölümler ve farklı alanlar olduğu dikkate alındığında BİT'nin eğitim süreçlerinde genel kullanımına yönelik yaklaşımın yanında her bölüme özgü kullanım alanlarının ortaya konması da yararlı bir yaklaşım olabilir. Bu nedenle bu çalışmanın amacı eğitim fakültelerindeki öğretim elemanlarının kendi bölümlerine özgü olarak, kendi bölümlerindeki öğretmen adaylarının BİT'den nasıl ve ne düzeyde yararlanmaları gerektiğine dair görüşlerini ortaya koymaktır. Böylelikle elde edilen bulgulardan eğitim fakültelerinde bölümlerin her birine özgü BİT ders içeriği oluşturulmasında yararlanılabilir. Öğretmen adayları BİT'nin kendi alanlarında uygulamalarına dönük daha somut uygulama örnekleri görebilirler.

Yöntem

Araştırma betimsel bir nitel çalışmadır. Veriler yarı yapılandırılmış görüşme formuyla toplanmaktadır. Veri toplama aracındaki sorular Bilgisayar ve Öğretim Teknolojileri Eğitimi Bölümünden iki öğretim üyesi ve Ölçme Değerlendirme alanından bir öğretim üyesi tarafından görüş alınarak hazırlanmıştır. Daha sonra iki ön görüşme yapılmış ve soruların araştırma amacına uygun olduğu görülmüştür. Verilerin analizinde NVIVO kullanılarak analiz edilecek, temalar ve alt temalar belirlenecektir. Araştırma Pamukkale Üniversitesi Eğitim Fakültesi'ndeki bölümlerin her birinden bir öğretim elemanı ile gerçekleştirilmektedir. Çalışma Grubundaki katılımcılar amaçlı ölçüt örnekleme ile belirlenmiştir. Katılımcılar BİT kullanımında kendilerini iyi düzeyde algılayan öğretim elemanları arasından seçilmiş ve görüşmeler yapılmaktadır.

Eğitim Felsefesi Açısından Ahilik Teşkilatında Meslek ve Değerler Eğitimi

Ömer Faruk ERDEM
Necmettin Erbakan Üniversitesi

Özet

Kökleri 13.yy’a kadar giden Ahilik teşkilatı, Anadolu Selçuklu Devleti döneminde kurulmuş, Osmanlı devletinin kuruluş ve gelişmesinde önemli katkılara sahip olan, geleneklerine dair izlerin günümüze kadar görüldüğü, Türk örf ve adetlerinin İslam Ahlakı ile birleşmesiyle teşekkül eden, mesleki ve ahlaki sivil bir organizasyondur. Ahiliğin yüzyıllar içerisinde geliştirdiği ve sağlam bir zemine oturttuğu köklü sistemin meydana gelmesinde en önemli etkenlerden birisi, şüphesiz ki sahip oldukları eğitim felsefesidir. Doğudan batıya doğru uzun yıllar içerisinde yoğun bir şekilde devam eden Türk göçlerinden kaynaklanan ihtiyaçlar sebebiyle kurulan bu teşkilat, felsefi ve ahlaki doktrinlerini kendilerinden çok daha öncesine dayanan fütüvvet anlayışından alarak kendi bünyesine uygun hale getirmiş ve yerleştirmiştir. Eğitim felsefelerinin temel amacı olarak huzur ve barış ilkesini benimseyen bu teşkilat, amacın gerçekleşmesi için de en önemli unsurların meslek (sanat) ve değer (ahlak) eğitimi olduğunu düşünmüştür. Sanat eğitimiyle herkes bir meslek sahibi olacak, kendi rızkını kendi kazanabilecek ve ahlak eğitimiyle de kazandığı bu rızkı doğru şekilde harcayarak barış ve huzura katkı sağlayacaktır.

Ahilik teşkilatı, amaçladığı bu hedef doğrultusunda vermek istediği mesleki ve değerler eğitimine dair kendine has metotlar geliştirmiş ve bu metotları istikrarla uygulamıştır. Mesleğe başlamada yetenek ve eğilimleri göz önünde bulundurarak, iş başında görerek, tedrici bir metotla mesleki eğitimi veren bu teşkilat, aynı zamanda ahlak eğitimini de meslektaşları aracılığıyla bireye kazandırmaktaydı.

Bu çalışmamızda ahilik teşkilatının eğitim felsefesi, kullandığı metotlar, eğitim alanları, disiplin, başarı ve başarısızlık karşısındaki tutumları ve yüzyıllar boyu devam etmiş bir geleneğe sahip olan bu teşkilatın eğitim felsefesinin günümüzde uygulanma imkânı üzerinde durulacaktır.

Giriş

Ahilik teşkilatı denildiğinde bir felsefe ve teşkilatlanma modeli akla gelmelidir. Bu teşkilatlanma biçimi bir organizasyon birliğinin yanında köklü bir felsefi, ahlaki geleneğe de sahiptir. Bu teşkilatın fertleri “ahi” olarak isimlendirilmektedir. Teşkilat içerisinde kullanılan bu kelimenin kökenine dair iki rivayet nakledilmektedir. Bunlardan birincisi Arapça kardeşim anlamına gelen “أخي” kelimesinden geldiği rivayettir. İkincisi ise Divanu Lugati’t-Türk ve Atabetü’l Hakayık gibi kaynaklarda geçen eli açık, cömert anlamına gelen “أف” (akı) kelimesinden geldiği rivayettir. Her iki rivayetin de doğru olma imkânı bulunmakla birlikte. Arapça “kardeşim” anlamından geldiği rivayeti daha ağır basmaktadır. Nitekim ahilik anlayışının felsefe, ritüel ve kavramlarını daha ziyade Arap coğrafyasından aldığı söylenebilir. Peki, bu kavramlar Anadolu’ya neden Arap coğrafyasından intikal etmiştir?

Ahilik teşkilatının bir felsefesi olduğunu ve bir de organizasyon biçiminin bulunduğunu daha önce ifade etmiştik. Bu teşkilatın felsefi yapısı büyük ölçüde 13.Yy’da Abbasi Halifesi Nâsir-Lidînillâh (1180-1225) (Hartmann, 2006, s.399-402) tarafından merkezi bir otoriteye bağlanan fütüvvet teşkilatları tarafından oluşturulmuştur.(Şahin, 2006, s.299) Fütüvvet teşkilatı denilince de aklımıza gelmesi gereken daha ziyade tasavvufi bir nitelik taşıyan teşkilatlanma biçimleridir. Halife Nâsir tüm İslam ülkelerini fütüvvet teşkilatı altında toplanmaya davet etmiş ve devletlerin büyük çoğunluğu da bu davete icabet etmiştir. Daha önceleri dağınık durumda bulunan fütüvvet teşkilatı Halife’nin bu hamlesiyle merkezi bir otoriteye bağlanarak siyasi bir birlikteliğin de aracı olmuştur. Bu sürecin ardından Halife Nasır, fütüvvet anlayışını yaymak amacıyla Müslümanların yaşadığı topraklara fütüvvet anlayışını benimsetmek ve öğretmek için çeşitli temsilciler göndermiştir. O zamanlar Anadolu topraklarına bu anlayışı yaymak üzere gelen iki isim konumuz açısından önemlidir. Bunlardan birincisi “Ahi Evran” lakabıyla bilinen Şeyh Nasîrüddin Mahmûd (1171-1261)) (Şahin, 1988, s.529-530) diğeri ise Ahi Evran’ın hocası ve aynı zamanda da kayınpederi olan Evhadüddîn-i Kirmânî lakabıyla bilinen, Hâmid b. Ebi’l-Fahr el-Kirmânî’dir (ö.1238) (Azamat, 1995, s.518-520).

Ahiliğin bir tarikat mı? Bir esnaf teşkilatı mı? Bir anlayış mı? Olduğuna dair farklı tartışmalar bulunmakla birlikte tarikatlar gibi içe dönük bir yapısı olmaması, zikir, vird vb. özel dini ritüellerinin olmaması sebebiyle ve teşkilatın amacının bir dini topluluktan ziyade dinin buyruklarını hayatlarına aktararak mesleklerini, yaşam biçimlerini, sosyal yaşantılarını şekillendirmek olmasından ötürü bu yapıya, bir tarikat denilmesi zor görünmektedir. Yapılanma biçimi olarak şehirlerde mahalle ahiliği vb. yapılanmaların da var olduğu düşünüldüğünde ahiliğin bir düşünce yapısının teşkilatlanmış biçimi olduğu ve benzer düşünceleri paylaşan esnafların da bu felsefe etrafında oluşturduğu organizasyon biçimleri görülmektedir. Burada daha ziyade bizi

ilgilendiren taraf esnaf teşkilatlanmaları biçiminde ortaya çıkan ahilik ve bu teşkilatın meslek eğitiminde uyguladığı temel prensiplerdir.

Esnaf teşkilatı olarak ahilik, 1204 yılında Bağdat üzerinden Anadolu'ya gelen ve 1205 yılında hocası Evhaduddin-i Kirmâni ile birlikte Kayseri'ye yerleşerek orada bir debbağ atölyesi kuran Ahi Evran tarafından kurulmuştur. Ahilik teşkilatı Moğol istilalarıyla birlikte ciddi hasarlar almış olsa da Anadolu Selçuklu Devleti ve ardından da Osmanlı Devleti içerisinde sosyal, siyasi, askeri ve iktisadi anlamda önemli görevler üstlenmiştir. Uzun yıllar boyunca teşkilat yapısı ve düşünce biçimleriyle önemli roller üstlenen bu teşkilatın neredeyse yedi yüzyıllık bir tecrübesi ve geleneği bulunmaktadır. Bu gelenek ve tecrübe sadece teşkilat ve öğretilere dair olmayıp aynı zamanda eğitim alanında da kendini göstermiştir. Asırlar boyu süregelen mesleki eğitim ve değerler eğitimine dair bu tecrübeler bugün görmezden gelinemeyecek bir değere sahiptir. Fütüvvet anlayışının Anadolu'ya gelmesiyle birlikte bunun bir esnaf teşkilatı haline dönüşmesi Türk örf ve ananeleriyle İslam Dini'nin temel esaslarının bir araya getirildiği Anadolu'ya ait yerli bir teşkilat modelini meydana getirmiştir. Bu teşkilat modelinin eğitim anlayışı da yüzyıllar boyunca Anadolu insanının ruhuna hitap ederek, bünyesine uygun bir eğitim anlayışı olarak devam etmiştir. Yapılması gereken ise bu tecrübenin kullanılarak günümüzde uygulanabilirliğinin imkânlarını araştırmaktır.

Ahilik ve Eğitim:

Toplumun huzur ve refahının her bir bireyin bir meslek ve sanat sahibi olmasına bağlı olduğunu düşünen ahilik anlayışında eğitim önemli bir yer tutmaktadır. Toplumun neredeyse her kesimine farklı yerler ve farklı şekillerde eğitim imkânlarını ulaştırmaya çalışan ahiler, özelde de kendi mensuplarına mesleki, dini ve ahlaki bir eğitim vermekteydiler. Bu eğitimleri verirken de bazı metot ve uygulamaları takip etmekteydiler. Bunları maddeler halinde sıralamaya çalışırsak şunları söyleyebiliriz:

1. Kabiliyet ve yeteneklere göre eğitim
2. İş başında eğitim
3. Samimiyet ve otoriteye dayalı bir eğitim
4. Tedrici metoda dayalı bir eğitim
5. Ahlaki yaşama ve bizzat uygulamaya dayanan eğitim (Edt.Akdağ, 2016, s.170)

Kabiliyet ve yeteneklere göre eğitim: Ahilikte herhangi bir mesleğe aday olana öğrenmeyi talep eden kimse anlamında “talip” denilirdi. Talip olan kişinin durumu teşkilatça değerlendirmeye tabi tutulur ve uygun bulunursa eğitilmek üzere kabul edilirdi. Burada daha işin başlangıcında bu teşkilata veya mesleğe katılmanın ancak isteyerek olacağı “talip” sözcüğünden anlaşılmaktadır. Burada birey, bir eğitim sürecine zorunluluktan ziyade talep ederek girer. Mesleki derecelendirme açısından üç basamaklı bir derecelendirme bulunmaktadır bunlar; yamak ve çırak (ikisi bir derece sayılmakta), kalfa ve ustadır. Yamak olarak başlanılan bu mesleki eğitim sürecinde en fazla 10 yaşındaki bir çocuk velisi tarafından sanat ve meslek öğrenmek amacıyla ustaya yani öğreticiye talepte bulunur. Bir mesleğe başlatmadan önce bu genç bazı sınavlara tabi tutularak mesleki yönlendirmeye gidilir. Bu sınavda mesleğe aday olan kişinin kabiliyeti ve yetenekleri ölçülür, zekâ seviyesi ve hangi mesleklerle yatkın olduğu tespit edilerek adayın da isteği göz önünde bulundurularak yönlendirme ve kabul tamamlanır.

Mesleki eğitim açısından kabiliyet, yetenek, zekâ ve istek kriterleri gerçekten de önemlidir. Günümüz eğitiminde çoğu zaman öğrencilerin bireysel farklılıkları göz ardı edilebilmekte ve mesleklere yönelim üniversite dönemine kadar ötelenmektedir. Yönlendirmeler, meslek üzerindeki beceriden ziyade genel müfredatlarda verilen derslerden yapılan sınavların sonuçlarına göre belirlenmektedir. Öğretmen olacak bir bireyin çocuk sevgisi, hukuk okuyacak bir bireyin adalet duygusu, sağlık bilimleri okuyacak bir genç insanın insan sevgisi, veterinerlik okuyacak bir gencin hayvan sevgisi, mimar olacak bir bireyin ise tabiat sevgisi göz önünde bulundurulmadan itibar ve para getiren meslekler tercih konusu olmaktadır. Oysa ki her bir mesleğin kendi özel durumları, değerleri ve bireylerde bulunması gereken gereksinimleri vardır. Bu yatkınlıklar ve değerler ya doğuştan gelmeli ya da genç yaşta bireye kazandırılmalıdır. İlerleyen yaşlarda bunların kazandırılma imkânı çok zorlaşmaktadır.

Bireyin genç yaşlarda kabiliyet ve yeteneklere göre yönlendirilmesi durumu günümüz ve gelecek açısından ahilikten alınması gereken en önemli tecrübelerden birisidir. Geleceğin teknolojileri ve bilimleri diyebileceğimiz birçok mesleki bilgi gerektiren alanlar artık çocuk yaşlarda başlayan bir eğitimi gerektirmektedir. Örneğin dünyayı yönlendirecek güçte geleceğin en önemli araçları olarak gördüğümüz yazılım, mikroçip, yapay zekâ, hologram, sanal gerçeklik, genetik, insansı robot, güneş enerjisi, batarya ve drone teknolojileri konusunda dünyada söz sahibi olmak isteyen milletler bu teknolojilerle ilgilenecek nesillerini şimdiden daha çocuk yaşta mesleğe yönlendirmek durumundadırlar. Bu teknolojiler hakkında kritik ve analitik düşünce biçimlerinin en iyi geliştirilebileceği, arge ve yeniliklere en açık zihinler genç zihinlerdir. Bu anlamda geleceğe dair kurgularımız hala üniversiteye gidene kadar tek bir satır yazılım ortaya koymamış bir gencin mezun olduktan sonra yazılım üreteceğini ummak üzerine kurulduğu takdirde, gelişen dünyada geri kalmamız kaçınılmaz olacaktır.

İş başında eğitim: Ahiliğin meslek eğitiminde önemli olan hususlardan birisi de eğitimin iş başında verilmesidir. Usta yani eğitmen çırağa yani öğrenciye bilgi ve beceriyi iş başında kazandırmaktadır. Burada teorik eğitimden ziyade pratik bir eğitim anlayışının hâkim olduğu görülmektedir. Günümüz genel eğitim ve mesleki eğitim

anlayışlarının en büyük eksikliklerinde birisi de verilen bilgilerin teorik bir tarzda öğrenciye sunulması ve bu teorik bilgilerin sınavlarda yine teorik olarak ölçülmesinden kaynaklanmaktadır. Herhangi bir uzmanlık alanına sahip olan fertlerimizin büyük bir çoğunluğu mesleğine dair uygulamaya yönelik bilgileri gençlik dönemlerinin sonuna doğru ancak almaya başlamaktadır. Bu da teoride kalan bilgilerin pratik kabiliyetlere dönüşmesi açısından önemli bir gecikme olarak görülebilir. Bu anlamda pratiğe dayalı mesleki eğitimlerin, bireyin temel öğretim seviyesi olarak kabul edebileceğimiz ilkökul seviyesinden itibaren başlaması gerektiğini bize göstermektedir. Bu eğitim süreci elbette ki rastgele bir düzene bırakılamayacak kadar hassas bir süreçtir. Geleceğe dair mesleki planlar ideolojik bakış açılarından arındırılarak stratejik bir anlayışla programlanmalı ve özellikle bu stratejik mesleklerle dair yönlendirmeler öğrenci kabiliyet ve isteklerine göre ülke nüfusu da dikkate alınarak belirli oranlarda belirlenmelidir. Örneklendirmek gerekirse yazılım dünyasına dair yetiştirilmesi gereken öğrenci sayısı nüfusa oranla belirlenip bu süreç içerisinde çeşitli nedenlerle süreçten ayrılacak bireyler de hesaplanarak bir sayı elde edilebilir. Elde edilmek istenen sayı tam tutmasa bile bu plan içerisinde geleceğe dair asgari ihtiyaç bu şekilde yaklaşık bir oranda nitelikli bireylerle karşılanabilir.

Mevcut durumda yazılıma dair gelecek planlarımız; öğrencilerin örgün ve yaygın kurumlarda çok farklı alanlarda teorik bilgilerle doldurulması ve bilgilerin üniversite sınavı içerisinde ölçülerek üniversite sonrasında mesleğe atılması biçimindedir. Bazı derslerle ilgili yeteneği düşük olsa bile belki de yazılım konusunda bir deha olabilecek bireyler bu seçilme sürecinde geri plana düşerek yetenekli olduğu alandan tamamen uzak kalabilmektedirler. Özellikle deha sayılabilecek kişilerin düzenli eğitim sistemleri içerisinde yaşadığı sorunlar bilim tarihinde çok sayıda örneklerle doludur. Bu kişilerin kaybedilmesi nicelik açısından görmezden gelinebilecek oranlarda olsa bile niteliksel açıdan gözden kaçırılmayacak kadar önem arz etmektedir. Örnek vermek gerekirse Whatsapp, Facebook, Twitter, Google, Youtube vb. gibi sadece birkaç kişinin bireysel yetenekleriyle kurulmuş yazılım firmaları tek başlarına, küçük boyutta ülkelerin tüm şirketlerinin, orta büyüklükte ülkelerin ise asırlarca emek verdikleri ve binlerce çalışanı olan şirketlerinin büyük çoğunluğunun toplam değerine yakın değerlere sahip olabilmişlerdir. Tüm bunların gerçekleşebilmesi ve daha ileriye gidilebilmesi için, henüz hayal dünyası çok geniş olan, yorulmak bilmeyen, istekleri karşısında azim sahibi olabilen genç zihinlerin sahip oldukları bu yeteneklerini pratik alanda değerlendirebilmesine bağlıdır.

Ahilik içerisinde pratik eğitime dair uygulamaların sadece iş yerinde değil hayatın her alanında devam etmesi de bir başka eğitim anlayışı olarak karşımıza çıkmaktadır. Örneğin sosyalleşme fonksiyonu da olan ahi zaviyelerinde yapılan eğlencelerde bile oynanan oyunlar bir eğitim anlayışı için kullanılmıştır. Zaviyelerde tekerleme ve yüzük oyunu gibi oyunları oynarlarken, tekerleme oyununda dili iyi kullanmayı, yüzük oyunu oynarken de dikkati, disiplinli olmayı, kurallara uymayı öğretmeyi amaçlamışlardır (Edt.Akdağ, 2016, s.198).

Samimiyet ve otoriteye dayalı bir eğitim: Ahilik içerisinde öğretici konumunda bulunan usta ve öğrenci konumunda bulunan çırak arasındaki ilişki, işçi işveren ilişkisi gibi olmayıp baba-oğul ilişkisi biçiminde görülmektedir. Genç talibin ailesi çocuklarının herhangi bir şekilde istismara uğramayacağı güveni içerisinde çocuklarını ustalara emanet etmekte ve “eti senin kemiği benim” demektedirler. Günümüz açısından güven azalmasına dair birçok olumsuz örnekle karşılaşmış olsa da bu eğitim anlayışından günümüze dair örnekler çıkarmamız mümkündür. Talibin velisi “eti senin kemiği benim” diyerek bir anlamda babalık vazifesinin bir kısmını devretmektedir. Bu aynı zamanda baba otoritesinin ve güveninin de devredilmesi olarak görülebilir. Otorite, güven, emanet gibi kavramlar eğitim anlayışı açısından hayati kavramlar olarak karşımıza çıkmakta ve bunların bir denge içerisinde kurulması gerekmektedir.

Genel eğitimde olsun, mesleki eğitimde olsun tüm sorumluluğun öğretici kişi ve kurumlara yüklendiği bir anlayış hedeflenen amaçlara ulaşmada yeterli olamayacaktır. Elbette ki öğreticinin sorumlulukları ve görevi büyük oranda mevcuttur. Ancak öğreticinin kaydedilmiş bir diski okuyan teyp gibi yetkisiz ve otoritesiz olması halinde bu görevlerini yerine getirebilmesi gerçeklikle uyuşmayacaktır. Burada kastettiğimiz fiziksel veya psikolojik şiddetin herhangi bir türü değildir. Ancak ailelerin sorumluluk olarak öğrencilere yardımcı olması ve hoşlarına gitmeyen her durumu şikâyet konusu haline getirmemeleri bir başlangıç olarak düşünülebilir. Örneğin ahilik eğitiminde talibin işe gidip gelmesi velinin sorumluluğuna bırakılmıştır. Ahilerde görülen kısmi velayet aktarımı öğrencinin bir evlat olduğu düşüncesinin de benimsendiğini göstermektedir. Öğretici bir eğitim aracı, öğrenci bir müşteri değildir. Nasıl ki aileler çocuklarının olumsuz davranışları karşısında her zaman ödüllendirmeyi bir motivasyon aracı olarak kullanmıyor, zaman zaman farklı şekillerde otoritelerini kullanıyorlarsa, öğrenciler için de benzer durumlar söz konusu olabilmektedir. Öğrenme ortamında her bir gencin kendi hak, duygu ve hassasiyeti olduğu gibi görev ve sorumlulukları da bulunmaktadır. Bu sorumluluklarını yerine getirebilmeleri ve diğer öğrencilerin de haklarına riayet edebilmeleri için velilerin sorumluluk alması, öğrencilerin de yetki ve otoritelerinin bulunması gerekmektedir.

Tedrici metoda dayalı bir eğitim: Ahilik öğretim sürecinde kazandırılmak istenen bilgi ve beceriler belirli bir sıraya konulmuş ve kazandırılmak istenen bu bilgi ve beceriler tedrici bir şekilde, belirli zaman dilimi içerisinde öğrenciye kazandırılmaya çalışılmaktadır. Bu anlayış içerisinde bilgi bir bütün olarak kabul edilir ve aşamalar öğrenme gerçekleşene kadar takip edilir. Yani bir beceri kazandırılmadan önceki bilginin aktarımına geçilmez. Böyle bir metodun uygulanabilirliği elbette ki pratik bir öğrenme süreci içerisinde takip edilebilir bir durum olmasından dolayı mümkündür. Teorik öğretimin verildiği günümüz örgün kurumlarında bu işlem ciddi bir

ölçme ve değerlendirme süreciyle ancak mümkün olabilir. Bu anlamda ölçme ve değerlendirme süreci işin önemli bir tarafı iken bundan önce yapılması gereken işler de bulunmaktadır. Öğrenme sürecinde çok hızlı öğrenebilen, bazı yetenekleri ön planda olan öğrenciler olabildiği gibi daha zor öğrenen ve geri kalan öğrenciler de olabilmektedir. Tüm öğrencilerin algı ve dikkat düzeyinin aynı seviyede olduğu varsayımıyla oluşturulan sınıflarda öğretici kimin öğrenip kimin öğrenemediğini tespit etmekte zorlanabilmektedir. Tespit edebilseler de geri kalan öğrencilere göre seviyeyi ayarladıklarında hızlı öğrenen öğrencilerin dikkatini toplamakta zorlanmaktadır. Hızlı öğrenen öğrencilere göre hareket ettiklerinde ise yavaş öğrenen öğrenciler zamanla bilgileri kayırarak öğrenme sürecinden kopmaktadırlar.

Günümüzde uygun sınıf ortamları dışında müfredat içerikleri de tam öğrenmenin gerçekleşmesi önünde bir problem olarak durmaktadır. Her ne kadar iyi niyetle de olsa günümüz müfredatları daha çok şey öğretmek amacıyla yoğun biçimlerde hazırlanmaktadır. Dikkat etmemiz gereken ise çok ama hemen unutulacak bilgiler yerine tam öğretilebilecek az ama önemli bilgileri vermeye çalışmak olmalıdır. Bu anlamda öğrencilerin öğrenim süreçlerinin daha kolay kontrol edildiği ve bir öğrenme durumu gerçekleşmeden bir sonraki aşamaya geçilmemesi gereken müfredat ve sınıf ayarlamaları bu konuda yardımcı olabilecek hususlar olarak görülebilir. Yine bu durumların ölçülebilmesi için gerekli olan ölçme ve değerlendirme süreçleri bir popülizme gitmeden değerlendirilmelidir. Çoğu zaman öğrenciler not verirken “sanki cebinden mi veriyorsun” veya “garipleri sevindirirsen ölür müsün” şeklinde eleştirilere konu olabilmektedirler. Gerçekten de öğrenciler ceplerinden bir şey vermemektedirler. Ancak her öğrenciye sürekli yüksek notlar verilmesi hem öğretilmek istenen becerilerin kazanılamaması hem de bu süreçteki eksikliklerin tespitinin imkânsızlaşması durumunu ortaya çıkaracaktır. Bununla birlikte başarılı olmadığı halde başarılı olmuş muamelesi gören genç, eğitim süreci boyunca böyle muamele görmüş olması sebebiyle bu süreçten çıktıktan sonra karşılaşacağı hayat karşısında ne yapacağını bilemeyecek, kendisine haksızlık edildiğine inanarak liyakate dair bir düşünceye sahip olamayacaktır. Mesleki ve genel öğretimde başarı herkese takdir belgelerinin düzenlenmesinden ziyade, herkesin takdir edileceği bir seviyeye yükseltilmesiyle mümkün olacaktır. Popülizm hem öğretici hem de öğrenci açısından kolaycılık olmakla birlikte toplum açısından eğitim anlamında bir ilerleyişe imkân vermeyecektir.

Ahlaki yaşama ve bizzat uygulamaya dayanan eğitim: Ahilikte eğitime dair en önemli unsurlardan bir tanesi de sadece bir meslek eğitimine dair bilgilerin verilmesiyle yetinmemeleridir. Tüm sistemlerinin oluşumunun arkasında yatan temel etken olan dinlerinden almış oldukları ahlaki değerleri hayatlarına geçirmeye gayret etmişlerdir (Kaya, 2013, s.43). Ustalar çıraqlara mesleklerine dair tüm bilgileri aktarırken aynı zamanda ahlaki değerleri de kendi yaşantılarında göstererek aktarmaya çalışmışlardır. Burada sadece kitapların içinde verilen bilgilerin kuru aktarımından değil hayatın içinde bizzat yaşatarak aktarmaktan bahsetmekteyiz. İslam inancına samimiyetle bağlı olan ahiler, namaz vakitlerine riayet ederek iş hayatlarını ve zaman yönetimlerini de buna göre ayarlamışlardır. Bunun yanında dinlerinin buyurduğu dürüst olma, üretim merkezli olma, komşularının haklarına riayet etme, yardımlaşma konularında da hassas davranmışlar ve bunu çıraqlarına da öğretmişlerdir. Bunları kazandırırken de aşama aşama ve uygulamalı bir metodu benimsemişlerdir. Örneğin çıraklık aşamasında bir ahinin 124 görgü kuralını öğrenmesi gerektiği ifade edilmekte, bu görgü kuralları her aşamada daha da artmaktadır. Ahilerin sosyal hayat içerisindeki görgü kuralları fütüvvetnamelerde detaylı olarak anlatılmaktadır. Buradan anlamaktayız ki ahilik değer anlamında topluma rahatsızlık vermeyecek, örnek birer insan olmayı amaçlamakta ve tüm bireylerine bunları aşama aşama kazandırmayı hedef edinmektedir. Ahiler, yemek yeme, su içme, söz söyleme, elbise giyme, eve girme, evden çıkma, yürüme, mahallede, alışverişte, bir şey getirmedi, misafirlikte, hasta ziyaretinde dikkat edilmesi gereken hususlar gibi birçok detaylı görgü kuralı ve adabı hayatlarına geçirmeye çalışmışlardır (MEB, 2016, s.34). Günümüz eğitim sürecinde ise bu başlıklara dair maalesef pek bir değer aktarımında bulunamadığımızı üzülmeye ifade edebiliriz. Bu hususlar daha ziyade ailelere bırakılmış ve okul hayatında birer yarışmacı gibi yetiştirilen öğrencilerin bu hususları öğrenmeye vakti kalmamıştır. Oysa ki tüm bu adaba dair bilgiler, sadece ilköğretimde öğrencilere uygulamalarıyla birlikte aktarılması mümkün olan basit ama önemli bilgilerdir.

Yine ahilikte farklı derecelendirme biçimleri bulunmaktadır. Mesela Burgazi fütüvvetnamesinde bu dereceleri “yiğit, ahi, şeyh” olarak bildirmekte; yiğitliği yola girmek, ahiliği yolda olmak ve şeyhliği de menzile varmak olarak değerlendirmektedir (Gölpınarlı, 2015, s.90). Bununla birlikte her bir derecenin içinde farklı derecelendirmeler de bulunmaktadır. Mesela yiğit, çırak, kalfa, usta sıralaması ahiliğin kendi içindeki sıralamadır. Mesleki öğretimde derecelendirmeleri ifade eden bu sıralamanın her bir aşaması belirli bir eğitim süresini ve kazanılması gereken becerileri kapsamaktadır. Bu süreçlerin her birisi arasında bulunan geçişlerde belirli tören biçimleri ve semboller kullanılmıştır. Bu törenlere dair detaylı bilgi vermek konumuzu aşmakla birlikte bu uygulamalardan elde edilmek istenenleri kısaca özetleyebiliriz.

Örneğin yamak olarak başlayan talip, çırak olmaya hak kazandığı iki yılın sonunda bir törenle çırak ilan edilir. Bu tören bir sabah namazı sonrası ustası, işyerindeki kalfalar ve babası eşliğinde yapılır. Bu törenle birlikte genç kendisine verilen önemi ve sorumluluklarını daha iyi kavrar. Artık bir mesleğe başlamış ve ona göre kendisini yetiştirmesi, ustalarının ve ailesinin sözünü dinlemesi gerektiğini öğrenmiştir. Üç yıllık çıraklık süreci sonrasında bilgi, beceri ve ahlaki yeterli seviyeye gelen çırak yine bir törenle kalfalığa terfi ettirilir. Bu törende ise ilk kez kendisine kuşak bağlanacaktır ve artık ustasının vekili konumuna yükselecektir. Kuşak bağlama

töreninde artık genç, ahiliğin temel sorumluluklarını yerine getireceğine dair bir anlamda söz vermektedir. Kuşak bağlayarak eline, diline, beline sahip olacağını vaat etmektedir. Yine üç senelik kalfalık sürecinde yeni gelen yamakları yetiştirecek ve çıraklara yardımcı olacaktır. Sanatında yeterli seviyeye geldiğinde ise esnaflar arasında yapmış olduğu bir işi göstererek bir nevi imtihan olacak ve başarılı olduğu takdirde ustalıkla terfii edecektir. Bu törenlerde birçok sembol ve mesaj bulunmaktadır. Yine bu törenlere katılım her bir terfii de daha da üst seviyede olmaktadır. Örneğin ustalık töreninde esnafların şeyhleri, kadı, müftü, diğer esnaflar gibi çok sayıda katılımcı olmaktadır. Artık usta tüm esnaflar tarafından tanınan biridir ve hareketlerinde bunu bilerek hareket etmelidir. Bu eğitim süreci ve törenler bir anlamda otokontrol ve sorumluluk bilincini kazandırmayı amaçlamaktadır. Yine bu törenlerde içilen şerbet bile bir anlam ifade etmekte meslek sahiplerini ve yeni terfii etmiş usta veya kalfaya bazı değerleri hatırlatmaktadır. Bu şerbet aslında tuzlu sudur ve suyun içindeki tuz bütün fazilet ve güzel huyların kazanılmasına sebep olan adaleti temsil etmektedir. Ahiler bu şerbeti her içtiklerinde bu değeri hatırlamakta ve sofralarından bu şerbeti eksik etmemektedirler.

Yardımlaşma ve cömert olma da ahilerin en önemli değerleri olarak karşımıza çıkmaktadır. Örneğin esnaf sandığı denilen bir uygulamaları vardır ve ahilerin gelirlerinin ihtiyaçlarından fazla olanı biriktirilir. Bu sandıktan elde edilen gelirle misafirler ağırlanır, yolculara ve fakir fukaraya yardım edilir, ahi zaviyesinde herkese açık sofralar kurulur. Yeni usta olmuş ve işyeri açmak isteyen üyelerine dükkân açması için sermaye sağlanır, hammadde temin edilir. Tezgâhlarını büyütme isteyenlere yardım edilir, zor durumda kalanlara borçlarını ödemesi için destek olunur. Burada teşkilat mensubu biri zor duruma düşenin malını ucuza kapatarak ele geçirmeyi değil ona yardım etmesi gerektiğini öğrenir. Çünkü onlarda yaşat ki yaşayasın düşüncesi bir değer olarak bulunmaktadır. Bu değerleri mesleki eğitim süreci içerisinde kazanan her bir birey kendisinden sonrakilere de bu değerleri aktarmaya çalışmıştır. Günümüz dünyasında mesleki bilgi sahibi olup da bu değerlere sahip olamayan bireyler aslında birliktelikle elde edebilecekleri sinerji yerine birbirinin kurdu olmakta ve meslektaşlarını kardeşleri olarak değil de rakipleri olarak görmektedirler. Değerler olmadan kurulan piyasalar kurtlar sofrası olmakta, düşenin malını ucuza kapatmak maharet sayılmakta, güç elde edebilmek için her şey mubah sayılmakta ve bu olağan bir durummuş gibi karşılanmaktadır. Bu anlayış biçiminin toplumu kemiren, işçiyi ve tabiatı sömüren, huzursuz bir ortam oluşturması kaçınılmazdır.

Ahilerin değerleri kazandırmaya dair uygulamalarının daha detaylı şekilde incelenerek günümüz meslek ve ticaret eğitimine uygun hale getirilip gençlerimize bu tecrübeleri aktarmanın yollarını aramamız gerekmektedir. Geleceğe dair hem maddi hem de manevi zenginlikleri barındıran bir medeniyeti geçmişimizde olduğu gibi tekrar diriltmek ancak huzur, dostluk, kardeşlik, merhamet, cömertlik, yardımseverlik duygularıyla beslenen bir nesil ile mümkün olabilir. Unutmamak gerekir ki “değerler”in olmadığı bir dünya gerçekten değersiz bir dünya olacaktır.

Abstract

The purpose of this study is to explain the modelling and modelling process of probability thinking ability acquiring problems by using simulations in an instructional way. Both Cereal Box and Birthday problems were analysed experimentally and theoretically in the study. Since the aim of the study is to adopt experimental rather than theoretical approaches in the solutions of the problems, the focus was on creating simulation models for problems, doing experiments, visualisation of the results and calculation processes. Then, experimental and theoretical solutions were compared. Thus, the relations and models which help to understand the theoretical solutions of probability problems by using experimental data were proposed. Moreover, the study also sheds light on the questions of how to use the TinkerPlots in order to increase the comprehension of students and how to integrate the technology into probability teaching. In this case, it is thought that the study will be beneficial for researchers, teachers and students alike.

Equivocal, Inconsistent And Ambiguous: Setting Practical Parameters To The Definition Of Blended Learning

Abstract

Drawing further in depth into the argument of gaps and issues pertaining to blended learning, it has been established that there exists an inconsistency when defining blended learning. Some definitions are weak and vague, labelling any teaching approach that involves technological intervention as blended learning; while others offer a more precise description, utilizing ratio, suggesting that only courses with parameters; 30% to 79% of online content can be considered blended. In this context, the clarity of definition and concept are very much inconsistent and ambiguous; thus, constructing an accurate and concise approach, delivery and execution are unviable without a mutual conception of its connotation and meaning. Despite various delineations, blended learning has emerged as one of the pivotal trends and game changers in the landscape of teaching and learning. With the aim to examine the various definitions used in the blended learning studies, 96 samples obtained from a meta-analysis were qualitatively analyzed; adapting Sharpe et al.'s (2006) Eight Dimensions of Definition Framework. Subsequently, coding scheme was devised to further explicate these eight dimensions wherein different modes of (a) Delivery, (b) Combinations of Technology, (c) Chronology of interventions, (d) Locus, (e) Roles, (f) Pedagogy, (g) Focus, and (h) Direction are juxtaposed. All eight dimensions of definition were identified, scattered across all 96 included samples; however, none of the samples demonstrated all eight dimensions of definition. Deriving from the coded criteria, it is revealed that the common blended learning implementation is to include (a) Practical, (b) Independent, (c) Asynchronous, (d) Peer-Collaborative, and (e) Interactive components and predominantly, definition and notion of blended learning ubiquitously discovered is a combination of technological and traditional delivery with additional instructional strategies introduced whereby software such as platforms, programs and online materials are utilized.

Essential School Leadership For School Principals In The Northeast Of Thailand

Abstract

The main aim of this paper was to examine the factors of five essential leadership styles of school principals in the northeastern region of Thailand. The designed research survey was carried out to validate the goodness-of-fit of a structural relationship model. A total of 560 primary school directors were selected from a population of 11,720 using multi-stage sampling technique. A quantitative method employing questionnaire was constructed by researchers as an instrument to collect data. Data was analyzed using confirmatory data analysis. The results of the study indicated that learning leadership consists of six factors, strategic leadership has three factors, technological leadership is comprised of four factors, collaborative leadership consists of five factors, and ethical leadership has five factors. Final result showed that the structural relationship model is found to be consistent with empirical data, with chi-square $\chi^2 = 94.294$, $df = 89$, $p\text{-value} = 0.253$, $RMSEA = 0.013$, $SRMR = 0.019$, $CFI = 0.999$, and $TLI = 0.998$.

Keywords: *Collaborative leadership; ethical leadership; learning leadership; strategic leadership, technological leadership*

Introduction

Current school directors must understand various leadership styles in order to motivate their teachers to learn and to solve problems collaboratively (Somprach, Tang, & Popoonsak, 2017). According to Ariratana, Sirisooksilp, and Tang (2016), sustainable development of educational leadership needs to be highly emphasized to ensure it is managed to produce knowledgeable human capital in order to remain compatible at the global level. Therefore, it is imperative for school directors to modify their target goals to drive their school excellence by practicing appropriate leadership styles. This is supported by Somprach and Tang (2016) who indicated that leadership is a vital factor in job reform for organizational effective and is an important mechanism affecting the process, organizational structure, patterns, social interactions, belief, values, attitudes, and working behaviors.

Learning leadership is defined as engaging in the design, implementation, and sustainability of powerful innovative learning environment (Somprach & Tang, 2016). Therefore, learning leadership puts creating the 21st century teaching and learning at the core of leadership practice. Hence, learning leadership establishes creativity and often courage. Kouzes and Posner (2016) defined learning leadership as a strong determinant of directive outcomes at the micro and macro level of school operations.

On the other hand, strategic leadership is viewed as the set of decisions and actions that resulting in the formulation, implementation, and control of plans designed to achieve an organization's vision, mission, strategy, and strategic objectives within the administrative environment in which it operates (Prasertcharoensuk & Tang, 2017). As a result, strategic leadership is defined as the leader's ability to anticipate, envision, and maintain flexibility and to empower others to create strategic change (Hitt, Ireland, & Hoskisson, 2007: 375).

Technological leadership is defined as the act of commitment to the provision of technology facilities and enabling environment that can support their application in school administration to promote teachers' teaching and students' learning. It entails the enhancement of the leadership roles of school directors through the provision of technological facilities and coordinating their utilization for the achievement of organizational goals (Tang & Somprach, 2015). Collaborative leadership refers to the process of facilitating and operating in a reciprocal interactions and relationships between school directors, teachers, situations, school-level factors of their work, and the school environment (Somprach et al., 2017).

Ethical leadership refers to the school directors have to play a significant role as a leaders and role models for their

students. An ethical school director not only endeavors to do the right thing but also to do things right (Prasertcharoensuk, Tang, & Klinthaisong, 2017). Since school directors are the main decision makers, their ethical behaviors and decisions directly affect school climate positively. Based on the above literature reviews, researchers would like to investigate the structural relationship model of the five leadership styles and the congruence of the structural model with empirical data among the directors of primary schools in northeast of Thailand.

Method

Survey design was employed using questionnaire as a method to collect quantitative data. A total of 560 samples was selected using multi-stage sampling from a population of 11,720 school directors who administer the primary schools in northeast of Thailand. Hair, Back, Babin and Anderson's (2013) proposed that the proper ratio of samples is 20:1 or 20 samples per one parameter. Since there were 28 parameters in this study, the required sample size was 560 samples of school directors. On this line of reasoning, simple random sampling technique was utilized to select 560 of school directors to fulfill Hair et al. (2013) suggestion that sample size should not less than 100.

A survey questionnaire was administered in Thai language to ensure that the respondents were able to understand the statement better. The instrument consists of two sections. Section A of the questionnaire was intended to gather information related to demographic factors of the respondents which included information pertaining to their personal background such as gender, age, education level, job position, and working experience. Section B was specifically designed by researchers to elicit information relating to school directors' administrative behaviors, exercise of power, abilities to motivate, and abilities to direct. This section was aimed to evaluate the leadership styles of the school director namely learning leadership, strategic leadership, technological leadership, collaborative leadership, and ethical leadership. To measure the respondents' responses toward leadership style practice, a five-point Likert scale was used.

This questionnaire was then sent to a panel of experts for comments and feedbacks. The panels of expert were selected using the criteria based on their expertise. From the feedbacks returned by the panel, some modifications were made to the original instrument. Subsequently, the questionnaire was tested according to the index of item-objective congruence of at least 0.50 and further testing the reliability test to a pilot test group consisted of 30 primary school directors (Srisatidnarakul, 2012: 5). Cronbach alpha value gained from the pilot study was 0.987, thus the questionnaire was ready to use in the actual study. Confirmatory Factor Analysis (CFA) is used to validate the structural relationship model. CFA was used as a desirable validation stage preliminary to the main use of structural equation model to identify the causal relations among latent variables (Schumacker & Lomax, 2004).

Results

Results of this study are presented based on the research aims that are indicated above. The initial result is the descriptive results related to the background of the 560 respondents. This is followed by results of the CFA to confirm the correlation between the essential leadership factors in the structural relationship model. Finally, result from the goodness-of-fit is presented.

Descriptive results of respondents' background

A total of 560 primary school directors were the selected respondents who participated in the survey showed that most of them are males, aged more than 50 years old and have more than 20 years working experience. Majority of them are master's degree holders, followed by bachelor's degree, and doctoral degree.

CFA of school leadership style in structural relationship model

Results of CFA showed that there are five latent variables in the structural relationship model namely learning leadership, strategic leadership, technological leadership, collaborative leadership, and ethical leadership. In addition, results of the study indicated that learning leadership consists of six factors, strategic leadership has three factors, technological leadership is comprised of four factors, collaborative leadership consists of five factors, and ethical leadership has five factors.

Specifically, results showed that each latent variable has its factors so called as observable variables as follow. Learning leadership (x1) consisted of learning environment (x11), team learning (x12), integration (x13), advanced technology (x14), creativity (x15), and self-directed learning (x16). Strategic leadership (x2) was comprised of organizational direction (x21), strategic action (x22), and evaluation (x23). Technological leadership (x3) included technology in teaching and learning (x31), technology in management (x32), technology in measurement and evaluation (x33), and ethics in technology use (x34). Next is collaborative leadership (x4) encompassed rotation of leadership roles (x41), shared decision-making (x42), team building (x43), communication (x44), and change-making (x45). Finally, ethical leadership (x5) covered trustworthiness (x51), justice (x52), responsibility (x53),

respect (x54), and good citizenship (x55). There are a total of 23 observable variables as shown in Figure 1 below.

CFA was used to validate at the preliminary stage to identify the causal relationships among the latent variables. Results related to factor loading values of all the latent variables for leadership styles structural relationship model ranged from 0.924 to 0.982 are statistically significant at 0.01. Moreover, factor loading is the importance of standard factors of each observable variable in the relationship model of leadership styles had been taken into account. The co-variance with leadership style was from 85.40 to 96.50 percent. Besides, results regarding to factor loading values of the leadership style factors or observable variables ranged from 0.518 to 0.900 are statistically significant at 0.01. The co-variance with leadership style factors was from 26.90 to 81.00 percent. Table 1 shows factor loading results of the five leadership styles and their related factors. As a result all the factors of the structural relationship model are found to be important construct for leadership styles.

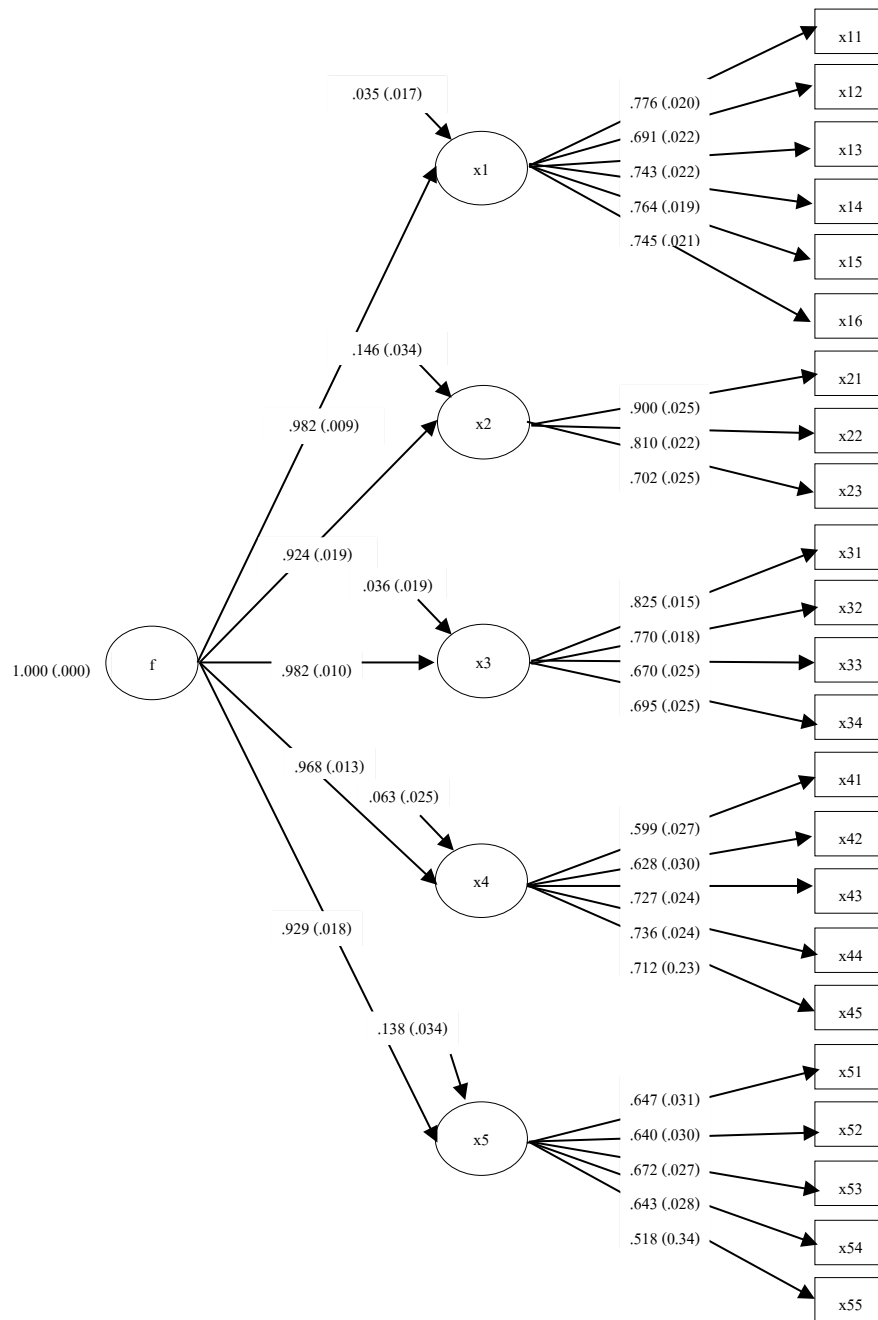

Figure 1. Factors of Hypothesis Structural Relationship Model

Firstly, the leadership styles with the highest factor loading was learning leadership and technological leadership with the same β value that is 0.982 and slightly difference in term of R^2 that are 0.965 and 0.964 respectively. The second highest leadership style was collaborative leadership ($\beta = 0.968$, $R^2 = 0.937$). This is followed by ethical leadership ($\beta = 0.929$, $R^2 = 0.862$). The strategic leadership was found to have the least capacity with the β value as 0.924 and R^2 value as 0.854. On this line of reasoning, school directors should prioritize developing the aforementioned variables of essential leadership in that order. These five essential leadership styles are comprised of 23 factors, with average factor loading values within 0.518 to 0.900.

The factor with the highest factor loading was organizational direction ($\beta = 0.900$, $R^2 = 0.810$). The second highest factor was technology in teaching and learning ($\beta = 0.825$, $R^2 = 0.681$). The third highest factor was strategic action ($\beta = 0.810$, $R^2 = 0.657$). This is followed by learning environment ($\beta = 0.776$, $R^2 = 0.603$), technology in management ($\beta = 0.770$, $R^2 = 0.593$), advanced technology ($\beta = 0.764$, $R^2 = 0.584$), creativity ($\beta = 0.745$, $R^2 = 0.554$), integration ($\beta = 0.743$, $R^2 = 0.552$), communication ($\beta = 0.736$, $R^2 = 0.542$), self-directed learning ($\beta = 0.732$, $R^2 = 0.535$), team building ($\beta = 0.727$, $R^2 = 0.528$), change-making ($\beta = 0.712$, $R^2 = 0.507$), evaluation ($\beta = 0.702$, $R^2 = 0.493$), ethics in technology use ($\beta = 0.695$, $R^2 = 0.483$), team learning ($\beta = 0.691$, $R^2 = 0.477$), responsibility ($\beta = 0.672$, $R^2 = 0.451$), technology in measurement and evaluation ($\beta = 0.670$, $R^2 = 0.448$), trustworthiness ($\beta = 0.647$, $R^2 = 0.419$), respect ($\beta = 0.643$, $R^2 = 0.413$), justice ($\beta = 0.640$, $R^2 = 0.409$), shared decision-making ($\beta = 0.628$, $R^2 = 0.394$), and rotation of leadership roles ($\beta = 0.599$, $R^2 = 0.359$) respectively. The factor that had the lowest factor loading was good citizenship ($\beta = 0.518$, $R^2 = 0.269$). As a result all the factors of the structural relationship model are found to be important construct for leadership style practice.

Table 1. Factor loading and validity of leadership styles and their factors in the structural relationship model

Latent variables	Observable variables	β	S.E.	R^2	t
Learning leadership		0.982	0.009	0.965	113.355
	Learning environment	0.776	0.020	0.603	37.908
	Team learning	0.691	0.022	0.477	31.190
	Integration	0.743	0.022	0.552	34.334
	Advanced technology	0.764	0.019	0.584	39.441
	Creativity	0.745	0.021	0.554	35.118
	Self-directed learning	0.732	0.022	0.535	33.397
Strategic leadership		0.924	0.019	0.854	49.560
	Organizational direction	0.900	0.025	0.810	36.219
	Strategic action	0.810	0.022	0.657	37.442
	Evaluation	0.702	0.025	0.493	27.736
Technological leadership		0.982	0.010	0.964	99.560
	Technology in teaching and learning	0.825	0.015	0.681	54.087
	Technology in management	0.770	0.018	0.593	42.101
	Technology in measurement and evaluation	0.670	0.025	0.448	26.936
	Ethics in technology use	0.695	0.025	0.483	28.045
Collaborative leadership		0.968	0.013	0.937	74.719
	Rotation of leadership roles	0.599	0.027	0.359	22.075
	Shared decision-making	0.628	0.030	0.394	20.936
	Team building	0.727	0.024	0.528	30.663
	Communication	0.736	0.024	0.542	30.654
	Change-making	0.712	0.023	0.507	31.243
Ethical leadership		0.929	0.018	0.862	51.142
	Trustworthiness	0.647	0.031	0.419	21.116
	Justice	0.640	0.030	0.409	21.395
	Responsibility	0.672	0.027	0.451	24.799
	Respect	0.643	0.028	0.413	22.656
	Good citizenship	0.518	0.034	0.269	15.336

Quantitative results of congruence of the structural relationship model with empirical data

Results from the correlations between the factors of leadership styles performance could be assessed in the standard component score (β). Results showed that the structural relationship model has a goodness fit with evident data, with $\chi^2 = 94.294$, $df = 86$, and $p = 0.253$. This means that chi-square value was not significant and RMSEA =

0.013, SRMR = 0.019, CFI = 0.999, and TLI = 0.998. This means that the structural relationship model of leadership style among the school principals in northeast of Thailand is correlated with empirical data.

Discussion And Conclusion

The major focus of this study was on the importance of standard factor loading of each variable in the structural relationship model. Results revealed that all the factors of the five leadership styles namely learning leadership, strategic leadership, technological leadership, collaborative leadership, and ethical leadership are important for these leadership styles to practice by school directors. As a result, results seem to be in accordance with theories and previous research studies.

Results of this study showed that the variables used in the structural relationship model are compliance with the reference criteria and correlated with the empirical data. This shows that these five leadership styles and their factors are correlated in the same direction. If school directors want to practice that particular leadership, they have to implement each factor as well. Nevertheless the results can be used to explain the relationship between the leadership styles and their factors. This implies that the variables developed either the latent or observable variables are relevant to the context and nature of primary school administration in northeast of Thailand. The results of this study are found to be parallel to Prasertcharoensuk and Tang (2017), Prasertcharoensuk, Tang, and Klingthaisong (2017), Somprach et al. (2017), and Tang and Somprach (2015).

The overall results are useful for the policy maker, educational administrators, school directors, educators, and practitioners. Empirical development particularly in the a few leadership styles largely neglects to recognize their factors as important elements in administrative practice. Therefore, the results are able to provide empirical justification that leadership styles are crucial in the construction of their factors practices. The richness and justification of data reveals its valuable contribution to educational administration.

Abstract

The typical method to the exercise of ethics (morals) in schools, professional and administration could be an inflexible method, which concentrations on what student, workforces and persons in all-purpose must do to act as honorably accountable players (Jones, 1991). When the standards and customs of the congresses of the school and commercial world show to go straightforward on the materials speediness, it looks more and more compulsory to not only gauge but also analyses how and why unethical behavior can intensification so straightforwardly and effectively, in the face of the occurrence of numerous controller and technological following systems (De Cremer, 2010).

In this education, a numerical opinion poll useful to a sample of 145 business department student at a vocational school in Turkey. Statistical analysis revealed that male student has a suggestively less ethical behavior in three features that egotism, abstract dishonest and computer ethics than female student in this department. It is very significant to comprehend that one of the main areas of any informative program is to change personalities' both personally and professionally.

Key words: *ethics, ethical behavior, vocational school student*

Introduction

Ethics is the responsibility of each student at the school. Therefore, every student of the vocational school stand-in on the department of the university, is in charge for ethical comportment dependable with Kocaeli University's procedures. Vocational school student essential assume accountability for confirming which the comportment, and the processes for parts that students learn, observes with the policy. Kocaeli University rules of morals is a declaration of the acceptance in ethical, allowed and specialized performance in the communications in some situations, exterior of the school. Student of the university are anticipated to workout duty suitable to the situation. Students are accepted to the campus communal for the activities and the choice don't to performance. Every specific participant is anticipated to behavior the rules of the university in harmony with the directions of ethics to superlative assist the authority of the university (Forsyth, D. R. and W. R. Pope: 1984; Grove, S.J., S.J. Vitell and D. Strutton: 1989; Nejati, M., Jamali, M. And Nejati, M., 2009; Bellizzi, J.A. and W. Murdock, 1981; Schonert-Reichl, K. 2000).

Several scholarships have inspected ethical behavior and the reasons of student from different countries (Hosmer 1999; Helfgot, 2005; McDonald & Carroll, 2006; Schonert-Reichl, K. 2000). Observed exploration on ethics reports plentiful variances between students. For example, St. Pierre et al. (1990) found that bookkeeping student keep count subordinate at the defining issues test, a survey on ethical intellectual, and then psychology student. In alternative education, (Hosmer, 1999) in its homework distinguished that accounting and finance student were supplementary prospective to observe business ethics and community accountability to be normally inconsequential, as associated to another student (Schonert-Reichl, K. 2000; Nejati, M., Jamali, M. And Nejati, M., 2009; Forsyth, D. R. and W. R. Pope: 1984).

Method

There have been different lines for calculating ethics using different scales between several studies on student' ethics. Many of the scholars have unrushed the boldness in the direction of ethics using opinion poll. The key resolution of our training is to inspect student' ethical behavior in the university atmosphere at the view of observed conclusions testified in the poetry on genders (Forsyth, D. R. and W. R. Pope: 1984; Nejati, M., Jamali, M. And Nejati, M., 2009).

The sample for this study comes from accounting department of a vocational school of a Turkish university. An open-ended questionnaire used to accumulate data for this study was applied in four classes (2-first classes and 2-second classes) on the vocational school. There were no motivations given to the student to participate in the study. 145 student participated the study. The gender segment of the study model is below (table 1). As indicated %53 of the student were females and %47 is male. Besides, student' age interval from 18 to 23 years old (Forsyth, D. R. and W. R. Pope: 1984; Grove, S.J., S.J. Vitell and D. Strutton: 1989; Nejati, M., Jamali, M. And Nejati, M., 2009).

Table 1 gender of study sample

		Category	Frequency	Percent	hypotheses for the aim of this study (Nejati, M., Jamali, M. And Nejati, M., 2009): • Female student are "computer ethics" than male student • Female student are meaningfully less than "violations" than male student
We define the following study	(Nejati, M., Jamali, M. And Nejati, M., 2009):	Male	68	46.9	
		Female	77	53.1	
		Total	145	100.0	

For the resolution of calculating student' ethical behavior, an opinion poll was changed by the education of Zopiatis and Krambia-Kapardis (2008). The feedback form involved of 19 questions, calculating student' ethical behavior in the groupings, explicitly destruction of school principles (4 questions), egotism (6 questions), abstract dishonest (5 questions), and computer ethics (4 questions). Also, a five-point ruler established by Grove at all (1992) and Vitell (1992) was added in the questionnaire.

whether they supposed the travels tha having erroneous (unethical), coded as 1, or not erroneous (ethical), implied by five types (Grove, S.J., S.j. Vitell and D. Strutton: 1989; Nejati, M., Jamali, M. And Nejati, M., 2009).

Findings

The findings show that male data have a larger mean altogether four sorts of destruction of school principals (regulations), egocentricity (selfishness), abstract unprincipled (academic cheating), and processor ethics (computer ethics) (table 2) (Nejati, M., Jamali, M. And Nejati, M., 2009).

Table 2 student ethical behavior

Category	Gender	Mean	Standard deviation
Violation of school regulations	Male	1.814	0.345
	Female	1.716	0.374
Selfishness	Male	1.859	0.448
	Female	1.647	0.353
Academic cheating	Male	2.215	0.654
	Female	1.851	0.543
Computer ethics	Male	2.250	0.745
	Female	1.876	0.451

According to above table, we can say that the female student has a suggestively not as much of affectionate arrogance toward ethics. With the purpose of test the steadfastness of the education, we applied cronbach's alpha both disjointedly and collected for all the features. The cronbach's important for all the 19 influences was 0.785 (Bellizzi, J.A. and W. Murdock, 1981; Nejati, M., Jamali, M. And Nejati, M., 2009; Grove, S.J., S.j. Vitell and D. Strutton: 1989).

With the purpose of test whether these variances are momentous, we applied t-test. Even though both male and female plaintiffs have an unkind less than the usual in all sorts, the submission of t-test confirmations that female plaintiffs have a suggestively less tender behavior in the direction of all the sorts than male student (table 3) (Grove, S.J., S.j. Vitell and D. Strutton: 1989; Nejati, M., Jamali, M. And Nejati, M., 2009).

Result

It is well-known reality that one of the primary areas of any educational system in the world is to develop individuals' both for my part and for work. In other words, it is of most standing to run student with mandatory abilities and facts and do participants accustomed with the social order and business ethical ideals at the end the education life (Nejati, M., Jamali, M. And Nejati, M., 2009). We believe that this education and its discoveries are imperative as it is between the very first studies shown among Turkish vocational school student on ethical behavior, when getting into account the gender differences. Extra new and extended research might investigate the reasons that why male student to do low ethically in assessment to female student.

Abstract

The paper focuses on declared practices of eight parents (mothers and/or fathers) of pupils belonging to the CM1-CM2 classes (the last two levels of the primary education) of Nuku Hiva island, in the Marquesas archipelago, French Polynesia. To evaluate declared parenting practices (essentially, parents' representations about their educative performances), we opted for the Scale of Educative Parental Skills (échelle des compétences éducatives parentales - ECEP). According to the results of our fieldwork, parents in Nuku Hiva perceive their parenting performance as "normative" but, paradoxically, they also perceive their practices as "extremely liberal". We interpret these results as an effect of the joint pressure generated by local, national and global ideologies (due to the fact that, often, locally grounded attitudes and practices are not coherent with the expectations of national institutions -such as school- and global markets).

Theoretical Framework

Several authors have been exploring the impact of domestic parents' practices on school adaptation of their children (Baumrind, 1966; Lautrey, 1995; Kellerhals & Montaudon, 1991). Educative practices may be observed in the framework of "everyday routines" (playing, domestic chores and jobs around the house) or as a part of activities especially focused on learning (supporting exploration and "discoveries", visiting a museum, assisting for homework).

In our previous works on family education (Ailincal, 2005; Ali, 2016a; Ali & Ailincal, 2013), we showed that the same parent may act with different interactive styles, according to the type of activity and the influence of ecosystemic variables. We observed parent-child dyadic interactions in both of their everyday life (using ethnographic tools such as participatory observation and ethological-systematic observation with behavior sampling), with the aim to identify "spontaneous interactive styles", and in experimental situations (observing children during a "learning-focused activity", in a school context), with the aim to identify "epistemic interactive styles". Contemporary scholars typically classify parenting styles into four groups:

1. Autocratic, with high levels of control and low levels of affectivity;
2. Indulgent and permissive, with low levels of control and high levels of affectivity;
3. Democratic, with high levels of control and affectivity;
4. Careless or negligent, with a lack of control and affectivity.

Nevertheless, this approach only focuses on two variables: control (or authority) and affectivity. We prefer a different classification (Ailincal, 2005), based on the « quality » of the educative interaction:

1. The "guiding" style (parents imposing the "way to well doing", bringing knowledge, defining procedures, objectives and goals; he or she is concerned about the attention children shows for the activity and the accomplishment);
2. The "evocative" style (parents questioning children about chosen procedures, encouraging them to present their arguments, to create links between different domains of knowledge and to explain their decisions. They also bring children about proactive attitudes, reformulating questions, clarifying their expectations, asking the advice -or the assistance- of the same children);
3. The "autonomizing" style (parents leave children free to discover, supporting their "trial and error" activities, observing them when focused on their task -the parents' presence itself offering an implicit evaluative support to the activity-. The assessment is formative and its positive impact is a consequence of the authorization allowed to the children to dedicate to their activities);
4. The "disjoint functioning" style (characterized by a lack of dialogic interactions. Sharing the same individualistic ideology, both adults and children act according exclusively to their individual needs).

These typologies are a very useful tool for scholars in socio-anthropology of education and comparative education studies, because they contribute to define the domestic educative contexts (*id est*, how the family members play the role of educators) and to better understand the domestic causes of the school success (or defeat). Actually, it is not possible to imagine a positive correlation between a given educative style and the certain school success. In fact, a review of the latest development in research in education confirm that same interactive typologies have a different incidence according the surrounding social environment. In a seminal work, Darling et Steinberg (1993) elaborated a theoretical model to understand the connection between parenting styles, parental practices and child development.

Nevertheless, those approaches neglect other factors, such as teachers' practices. Actually, recent research in socio-anthropology of education suggests that the degree of coherence between the educative styles of parents and teachers influences school outcomes. However, according to Duru-Bellat et van Zanten (2009), in most cases that kind of continuity -between family and normative school frameworks- is a privilege shared by few well-off families.

Motivated to explore this peculiar "continuity", we developed -with the financial aid of the French Ministry of Overseas Territories and the EASTCO Research Lab at the University of French Polynesia- the PREEPP research project (*PRatiques Éducatives Enseignantes et Parentales en Polynésie française* – Teachers' and Parents' Educative Practices in French Polynesia) supposing that there is a correlation between parenting practices and school achievements. To confirm our hypothesis, we compared children's school assessment with declared and actual practices (*id est*, perceived vs. observable performances) of parents and teacher in several Polynesian communities.

Methodology

In this paper we focus on the data gathered in Nuku Hiva, the main island of the Marquesas archipelago, in the northern sector of French Polynesia (the global findings of the project are archived on-line, freely available on the project web space: <http://www.itereva.org/mompepe/frontend/>). Most of the inhabitants belongs to the Enata autochthonous community, speaking the 'éo enana, an Oceanian language with Austronesian origins.

As regards the methodology applied to evaluate declared parenting practices (essentially, parents' representations about their educative performances), we opted for a survey tool, the Scale of Educative Parental Skills (*Échelle des Compétences Éducatives Parentales* - ECEP) created by Terrisse et Larose (2000; 2009), specifically the version they elaborated for parents with children aged between 6 and 9 years old.

Through 47 questions, ECEP explores three main domains:

1. the educative attitudes of parents (how they develop their relationship with children);
2. their educative practices;
3. the perceptions of parents concerning their capability to control and manage the behavior of their children.

We reformulated some questions with the aim to facilitate the lecture and we opted for a simplified written data input procedure (the participants were only asked to check if they agree or not with the affirmations presented in the survey).

By using the ECEP scale, we had the opportunity to systematize declared parenting practices of the parents from Nuku Hiva and to compare the trends with the school achievements of their children that we registered. Finally, the results are discussed taking into account the observations we made among other Polynesian communities (Ali, 2016a, 2016b). Because of our special concern for analyzing family dynamics and family/school relationships, the gathered data have been interpreted using an ecosystemic perspective (Bronfenbrenner, 1979; Super & Harkness, 1986) and a sociocultural approach (Vygotsky, 1934; Valsiner, 1987).

Population

Data presented in this paper were gathered in Nuku Hiva island and the sample was selected among parents of pupils belonging to the CM1-CM2 classes (the last two levels of the primary education).

<i>Location of the school</i>	<i>N. of parents participating to the study</i>	<i>Age</i>	<i>Sex</i>
AAKAPA	1	+ 45yo	F

<i>HATIHEU</i>	1	36-40yo	F
<i>TAIOHAE</i>	5	36-40yo	F
		41-45yo	F
		41-45yo	F
		31-35yo	F
		26-30yo	F
<i>TAIPIVAI</i>	2	31-35yo	M
		41-45yo	F

Table 1 : The population of our study.

The nine ECEP surveys were filled at school, after a meeting gathering researchers, students' parents and school staff. Parents completed the surveys individually. Our choice -to pass the questionnaires inside the schools- is justified by the need to use school personnel (especially the pedagogical counselor in charge of the Nuku Hiva district) as translator, due to the fact that some parents are illiterate and unable to read in French. The findings presented in this article concern only declared parenting practices but the same parents were also invited to participate in an experimental study focused on observable parenting practices: they were filmed with their children during a situation of learning support for a scientific activity. The relation between declared and observable practices will not be analyzed here but it will be evoked to discuss the results of students' assessments and -at least, we hope- to bring more elements to confirm our hypothesis. To interpret the results of our surveys, we applied the scores calculation procedure proposed by the two ECEP creators (Terrisse et Larose, 2009). Every question is associated to an item and every item to a scale. The first one, the attitude scale, organize the items in three groups of poles: rigidity/flexibility (including 4 items), distrust/trust (6 items), internal control/external control (10 items). The second one, the practices scale, organize the items on two groups: normative/creative (9 items) and strict/permissive (7 items).

Finding N.1: Parents Attitudes According To Their Declarations

Once the survey were passed, we analyzed the items included on the attitude scale with the aim to describe how they perceive their educative attitudes (and, *latu sensu*, how they auto-evaluate their parental "role"). Parents n.2 and n.5 obtained a score of 10-12, corresponding to an extremely controlling attitude. This attitude is often correlated with rigidity, distrust and an interactive style based on a scarce verbalisation (explanations, discussions) between parents and children: instructions are shorts, emitted with authoritarian thones and formulated as orders. The content of verbal interventions is often linked with the formulation of menaces or the application of consequences (which were not announced, explained nor negotiated in advance with children). Parents n.4 and n.8 obtained a 14-15 score, corresponding to an average and standard normative attitude: a relatively frequent "way of parenting" including some authoritarian behaviour but also a large space allowed to exploration, creativity and dialogic participation to the family everyday life. All other parents obtained an intermediary score (more than 12 but less than 14), associated with high levels of top-down normativity and low levels of bottom-up participation. No parents obtained a score upper than 16, associated with tolerant and extremely tolerant parenting styles. Figure n.1 show the scores obtained by our study subjects on the attitude scale.

Scores obtained in the ECEP attitude scale

Figure 1 : Scores obtained in the ECEP attitude scale by Nuku Hiva parents.

Although in terms of attitudes most of parents declared they perform a standard normative attitude (in our survey the exception were represented by the extremely controlling attitude of parents n.2 and n.5), this constatation need to be interpreted prudently. In fact, our survey demonstrated that this standard “way of parenting” (*id est*, an average level of normativity) is, in most of cases, the effect of the balance of opposite attitudes, intrinsically polarized (especially on both distrust/trust and rigidity/flexibility axis. See figures n.2 and n.3).

Rigid/flexible attitude

Figure n.2 : Declared attitudes of Nuku Hiva parents : scores obtained in rigidity/flexibility axis. This axis focuses on controlling or tolerating attitudes.

Distrustful/confident attitude

Figure n.3 : Declared attitudes of Nuku Hiva parents : scores obtained in distrust/trust axis.

In other words, parents declared that, at home, they impose a strict normative framework (a series of obligations which breaking is associated to a severe punishment) but, concerning their children skills (and their ability to “handle things”), they affirm to be sincerely confident, tolerant and “open-minded”.

Finding N.2: Parents Practices According To Their Declarations

The ECEP scale allows us to identify parenting skills taking into consideration the declared practices (*id est*, the declared parenting performances: how parents describe their parental role). The scores obtained by our study subjects has to be interpreted as follows:

1. A score between 16 and 17 corresponds with formalist practices, typical of parents focused on the formal respect of external norms (imposed or reproduced ideologies, dogmes and believes). The dialogues are limited and, often, the interactions are articulated as orders;
2. A score between 22 and 23 corresponds to an average level of normativity, combining a system of obligations-and-sanctions and a permissive approach to the intellectual development of the child, facilitating the interpersonal exchanges, the exploration, the taking of initiatives;
3. A score between 30 and 32 corresponds to extremely liberal practices, carактерized by a low level of parental supervision, by an horizontal hierarchy in family structure, facilitated by interactive exchanges guided by the children (encouraged by parents to be creative and authonomous) and by a normative system lacking of sanctions and punishments.

Figure n.4 shows the scores obtained in the ECEP practices scale by parents in Nuku Hiva.

Scores obtained at the ECEP practices scale

Figure n.4 : Scores obtained in the ECEP practices scale by Nuku Hiva parents.

The data we gathered show that parents participating in our survey situate themselves between the “average normativity” (22-23 points) and “extremely liberal” profiles (30-32 points). As we see in the last chapter, the average normativity is a relatively frequent parenting profile combining authoritarian behaviour (and the application of punishments) with the stimulation of creativity and dialogic participation between parents and children, especially to facilitate the comprehension of the family and social normative system (in anthropological terms, the social organization and its “interiorization” as a structure. See Ali & Ailincal, 2013).

Extremely liberal practices are typically associated to child-centered families, where the “spoiled child” (a sort of little tyrant) is omnipresent and constantly overstimulated. Actually, this family profile -often combined with laxist attitudes- has been accused to undermine the children self-confidence and to have negative consequences for the personality development (De Luccie, 1996 ; Zerkowitz et Papageorgiou, 1996).

As seen for the declared attitudes, declared practices may be discussed in a more detailed manner by the analysis of the results obtained in every axis constituting the ECEP scale (see figures n.5 and n.6).

Normative/encouraging practices

Figure n.5 : Declared practices of Nuku Hiva parents : scores obtained in normative/encouraging axis.

Strict/permissive practices

Figure 6 : Declared practices of Nuku Hiva parents : scores obtained in strict/permissive axis.

In fact, the data we gathered show that, if on one hand, most of parents in Nuku Hiva perceive their practices as an effective « tool » to facilitate the intellectual development of their children (and their ability to « elaborate » the surrounding social and natural environment), on the other side they do not exclude the use of authority and a severe approach to the family hierarchy.

Conclusions

According to our ecosystemic approach, our results may be interpreted according to the cultural and geographic context. Actually, the significative statistical deviations we observed between the scores obtained in declared attitude and practices scales (and the fact that they perceive their parental attitude as normative unlike they consider their parental practice as encouraging and tolerant) confirm what we observed, using an ethnographic approach, during our fieldwork: the parents' attitudes oscillate permanently, as an effect of an incessant dynamic to respond to the imperious needs of the ecosystem upper levels: the local ideologies (believes, customs and traditions), the civic duties, the participation to the global markets. This oscillating attitude, affecting the parents' educative role, is shared by other social groups. For indeed, we observed similarities among the Wayana-Apalai -a native community living in the Amazon rainforest, in Brazil, Suriname and French Guiana- but also among the Enata living in Hiva Oa, an island of the Marquesas archipelago (Ali, 2016a), suggesting the hypothesis that such a "schizophrenic attitude" is the effect of postmodern dynamics in postcolonial territories (see also Ali, 2010 and Ali & Ailincal, 2016, 2017).

Nevertheless, the results obtained in this exploratory study do not aspire to display an universal trend. A larger set of researches needs to be developed to unveil what is changing in parenting dynamics in postcolonial context. Therefore, in the future we will work to another set of publications comparing the results obtained in Nuku Hiva with the results we obtained in other Polynesian islands (Ailincal et al., 2016b and 2016c; Ali, 2019) and among indigenous communities and minority groups in French Guiana (Ailincal et al., 2012, 2016a and 2017; Ali, 2015, 2016a, 2016b and 2017). Also, we envisage a deeper analysis of the data obtained at Nuku Hiva to better understand what determines not only parents attitudes and practices in everyday learning situations (routinary activities) but also their epistemic parenting styles (applied to learning focused activities). Actually, we are interested to identify the factors facilitating the coherence between both spontaneous and epistemic interactions (Ailincal, 2015). Finally, a next step will be the comparison of the parental survey with the school assessments of their pupils.

We hope that our work may contribute to a better understanding of the domestic factors that incide on children scholar careers. With optimism, we also hope that it may contribute to a deepen reflection about the need to develop inclusive education systems structured to allow an horizontal dialogue between school and families (with the aim to take conscience of the expectations -the educative ideologies- of both social actors), especially among ethnic communities and minority groups.

Aknowledgements

The PREPP research project (*PRatiques Éducatives Enseignantes et Parentales en Polynésie française – Teachers' and Parents' Educative Practices in French Polynesia*) was supported by the French Ministry of Overseas Territories and the EASTCO Research Lab at the University of French Polynesia: we aknowledge their financial aid and their logistic support. We also aknowledge our colleagues that collaborate to our endeavour, both those who directly contributed to PREPP and those who patiently reviewed the publications produced in the framework of the project (especially Professor David Amórtégui and Professor Zehra Gabillon).

Abstract

Anatomy laboratory studies are very important in terms of medical education. Despite the contribution of technological developments to the education of anatomy, cadaver dissection still remains as the basis of anatomy education. Cadaver and organ donations have a very low rate in society. In this study conducted among dentistry students who will become health professionals of the future; we aimed to evaluate the effect of anatomy laboratory education on knowledge, attitudes and behaviors of dentistry students on organ and cadaver donation issues. Our work was carried out between 2017-2018 academic year, Kocaeli University Faculty of Dentistry Term-1 students. A total of 66 students (43 female, 23 male) who had not previously participated in the cadaveric dissection were included in the questionnaire study. The same questionnaire was repeated within the same group after students see the cadaver for the first time. A total of 12 questions including "Yes", "No" and "I do not know" answers were addressed to the students who participated in the study. The anatomy laboratory studies were accepted as normal by 16.7% (n = 11) by the participants before the dissection study, and this ratio increased to 37.9% after dissection study (p <0,05). When the question "Would you consider donating your organs if brain death takes place?" was asked %57,6 (n=38) of the participants said "Yes" before the dissection study and % 62,1 (n=41) said "Yes" to the same question after they see the cadaver for the first time. (p >0,05) In this context, the greatest responsibility for the creation of social awareness in organ and cadaver donation issues is down on the health professionals. Determining health workers' attitudes towards the topic will be helpful in raising public awareness and so increasing the quality of community health and health education.

Keywords: *Cadaver donation, organ donation, anatomy education, dentistry students*

Introduction

Anatomy lessons are important for all health care professionals. Despite the contribution of technological developments to the education of anatomy, cadaver dissection still remains as the basis of anatomy education. Cadaver procurement has always been a major problem and the procurement routes bring out ethical arguments along with it. There are many cadaver procurement methods applied in different countries such as; presumed consent where person who has deceased is presumed to have consented to organ donation unless he or she expressly forbade it before death or a family member forbids it., explicit consent is a system where cells, tissues or organs may be removed from a deceased person if the person had expressly consented to such removal during his or her lifetime before, familial consent is to obtain the consent of family members after the person has died, required request, payment for organs. Among these procurement routes, it is thought that the most ethical method is based on volunteerism which is obtaining human body or body parts through donation (Dalal, 2015, Kleinman & Lowy, 1989). Reports from countries around the world have noted that people's attitudes toward organ donation are influenced by factors such as knowledge, education, and religion. Anatomy laboratory studies may also influence the attitudes of student. Understanding the attitudes of dentistry students towards cadaver and organ donation might help us to understand the attitudes of health care professionals and attitudes of population to some extent. In this context we aimed to evaluate attitudes of dentistry students towards cadaver and organ donation and whether these attitudes change after anatomy laboratory studies.

Material And Method

Our study was carried out between 2017-2018 academic year, Kocaeli University Faculty of Dentistry Term-1 students. A total of 66 students (43 female, 23 male) who had not previously participated in the cadaveric dissection were included in the questionnaire study. The same questionnaire was repeated within the same group after students saw the cadaver for the first time. Questions that investigated demographic characteristics, such as age, sex, region and a total of 12 questions including "Yes", "No" and "Undecided" answers were addressed to participants. The questions in the questionnaire directed to the students were designed to assess their views on cadaver and organ donation, awareness of the issue and their attitudes in case of need for one's own or relatives [Figure 1]. The questionnaire was applied based on volunteerism. Therefore, response rate of the questionnaire was 100%. Obtained data from study was transferred to the digital environment and

Questionnaire On Cadaver and Organ Donation Attitudes For Dentistry Students			
Date of birth:	Yes	No	Undecided
Gender: Woman Man	Yes	No	Undecided
In which region does your family live?	Yes	No	Undecided
a- Mediterranean Region b- Eastern Anatolia Region c- Aegean Region d- Southeast Anatolia Region	Yes	No	Undecided
e Central Anatolia Region f- Black Sea Region g- Marmara Region	Yes	No	Undecided
1- Do you want to donate your organs when brain death takes place?	Yes	No	Undecided
2- Do you want to donate the organs of anybody from your family when brain death takes place?	Yes	No	Undecided
3- Would you donate one of your own kidneys to any of your relatives or loved ones if it were necessary?	Yes	No	Undecided
4- Are you a registered organ donor?	Yes	No	Undecided
5- Would you accept organ donation from another person whose brain death takes place in case of need?	Yes	No	Undecided
6- I think that the donation of the organs carried out after death disturbs the peace of the dead.	Yes	No	Undecided
7- I believe that it's not appropriate for my religion to donate organs after death.	Yes	No	Undecided
8- Do you think organ donation after death disturbs body integrity of the dead and harms that person?	Yes	No	Undecided
9- Have you ever seen a cadaver used in medical education?	Yes	No	Undecided
10- Would you consider donating your body as a cadaver for medical education purpose?	Yes	No	Undecided
11- Do you want someone from your family donate himself/herself as a cadaver?	Yes	No	Undecided
12- I think it's "....." to work in the anatomy laboratory,	Yes	No	Undecided
a- Frightening b- Disgusting c- Exciting d- Interesting e- Something normal	Yes	No	Undecided
* Do you think that medical education has changed your mind about organ and / or cadaver donation?	Yes	No	Undecided

Figure 1: Questionnaire that is used in the study

Findings

Among 66 students who participated in the study 43 (65.2%) were female and 23 (34.8%) were male. The average age of the students is 19,9. The geographical region where the students' families mostly live is found as Marmara region with 60.6% (n: 40).

When we evaluated the obtained data, it is found that 57,6% (n:38) of students would want to donate their organs if brain death takes place. 28,8% (n:19) of the students would consider donating their relatives' organs. 83,3% (n:55) of participants said they would accept organ donation from another person whose brain death took place in

case of need. Only 3% (n:2) of the students indicated that they would consider donating their body as a cadaver for medical education purposes. Even though there was no scientifically significant difference between the answers given before and after anatomy laboratory studies, when we compare answers given to different questions there were significant differences.

Comparison of students' tendencies for donating their organs and their tendency towards donating their body as cadavers shows that while 57,6% (n:38) indicates that they would donate their organs, this ratio is only 3% (n:2) for donating body as a cadaver [Table 1].

Table 1: Comparison of students' tendencies for donating their organs and donating their body as cadaver

Questions	Before Dissection			After Dissection		
	Yes	No	Undecided	Yes	No	Undecided
1- Do you want to donate your organs when brain death takes place?	57,6% (38)	9,10% (6)	33,3% (22)	62,1% (41)	12,1% (8)	25,8% (17)
2- Would you consider donating your body as a cadaver for medical education purposes?	3% (2)	74,3% (49)	22,7% (15)	6,1% (4)	71,2% (47)	22,7% (15)

When students' tendencies towards donating their organs and their tendencies toward donating organs of relatives in case of brain death are compared, while 57,6% (n:38) indicates that they would donate their organs, this ratio is 28,8% (n:19) for donating relatives' organs [Table 2].

Table 2: Comparison of students' tendencies for donating their organs and donating a relatives' organs in the case of a brain death

Questions	Before Dissection			After Dissection		
	Yes	No	Undecided	Yes	No	Undecided
1- Do you want to donate your organs when brain death takes place?	57,6% (38)	9,10% (6)	33,3% (22)	62,1% (41)	12,1% (8)	25,8% (17)
2- Do you want to donate the organs of anybody from your family when brain death takes place?	28,8% (19)	21,2% (14)	50% (33)	36,4% (24)	28,8% (19)	34,8% (23)

It is also seen that students' tendency for accepting organ donation in case of need is significantly higher than their tendency towards donating their own organs. While acceptance ratio is 83,3% (n:55) the ratio for donating one's own organ is 57,6% (n:38) [Table 3].

Table 3: Comparison of students' tendencies for donating their organs and accepting organs in the case of need

Questions	Before Dissection			After Dissection		
	Yes	No	Undecided	Yes	No	Undecided
1- Do you want to donate your organs when brain death takes place?	57,6% (38)	9,10% (6)	33,3% (22)	62,1% (41)	12,1% (8)	25,8% (17)
2- Would you accept organ donation from another person whose brain death takes place in case of need?	83,3% (55)	1,5% (1)	15,2% (10)	80,3% (53)	1,5% (1)	18,2% (12)

When asked how the students feel about studying in the anatomy laboratory, there was a scientifically significant difference between before and after first cadaver dissection study ($p < 0.05$). Before the first anatomy laboratory study 16,7% (n:11) of the students described studying in anatomy laboratory as something normal this ratio increased to 37,9% (n:25) after the first laboratory study [Table 4].

Table 4: Distribution of the views of students participating in the research about the anatomy laboratory studies before and after participating in a dissection study

	I think it's "....." to work in the anatomy lab.
--	---

	Frightening	Disgusting	Exciting	Interesting	Something normal
Before Dissection	3% (2)	9,1% (6)	28,8% (19)	42,4% (28)	16,7% (11)
After Dissection	6,1% (4)	4,5% (3)	12,1% (8)	39,4% (26)	37,9% (25)

Discussion And Conclusions

Anatomy studies and lessons are a very important part of medical education. Cadaver needs for anatomy education is increasing day by day. Although there are many different methods for cadaver procurement, most of those procurement methods are a topic of argument in terms of ethic on a broad perspective (Caplan, 2014, Emson, 1987). Among these procurement methods most ethical method is thought to be obtaining body or body parts through donation. Yet still cadaver and organ donation rates are not enough to compensate the need.

There are many studies on the topic of cadaver and organ donation. In a study conducted among 1184 health care professionals, 44,2% of participants claimed they were willing to donate their organs (Akgün, 2003). On another study conducted among 689 intensive care unit staff members rate of willingness to donate organs was found as 49% (Bøgh & Madsen, 2005). In our study this ratio is found as 57,6%.

Healthcare professionals' knowledge and attitudes toward organ donation and transplantation are essential factors to promote a positive influence and rise the donation rate in community. When we evaluate the obtained data; in the case of brain death, it is observed that people would consider donating their own organs more easily than their relatives' organs [Table 2]. However, it is also seen that the rate of donation acceptance is higher when the same situation is questioned according to the needs of themselves or their families [Table 3]. Also people have more positive attitudes towards organ donation than cadaver donation [Table 1].

In conclusion well-rounded anatomy laboratories are essential for increasing the quality of medical education. To achieve such laboratories cadaver procurement is a keystone. In this context, the greatest responsibility for the creation of social awareness in organ and cadaver donation issues is down on the health professionals. Determining health workers' attitudes towards the topic will be helpful in raising public awareness and so increasing the quality of community health and health education.

 City of Dasmariñas, Cavite, Philippines

Abstract

This study was undertaken to evaluate the conduct of Executive Communication course for the Graduate School of Business students of the College of Business Administration and Accountancy of De La Salle University-Dasmariñas, City of Dasmariñas, Cavite, Philippines. Specifically, this determined the profile of the respondents in terms of select classificatory variables, the rating of the respondents on the following: *Syllabus; Content and Methodology of Teaching; Personal Experience and Association; and Celebration/Culmination of the Course*, over-all evaluation of the respondents on the conduct of Executive Communication course for all Graduate School of Business students of De La Salle University-Dasmariñas College of Business Administration and Accountancy, and recommendations of the aforesaid respondents vis-à-vis the conduct of the course. After the evaluation on the conduct of the course, it clearly shows that the College of Business Administration and Accountancy Graduate School of Business of De La Salle University-Dasmariñas is responsive to the needs of the students and that the integration of such to the curriculum effects positive change into the lives of the students. It can also be concluded that the Executive Communication Course Level Learning Outcomes have been fully realized.

Introduction

In SY 2007-2008, the Graduate School of Business of the College of Business Administration and Accountancy of De La Salle University-Dasmariñas, Cavite, Philippines started to offer the Executive Communication course as an elective subject for those students enrolled in the Executive and Regular MBA programs.

For the past years, several students have already enrolled and finished the course. Some have successfully defended their theses and graduated, some have been promoted in their respective areas of work, some have delivered already a number of presentations outside their own work places, some have pursued further studies and have enrolled in the PhD programs, and among others.

However, since its initial offering in SY 2007-2008, no attempts yet have been initiated to evaluate the offering of the Executive Communication course in the Graduate School of Business. This has prompted the researcher to undertake a study to determine how significant and helpful the program has become for all the students who have finished it and likewise identify areas where the program could be better improved, delivered, facilitated, and implemented to future takers. This would help the Graduate School of Business in the revision of its curriculum relative to the offering of the Executive Communication course.

This study was anchored on Paul Allen's *Communication: A Critical Executive Skill* (2017). According to Allen, there is no debate with regard to the importance of communications in the context of executive effectiveness. It is critical for leaders to be able to present their ideas and initiatives in a powerful and compelling way, and to gain backing for those ideas, whether from the team, the board or the customer. Communications effectiveness is a close relation of executive effectiveness.

He further adds that however, despite the importance of this skill, most executives still struggle significantly to craft presentations that are truly compelling or impactful. This could be attributed to those bad habits we don't know how to break creep back in – and all too often we present bland and uninspiring material, leaving our hearers unmoved, and more importantly unmotivated to act. We may laugh at the term 'Death by PowerPoint', but we are often the perpetrator, not the victim.

Finally, Allen clearly elucidates that of course, most companies recognize this problem, and have deployed training to address this important skill gap. Unfortunately, this is where a second problem presents itself. While it certainly makes sense to invest in solving this problem, traditional training solutions typically focus heavily on the trivia of eye contact and body language, squarely hitting the bulls' eye on the wrong target.

The Study

This study focused on the MBA students from the Graduate School of Business of the De La Salle University-Dasmariñas College of Business Administration and Accountancy who enrolled and finished the Executive Communication course from SY 2007-2008 up to SY 2016-2017.

This study utilized the descriptive research survey technique. A survey is a non-experimental, descriptive research method. Surveys can be useful when a researcher wants to collect data on phenomena that cannot be directly observed (such as opinions) (<http://www.gslis.utexas.edu/~palmquis/courses/survey.html>).

A survey is a means of gathering information about a particular population by sampling some of its members, usually through a system of standardized questions. It can be conducted by mail, telephone, personal interview or internet. It can be administered either to individuals or groups. Questions may be related to behaviors, beliefs, attitudes and/or characteristics of those who are surveyed. The aforementioned research technique was employed in this study considering that the purpose of a survey is to elicit information, which after evaluation, results in a profile or statistical characterization of the population sampled. (<http://www.fairfaxcounty.gov/demogrph/pdf/questionnairedesign.pdf>).

Using the Slovin's Formula with the marginal error of 0.1, which gives a 90% accuracy rate, the computed sample size for the study is 73 respondents. The aforesaid respondents finished the Executive Communication course from SY 2007-2008 to SY 2016-2017. All of them were given the communications regarding the conduct of the research and survey questionnaire was also distributed through email and Facebook.

Data for this study were collected with the use of a researcher-made and validated survey questionnaire. The questionnaire is a structured technique for collecting primary data in a marketing survey. It is a series of written or verbal questions for which the respondents provide answers (Quick MBA, Marketing, Knowledge to Power Your Business/www.quickmba.com/marketing/research/design/2008).

A self-made survey-questionnaire was prepared by the researcher and validated by faculty and administrators. It was pilot-tested to select students of the College of Business Administration and Accountancy Graduate School of Business and had undergone reliability testing using the Cronbach's Alpha in which the alpha coefficient for the 28 items is **0.959**, suggesting that the items have an **Excellent Internal Consistency**. Based on the items contained in the questionnaire, the questions were grouped according to the following: PART I: Personal Information; PART II: The Syllabus with 7 items; The Content and Methodology of Teaching with 8 items; The Personal Experience and Association with 10 items; and The Celebration/Culminating Part with 3 items. Commendations and recommendations relative to this were also noted. This study used a 5-Point Likert Scale to evaluate/assess the implementation of the conduct of Executive Communication course.

- 1= Poor; Does not meet expectations
- 2= Needs Improvement; Sometimes meets expectations
- 3= Fair; Meets expectations
- 4= Good; Exceeds expectations
- 5= Excellent; Far exceeds expectations

The survey-questionnaire was sent to all respondents through email and Facebook. The same was retrieved through email, Facebook and personal delivery to the researcher. The survey started on March 28, 2017 and ended on April 25, 2017.

In order to evaluate and assess the implementation of the conduct of Executive Communication course, the following descriptive statistical techniques were applied: mean; and standard deviation. The following was used to interpret the results of the study:

- 4.21 – 5.00 - Excellent; Far exceeds expectations
- 3.41 – 4.20 - Good; Exceeds expectations
- 2.61 – 3.40 - Fair; Meets expectations
- 1.81 – 2.60 - Needs Improvement; Sometimes meets expectations
- 1.00 – 1.80 - Poor; Does not meet expectations

Findings

Evaluation of the Respondents on the Syllabus Used for the Course

	N	Mean	Std. Deviation	Verbal Interpretation
It contains significant and relevant topics in Executive Communication, which can be applied in my current assignment/position.	73	4.6575	.60597	Excellent
It contains specific items about the Expected Lasallian Graduate Attributes such as Passion for Excellence, God-centeredness and Patriotism.	73	4.4521	.78247	Excellent
It has topic learning outcomes, teaching-learning activities and assessment strategies.	73	4.7260	.60691	Excellent
It has sufficient number of references such as books, journals, publications, and other on-line resources.	73	4.3288	.81743	Excellent
It contains topics, which are covered/finished within the given term.	73	4.6301	.58942	Excellent
It has been distributed to the members during the first day of class.	73	4.6301	.67714	Excellent
It has been fully discussed to the class.	73	4.7260	.62938	Excellent
Mean	73	4.5934	.58575	Excellent

Table 1 reveals that generally, the respondents affirmed that the **Syllabus** used in the course was excellently prepared and executed, as evidenced by the mean score of **4.5934**. As regards the specific items contained in this table, the respondents rated the following with excellent evaluation: It contains significant and relevant topics in Executive Communication, which can be applied in their current assignment/position; It contains specific items about the Expected Lasallian Graduate Attributes such as Passion for Excellence, God-centeredness and Patriotism; It has topic learning outcomes, teaching-learning activities and assessment strategies; It has sufficient number of references such as books, journals, publications, and other on-line resources; It contains topics, which are covered/finished within the given term; It has been distributed to the members during the first day of class, and It has been fully discussed to the class. The rating scores show that the **Syllabus** used in the course far exceeds the expectations of the respondents. The excellent rating could probably be attributed to the adherence to the standard format of the DLSU-D Syllabi be it in the Undergraduate or Graduate Levels. Parkes and Harris (Retrieved May 2, 2017 from https://jan.ucc.nau.edu/~coesyl-p/syllabus_cline_article_2.pdf) in their article titled **The Purposes of a Syllabus** explain that the purposes of a syllabus are almost as varied as the possible contents but can be grouped into several categories. The article proposes that syllabi serve three major roles: the syllabus as a contract, the syllabus as a permanent record and the syllabus as a learning tool. Each function has implications for what a syllabus should contain. The syllabus as a contract contains clear and accurate course calendar grading policies: components and weights; attendance policy; late assignment policy; make-up exam policy; policies on incompletes and revisions; academic dishonesty policy; academic freedom policy; and accommodation of disabilities policy. As regards the syllabus as a permanent record, Parkes and Harris include title and date(s) of course; department offering; the course credit hours earned; title and rank of instructor(s); pre- or co-requisites; required texts and other materials; course objectives; linked to professional standards; description of course content; and description of assessment procedures. Finally, as a learning tool, the following compose these functions: planning and self-management skills; time to spend outside of class; tips on how to do well on assessments; common misconceptions or mistakes; specific study strategies; availability of instructor(s) and teacher assistants; campus resources for assistance; offices that aid students with disabilities; relevance and importance of the course to students; and a model of high-quality work. General observations about constructing syllabi conclude the article.

Table 6: Evaluation of the Respondents on the Content of the Course and Methodology of Teaching

	N	Mean	Std. Deviation	Verbal Interpretation
The topics presented range from the very specific to the most challenging ones.	73	4.5205	.66895	Excellent
The basics and rudiments of executive communication such as the different techniques, approaches and methodologies introduced and developed by experts, which shall have an immediate impact on presentations have been included in the discussions and presentations.	73	4.6575	.65020	Excellent
The topics presented stimulate critical thinking, open-mindedness and scholarship in reading and writing.	73	4.5205	.74740	Excellent
The topics help the students in developing, demonstrating and exhibiting mastery in subject presentations by delivering practical examples of what not to do and what to do when caught in those worst-of-all-possible situations that require a higher level of communicative competence.	73	4.6986	.63868	Excellent
The subject itself demonstrates the importance of integrity, truthfulness, objectivity, competency, and proficiency by integrating creative, effective, dynamic, and Christian-like executive communication skills and practices in and out of the business world.	73	4.6027	.70198	Excellent
It also bolsters sensitivity to human, communal and societal needs and problems inferred from the topics by dealing with people and circumstances particularly by engaging in constructive conversations even when criticisms, complaints and other tough encounters are necessary.	73	4.5753	.74382	Excellent
Employment of different teaching and learning methodologies such as Socialized Recitation, Video Presentations, Lecture-Fora, Oral Presentations, Classroom Activities, Article Critiquing, Q and A Sessions have been done.	73	4.6712	.68829	Excellent
Different assessment strategies such as Group Discussion; Oral Presentation; Self and Group Assessment; Self-Introduction; Presentation of the Company Profile; Q and A Sessions; and Critiquing have also been incorporated in the course.	73	4.7534	.66208	Excellent
Mean	73	4.6260	.61533	Excellent

It can be gleaned from Table 6 that in regard the **Content of the Course and Methodology of Teaching**, the respondents agreed that it far exceeds their expectations, as reflected in the mean score of 4.6260 with a standard deviation of .61533. Specifically, it can be noticed that all the 8 items presented have excellent ratings. The excellent ratings could be due to the proven good selection of topics contained in the syllabus and the different methodologies employed in the teaching of the course particularly on the following areas: different techniques, approaches and methodologies introduced and developed by experts; topics presented stimulate critical thinking, open-mindedness and scholarship in reading and writing; topics help the students in developing, demonstrating and exhibiting mastery in subject presentations by delivering practical examples of what not to do and what to do when caught in those worst-of-all-possible situations that require a higher level of communicative competence; the topics bolster sensitivity to human, communal and societal needs and problems inferred from the topics by dealing with people and circumstances; subject presentations demonstrate the importance of integrity, truthfulness, objectivity, competency, and proficiency by integrating creative, effective, dynamic, and Christian-like executive communication skills and practices in and out of the business world; employment of different teaching and learning methodologies and assessment strategies such as Socialized Recitation, Video Presentations, Lecture-Fora, Oral Presentations, Classroom Activities, Article Critiquing, Q and A Sessions; Group Discussion; Self and Group Assessment; Self-Introduction; Presentation of the Company Profile; and among others.

In the article *Effective Teaching Strategies: The Importance of Marrying Content and Process*, Weimer (2008) points out that when teachers think the best way to improve their teaching is by developing their content knowledge, they end up with sophisticated levels of knowledge, but they have only simplistic instructional methods to convey that material. To imagine that content matters more than process is to imagine that the car is more important than the road. Both are essential. What we teach and how we teach it are inextricably linked and very much dependent on one another. She further adds that even though both are tightly linked, development of one does not automatically improve how the other functions. So you can work to grow content knowledge, but if the methods used to convey that knowledge are

not sophisticated and up to the task, teaching may still be quite ineffective. It may not inspire and motivate students. It may not result in more and better student learning. Because teachers so love the content, they almost never blame it. No, it's the students' fault. They aren't bright enough. They don't study enough. They don't deserve to be professionals in this field.

Finally, as excerpted in the Content Knowledge: A Barrier to Teacher Development, The Teaching Professor (2007), Weimer (2008) highlights

the topic "The Power of Process in Determining Student Learning Outcomes". She discusses that the typical college teacher has spent years in courses developing the knowledge skill set and virtually no time on the teaching set. This way of preparing professors assumes that the content is much more complex than the process, when in fact both are equally formidable. Marrying the content and the process requires an intimate and sophisticated knowledge of both. Some kinds of content are best taught by example, some by experience. Other kinds are best understood when discussed and worked on collaboratively. Other kinds need individual reflection and analysis. Besides these inherent demands of the content itself, there are the learning needs of individual students, which vary across many dimensions.

Furthermore, Weimer affirms that the best teachers are not always, not even usually, those teachers with the most sophisticated content knowledge. The best teachers do know their material, but they also know a lot about the process. They have at their disposal a repertoire of instructional methods, strategies, and approaches—a repertoire they continually cultivate, just as they develop content knowledge. They never underestimate the power of the process to determine student-learning outcomes.

Table 7: Evaluation of the Respondents on their Personal Experience and Association in the Course

	N	Mean	Std. Deviation	Verbal Interpretation
I have experienced that introductory activities relative to the topics for the session have been conducted and participation of everyone has been accomplished.	73	4.7534	.59584	Excellent
I have fully appreciated what is expected of me as an ExeCom student.	73	4.6849	.70468	Excellent
I could personally say that I have now fully understood the basics and rudiments of Executive Communication.	73	4.5890	.70387	Excellent
I have seen the relevance of the activities done in the class and have enjoyed them at the same time.	73	4.7534	.66208	Excellent
I have seen that professor and the student-presenters have prepared for the session.	73	4.6438	.71433	Excellent
I have noticed that the lecture room is conducive for the kind of session we have had for the day.	73	4.6164	.82715	Excellent
I have observed that the discussions and activities done in the class have promoted an atmosphere of active participation, commitment and solidarity.	73	4.7260	.69242	Excellent
I have been given the opportunity to share my expectations about the session/activity.	73	4.6712	.68829	Excellent
I have observed that everyone has been given the opportunity to share his/her thoughts about the topics during the session.	73	4.6575	.73066	Excellent
I have observed that everyone has been very comfortable sharing his/her thoughts about the topic.	73	4.5616	.76351	Excellent
Mean	73	4.6658	.63360	Excellent

Going over Table 7, it can be noted that the evaluation of the respondents in terms of their **Personal Experience and Association in the Course** shows an excellent rating, as reflected in the mean score of 4.6658 verbally described as far exceeds expectations. The said mean score clearly shows that the respondents have experienced introductory activities relative to the topics for the session and that they have participated very actively; they fully appreciated what is expected of them as students; they have now fully understood the basics and rudiments of Executive Communication; they have seen the relevance of the activities done in the class and have enjoyed them at the same time; they have seen that professor and the student-presenters have prepared for the session; they have noticed that the lecture room is conducive for the kind of session they have had; they have observed that the discussions and activities done in the class have promoted an atmosphere of active participation, commitment and solidarity; they have been given the opportunity to share their expectations about the session/activity; they have observed that everyone has been given the opportunity

to share his/her thoughts about the topics during the session; and they have observed that everyone has been very comfortable sharing his/her thoughts about the topic. The excellent evaluation is a proof of the commendable partnership between the students with their classmates and the students with their professor. Rimm-Kaufman and Sandilos (2017) in their article titled *Improving Students' Relationships with Teachers to Provide Essential Supports for Learning* clearly elucidates that positive relationships can also help a student develop socially. Improving students' relationships with teachers has important, positive and long-lasting implications for both students' academic and social development. Solely improving students' relationships with their teachers will not produce gains in achievement. However, those students who have close, positive and supportive relationships with their teachers will attain higher levels of achievement than those students with more conflict in their relationships.

Significantly, the American Psychological Association (2017) emphasizes the importance of the topic *How to cultivate positive relationships in your classroom*. This includes: Know your students; Give students meaningful feedback; Create a positive classroom climate; and Be respectful and sensitive to adolescents.

Similarly, Bonura (2008) in her paper *Classroom Relationships* discusses that when students believe that their peers and teachers like and respect them, they are more likely to achieve academic success (as cited by Goodenow, 1993; Ladd, 1990; Ryan & Patrick, 2001). There are many benefits for developing positive relationships with students – students who feel cared for by their teachers and in their learning environments experience higher self-efficacy for learning, enjoy learning more, are more likely to request needed help, less likely to cheat, and more likely to achieve at high levels (as cited by Hayes, Ryan, & Zsellar, 1994; Kim, Solomon, & Roberts, 1995; Murdock, Hale, Weber, Tucker, & Briggs, 1999; Osterman, 2000; Ryan & Patrick, 2001; Ryan, Pintrich, & Midgley, 2001; Wentzel & Wigfield, 1998). Further, Gorham and Millette (1997) indicate that students attribute demotivation (i.e., loss of motivation for academic performance) to teacher behavior, including lack of enthusiasm. Classroom relationships matter in both the traditional classroom and in the modified classroom of an online learning community, where technology strategies need to be developed in ways that support the development of classroom relationships (as cited by Bennett, 1999).

Table 8: Evaluation of the Respondents on the Celebration/Culmination of the Course

	N	Mean	Std. Deviation	Verbal Interpretation
I have witnessed wonderful presentations from the different groups.	73	4.6986	.61655	Excellent
I have seen that the final outputs such as the Lecture Forum, Toastmaster Session and Mock Board Meeting, and Communication Survey are clear manifestations and proofs of the success of the course.	73	4.7397	.68774	Excellent
I find the conduct of ExeCom sessions very relevant, helpful and contributory to my development as a student in the Graduate School of Business and as an employee of my company.	73	4.8082	.63809	Excellent
Mean	73	4.7489	.60588	Excellent

Table 8 presents the evaluation of the respondents on the **Celebration/Culmination of the Course**. The table points out that the all items contained in this area were all rated excellently, as reflected in the mean score of 4.7489 verbally described as far exceeds expectations. The said mean score clearly shows how successful the conduct of the Executive Communication course had become, how the students enjoyed and loved watching presentations of the different groups, how fulfilling the presentation of the final outputs such as the Lecture Forum, Toastmaster Session and Mock Board Meeting, and Communication Survey, and how very relevant, helpful and contributory to their development the course is, as students in the Graduate School of Business and as an employee of the company. In the article titled *What is a Culminating Activity*, the following have been presented: a Culminating Activity should: be central to the purpose of the course or the unit and require students to think about important issues or questions; be multifaceted, requiring a number of skills, different learning styles or mental intelligences, and assess more than one aspect of achievement; be engaging and hold the interest of students over time; use important content and meet many of the specific expectations of the curriculum guideline; provide for clear assessment of student development with levels of achievement identified; be authentic in nature or represent a real-life experience, role or application as opposed to a contrived situation; provide opportunities for the teacher and student to monitor the process of development of the activity or project and assess (formative) the learning; be described in advance to the students, including examples, timeline for development, process sequence, expectations, and formative and summative assessment (The Confederation Chronicles Retrieved May 03, 2017 from www.collectionscanada.gc.ca/obj/008001/f2/008001-4020.10-e.pdf).

Table 9: Over-all evaluation on the Conduct of ExeCom Course

Legend:

4.21 – 5.00	Excellent
3.41 – 4.20	Good
2.61 – 3.40	Fair
1.81 – 2.60	Needs Improvement
1.00 – 1.80	Poor

	N	Mean	Std. Deviation	Verbal Interpretation
Syllabus	73	4.5934	.58575	Excellent
Content and Methodology of Teaching	73	4.6260	.61533	Excellent
Personal Experience and Association	73	4.6658	.63360	Excellent
Celebration/Culmination of the Course	73	4.7489	.60588	Excellent
Overall Mean	73	4.6586	.57493	Excellent

In summary, the over-all result of 4.6586 with an excellent rating verbally described as far exceeds expectations is a manifestation and an empirical proof of the success of the conduct of Executive Communication course for all Graduate School of Business students of De La Salle University-Dasmariñas College of Business Administration and Accountancy. Notably, the individual mean score and standard deviations reveal that the objectives of the course were met, the content and methodology of teaching were highly commendable, the personal experience and association parts were great, and the celebration/culmination of the course were highly appreciated. The excellent rating for the conduct of the Executive Communication course clearly shows that the College of Business Administration and Accountancy Graduate School of Business is responsive to the needs of the students and that the integration of such to the curriculum effects positive change into the lives of the students.

Taking a look at the aforesaid evaluation on the entirety of the Executive Communication course, it can be concluded that the **Course Level Learning Outcomes** have been fully realized specifically on the area of different techniques, approaches and methodologies introduced and developed by experts, do's and don'ts in executive communication; critical thinking, open-mindedness and scholarship in reading and writing; mastery in subject presentations; importance of integrity, truthfulness, objectivity, competency, and proficiency by integrating creative, effective, dynamic, and Christian-like executive communication skills and practices in and out of the business world; and sensitivity to human, communal and societal needs and problems inferred from the topics by dealing with people and circumstances.

Acknowledgments

I have become who I am today because of De La Salle Health Sciences Institute and De La Salle University-Dasmariñas. My gratitude is forever accorded to the men and women of these beloved Institutes of Higher Learning who value faith, zeal for service, communion in mission, and reverence for life. Animo La Salle!

Conclusions

The over-all result of 4.6586 with an excellent rating verbally described as far exceeds expectations is a manifestation and an empirical proof of the success of the conduct of Executive Communication course for all Graduate School of Business students of De La Salle University-Dasmariñas College of Business Administration and Accountancy. Notably, the individual mean score and standard deviations reveal that the objectives of the course were met, the content and methodology of teaching were highly commendable, the personal experience and association parts were great, and the celebration/culmination of the course were highly appreciated. The excellent rating for the conduct of the Executive Communication course clearly shows that the College of Business Administration and Accountancy Graduate School of Business is responsive to the needs of the students and that the integration of such to the curriculum effects positive change into the lives of the students.

Taking a look at the aforesaid evaluation on the entirety of the Executive Communication course, it can be concluded that the **Course Level Learning Outcomes** have been fully realized specifically on the area of different techniques, approaches and methodologies introduced and developed by experts, do's and don'ts in executive communication; critical thinking, open-mindedness and scholarship in reading and writing; mastery in subject presentations; importance of integrity, truthfulness, objectivity, competency, and proficiency by integrating creative, effective, dynamic, and Christian-like executive communication skills and practices in and out of the business world; and sensitivity to human, communal and societal needs and problems inferred from the topics by dealing with people and circumstances.

Evaluation On The Pulitzer and Awarded Workshop Between The World's Most Important Journalism Awards For The Photography Composition Level

Ayşe Derya KAHRAMAN

KTO Karatay University

aysederyakahraman@gmail.com

Summary

Composition is the use of all the narrative elements forming the surface of the photograph as a surface, so that the expression can be effectively used. It is the use of items that will facilitate the expression of the viewer's emotions and thoughts. This regulation needs to be done in a certain art discipline and at a suitable aesthetic rate. The most important elements of the composition are simplicity, simplicity, golden ratio, clarity, balance, harmony and rhythm. This study is based on the review of five photographs of Pulitzer that were among the best journalism awards in the world, taking into consideration these items.

Introduction

The concept of composition is independent of each other, the content is composed of harmony and rhythm harmony together as a whole. The composition that all these components will form creates different aesthetic pleasures in the audience. The concept of composition lies in every aspect of life in nature. According to the constructions in different circles, the seasons are combined with many elements such as geography and they are shaped appropriately. In this sense, composition constitutes the most important part of life (Karageçi 2006: 2).

Composition of the items

Light:

It is necessary to use the light well when creating composition in photography. The most important item in photography is light. Pictures can not be taken without light. By examining every aspect of the framed picture, the direction of the light is selected according to the composition. The light that is used when an object is being taken outside is called the external light. After all, at the beginning of the picture there is light at the end (MEB, 2012: 7). Light creates size, depth volume in the photo. One of the ideal light sources for volume effect is the lateral light. By using shadows, the depth of light is gained by the impression. While light illuminates objects, it also creates visual effects on their color and shape. (Full Moon and Distributor, 2016: 190). It is the first circumstance of visual perception of the world. Secondly, the energy emitted from the light source is projected by a surface to reach the pore. The third is the transmission of energy to the brain by the receptors on the retina layer. It is a kind of energy that allows us to see the light (savior, 2013: 117).

Simplicity

While the composition is being edited in the photo, the complicated rear structure which is not in harmony with the subject is cleaned and simple and simple compositions are preferred. It focuses on the subject of simplicity watching when approaching the main subject. while the composition is applied, it provides short and clear expressions in the simple photograph. The main issue emerges clearly (Akbaş 2011: 34). In a photo, there are many items beside the main item. When the camera reflects on the film you see, items outside the items that support the main theme need to be removed from the photo frame.

Simplicity

Gold

It is a rule applied so that the object or area being photographed can be more pleasing to the eye and be perceived more easily by the brain. The frame is vertically divided horizontally into 3 and consists of 4 points of placement. The photographed object is placed at one of these points to make the composition harmonious. If we want to emphasize the point and dynamism when we take the picture, we can make the frame according to it either horizontally or vertically. In the vertical photograph, the upper side is highlighted; while the front is highlighted on the horizontal (Kamburoğlu 2013: 189).

ratio

Balance:

The balance element forms the compass of the composition. The balance item is used to complement the compositional elements such as light, color, tones, visual accents, main theme, light or dark areas and complement each other. It is controlled with the aim of establishing the balance in relation to the size and space of the content of the photographed image (Akbaş 2011: 50).

Framing

The photographing of the main theme alone leads to a dry view; but when enriched by framing, a beautiful composition is obtained. Framing hides non-point-blank images that do not look nice, as well as showing the photographs of objects in a different way, resulting in a smooth image. The framing element of the composition reveals details in landscape and architectural shots. In this context, such elements as doors, windows, between tree branches, between minarets and columns can be used as a natural frame (Akbaş 2011: 172).

Mounting

Overlapping mistakes must be avoided to achieve a successful composition. This error can be encountered in many photo types. When composing a composition, it is distracting to overlay other objects or lines on the highlighted theme. The fact that the background and the objects on the front are in the same tone and colors make the picture inevitable. The points to be emphasized disappear with the mixing of tones. The object to be removed to the foreground disappears in the overlying colors. As a result, the desired contrast can not be revealed (Eyriboyun 2009: 31).

Stain and Form

The photograph, which shows the instantaneous particles of time, shows the physically stationary objects in two dimensions. The photographed objects can be reflected and changed by changing to the viewfinder of the photographer. In this context, the meaning of the content of the photograph may change. Stain and form elements also show moments when our living spaces reflect on the photo. The stain element in the composition shows the boundaries of the items photographed in two dimensions; and the form element is three-dimensional. The blemish and the form carry graphical features besides providing images from the real world to us. The abstraction effect of these graphical features becomes more evident by the transformation of the photographed objects into a square (Akbaş 2011: 84).

Tissue

All the motifs in the scene are made up of the texture that comes together. The tissues of the light from the side more reveal very successful compositions. In this context, photographs can be taken with the aim of getting closer to the main theme with the appropriate optical material. Appropriate objects for texturing: Painted walls or painted walls in ruins and rundown spaces, dehydrated soil, carpet designs, dry tree caves, fences ... (Kamburoğlu 2013: 192). It is evident that the proportions of these proportions are more attractive when certain ratios are involved in the disintegration of the surface within a given frame. Apart from the abstract richness that the lines, dots, and tones expressed on the surface impart to the surface, there are second-order functions such as giving depth to the small diameter by reflecting the natural structure of the surface (kalfagil 2014: 153).

Background

In the composition, the background photographed is an element of life, color, strength of meaning, and richness of the object. The photographed object is backed with a background; Sometimes there is an opposite meaning. This changes according to the purpose of the photographer. The background is one of the main elements of the photo. When photographing an object in the foreground, it is important to pay attention to the suitability of the background for the object. In this context, the front panel must be avoided from details that would pull the standing object away from the center of interest and create a mixed image. The things to be avoided are the tree branches that entered the frame, and the details of the other structures beside a frame full of the face, which distort the composition as if it were in the frame from the edges (Akbaş 2011: 104).

Rhythm

Rhythm is an object to use many times in photography. It is more influential than the fact that the photographs that make up the rhythm consist of repeating itself regularly and repeating it irregularly. Multiple narrative is more advantageous than single narrative. For example; a harmonious image of flowers with the same color, a row of people walking in a single row, a staircase, steps, a lot of image rhythms in the nature (birds fly in sequence, traces shaped by the wind etc.) (MEB 2011: 7). More objects on three sides with equal spacing make a stronger emphasis than the complex array. The prerequisite for equating rhythm is equally spaced. At least two intervals are required to be able to speak of equality. In addition, equally spaced objects must be identical in order to be able to speak rhythm (kalfagil, 2014. 96).

Contrast

Contrast, which is literally the opposite of word meaning, is the fact that elements that express opposition in terms of color, light and objects are placed in a square. For example; Two items of different sizes must be in the same frame to emphasize their size. An image of objects moving in two different directions can be an example of motion contrast. A rounded object with a square cismis on the same square is a form of contrast. Colors can also emphasize contrast. The use of two different color shades leads to both contrast enhancement and richness in the photo (MEB 2011: 9). Contrast

It is the relationship between the elements that make balancing the one in the photo and the elements that make it balancing. The mobility brings vitality to the photo. Contrast is the relationship between vertical horizontal lines, hardness softness, distance proximity, dark lightness, color tones (Carafgil, 1981: 12). The contrast in the colors becomes important in the photo. Contrast gives a unique message. The presence of more than one contrast area in the photo can create confusion, while the low contrast areas lead to soft sensations (Grill and Scanlon, 2003: 15).

In the composition the light is reflected from the correct location. The photograph is of a framed nature. It is a triangular composite of the refugee's eclipse shape. Composition is simple and the background is also simple. The main subject, the refugee front plan has been removed. The photographer used the horizontal frame. There is a hand perpendicular to the horizontal composition. The subject is centered in a balanced manner. Photo colors are composed of cool colors. Only a strip of burgundy that cuts from the bedside, which is in the form of a red line on the bottom, appears.

Horizontal and vertical framing is used in the composition. The graffiti on the train increases the attention to the subject. In the composition, the backlit trainers provided movement to the composition in the vertical position. The hand movement of the left-hand side of the refugee gives the feeling that it is pointing to the subject. Another factor that activates the mind is that the refugees are rhythmically standing with a steady position.

Foto 3: Tranquil composition was used in photography. The attention of the refugee in front of the subject attracts attention. Sky and sea colors are united in gray tones. It gives horizontal movement to the vertical composition with the hand attracting small refugees. Refugees on the back improve the expression of the child in front. As a composition, overlapping is the issue. Correct framing is used. Colors are harmonious in terms of light usage

The two refugees who fall on a steel field to get the goods distributed are visually accentuated. The overlapping refugees are taking a rhythm to get the goods distributed. Blue hats also form a rhythm. In the photo there is a triplet composition.

RESULT:

Composition is the use of all the narrative elements forming the surface of the photograph as a surface, so that the expression can be effectively used. There are a number of schemes in mind when it comes to composition. These schemes are the functional fiction of photography. The photograph also contains its own plastic items. This study is based on a review of five photographs that won the Pulitzer award among the world's best journalistic awards, taking advantage of basic design elements. It is thought that the worker will contribute to the writing of the field about photo analysis.

Examination Of Computer Based Statistical Usage Of Higher Education Students Within The Framework Of Technology Acceptance Model

¹Yasemin KARATAŞ ELÇİÇEK

²Mithat ELÇİÇEK

³Hasan KARAL

Abstract

With increasing interest in the demand for statistical information, the amount of statistical data has increased considerably. This increase in the amount of data has resulted in the need for software to analyze data accurately and quickly. For this reason, many statistics software has been developed. SPSS (Statistical Package for the Social Sciences) is also one of these software, especially used in computer-based statistical courses. Mostly preferred in higher education institutions. It is possible to talk about many advantages of computer-based statistical software. However, when the literature is examined, it is seen that sensory features such as attitudes, intentions, beliefs, benefits and behavior are determinants in the use of computer-based statistical software. In this context, the aim of the research is examination of computer based statistical usage of higher education students within the framework of technology acceptance model. The survey research method was used in the research. The sample consists of 82 students attending Computer and Instructional Technology Education at Siirt University in 2017-2018 spring term. As data collection tool, a seven-point likert type scale developed by Šebjan, Tominc and Yıldırım (2017) using the framework of Technology Acceptance Model (TAM) consisting of 20 items and 5 dimensions (Ease of SPSS Usage, SPSS Usability, SPSS Usage Attitude, SPSS Usage Intent, Statistical Information Requirements Compatibility). In the analysis of the data, percentage, frequency, mean and t-test were used. According to the results of the research, higher education students' admission and utilization levels were high. In addition, it was observed that there was a difference in the acceptance levels of students who had previously received computer-based statistical education and those who continued to receive computer-aided statistical education, attitudes towards the use of SPSS, and intentions to use SPSS.

Examination Of Some Performance Tests Used In Tennis Talent Selection And Anthropometric Characteristics By Gender

Selma CİVAR YAVUZ, Meryem ÇOBAN

Faculty of Sport Sciences, Sport Sciences Research and Application Center, Akdeniz University TURKEY
scivar@akdeniz.edu.tr

Abstract

The aim of this study is to examine some performance tests used in tennis talent selection and the anthropometric characteristics by gender. A total of 60 athletes consisting of 30 females with an average of age of 09.99 ± 01.87 years, an average height of 137.25 ± 11.92 cm, an average weight of 34.75 ± 08.13 kg and a body mass index (BMI) of 18.19 ± 01.90 kg/cm², and 30 males with an average of age of 09.93 ± 01.84 years, an average height of 142.30 ± 14.02 cm, an average weight of 35.25 ± 09.27 kg, and a body mass index (BMI) of 18.19 ± 01.90 kg/cm² voluntarily participated in the study. Participants participated in anthropometric and performance tests. All anthropometric measurements were performed according to the Anthropometric Standardization Reference Manual. Height measurements were performed using a digital height measuring device, weight measurements were performed using a weighing machine with 0.01 kg precision, and skinfold measurements (skinfold thickness) were performed with Holtain brand caliper as recommended by Lohman. The obtained values were recorded in millimeter by taking the average of the two closest measurements. Measurements were taken from a total of 5 regions including biceps, triceps, subscapular, suprailiac and calf. Circumference measurements were taken from a total of 4 regions including thigh, knee, calf and forearm as recommended by Behnke and Wilmore. In diameter measurements, humerus and femur diameters were measured with anthropometric caliper. Of performance measurements, sit and reach flexibility, triple jump, 10m sprint, targeting, medicine ball throw, flamingo balance test, and auditory and visual reaction tests were applied. 10m sprint test was performed using the Newtest 2000 device, upper body strength was measured by medicine ball throw test, leg quick strength was measured by standing triple long jump test, flexibility was measured by sit and reach test, static balances were measured by flamingo balance test, targeting was measured by tennis balling throw test, and the auditory and visual reaction time was measured using the New-Test 2000 device. As a result of the statistics, no statistically significant difference was found between the groups in terms of age, height, weight, and BMI values ($p < 0.05$). With respect to the anthropometric characteristics of the participants, it was seen that only the difference between gender-specific averages of humeral diameter values of bone diameter measurements was statistically significant ($p < 0.05$). In the comparison of the performance values of the participants, it was seen that only the difference between gender-specific averages in auditory reaction values was statistically significant ($p < 0.05$). When the data obtained as a result of the study we carried out on boys and girls playing tennis were examined with other studies, it was seen that they showed low or high values in some parameters although they are partially parallel to other similar studies in Turkey. It is thought that this may depend on many factors such as individuals' nutritional status, environmental conditions, training quality and coach attitude.

Keywords: *Children, tennis, performance, anthropometric characteristic*

Introduction

To achieve a high level of success in sports is closely related to early orientation to sports. The fact that children and the young are oriented to the branches where they will have the highest performance at the right time constitutes the most important issue of sport science. For this reason, it is an important issue to orient children to the branches where they can be successful at the earliest possible age. Tennis is a performance sport in which aerobic and anaerobic loads are together and also which requires a good level of biomotorical features such as strength, speed, durability, flexibility and coordination.

A tennis match normally lasts for 1.5-2 hours on average under normal circumstances, but it also appears to reach 4 hours (Fernandez et. al., 2006). In tennis branch, technical and tactical trainings are primarily kept at the forefront to make an athlete to reach high-level performance. However, it should not be forgotten that body composition also affects physical performance. Nowadays, it should not be forgotten that sporting success is associated with starting sports at an early age regardless of the branch. Nevertheless, it is of great importance to be involved in sports at an early age since sports will play a significant role in the growth, maturation, cognitive development and socialization of the child.

In this study, some performance tests used in tennis talent selection of male and female athletes performing sports in the tennis branch and gender-specific anthropometric characteristics were examined.

The Study

Participants

A total of 60 athletes consisting of 30 girls with an average of age of 09.99 ± 01.87 years, an average height of 137.25 ± 11.92 cm, an average weight of 34.75 ± 08.13 kg and a body mass index (BMI) of 18.19 ± 01.90 kg/cm²,

and 30 boys with an average of age of 09.93 ± 01.84 years, an average height of 142.30 ± 14.02 cm, an average weight of 35.25 ± 09.27 kg, and a body mass index (BMI) of 18.19 ± 01.90 kg/cm² voluntarily participated in the study.

Measuring Instruments

All anthropometric measurements were performed according to the Anthropometric Standardization Reference Manual (Lohman et al., 1988). Height measurements were performed using a digital height measuring device (heels together, in upright position and barefoot) and were recorded in cm. Weight measurements were performed (barefoot, t-shirt and shorts) using a weighing machine with 0.01 kg precision (TANITA TBF-300), and the results were recorded in kg. Skinfold measurements (skinfold thickness) were performed by measuring twice on the right side of the body with Holtain brand caliper (Holtain United, Dyfed, UK) as recommended by Lohman, and a third measurement was performed when the difference between the two measurements was greater than 0.4. The obtained values were recorded in millimeter by taking the average of the two closest measurements. Measurements were taken from 5 regions including biceps, triceps, subscapular, suprailiac and calf. Circumference measurements were taken from a total of 4 regions including thigh, knee, calf and forearm as recommended by Behnke and Wilmore. In diameter measurements, humerus and femur diameters were measured with anthropometric caliper. In our study, sit and reach flexibility, triple jump, 10m sprint, targeting, medicine ball throw, flamingo balance test, and auditory and visual reaction tests of performance measurements were applied.

10m Sprint Test: 10m sprint test was performed using the Newtest 2000 device. Participants were asked to run for 10 meters at maximum speed with high start in the 10-meter area designated. Measurements were taken with the photocell placed in the start and end sections. The test was repeated twice, and the best result was recorded.

Medicine Ball Throw Test: The medicine ball throw test was applied to measure the upper body strength. Participants were asked to extend parallel to the ground with hip, back and head in upright position and legs ahead and to throw the ball forward over the head with two hands in order to throw the medicine ball weighing one kilogram as forward as possible horizontally. The distance the starting point of the ball to the point where it first hits the ground was taken in cm. The test was repeated twice, and the best result was recorded.

Standing Triple Jump Test: Its purpose is to measure the leg quick strength. Participants were asked to make three jumps in the standing position, without gaining speed, in posture position, with the two legs connected with each other. The distance between the line at jumping point and the latest jumping point was measured in cm. The test was repeated twice, and the best result was recorded.

Flexibility Test: The sit and reach test was applied to determine the flexibility feature. The participant was asked to sit on the flat ground, to evenly lean his bare soles against the test table, and then to wait for a second or two seconds at the latest point with arms and fingers stretched and straight by extending his body forward as far as possible, and the best result was recorded after two trials.

Flamingo Balance Test: Flamingo Balance Test was used to determine the static balances of the study group. The aim is to stand in balance on an iron bar or metal beam with one leg (50cmx4cmx3cm). According to this test, participants stand in balance on the balancing instrument by extending dominant leg forward. He bends his other leg on the knee, pulls it towards his hip and holds it with his hand on the same side. The time starts when the research group stands in balance with one foot in this way, and they try to stay in balance for 1 minute in this position. The time is stopped when he becomes unbalanced (if he leaves his foot while holding, if he falls to the ground from the board, if he touches the ground with any part of his body, etc.). The time resumes when the research group gets onto the balancing instrument and keeps balance again. The test lasts for one minute in this way. When the time finishes, every attempt of the research group to keep balance (after falling) is counted, and this number is recorded as the score of the research group when one minute is completed at the end of the test.

Tennis Ball Throwing Test: The participant was asked to take the tennis ball into the basket hanged against him. The aim is to measure how many tennis balls he has targeted. The participant was asked to try to target 20 balls to the basket. The amount of balls he could target was recorded. Auditory and visual reaction time measurements were performed using the New-Test 2000 device. Before the test, the test was explained to all participants, and they were allowed to sit on the chair, put their hands on the table, sit comfortably and make a trial. The athletes were ensured to concentrate and to push the button with their index fingers. Sound and light stimuli were given for 3 times. The reactions of the athlete were recorded as a measurement result in milliseconds and by calculating the arithmetic mean.

Data Analysis

The statistical analyses of this study were performed using the IBM 22.0 SPSS package program. Mean, Standard deviation (SD), minimum (Min.) and maximum (Max.) were used as descriptive values. Before performing the statistical operations, the Kolmogorov-Smirnov was applied for controlling the normal distribution, and the Levene's Test of Homogeneity was applied for controlling the homogeneous distribution. The Independent-Samples T test was used in the comparison of gender-specific groups to determine the differences between the groups. A significance level of $p < 0.05$ was used in the analysis of the data.

Findings

The mean, standard deviation, minimum and maximum values of age, height, weight and body mass index values of boys and girls participating in the study are presented in table 1.

Table 1. Age, height, weight and BMI values of Boys and Girls

Girls (n=30)			Boys (n=30)		
Mean ± S.D.	Minimum	Maximum	Mean ± S.D.	Minimum	Maximum
09.99±01.87 13.33	07.41	13.42	Age (year)	09.93±01.84	07.42
137.25±11.92	111.00	160.00	Height (cm)	142.30±14.02	110.00
34.75±08.13	19.00	52.00	Weight (kg)	35.25±09.27	20.00
18.19±01.90	15.42	22.32	BMI (kg/cm ²)	17.26±03.16	13.43
					25.60

The comparison of the age, height, weight and body mass index values of the participants of the study is presented in table 2.

Table 2: Comparison of the age, height, weight and BMI characteristics of the participants

Girls (n=30)		Boys (n=30)		t Value	P Value
Mean ± S.D.		Mean ± S.D.			
09.99±01.87	Age (Years)	09.93±01.84		-0.017	0.915
137.25±11.92	Height (cm)	142.30±14.02		1.227	0.227
34.75±08.13	Weight (kg)	35.25±09.27		-1.181	0.857
18.19±01.90	BMI (kg/cm ²)	17.26±03.16		-1.114	0.272

The anthropometric mean, standard deviation, t value and p values of the participants of the study are presented in table 3.

Table 3. Gender-specific comparison of the anthropometric characteristics of the participants

Girls (n=30)		Boys (n=30)		P Value
Mean ± S.D.		Mean ± S.D.	t Value	
13.18±03.29	Triceps	11.92±03.60	-1.153	0.256
07.75±02.33	Biceps	06.97±01.61	-1.230	0.226
09.67±03.60	Subscapula	08.23±02.52	-1.453	0.154
08.53±02.89	Subrailliac	08.57±04.81	0.028	0.978
13.80±03.76	Calf	13.72±04.66	-0.060	0.953
08.14±00.70	Femur diameter	08.19±00.82	0.206	0.838
05.06±00.65	Humerus diameter	05.58±00.76	2.329	0.025*
28.65±03.34	Calf circumference	28.78±03.46	0.116	0.908
38.72±05.26	Thigh circumference	38.15±04.57	-0.369	0.714
21.70±03.13	Forearm circumference	21.25±03.30	-0.442	0.661
31.42±03.29	Knee circumference	31.27±03.69	0.136	0.893

*p<0.05

In anthropometric characteristics of the participants, it was seen that only the difference between gender-specific averages of humeral diameter values of bone diameter measurements was statistically significant (p<0.05).

The mean, standard deviation, t-value and p-value of targeting, flexibility, visual and auditory reaction, 10 m sprint, triple jump, flamingo balance and medicine ball throw tests of the participants are presented in table 4.

Table 4. Performance values and gender-specific comparison.

Girls (n=30)		Boys (n=30)		P Value
Mean ± S.D.		Mean ± S.D.	t Value	
07.65±01.76	Target (hit)	08.40±02.42	1.123	0.268
22.25±07.08	Flexibility (cm)	23.65±05.68	0.689	0.495
460.50±87.24	Visual Reaction (sec.)	497.55±94.94	1.285	0.207
378.30±57.23	Auditory Reaction (sec.)	463.95±100.74	3.306	0.002*
02.53±00.34	10 m Sprint (sec.)	02.50±00.26	-0.352	0.726
105.9±21.71	Triple Jump (mt)	117.90±26.67	1.567	0.125
05.53±03.43	Flamingo Balance (error)	05.37±02.96	-1.152	0.880
06.08±02.16	Medicine Ball Throw (mt)	05.88±01.27	-0.358	0.723

*p<0.05

In the comparison of the performance values of the participants, it was seen that only the difference between gender-specific averages in auditory reaction values was statistically significant ($p < 0.05$).

Conclusions

In the study carried out to examine some performance tests used in talent selection made in tennis and the anthropometric measurements by gender, the following results were obtained in the gender-specific evaluation of age, height, weight, body mass index (BMI), flamingo balance test, medicine ball throw, triple jump, tennis ball targeting, auditory and visual reaction, 10 m sprint, sit and reach test values of the participants. No statistically significant difference was found between the groups in terms of age, height, weight, and BMI values ($p < 0.05$). This also removes the idea that chronological age or a physical characteristic with height and weight values could be effective, in the evaluation of both genders in the same age group in our study.

In a study carried out on little girl athletes with an average age of 9.75 ± 0.41 years, it was reported that skinfold values were measured as 13.13 ± 2.62 mm for triceps, 7.46 ± 1.95 mm for biceps, 9.51 ± 3.31 mm for subscapula, 12.77 ± 4.34 mm for suprailiac, and 14.52 ± 2.23 mm for calf. In the same study, in circumference measurements, biceps circumference and calf circumference were reported to be 22.1 ± 1.9 cm and 22.1 ± 1.9 cm, respectively, while it was reported that humerus diameter and femur diameter were measured as 6.0 ± 0.4 cm and 8.8 ± 0.5 cm, respectively (Bektaş et al., 2007). In our study, it was determined that girl athletes' skinfold values were 13.18 ± 0.29 mm for triceps, 07.75 ± 0.23 mm for biceps, 09.67 ± 0.36 mm for subscapula, 08.53 ± 0.29 mm for subrailliic and 13.80 ± 0.37 mm for calf, that diameter measurements were 08.14 ± 0.07 cm for femur diameter and 05.06 ± 0.05 cm for humerus diameter, and that circumference measurements were 28.65 ± 0.34 cm for calf circumference, 38.72 ± 0.52 cm for thigh circumference, 21.70 ± 0.13 cm for forearm circumference and 31.42 ± 0.29 cm for knee circumference. Although similar results were found in many variables when we compared the results of our study with the results of this study, it is seen that there are differences in subrailliic and calf skinfold value, and in humerus and femur diameter value. In another study carried out on female students with an average age of 9 years, skinfold values were reported as 7.10 ± 1.06 mm for triceps, 4.05 ± 0.96 mm for biceps, and 5.07 ± 0.05 mm for subscapula (Ziyagil et al., 1999). It is seen that these values are lower than the values in our study. It can be said that the reason for this is related to involvement in sports.

In our study, it was determined that boy athletes' skinfold values were 11.92 ± 0.36 mm for triceps, 06.97 ± 0.16 mm for biceps, 08.23 ± 0.25 mm for subscapula, 08.57 ± 0.41 mm for subrailliic and 13.72 ± 0.46 mm for calf, that diameter measurements were 08.19 ± 0.02 mm for femur diameter and 05.58 ± 0.06 mm for humerus diameter, and that circumference measurements were 28.78 ± 0.46 mm for calf circumference, 38.15 ± 0.47 mm for thigh circumference, 21.25 ± 0.30 mm for forearm circumference and 31.27 ± 0.39 mm for knee circumference. In a study carried out on boys in the 7-11 age group, it was reported that the average height of boys in the 9-year-old age group was 130.42 ± 6.99 cm and their average weight was 31.05 ± 7.66 kg (Özgün, 2002). The values related to physical characteristics obtained from our study are not parallel with the values of the same age group in this study. In another study carried out on 8-10 year old boys, triceps skinfold value was reported to be 9.59 ± 3.25 mm (Ayan et al., 2007). In a study carried out to determine the health-related physical fitness norms of 8-10 years old Turkish boys, triceps skinfold value was reported to be 10.46 ± 5.21 mm for an average of 9 years (Güler et al., 2004). The values obtained in that study are not parallel to our study and do not support the study. Subscapular skinfold thickness is an anthropometric measurement that best reflects the amount of fat in the central region of the body (Selby et al., 1989).

With respect to performance values, it was determined that the number of hits in the tennis ball target hit test was 07.65 ± 0.17 in girls and 08.40 ± 0.42 in boys, flexibility values (cm) were 22.25 ± 0.08 in girls and 23.65 ± 0.68 in boys, visual reaction time (seconds) was 460.50 ± 87.24 in girls and 497.55 ± 94.94 in boys, auditory reaction time (seconds) was 378.30 ± 57.23 in girls and 463.95 ± 100.74 in boys, 10 meter sprint test value (seconds) was 02.53 ± 3489 in girls and 02.50 ± 0.26 in boys, triple jump test value (meters) was 105.9 ± 21.71 in girls and 117.90 ± 26.67 in boys, flamingo balance test value (error) was 05.53 ± 0.43 in girls and 05.37 ± 0.29 in boys, and medicine ball throw test value (meters) was 06.08 ± 0.16 in girls and 05.88 ± 0.17 in boys. As a result of the statistics, it was seen that the difference between the genders was significant in favor of girls only in the auditory reaction test in performance values ($p < 0.05$). In a study carried out on children, it was reported that there was no significant difference between boys and girls in terms of motor performance. Girls were found to be more inactive than boys. Furthermore, it was stated that there was a significant positive correlation between physical activity and motor performance (Fisher et al., 2004). Attracting children to sports is influential in the formation of healthy and productive societies (Turna and Kılınç, 2018). In a study carried out on girls playing tennis with an average age of 9 years, it was reported that the mean value of standing long jump performance was 1.39 ± 0.13 m (Akşit and Özkol, 2006). In another study, it was reported to be 100.36 ± 17.62 cm. (Haslofça et al., 2006). Speed is an important motor characteristic that determines efficiency in many types of sports. In a study carried out on 9-10 year old girl students, it was reported that the mean 20 m sprint was 4.23 ± 0.19 seconds and the mean medicine ball throw was 5.33 ± 0.94 meters (Arabacı et al., 2008). In another study, the mean 20 m sprint was reported to be 4.51 ± 0.21 seconds (Ziyagil et al., 1999). We know that the variables related to talent selection in sports are of similar nature

in many sport branches. However, there are some differences when orientation to branch in talent selection is taken into account. For instance, it has been indicated in many studies that the maximal speed of athletes and even athlete candidates should be examined while making evaluation for short distances in talent selection in athletics. In a study carried out on talent scanning in children aged 10-12 years, it was reported that the flexibility value was 18.7 ± 5.2 cm in girls and 20.0 ± 6.4 cm in the 12-year-old age group, and in males, it was 17.3 ± 5.4 cm in the 10-year-old age group and 18.4 ± 5.6 cm in the 12-year-old age group. In the same study, standing medicine ball throw was reported to be 419.2 ± 87.9 cm in 10 year old girls, 481.9 ± 92.7 cm in the 11-year-old age group and 543.8 ± 116.3 cm in the 12-year-old age group. (Pekel, 2007). In a study carried out on boys aged 10-12 years who do not play sports, it was reported that the flexibility value was 10.7 ± 3.6 cm and the value of standing medicine ball throw was 507.5 ± 0.92 cm (Gül et al., 2006).

When the talent search model of norm studies which can be performed in many areas of sports is considered, it is stated that very complicated tests should not be used. In particular, it is stated in various sources that most of the preliminary tests are composed of simple field tests and the coach's observations provide the most important information. An athlete with normal values will be able to perform better than an athlete who keeps himself background in some environments and cannot show his real performance. On the other hand, among two children with the same chronological age, the child with early development will be able to get a much better test data compared to the child with late development. In such cases, not only the studies like talent scanning studies and norm development will be important but also the coach's observation will be of great importance.

When the data obtained as a result of the study we carried out on boys and girls playing tennis were examined with other studies, it was seen that they showed low or high values in some parameters although they are partially parallel to other similar studies in Turkey. It should not be ignored that this may depend on many factors such as individuals' nutritional status, environmental conditions, training quality and coach attitude. It should not be forgotten that to carry out more comprehensive studies by addressing environmental factors during talent scanning in future studies may be an important factor in the selection of sports branch.

Authors' Disclosures of Potential Conflicts of Interest

The authors indicated no potential conflicts of interest.

Abstract

This study aimed to determine the use of social networks in educational environments from a student's perspective, for which 57 students at Kastamonu University, Kastamonu Vocational School, Department of Nursing and Care Services, Child Development Programme and taking Educational Tools and Development course were interrogated. The students were asked to use Facebook, which was among the most used social networking sites in Turkey. A group of administrators were selected based on volunteerism among the students enrolled in the course. A closed Facebook group was created for these students. Each week, the students posted the images of the materials and their ideas of the new course material in this closed group. Other fellow students shared positive or negative criticisms about these posts by stating their reasons. The course instructor commented on students' new ideas. At the end of the 15-week course, students' opinions were gathered via semi-structured interview form and evaluated using a content analysis method. A total of 724 statements of opinion were obtained according to the research results. These expressions were collected under Technological Advantages, Negativities, Influencing Classroom Communication, Factors Considered in Commenting, Idea and Project Sharing.

Keywords: *Social media, Facebook, material development course*

Introduction

Many innovations have come to the fore in the 21st Century in the field of information and communication technologies. One of them is the emergence of some new techniques and applications that transform users into active participants instead of passive recipients in the information building process (Amasha & Alkhalaf, 2017). Social networking sites (SNS) are particularly popular among youngsters (Fewkes & McCabe, 2012). Kaplan and Haenlein (2010) defined social media as 'a group of Internet-based applications that build on the ideological and technological foundations of Web 2.0 and that allows the creation and exchange of user-generated content' and have classified the existing social media as follows:

Table 1: Classification of social media based on social presence/media richness and self-presentation/self-disclosure (Kaplan & Haenlein, 2010)

Self-presentation/Self-disclosure	Social presence/Media richness			
		Low	Medium	High
	High	Blogs	Social networking sites (e.g. Facebook)	Virtual social worlds (e.g. Second Life)
	Low	Collaborative projects (e.g. Wikipedia)	Content communities (e.g. YouTube)	Virtual game worlds (e.g. World of Warcraft)

Nowadays, people not only need online networks connections but also feel obligated to be connected to their SNS that offer a wide range of services (Kanthawongs et al., 2016). People join social media sites, create profiles, connect with existing friends, maintain communication and interpersonal relationships, update various events, share photos, archive events, receive news about their friends, add new friends, inform friends or family members about new developments (Civicevic et al., 2016).

970 million users registered on social media in 2010; this figure reached 2.62 billion in 2018 and is estimated to be 3.02 billion in 2021. As of April 2018, the most used SNS include Facebook (2.234 billion users), YouTube (1.5 billion users), WeChat (980 million users), Instagram (813 million users), Tumblr (794 million users), QQ (783 million users) and Twitter (330 million users) (Statista, 2018). As of January 2018, there are 51 million active SNS users in Turkey, equivalent to 63% of the total population. These users spend an average of 2 h 48 min per

day on SNS. The widely used SNS in Turkey include YouTube (44 million users), Facebook (41 million users), Instagram (37 million users) and Twitter (29 million) (Weareinsocial, 2018).

SNS offer advantages to students, such as sharing information, asking for help and questions to fellow students. Instructors can get access to students even outside school (Mazer, Murphy, & Simonds, 2007), use SNS as a forum and a blog (Barczyk & Duncan, 2013) as well as a learning management system (Manca & Ranieri, 2013).

Social media tools are a powerful means for changing teaching and learning practices in terms of openness, interaction and socialisation (Manca & Ranieri, 2016). Students use Facebook for leisure activities and not for educational purposes. Facebook apps are used less for educational purposes and more for connecting with friends (Kanthawongs et al., 2016). There is no direct connection between the intensity of Facebook use and the academic performance of students (Jankovic et al., 2016; Lambic, 2016). However, several studies mentioned the positive effects of using Facebook for education (Ainin et al., 2015; Irwin et al., 2012; Shih, 2011).

Using collaboration tools and interaction opportunities of Facebook, this study was conducted to determine the opinions of the students regarding the usage of Facebook in material development for educational purposes.

Method

Study Group

The study group comprise 57 second-year students enrolled in 'Materials and Education Development in Education' course in the Child Development Programme of the Kastamonu University Vocational School of Higher Education during the 2017–2018 spring semester.

Process

The research was performed for 15 weeks during the 2017–2018 spring semesters. The course was held face-to-face for 5 h per week. After the course, students shared the necessary changes in their work, the new ideas they wanted to implement, every step taken to achieve these ideas, the materials they used in the closed group created on Facebook. The friends of the students, and when necessary, the instructor responsible for the course, contributed to the sharing of the students by commenting. Students were given the opportunity to criticise the works of their friends in the Facebook group. After the practice, the interview form was used to obtain students' opinions about the course. Three expert opinions on the interview form were taken, and the form was finalised in line with expert opinion.

Data-collection Tool

The data were collected from students with an open-ended interview form, which comprised the following five questions:

- Q1) What were the advantages of using SNS during this course?
- Q2) What were the disadvantages of using SNS during this course?
- Q3) How did using SNS in this course affect classroom communication?
- Q4) What were the things you paid attention to when commenting on the work of your friends on SNS during this course?
- Q5) What type of contribution did your friends share of their work and ideas on SNS with you during this course?

Analysis of Data

The data of this study were obtained with open-ended questions in the interview form. Participants were asked to write their answers in an itemised format. The contents were then analysed in detail considering the similarities and differences between them, and similar data were collected under the categories (main category) determined during the analysis. Subsequently, these data were re-examined and subcategories were created under the main categories (Yıldırım & Şimşek, 2011). Based on this practice, the method can be called as content analysis (Weber, 1990).

Content analysis is a systematic, repeatable technique, in which certain words of a text are summarised by small content categories using codes based on certain rules (Büyüköztürk et al., 2008).

Grounded theory methodology was used for data analysis. Some opinions of the participants were included in the findings of this study. The anonymity of the participants was maintained according to research ethics. While including their opinions, participants were given codes starting with K and indicating their number.

Reliability Study

The draft of the interview form was prepared by discussions and joint opinions of two researchers. This draft form was presented to the expert, and the form was finalised according to the feedback received. A pilot study was conducted with two students to draft a preliminary test of this form. The students stated that the questions were clear and understandable.

Two researchers formed the main categories and subcategories by discussing the data codes at each stage of the content analysis. The coding under the generated categories was presented to two different evaluators who reviewed the coding independently. As a result of the evaluation, it was considered as ‘agreement’ if evaluators agreed with the coding and ‘disagreement’ if they did not agree. The following formula was used to calculate the reliability of coding (Miles & Huberman, 1994): $\text{Reliability} = \text{Agreement} / (\text{Agreement} + \text{Disagreement})$. Reliability calculations were made separately for each sub-problem, which are listed Table 2.

Table 2: Reliability coefficients for the questions

Sub-dimensions	Number of Sentences	Reliability Coefficient
Technological Advantages	221	0.94
Negativities	88	0.82
Influence on Classroom Communication	143	1
Factors Considered on Commenting	117	0.87
Factors Provided by Idea and Project Sharing	155	0.86
Total	724	0.91

Thus, the coding was reliable because the reliability coefficient of coding for each sub-problem was >0.70 . Moreover, until all the reliability coefficients were 1, the researchers discussed the remaining sentences until they reached an agreement.

Results

This section discusses the findings in detail to provide the integrity of the study.

Findings Related to Advantages

Table 3 lists the findings related to the advantages of the using SNS during the course according to university students.

Table 3: Descriptive statistics of the advantages of using SNS during the course

Categories	Frequency
1. Personal Development Benefits	26
2. Easy Tracking of Posts	66
3. Enhancing Communication	18
4. Cooperation / Exchange of Ideas	31
5. Customisation of Materials	30
6. Detecting / Correcting Errors	33
7. Follow-up of Announcements	4
Invalid Statement	13

The students’ responses are divided into seven themes, as shown in Table 3. The first theme was ‘personal development benefits’. One of the students (K1) said that ‘It improved my self-confidence, and my knowledge has increased’. The following statements can be given as examples for other comments: ‘...a better and more functional material development process has occurred’ (K53), ‘... made the activities that I did more creative’ (K3) and ‘made our ideas grow’ (K50). The second most common theme in student comments was ‘easy tracking of the posts. A student (K43) mentioned that ‘I did not have to bring material to school constantly’, whereas another student (K45) said that ‘we have shared every detail of the material we made’. Examples for ‘enhancing communication’ theme can be given as ‘it has provided healthy communication’ (K46) and ‘the instant access of the instructor to the materials we made ensured efficient use of the time’ (K50).

The fourth theme was ‘cooperation/exchange of ideas’. An example that can be given to this theme is ‘helped me to come up with ideas that did not come to my mind before’ (K47). Two examples that may fall into the theme of ‘customisation of materials’ may be ‘I tried to make different activities’ (K39) and ‘I had the opportunity to compare the tools I did with the things my friends did’ (K42). The second theme in the frequency is the ‘detecting/correcting errors’. One participant (K41) described this as ‘I recorded the steps; then, I better realised what kind of errors I made, where I made mistakes and then reached the solution’, and another participant (K49) said that ‘I realised what we did wrong by step-by-step sharing’. The last theme was ‘the follow-up of announcements’, which was the least common theme. An example of this would be the response of the student who was coded as K46, ‘It was better to hear the announcements or other things from the course instructor’.

Findings Related to the Negativities Encountered

Descriptive statistics and statements related to the negativity of using SNS during the course by the university students are provided. Table 4 lists the findings related to this theme.

Table 4: Descriptive statistics of the negativity experienced in using SNS in the course

Categories	Frequency
1. Encountered No Negativity	24
2. Internet Problem	11
3. Student Error	4
4. Possibility of Cheating	6
5. Device Problems	7
6. Communication Problem	8
7. Concern Related to Material	6
8. Not Having an Account	12
Invalid Statement	10

24 students expressed no negativity in using SNS as an aid tool during the course, whereas the remaining answers were divided into seven themes. The first theme was ‘Internet problem’. As an example for this, student who was coded as K21 commented that ‘Facebook is giving an error’, whereas the student who was coded as K22 stated that ‘I have experienced Internet-related problems; quota problem’. The second theme of the problems encountered is ‘student error’. Student who was coded as K10 commented that ‘...it was my first time to post to the group so that I was confused at what stage I should post something, so I waited for some people to share something’. Another theme is ‘possibility of cheating’. An answer to this theme was ‘I hesitated to share the work I did. I was concerned that my friends would see something that I made differently and would do the same’ (K28). ‘Device problems’ is another theme; the student who was coded as K6 commented that ‘I had to log in to Facebook using my friend's phone because my phone was broken for a week’; the student who was coded as K12 stated that ‘my phone had memory problems due to having too many pictures’; while the student who was coded as K18 commented that ‘...the phone's camera was broken’. The next theme is ‘communication problem’. As an example to this theme, the following can be given: ‘I was a little uncomfortable because of the constant notifications’ (K7). The following expressions can be given as examples for the theme of ‘Concerns related to material’: ‘I saw that I was behind when I saw the work of my friends’ (K8), ‘I was demoralised when I saw the better ones than my material...’ (K35) and ‘if I was behind in the construction phase, my fear of not being able to finish increased when I saw that my friends completed their materials’ (K36). When the practice started, it was seen that 12 of the students did not have a Facebook account and some did not insistently open their Facebook accounts. The following statements of the students who were coded as K10 and K11, respectively, are the examples of the last theme of ‘Not Having an Account’: ‘I had to post the pictures of what I made from my friends accounts because I had no Facebook account at that time’ and ‘I had difficulty sharing when I did not have a social media account’.

Findings Related to the Effects on Class Interaction

Table 5 lists the descriptive results of the responses for the question ‘how using SNS in the class affect classroom interaction and communication’.

Table 5: Descriptive statistics about the effect of using SNS on classroom interaction

Categories	Frequency
Communication (Positive)	45
Interaction (Positive)	23
Interaction (Negative)	4
Communication (Negative)	0
Invalid Statement	71

Table 5 shows that a majority of students think that using SNS in the course positively affects communication. Students contributed to this theme with the following statements: K36 stated that ‘I got the chance to talk to new classmates’; K41 commented that ‘I learned the names of my classmates’; K9 said that ‘I got to know my classmates that I did not meet before and it helped me to communicate with them’; K53 commented that ‘we communicated not only about course topics but also for other things thanks to the group’. Many expressions about the positive influence on the classroom interaction have come to fore. K1 said, ‘It helped to increase the interaction when we played games in the group or when we were in the class and told the person that I liked their post’. K32 said that ‘I recognised people better, who made pots, by seeing their pictures and names. My interaction in the class increased and we got more topics to talk about’. Only four expressions, which mention negative effect on interaction, were noticed. These comments are: ‘Only posting on Facebook and not coming together put some distance between us’ (K31); ‘We used to get more positive or negative comments for our materials in the class. There were not many comments on Facebook’ (K7); ‘Interacting with friends on social media instead of meeting in person has affected socialising negatively’ (K50); ‘I received the replies late for the questions I asked, so I could not use my time efficiently which frustrated me and discouraged me to comment on my friends’ (K7).

Findings of the Theme of ‘Factors Considered When Making Comments’

The following table shows the results that students have taken into account when commenting on Facebook shares within the context of the course.

Table 5: Descriptive statistics about the factors considered by students while commenting comment on Facebook posts shared by peers

Categories	Frequency
1. Students who did not comment	15
2. Respect/Empathy/Kindness	26
3. Introverted/Face-to-Face	7
4. Academic	27
5. Objectivity	10
6. Criticism	10
Invalid Statement	22

As shown in Table 5, 15 students did not comment although they followed the posts and benefitted from these posts. The answers of the other students were divided into five different themes. First, several expressions were found under the theme of ‘respect/empathy/kindness’. Student with code K25 commented that ‘I tried to avoid being offending while explaining the wrong aspects’, whereas K29 said that ‘I tried to give my recommendations without offending my friends if they made mistakes; K40 stated that ‘I sought not be offensive’, whereas K42 said that ‘When I comment on them about my opinions, I paid attention not to despise their work’. Some expressions are included under the theme of ‘introverted/face-to-face’, which include ‘I never made comments on Facebook; we had positive or negative comments between us’ (K6); ‘I did not write comments under the posts on Facebook, but I talked about the ones in class that caught my attention’ (K28) and ‘I could not express myself well because I could not use gestures or mimics’ (K7). The most common theme is ‘academic’. For example, ‘when there are mistakes in the development stage of an event, this practice encourages you to do the project without mistakes’ (K3) and ‘...suitability of the material to the assignment given by the instructor...’ (K8).. Some students stated that they were careful to be ‘objective’ when commenting on the posts of their peers: ‘I took care to be more objective when commenting’ (K10). The final theme is ‘criticism’. K6, K8 and K53 stated, respectively: ‘It helped us to be more creative with the criticism of others’, ‘We have criticised whether it is right or wrong’ and ‘We got the opportunity to criticise without the disadvantages of face-to-face communication’.

Findings on Factors Affecting Personal Development Provided by Idea and Project Sharing

The results of the student responses for ‘What did the sharing of works and ideas on Facebook by your friends contribute to you?’ are provided in the following table.

Table 6: Descriptive statistics about the contribution of the posts to personal development

Categories	Frequency
1. Academic Development	23
2. Problem solving skills	7
3. Learning the opinions of others	20
4. Getting inspired	15
5. Making decision	8
6. Competition	12
7. Critical thinking	25
Invalid Statement	45

The answers given to this question are distributed to a total of seven themes. The first theme was ‘academic development’. The student K2 said that ‘I found the opportunity to get more information on the material I worked on’ while K9 stated that ‘When I did not know what to do about the subject given to us, I got the information easier with the help of this practice’. As in line with the theme of ‘Problem Solving’, students stated that they solved their problems and they made the following comments: K10 commented that ‘I chose the fabric by reading your comments and the products made by others’; K32 stated that ‘I corrected my mistakes by seeing the rights and wrongs’ and K34 said that ‘While I was preparing the product, I saw what was missing sides and then completed the product’. The following statements are thought to go under the theme of ‘Learning the opinions of others’: ‘It helped me to come up with new ideas’ (K23); ‘Our exchange of ideas were enhanced and developed new opinions’ (K25); ‘...learned new things as my friends shared’ (K15); and ‘Everybody shared their own ideas’ (K39). Another theme is ‘Getting inspired’, The examples for which include ‘We were able to add new things with the help of concepts shared by our friends’ (K22); ‘I had the opportunity to see many creative material’ (K57); ‘We understood that we had to be authentic when we looked at the work done’ (K51) and ‘We got inspired by our friends who used different materials’ (K50). The following statements are included under ‘Making decision’: ‘It helped me to make a decision faster when I was trying to choose my material’ (K46); ‘The practice made it easier for me to make decisions by looking at the posts of my friends when I was indecisive’ (K56) and ‘... made my decisions clear when I was indecisive on some issues’ (K3). The following statements are examples for ‘competition’ theme: ‘It provided me to compare my material with the materials of my friends’ (K37); ‘I was able to compare the level of my own material’ (K40) and ‘I tried to finish my product faster when I saw the pictures of the finished products of my friends’ (K7). The last and most common theme was ‘critical thinking’. The answers of students with the code of K45, K52 and K55 are as follows, respectively: ‘I think about things I have never thought about and I have gained a different perspective when I see things that have not come to mind’; ‘I have seen how much an idea can be developed’ and ‘It helped me to think how I could produce something different when I see the works of others’.

Discussion

This study aimed at examining students’ opinions about using Facebook in educational environments. Accordingly, the study group comprised 57 students enrolled in the Child Development Programme of the Kastamonu University Vocational School of Higher Education during 2017–2018 spring semester and pursuing ‘Educational Material Development’ course. During the course, students designed educational materials for children in the pre-school period. During the course of designing these study materials, which was time consuming, students discussed the materials developed by their peers among themselves and consulted the course instructor for 15 weeks in a closed Facebook group. After the practice, opinions on the use of SNS in the course were collected via a semi-structured interview form comprising a total of five questions. These opinions comprised 724 sentences, which were coded by two different coders. Then, reliability analyses were conducted and the themes for the opinions of students were formed.

According to the students, the biggest advantage of using SNS during the course was to follow the posts. Students could examine and archive the works of all their friends and be inspired by them. They no longer needed to carry their work to class. One of the biggest advantages provided by SNS in application-oriented courses was to allow students to see others’ activities. Students could observe each production phase of the materials of their peers and find the opportunity to examine many works, which would otherwise have been impossible to experience in a classroom environment. Students believed that these posts allowed them to think by exchanging ideas and that they could rectify their mistakes and produce more original works. In the model of Mazman and Usluel (2010), Facebook had three sub-dimensions for educational use: ‘communication’, ‘cooperation’ and ‘material and

resource sharing'. The advantages stated by the students of the study group concentrated on cooperation and material/resource sharing sub-dimensions.

Students, who had not encountered any negativity while using Facebook as an aid tool during the course, were in majority. The most common negativity included not having a Facebook account. Some students did not have an account at the beginning of the programme; they posted content using their friends' accounts and did follow their peers in the same way. Yapici and Hevedanli (2013) emphasised on similar negativity. Students preferred opening an account after they faced these difficulties. The second most common problem was Internet-related. In the age of information when Industry 4.0 is being discussed, it is clear that the difficulty in connecting the Internet or facing quota problems need to be solved.

Gathering the entire class in a Facebook closed group has enhanced classroom interaction and communication. Although there are only four negative sentences in this regard, students got closer, as determined from the rest of the statements. Many students had learned the names of their peers and communicated with them. Yapici and Hevedanli (2013) also showed that classroom communication improved.

Students commented on their peers shared posts in an academic context and were careful not to offend their friends. Some students stated that objectivity was a priority in their criticism. Almost one-fourth of the students did not comment at all; they only posted, followed the posts of their peers and benefitted from the comments made by others.

When asked about what they benefitted from information sharing via the SNS, the answers of the students were focused on critical thinking skills. Thus, SNS contributed to the critical thinking ability of the students. Similarly, students stated that their knowledge improved in an academic sense. The other important benefits provided are that 'learn from the opinions of others' and 'get inspired'.

Examination The Life Preparation Level Of The Science Curriculum In Turkey For Students

İpek Derman
Hacettepe Üniversitesi
ipekderman@hacettepe.edu.tr
Nuray Senemoğlu
Hacettepe Üniversitesi
n.senem@hacettepe.edu.tr

Abstract

Science education is regarded as an important keystone in preparing people to life. On the way of being a society that could produce science and knowledge, an indispensable goal of science education is to educate scientifically literate people, in other words, individuals who understand the nature of knowledge and apply the knowledge in their daily life easily.

This research aims to examine the science curriculum in Turkey within the framework of universal criteria obtained by examining the science education approaches of countries which are successful in international science education exams and transfer the information they produced to technology. In this respect, it has been thought that science curriculum criteria of these countries will be an indicator as they will display the attainment level of the science education curriculum in Turkey. At the same time, it could be also an indicator in preparing students to life with the science education curriculum in Turkey.

It is also expected that the findings will clarify the new regulations that aim to increase the life preparation level of science education for students. The research results will produce proposals to educate individuals that can solve the daily problems by adapting the science knowledge, produce useful products, adapt to the environment they live in and have positive consumption habits.

Examining The Academic Culture Of Education Faculty In Terms Of Third Generation University Characteristics: In Case Of Education Faculty In Aksaray University

Şenyurt YENİPINAR

PhD. Academician, Aksaray University, Education Faculty,

Abstract

Today's universities are called third generation universities which research, innovate, transfer findings into technology, trade and educate new generations using of all their accumulation. Education faculties, as a unit of the university, are not exempted of these functions. In order to meet the demands of real life requirements, they have to educate and train teacher candidates, accordingly. Acquisitions of teacher candidates come out as a result of complex interaction of faculties' different features. According to cultural theory, culture in an organization covers many things including mainly content (values, codes, discourses etc.), socialization (relations, communication, ceremonies etc.) and action (goals, structures, responsibilities etc.). Organizational culture impels individuals to action and give their actions meaning. Because of shaping effect of institutional culture, administrators strive to generate relevance culture. Academic culture refers to the norms, values, beliefs and practices related with the working lives of faculty members at higher education institutions. One of its members are students. Academic culture represents the comprehensive features of an academic unit. By this study, we wanted to find out answers of two questions in a stepwise manner. i) How do the teacher candidates perceive academic culture in education faculty and ii) Which features of education faculty match the third generation characteristics. This cross-sectional survey research was implemented in 2017-2018 academic year in Education Faculty of Aksaray University. We randomly selected the study group consisted of totally 762 teacher candidates, who are currently student in the case faculty. Data gathering instrument has two sub-sections namely demographic and academic culture scale. We analysed the data using both quantitative and qualitative techniques. In quantitative analyse we computed descriptive statistics (f, %, mean, standard deviation) and exploratory factor analysis. In qualitative phase, we generated theoretical features of third generation university based on the literature review. We finally compared the factor results and these theoretically suggested features.

Key words: *Teacher candidate, academic culture, third generation university*

Introduction

Till now, we have witnessed some paradigmatic changes in the university understanding. The first generation universities including Bologna, Paris and Oxford, focused on teaching in eleventh century. Then Humboldtian universities integrated teaching and researching and generated knowledge. Berlin University, which was the first example of second generation universities in the nineteenth century, implemented mainly these two functions of researching and teaching simultaneously. Depending on researching it generated knowledge then it taught for students (Yung, 2015; Yildirim, 2016). Technology driven changes, competition and looking for financial methods of higher education impacted university understanding and universities obliged to transfer knowledge into technology and industry. In addition, universities as cooperating to the non-academic bodies in industry, traded their products. Today's universities are called third generation universities which research, innovate, transfer findings into technology, trade and educate new generations using of all their accumulation (Wissema, 2009; Yildirim, 2016). Changes in the university understanding reflected on practices in various dimensions of higher education including academicians and teaching methods. Projects and finding new ways and innovations have already been the main topics in university courses. Positive attitudes towards new things and research methods are valuable for university community. Cooperating and working in group in multidisciplinary is way of innovating. Practices in genuine field is embedded in the daily training activities. Incentive mechanisms are proposed to enhance intra group cooperation and also out group competition. The main characteristics of the university education are *institutional diversity, broad freedom, flexibility, competitiveness* and enriched financial support (Vest, 2007; Yildirim, 2016). Education faculties, as a unit of the university, are not exempted of these functions. In order to meet the demands of real life requirements, they have to educate and train teacher candidates, accordingly. Acquisitions of teacher candidates come out as a result of complex interaction of faculties' different features. Training courses in any education faculty mainly demand from students to research, to get relevance knowledge, to cooperate with others, to suggest projects and implement them in the field, to observe theoretical

knowledge in the school field and to implement their theoretical accumulation in the classroom settings. Innovations, creativeness, and entrepreneurship are rewarded (Eurydice, 2008; OECD, 2009). Changes in university understandings and training activities are reflected in all dimensions of university life. All things including what we do and what we use to do refer to culture. According to cultural theory, culture in an organization covers many things including mainly content (values, codes, discourses etc.), socialization (relations, communication, ceremonies etc.) and action (goals, structures, responsibilities etc.). Organizational culture impels individuals to action and give their actions meaning. It has a potential to affect many things and it can also be influenced by internal and external developments, as well (Schein, 2010; Smith, 2001). Because of shaping effect of institutional culture, administrators strive to generate relevance culture. Academic culture refers to the norms, values, beliefs and practices related with the working lives of faculty members at higher education institutions (Szelenyi and Rhoads, 2013; Yung, 2015). One of its members are students who experience the different dimensions of academic life. Therefore, students can observe and witness the various elements of academic culture that represents the comprehensive features of an academic unit. This, in turn, gives opportunity to compare the characteristics of any academic unit to the characteristics of third generation university. Students in education faculties are future teachers so we can call them as teacher candidates. Teacher candidates, who have gone on their training courses, can give information about the culture in education faculty. Their point of view can provide different perspective on characteristics of an academic unit. Furthermore, we can evaluate the characteristics of education faculty in terms of third generation university's characteristics. However, we could not get particular study focused on teacher candidates' perception of academic culture through the literature review. By this study, we wanted to find out answers of two questions in a stepwise manner. *i)* How do the teacher candidates perceive academic culture in education faculty and *ii)* Based on the teacher candidates' perception, which features of education faculty match the third generation characteristics.

Method

This study was carried out in mix method model in which qualitative and quantitative research techniques can be integrated. In quantitative phase we operated cross-sectional survey research. Qualitative phase consisted of content analysis. We followed stepwise manner: We first describe the academic culture in the case faculty by using academic culture scale through perceptions of teacher candidates who have been training in the case faculty (Phase 1: Survey). Then we define the features of third generation university by content analysis of literature related with third generation university characteristics (Phase 2: Content analysis). We finally compare the features of third generation university with characteristics of education faculty (Phase 3: Content).

Aksaray university, education faculty was chosen purposefully as the case faculty because of economic and accessible reasons. Researchers have been working in the case faculty for eight years. They know well the case faculty that enable them to interpret the findings much more genuinely. Research group was selected in case faculty. We randomly selected the study group consisted of totally 762 teacher candidates, who are currently student in the case faculty in 2017-2018 academic year in Education Faculty of Aksaray University.

Data gathering instrument has two sub-sections namely demographic and academic culture scale. We used academic culture scale, which was developed by Yildirim (2016), as data gathering instrument ($\alpha=.94$). Corrected item-total correlation scores changed between .37-.67 referring to keep all 30 items in analyses. After eliminating improper forms, we implemented analyses data belonged to totally 716 participants. We checked the data in terms of missings, outliers and duplications. Missings were changed with series mean scores. There was no outlier and duplication case. We first performed descriptive analysis and computed mean and standard deviations for all items in the scale.

We analysed the data using both quantitative and qualitative techniques. In quantitative analyse we computed descriptive statistics (f, %, mean, standard deviation) and exploratory factor analysis. In qualitative phase, we generated theoretical features of third generation university based on the literature review. We finally compared the factor results and these theoretically suggested features. In evaluating phase, we coded characteristics whether they fully exist in the case faculty. These codes and meanings are follows: 2 refers full existences; 1 refers partly existence and 0 refers not existence.

Findings

Findings of the study are presented in the following lines in considering the research questions.

Characteristics of academic culture in the case faculty

Table 1 shows the descriptive analysis results of teachers' candidates perception about academic culture in the case faculty. In generally, teacher candidates perceived a positive environment and open communication. Lectures positively response their help demands. Rules and procedures are strictly followed and most of them obey these rules. In the case faculty there is a positive attitude for innovation. Because descriptive statistics refer that teacher candidates experience new methods and techniques in their courses. An emphasis put on the specialization on their profession. However, they could not use their creativeness and they have scarce works cooperatively. They do not

share knowledge, experience and material widely. And rewarding, reminding notable people in the faculty is mostly neglected. Finally, we could not get strong sign of the competition in the faculty.

Table 1. Descriptive statistics of teacher candidates' perception about the case faculty academic culture

Items	Mean	Std. Deviation	Item-Total Correlation	α if Item Deleted
C1. are in a trust and friendly but not hostile environment.	3,23	1,181	,558	,937
C2. behave honestly with each other.	2,64	1,153	,589	,937
C3. open to spontaneous communication.	3,28	1,140	,523	,937
C4. are treated in a fair and objective way.	2,75	1,264	,566	,937
C5. mostly experience joyful, compassion and courtesy.	2,89	1,139	,640	,936
C6. feel that their achievement, professional growth and happiness are emphasized.	3,10	1,190	,655	,936
C7. protect and support each other.	2,38	1,119	,556	,937
C8. behave in friendly way such touching and hugging.	2,66	1,129	,578	,937
C9. produce original things using their creativeness.	2,58	1,085	,521	,938
C10. use technologic devices in line with their functions.	3,02	1,159	,515	,938
C11. share knowledge, experience and material with their colleagues.	3,00	1,109	,553	,937
C12. strive for specialization on their profession.	3,04	1,065	,536	,937
C13. apply the new methods and techniques in their jobs.	3,11	1,106	,610	,937
C14. welcome the new and original things and appreciate them.	3,07	1,133	,610	,937
C15. continually develop their knowledge and skills.	2,95	1,082	,633	,936
C16. widely use symbols, emblem etc. that represent the institution.	3,04	1,169	,451	,938
C17. have common symbols.	2,85	1,190	,501	,938
C18. see photographs, drawings or symbols reminding the past of the institutions.	2,96	1,252	,368	,939
C19. notice information and anecdotes belonged to noteworthy people in the past.	2,84	1,222	,396	,939
C20. deal with the students' problems and try to solve them.	2,88	1,160	,643	,936
C21. considering students' well-being.	3,12	1,169	,670	,936
C22. positively response to help demands.	3,25	1,129	,640	,936
C23. give importance and care for ceremonies.	3,31	1,155	,556	,937
C24. definitely obey the rules.	3,01	1,106	,601	,937
C25. put emphasis on carrying out the responsibilities as they are scheduled.	3,16	1,115	,642	,936
C26. fulfil their responsibilities.	3,09	1,092	,622	,936
C27. express easily their will and demands to managerial bodies.	3,14	1,180	,649	,936
C28. behave freely and anybody does not interfere others' doings.	2,87	1,278	,380	,939
C29. spend effort for the success of institution.	3,19	1,075	,633	,936
C30. come to the institution in enthusiasm and excitement.	2,37	1,164	,607	,937

Basic characteristics of third generation university

We reviewed the literature (Çetinsaya, 2014; Şenses, 2007; Wissema, 2009; Yıldırım, 2016) on the third generation university's characteristics. Then we summarized them as in the Table 2. Third generation universities characterize as research, innovation, competition, produce and trade what they generate originally. They also collaborate with industry and find alternative financial methods beside public funds.

Table 2. Main characteristics of third generation university

1. Research, education and know-how
2. Public or proprietary
3. Productive
4. Create scientists, scientific professionals and entrepreneurs
5. Academics educate students along with the demands of industry.
6. Depend on scientific findings, publications and know-how marketization and contracts with the industry etc.

-
- 7.They actively compete for the best academics and best students
 - 8.They collaborate with industry, private R&D, financiers, and other universities.
 - 9.Institutions with oriented research works separately
 - 10.Research is largely trans-disciplinary or interdisciplinary
 - 11.Mass and elite education, provide different programmes for different clients.
-

Comparison of the case faculty characteristics to the third generation characteristics

Table 3 shows that based on the teacher candidates' perception, which features of education faculty match the third generation characteristics. Table 3 is constructed qualitatively. Maximum coherence is measured by total 36 point (11x2). However, we found that only 3 characteristics of third generation university are partly exist in the case faculty.

Table 3. Comparison third generation characteristics and the case faculty's academic culture characteristics

Third Generation University	Exist	Partly Exist	Not Exist
Research, education and know-how	1		
Public or proprietary			0
Productive	1		
Create scientists, scientific professionals and entrepreneurs			0
Academics educate students along with the demands of industry.			0
Depend on scientific findings, publications and know-how marketization and contracts with the industry etc.			0
They actively compete for the best academics and best students			0
They collaborate with industry, private R&D, financiers, and other universities.			0
Institutions with oriented research works separately			0
Research is largely trans-disciplinary or interdisciplinary			0
Mass and elite education, provide different programmes for different clients.	1		

Discussion, Result And Suggestions

This study aims to evaluate the academic cultural characteristics of Aksaray University Education Faculties in terms of third generation university's characteristics. We described the academic cultural characteristics on perceptions of teacher candidates.

In the limitations of the study, we concluded that the case university meet only very small number of characteristics of third generation university. This result is coherence with the result by Yıldırım (2016). Oran (2016) examined the academic culture in six Turkish universities and found that collaboration is weak. This result is confirmed by the current study. Therefore, we suggest that joint research activities requiring participation of different disciplines in the case faculty.

Although we have no intentions to generalize for other higher education institutions, but some previous studies (Çetinsaya, 2014; Şenses, 2007) argued same results that many Turkish universities do not meet the demands of third generation university because of lack competitive environment and organizational incompatibilities. In spite of rhetorically declared of being third generation universities, many academic units of higher education institutions have not had the third generation university characteristics such as generating information, transferring it into the technology and trading them. In considering the main functions of education faculties, it seems difficult to generate new knowledge and trading them but in education sector have still need the innovations in integrating pedagogy and technology. Therefore, technological changes should encourage educators and educational researchers to find new ways in educating new generations.

Abstract

The aim of this study is to examine the reasons of teacher candidates' choice of primary education mathematics teaching program, their expectations from the program and whether their expectations have been met or not in terms of gender, placement score and graduated high school type. In the study, special case study method has been used. Content analysis has been used in the analysis of the data obtained. The obtained data has been presented as a table with frequency and percentage calculations. The study has been carried out with 66 students attending elementary mathematics teaching program at Adnan Menderes University and 91 students studying at Afyon Kocatepe University. When we look at the data obtained from this special case study, the reasons of candidates' choice are respectively, they like mathematics and teaching profession; primary education mathematics teaching's being a promising job and their university entrance points are not enough for their desired departments. Among the expectations of the program, it has been observed that the candidates want to be qualified teachers, to receive good education and to engage in social activities. When analyzed the replies of candidates whether their expectations from this program met or not, candidates are generally satisfied. It has also been determined that the majority of students who prefer the program are female students.

Keywords: *Mathematics curriculum, elementary mathematics, expectation, placement score*

1. Introduction

It is very difficult to define mathematics and to express it in a closed form. It is a continuous developing work area of which application and use is large. In a simple way, an introduction can be made to the field of mathematics as a way of expressing the mental activities that people use for meaning and comprehension by using abstract concepts in a universal language and in accordance with the rules of this language (Altun, 2006). All the mathematical expressions we use are based on abstract concepts and the rules that do not contradict themselves. Mental activities in the language of mathematics and understanding and using this language is an art. While trying to make sense of abstract mathematical concepts such as numbers, geometric shapes and the relations between these concepts, mathematics provides the skills to discover patterns and solve problems due to its nature. Mathematics plays an important role in understanding the events and situations in all our lives, finding solutions according to the problems encountered and the discoveries made by humanity in the field of science and technology.

As in the field of science and technology in the last century, there have been important developments and needs in the field of education. To maintain and further enhance the gains obtained, the educational lives of children is a prominent issue in Turkey and in the world. For this reason, the development and progress of countries depends mainly on the knowledgeable and equipped teachers. Therefore, the question of "How should knowledgeable and equipped teachers and qualified teacher training programs should be?" is the basis of international studies. In our country, teacher training programs within the framework of National Education Law necessitated education in three main areas as field knowledge, pedagogical formation and general culture. Various studies are carried out to improve the teaching profession and teachers' equipment, to transfer the achievements of scientific studies to our teachers and hence to our children. In the studies conducted, the development of teacher training programs in universities, teachers' being experts in their fields and following the developments, having the knowledge of self-taught knowledge in different areas and subjects, expressing their knowledge and skills, contributing to students' education and learning skills and having self-confidence to guide the students' lives are aimed. In our age, there is a need for individuals who can investigate, question, and produce solutions to the problems they face. Therefore, our teachers have a great role in the effective implementation of educational plans and programs.

New approaches in education have started to be adopted. In these approaches, it is expected that a healthy communication between the teacher and the students will be established and students will actively participate in

the classes. In constructivist approach, a teacher is expected to be open-minded, self-improving, to take into account individual differences among students, to be expert in the field of work, not only to provide ready-made knowledge to students but also to prepare appropriate learning environments, to interact with their students and even learn with them (Selley, 1999; 22). The perspectives of teacher candidates to their occupation play an important role in training qualified teachers. Candidates who want to do teaching profession should firstly love the profession of teaching and gain their self-confidence about what they can teach. For this reason, the reasons of the students who choose the teaching profession and their expectations' meeting level for this program are important. In this study, it is thought that it will be useful to shape teacher training process by taking into consideration the reasons of teacher candidates to choose mathematics teaching program and their expectations from the program.

2. Method

Research Design

To reveal the reasons of teacher candidates who prefer elementary mathematics teaching program their expectations from the program, whether their expectations are met or not and how they want to be a teacher have been examined by special case study method by using qualitative pattern.

This research is a qualitative research and it is a special case study as the opinions, attitudes and expectations of the people in the sample have been tried to be determined. It provides the opportunity to concentrate on the ordinary situation in special case studies (Çepni, 2007).

Sample

The research has been made with the volunteer 66 teacher candidates who are on the first and second class in elementary maths teacher program in Adnan Menderes University in 2017-2018 academic year fall semester and with 91 teacher candidates in Afyon Kocatepe University. The demographic data of the teacher candidates in Adnan Menderes University is given in Table.1.a and the demographic information of teacher candidates attending Afyon Kocatepe University is given in Table.1.b.

Table 1. a. Adnan Menderes University Demographic information of the students, the schools they graduate and the Placement Score

CATEGORIES	SUB CATEGORIES	FREQUENCY	PERCENT
GENDER	WOMAN	56	85
	MALE	10	15
GRADUATED SCHOOL TYPE	SCIENCE HIGH SCHOOL	1	2
	ANATOLIAN TEACHER HIGH SCHOOL	16	24
	ANATOLIAN HIGH SCHOOL	30	45
	PRIVATE HIGH SCHOOL AND BASIC HIGH SCHOOL	18	27
	VOCATIONAL AND TECHNICAL HIGH SCHOOL	1	2
PROGRAM PLACEMENT POINTS	350 POINTS	2	3
	350-360	10	15
	360-370	12	18
	370-380	17	26
	380-390	12	18
	390 POINTS OVER	6	9

	NOT REMEMBER	7	11
--	--------------	---	----

As it is seen clearly, Adnan Menderes University teacher candidates are mostly female (85%), a portion of teacher candidates is The Anatolia and Anatolian Teacher High School graduates (69%) and there are also 18 (27%) teacher candidates who graduated from private schools and basic school. Only one teacher candidate graduated from science high school and one from vocational high school. It is also clear that 3% of teacher candidates' placement score are under 350 points, 15% between 350-360 points, 18% between 360-370 points, 26% between 370-380 points, 18% between 380-390 points and only 6 teacher candidates got over 390 points. There are also 7 teacher candidates who cannot remember their placement score.

Table 1.b. Afyon Kocatepe University demographic information of the students, the schools they graduated and their Placement Points

CATEGORIES	SUB CATEGORIES	FREQUENCY	PERCENT
GENDER	WOMAN	80	88
	MALE	11	12
GRADUATED SCHOOL TYPE	SCIENCE HIGH SCHOOL	3	3
	ANATOLIAN TEACHER HIGH SCHOOL	37	41
	ANATOLIAN HIGH SCHOOL	40	44
	PRIVATE HIGH SCHOOL AND BASIC HIGH SCHOOL	8	9
	VOCATIONAL AND TECHNICAL HIGH SCHOOL	3	3
PROGRAM PLACEMENT POINTS	350 POINTS	5	5
	350-360	16	17
	360-370	18	20
	370-380	12	13
	380-390	6	7
	390 POINTS OVER	7	8
	NOT REMEMBER	27	30

As it is given in the table, Afyon Kocatepe University teacher candidates are mostly female (88%). A large portion of teacher candidates is The Anatolia and Anatolian Teacher High School graduates (85%) and there are also 8 (9%) teacher candidates who graduated from private schools and basic school. 3 teacher candidates graduated from science high school and 3 from vocational high school. It is also clear that 5% of teacher candidates' placement score are under 350 points, 17% between 350-360 points, 20% between 360-370 points, 13% between 370-380 points, 7% between 380-390 points and only 8 teacher candidates got over 390 points. There are also 27 teacher candidates who cannot remember their placement score.

Data collection tool

The data obtained from the research has been collected through a semi-structured form with open-ended questions directed to the teacher candidates as “Why did you choose primary mathematics teaching program?”, “What are your expectations from the mathematics teaching program”, “Did the program meet your expectations?” and “How do you want to be a teacher?”. It has been stated in the instruction section of the distributed form that the answers of the questions the teacher candidates answered in the form would be kept confidential and the answers would not be used for any purpose other than the research. Thus, teacher candidates have been asked to give sincere answers. In addition, the questions in the semi-structured form used in the research which INCIKABI,

MERCIMEK, BİBER, SERİN conducted on 'Why am I in Elementary Mathematics Teacher Education Program?' in Kastamonu University in 2013 have been benefited.

Analysis of data

Content analysis has been used in the analysis of the data obtained in the qualitative pattern study. The results of the analysis have been collected under category and subcategory. As qualitative studies are not concerned with generalization, the results are limited only to teacher candidates in the research. It is important that the validity and reliability of the results in qualitative researches should be examined as deeply as possible and tried to be provided by direct submission (Yıldırım and Şimşek 2013). For this reason, the answers of the teacher candidates have been included in the research where necessary. The opinions of two education experts have been taken into consideration and they have been divided into categories and sub-categories.

3. Findings and Comments

In order to understand the expectations of teacher candidates from the elementary mathematics teaching program better, some of their answers have been quoted.

Examining the reasons of preference of primary mathematics teaching program according to gender, type of graduation and placement scores

Table 2. a. Examining the reasons for choosing the program according to gender in Adnan Menderes University

Gender	Girl		Male	
	Frequency (f)	Percent (%)	Frequency (f)	Percent (%)
Future anxiety	17	19	7	47
Predisposition to Maths	28	31	5	33
Predisposition to profession	25	28	3	20
Obligation due to placement score	20	22	0	0

The reasons of preference according to gender factor have been examined under 4 categories. These categories are future anxiety, predisposition to Maths, predisposition to profession and the necessity due to score points. The preference in terms of predisposition to Maths is 31% for girls and 33% for males and it can be said that there is no significant difference according to gender. Future anxiety among male teacher candidates (47%) is higher than female teacher candidates (19%). The predisposition to the profession has been observed in females (28%) and males (20%). In addition, the reasons for preferring due to placement points have been found only in the answers of female teacher candidates. The answers like "I have chosen being teacher as I love teaching" have been categorized in predisposition to profession, "I have chosen being teacher as I love Maths" have been categorized in predisposition to Maths, "The reason why I have chosen mathematics as a department is that it is the closest to my score" has been categorized in obligation due to placement score and "it is easier to be assigned" have been categorized in future anxiety.

Table 2. a. Examination of the reasons for choosing the program according to gender in Afyon Kocatepe University

Gender	Girl		Male	
	Frequency (f)	Percent (%)	Frequency (f)	Percent (%)
Future anxiety	12	15	1	9
Predisposition to Maths	25	31	3	27
Predisposition to profession	26	33	5	46
Obligation due to placement score	17	21	2	18

The reasons of preference according to gender factor have been examined under 4 categories. These categories are future anxiety, predisposition to Maths, predisposition to profession and the necessity due to score points. The preference in terms of predisposition to Maths is 31% for girls and 27% for males and it can be said that there is no significant difference according to gender. Future anxiety among male teacher candidates (9%) is lower than female teacher candidates (15%). The predisposition to the profession has been observed in females (33%) and males (46%). In addition, they stated that female teacher candidates (21%) and male teacher candidates (18%) have preferred because of the score requirement. The answers like "I have chosen being a teacher as I love

teaching” have been categorized in predisposition to profession, “I have chosen being a teacher as I love Maths” have been categorized in predisposition to Maths, “The reason why I have chosen mathematics as a department is that it is the closest to my score” has been categorized in obligation due to placement score and “it is easier to be assigned” have been categorized in future anxiety.

Table 3.a. Examining the reasons for choosing the program according to graduated school in Adnan Menderes University

Graduated High School	Science High School		Anatolian Teacher High School		Anatolian High School		Private high school		Vocational and Technical High School	
	f	%	F	%	f	%	f	%	f	%
Future anxiety	1	100	4	15	14	30	5	22	0	0
Predisposition to Maths	0	0	9	35	17	37	5	22	1	50
Predisposition to Profession	0	0	8	31	12	26	5	22	0	0
Obligation due to placement score	0	0	5	19	3	7	8	34	1	50
Total		100		100		100		100		100

While the reasons of teacher candidates’ preferences for primary mathematics teaching program according to the high schools they graduated from have been taken into consideration, it can be seen that the candidate who graduated from Science High School preferred to attend the school due to his/her future anxiety. For Anatolian Teacher High School graduates, future anxiety is 15%, predisposition to Maths is 35%, predisposition to occupation is 31% and point requirement is 19%. For Anatolian High School graduates, future anxiety is 30%, predisposition to Maths is 37%, predisposition to occupation is 26% and point requirement is 7%. For private high school graduates, future anxiety is 22%, predisposition to Maths is 22%, predisposition to occupation is 22% and point requirement is 34%. One of the 2 students who graduated from vocational high school preferred the program as he/she is tend to Maths and the other one preferred due to the requirement of point.

Table 3. b. Examination of the reasons for choosing the program according to graduated school in Afyon Kocatepe University

Graduated High School	Science High School		Anatolian Teacher High School		Anatolian High School		Private high school		Vocational and Technical High School	
	f	%	F	%	F	%	F	%	f	%
Future anxiety	1	33.3	7	19	3	7.5	0	0	1	33.3
Predisposition to Maths	1	33.3	9	24	17	42.5	2	25	0	0
Predisposition to Profession	1	33.3	7	19	17	42.5	5	62.5	1	33.3
Obligation due to placement score	0	0	14	38	3	7.5	1	12.5	1	33.3
Total		100		100		100		100		100

In Afyon Kocatepe University, when we have analysed the reasons of teacher candidates’ preferences for primary mathematics teaching program according to the high schools they graduated from it can be seen that the candidates who graduated from Science High School preferred to attend the school due to their future anxiety, predisposition to Maths and predisposition to occupation. For Anatolian Teacher High School graduates, future anxiety is 19%,

predisposition to Maths is 24%, predisposition to occupation is 19% and point requirement is 38%. For Anatolian High School graduates, future anxiety is 7.5%, predisposition to Maths is 42.5%, predisposition to occupation is 42.5% and point requirement is 7.5%. For private high school graduates, predisposition to Maths is 25%, predisposition to occupation is 62.5% and point requirement is 12.5%. One of the 3 students who graduated from vocational high school preferred the program as he/she is worried about the future, and the others preferred because of predisposition to occupation and the requirement of point.

Table 4. a. Examining the reasons for choosing the program according to placement points in Adnan Menderes University

Placement Ratings	Under 350 points		350- 360		360- 370		370- 380		380- 390		Over 390 points	
	f	%	f	%	f	%	f	%	f	%	F	%
Future anxiety	0	0	7	44	4	29	3	11	5	28	0	0
Predisposition to Maths	1	33	4	25	6	43	12	43	4	22	1	20
Predisposition to Profession	1	33	4	25	2	14	7	25	4	22	4	80
Obligation due to placement score	1	33	1	6	2	14	6	21	5	28	0	0
Total	100		100		100		100		100		100	

As it can be seen that the reasons for Adnan Menderes University teacher candidates with a placement score of less than 350 points are predisposition to Maths (33%), predisposition to profession (33%) and obligation due to placement score (33%). The reasons for the preference of the students in the 350-360 points are future anxiety (44%), predisposition to Maths (25%), predisposition to the profession (25%), and the score requirement (6%). The reasons for preference of students in the 360-370 points are future anxiety (29%), predisposition to Maths (43%), predisposition to the profession (14%) and the score requirement (14%). The reasons for preference of students in the range of 370-380 points are the future anxiety (11%), predisposition to Maths (43%), predisposition to the profession (25%) and the score requirement (21%). The reasons for preference of the students in the 380-390 points range are future anxiety (28%), predisposition to Maths (22%), predisposition to the field (22%) and the score requirement (28%). The reasons for the choice of students over 390 points have been determined as predisposition to Maths (20%) and predisposition to the profession (80%).

Table 4. b . Examining the reasons for choosing the program according to placement points in Afyon Kocatepe University

Placement Ratings	Under 350 points		350- 360		360- 370		370- 380		380- 390		Over 390 points	
	f	%	f	%	f	%	f	%	f	%	F	%
Future anxiety	1	20	2	12	1	6	3	25	0	0	2	29
Predisposition to Maths	2	40	7	44	6	33	3	25	2	33	1	14
Predisposition to Profession	1	20	3	19	6	33	4	33	4	67	3	43
Obligation due to placement score	1	20	4	25	5	28	2	17	0	0	1	14
Total	100		100		100		100		100		100	

When we look at table above, it is understood that the reasons for Afyon Kocatepe University teacher candidates with a placement score of less than 350 points are future anxiety (20%), predisposition to Maths (40%), predisposition to profession (20%) and obligation due to placement score (20%). The reasons for the preference of the students in the 350-360 points are future anxiety (12%), predisposition to Maths (44%), predisposition to the profession (19%), and the score requirement (25%). The reasons for preference of students in the 360-370 points are future anxiety (6%), predisposition to Maths (33%), predisposition to the profession (33%) and the score

requirement (28%). The reasons for preference of students in the range of 370-380 points are the future anxiety (25%), predisposition to Maths (25%), predisposition to the profession (33%), and the score requirement (17%). The reasons for preference of the students in the 380-390 points range are predisposition to Maths (33%) and predisposition to the field (67%). The reasons for the choice of students over 390 points have been determined as future anxiety (29%), predisposition to Maths (14%), predisposition to the profession (43%) and the score requirement (14%).

Table 5. a. Examining the teacher candidates' expectations of the program according to gender in Adnan Menders University

Gender	Girl		Male	
	F	%	f	%
Field knowledge	33	42	3	60
Pedagogical Knowledge	44	56	2	40
Social activities	2	2	0	0
Total		100		100

Elementary mathematics teacher candidates' expectations from the program have been analysed in 3 categories as field knowledge, pedagogical knowledge and social activities. 42% of female teacher candidates have expectations for field knowledge, 56% for pedagogical knowledge and only 2% for social activities. For male teacher candidates, it is 60% for field knowledge and 40% for the category of pedagogical knowledge. The expressions "I want to have more equipment in teaching and graduate as a fully-equipped teacher" and "I prefer learning teaching to learning mathematics" have been coded as field information (B34). The statement "Providing a permanent and enjoyable education environment by enriching the course with various activities, not just as a course" has been coded as pedagogical knowledge and social activity expectations (B35).

Table 5. b. Examining the teacher candidates' expectations of the program according to gender in Afyon Kocatepe University

Gender	Girl		Male	
	F	%	f	%
Field Knowledge	57	71.25	7	64
Pedagogical Knowledge	17	21,25	4	36
Social activities	10	12.5	-	-
Total		100		100

Elementary mathematics teacher candidates' expectations from the program have been analysed in 3 categories as field knowledge, pedagogical knowledge and social activities. Of the female teacher candidates 71.25% have expectations for field knowledge, 21.25% for pedagogical knowledge and 12.5% for social activities. For male teacher candidates, it is 64% for field knowledge and 36% for the category of pedagogical knowledge. It is seen that male teacher candidates have no expectations from the program as social activities.

Table 6. a. Examining the teacher candidates' expectations of the program according to graduated school in Adnan Menderes University

Expectations from Elementary Mathematics Education Program	Science High School		Anatolian Teacher High School		Anatolian High School		Private high school		Vocational Technical High School	
	f	%	f	%	f	%	f	%	f	%
Field Knowledge	1	50	12	46	18	50	11	48	1	50
Pedagogical Knowledge	1	50	14	54	17	47	10	43	1	50

Social activities	0	0	0	0	1	3	2	9	0	0
Total	100		100		100		100		100	

When the expectations of mathematics teacher candidates have been examined according to the type of high school graduates, it is seen that the students who graduated from Science High School, Anatolian Teacher High school and Vocational and Technical High School types have expectations for pedagogical knowledge and field knowledge. It has been analysed that expectations for field knowledge of Science High School graduates is 50%, Anatolian Teacher High School is 46%, Anatolian High School is 50%, Private High School is 48% and Vocational Technical High School is 50%. Expectations for pedagogical knowledge of Science High School graduates is 50%, Anatolian Teacher High School is 54%, Anatolian High School is 47%, private High School is 43% and Vocational Technical High School is 50%. It can also be stated that the teacher candidates who graduated from Science High School, Anatolian Teacher High School and Vocational Technical High have not mentioned any expectations for social activities.

Table 6. b. Examining the teacher candidates' expectations of the program according to graduated school in Afyon Kocatepe University

Expectations from Elementary Mathematics Education Program	Science High School		Anatolian Teacher High School		Anatolian High School		Private high school		Vocational Technical High School	
	f	%	f	%	f	%	f	%	f	%
Field Knowledge	2	50	27	73	24	57	7	87.5	3	100
Pedagogical Knowledge	1	25	6	16	13	31	1	12.5	0	0
Social activities	1	25	4	11	5	12	0	0	0	0
Total	100		100		100		100		100	

When the expectations of mathematics teacher candidates have been examined according to the type of high school graduates, it can be said that the students who graduated all types of high school have expectations for field knowledge. It has been analysed that expectations for field knowledge of Science High School graduates is 50%, Anatolian Teacher High School is 73%, Anatolian High School is 57%, private High School is 87.5% and Vocational Technical High School is 100%. Except for Vocational Technical High School, other graduates have expectations for pedagogical knowledge. Expectations for pedagogical knowledge of Science High School graduates is 25%, Anatolian Teacher High School is 16%, Anatolian High School is 31% and Private High School is 12.5%. It can also be stated that the teacher candidates who graduated from Private School and Vocational Technical High School have not mentioned any expectations for social activities.

Table 7.a. Examining the teacher candidates' expectations of the program according to placement score in Adnan Menderes University

Expectations from Elementary Mathematics Education Program	Under 350 Points		350-360		360- 370		370-380		380-390		Over 390	
	f	%	f	%	f	%	f	%	f	%	f	%
Field Knowledge	1	50	6	50	5	50	15	50	12	50	4	50

Social activities	1	50	1	8	0	0	1	3	1	4	0	0
Total		100		100		100		100		100		100

According to the placement scores of teacher candidates, it is seen that teacher candidates focus on knowledge of the field and pedagogical knowledge. The students who have a score of under 350 points have expectations for field knowledge 50% and social activities 50%. The students who have a score of between 350 and 360 points have expectations for field knowledge 50%, for pedagogical knowledge 42% and social activities 8%. The students who have a score of between 360 and 370 points have expectations for field knowledge 50% and for pedagogical knowledge 50%. The students who have a score of between 370 and 380 points have expectations for field knowledge 50%, for pedagogical knowledge 47% and social activities 3%. The students who have a score of between 380 and 390 points have expectations for field knowledge 50%, for pedagogical knowledge 46% and social activities 4%. The teacher candidates with a placement score of over 390 have expectations for field knowledge (50%) and pedagogical knowledge 50%.

Table 7.b. Examining the teacher candidates' expectations of the program according to placement score in Afyon Kocatepe University

Total		100		100		100		100		100		100

According to the placement scores of teacher candidates, it is seen that teacher candidates focus on knowledge of the field and pedagogical knowledge. The students who have a score of under 350 points have expectations only for field knowledge 100%. The students who have a score of between 350 and 360 points have expectations for field knowledge 75%, for pedagogical knowledge 19% and social activities 6%. The students who have a score of between 360 and 370 points have expectations for field knowledge 50%, for pedagogical knowledge 30% and social activities 20%. The students who have a score of between 370 and 380 points have expectations for field knowledge 75%, for pedagogical knowledge 17% and social activities 8%. The students who have a score of between 380 and 390 points have expectations for field knowledge 83% and for pedagogical knowledge 17%. The teacher candidates with a placement score of more 390 points have expectations for field knowledge 71.4%, pedagogical knowledge 14.3% and social activities 14.3%.

Did your primary mathematics teaching program meet your expectations? Examining the answers of the teacher candidates according to gender and type of high school graduated.

Table 8.a. Did Adnan Menderes University's Elementary Mathematics Teacher Program meet your expectations? Examination of the answers of teacher candidates according to gender

Did the program meet your expectations?	Girl		Male	
	f	%	f	%
Yes	24	43	2	22
No	6	11	0	0
Partially	11	20	0	0

Total		100		100		100		100		100

How do you want to be a teacher? When the answers given to the question have been examined according to the type of high school, it is understood that teacher candidates who graduated from Science High School want to be both a role model and a qualified teacher. A large number of Anatolian Teacher High School graduates want to be a role model and a qualified teacher. 6% of students want to be fair, contemporary and idealist. A large number of Anatolian High School graduates want to be a role model and a qualified teacher. 14% of students want to be fair, contemporary and idealist. A large number of Private School graduates want to be a role model and a qualified teacher and very few want to be idealistic teachers (6%). Teacher candidates who graduated from Vocational and Technical High School want to be both a role model and a qualified teacher.

Teacher candidates who graduated from Vocational and Technical High School want to be both a role model and a qualified teacher.

4. Discussion and Conclusion

In this study, it has been tried to determine the reasons of the teacher candidates who are attending the first and second class in Adnan Menderes University and Afyon Kocatepe University for their preference, their expectations and whether the expectations are met or not according to gender, placement score and type of school they graduated. Generally, it is seen that girls prefer this program more than males. According to the findings obtained from Adnan Menderes University female teacher candidates, it can be seen that they prefer the program respectively as they love mathematics (Disposition to Field), have interest in teaching profession (Disposition to Profession) and have points for the program (Score obligation). The reasons such as its being a promising job and its advantages (Future Anxiety) are the last reasons for preference. According to the findings obtained from Afyon Kocatepe University female teacher candidates, it can be seen that they prefer the program respectively as they have interest in teaching profession (Disposition to Profession), they love mathematics (Disposition to Field), and have points for the program (Score obligation). Future Anxiety is the last reason for preference. When we look at the results of the female students in two universities, it is understood that they prefer as they love mathematics lesson and the profession of teaching. The reason "future anxiety" takes the first place among the reasons for male teacher candidates in Adnan Menderes University while it is the last reason for male teacher candidates in Afyon Kocatepe University. It has been determined that male teacher candidates who are studying in Adnan Menderes University have not preferred the program because of the score requirement. Considering the reasons why the candidates prefer the program in Adnan Menderes University, the student who is a graduate of Science High School has future anxiety and the students in Afyon Kocatepe University have future anxiety, love Maths and love teaching profession. It is seen that the reasons of preference of the Anatolian and Anatolian teachers' high school graduates are disposition to maths and disposition to profession. In addition, when we look at the placement scores of the teacher candidates studying in Adnan Menderes University, it is seen that there is an accumulation between 360-380 points. The placement score of teacher candidates in Afyon Kocatepe University is in the range of 370-380. It can be said that the scores of the teacher candidates in both universities are close to each other. Analysing the expectations of teacher candidates, the majority of female teacher candidates studying in both universities have expectations in both academic and pedagogical fields. 2 female teacher candidates in Adnan Menderes University and 10 female teacher candidates in Afyon Kocatepe University stated that they expect social activities. When the expectations of the male teacher candidates in both universities are taken into consideration, there are more expectations in the teaching and teaching process especially in terms of teaching lessons and teaching practice courses. Furthermore, it is observed that there is no expectation of social activity from the program. When teacher candidates' expectations from the program according to the types of schools they graduated from are considered, pedagogical knowledge is the first place among the expectations of the Anatolian Teacher High School graduates who are studying in Adnan Menderes University. The ranking of other high school graduates is in the form of field knowledge, pedagogical knowledge and social activity. Students of vocational high schools do not expect social activities from the program. According to the high school graduates, the expectations of the teacher candidates in Afyon Kocatepe University are listed as field knowledge, pedagogical knowledge and social activity respectively. In addition, private high school and vocational high school graduates do not expect social activities from the program. When the teacher candidates' expectations from the program according to the placement scores in both university, they are in the form of field knowledge, pedagogical knowledge and social activity in all point ranges. Only teacher candidates who received a score of 360-370 and a score higher than 390 points do not expect social activities in Adnan Menderes University. Those who received a score of under 350 points and 380-390 points in Afyon Kocatepe University have no expectation of social activity.

Did the program meet your expectations? When analysed the answers to this question; the answers of female teacher candidates in Adnan Menderes University are “yes” 43%, “no” 11%, “partially” 20% and early to answer 26%. Male teacher candidates' answers are “yes” 22% and early to answer 78%. In Afyon Kocatepe University, the answers of female teacher candidates are “yes” 6%, “no” 20%, “partially” 44% and early to answer 30%. Male teacher candidates' answers are “yes” 27%, “no” 9%, “partially” 9% and early to answer 55%.

Did the program meet your expectations? According to the type of high school graduated from, in Adnan Menderes University, the expectations of the student graduated from Science High School have not been met. The answers of the students who graduated from Anatolian Teacher High School are “yes” 25%, “no” 6%, “partially” 13% and “early to answer” 56%. The answers of the students who graduated from Anatolian High School are “yes” 38%, “no” 3%, “partially” 21% and “early to answer” 38%. The answers of the students who graduated from Private School are “yes” 28%, “no” 17%, “partially” 22% and “early to answer” 33%. It is also seen that the expectations of the student who graduated from vocational and technical high school have been partially met. In Afyon Kocatepe University, the expectations of two students graduated from Science High School have been partially met. The other student's answer is “early to answer”. The answers of the students who graduated from Anatolian Teacher High School are “yes” 5%, “no” 19%, “partially” 41% and “early to answer” 35%. The answers of the students who graduated from Anatolian High School are “yes” 15%, “no” 22.5%, “partially” 32.5% and “early to answer” 30%. The answers of the students who graduated from Private School are “yes” 12.5%, “no” 12.5%, “partially” 62.5% and “early to answer” 12.5%. The expectations of a student graduated from Vocational and Technical High School have been partially met. The other two students' answers are “early to answer”. In general, since the teacher candidates are first and second year students, they answered the question as it is too early to answer.

As a result, in order to educate a qualified teacher, it is important to determine the reasons of preferences of teacher candidates, what their expectations are and whether their expectations are met or not (Tataroğlu, Özgen, Alkan, 2011).

According to the results of our research, it is understood that most of the teacher candidates come to the elementary mathematics teaching program willingly and fondly. Education faculties should have more responsibilities to train qualified teachers. On the other hand, it should be ensured that candidates with qualifications required by the profession be selected to the faculties of education. Because teaching is a profession that guides our future, has social responsibility and needs to be consciously chosen (İncikabı, Biber, Mercimek, 2016). To generalize, this study should not limited to a single university and should be applied in universities with more students.

Abstract

The communication definition is close to each other but defined in many ways. "Communication is the process of conveying emotions, thoughts, events and problems to people or groups." (Aydın, 1994). Simple communication is the sharing of knowledge, ideas and emotions. On the definition of communication, Amount states, Tutar Communication is the transmission of ideas, emotions, knowledge, skills through person or group to one another through icons. It is a process in which people or persons share messages in order to create meaning and to communicate" (Tutar, 2003).

About the communication process Amount alıcı The communication process is a form of sending a message clearly to the recipient. It organizes the source message (codes), the receiver detects the message and decodes the encoded message. If the buyer who decodes the coded message gives feedback, the communication process is completed "As in every field, the communication processes in organizations are composed of Source, Message, Channel, Buyer and Feedback. These processes should be known to the members of the organization and should be used effectively (Başaran, 2012).

The information, feelings and thoughts that are intended to be transmitted from the source to the transmitter are called coded messages. Tedir Although the message is not only verbal, it may be written or mimic. The message varies from non-verbal, verbal, actions, and correspondence. The channel is transmitted according to the status of the message and transmitted to the receiver according to the types mentioned above. The way the message is sent can be provided in many ways. Batlaş on this subject, is Message sent to the recipient in writing verbally, non-verbally and in writing is possible with the development of sending skills. The ability to send the message of the source is shaped by the social environment and personality characteristics (Cüceloğlu, 2007). The recipient is "the person who detects the message sent by a channel by the source and recognizes what this message means. It is the recipient of feedback, trying to share the meaning of the messages. In general, the source is the manager and the teacher is the teacher. As a teacher, the recipient is obliged to understand the messages from the administrator, the messages are more orders. In this case, the manager uses his authority against the teacher. Feedback is mostly observed among teachers. One of the main goals of education is feedback. Another name for the feedback is the feedback. It is the response of the receiver to a message sent by a resource. The effectiveness of communication depends on the fact that the message reaches the recipient without losing meaning in the complete and channel (Tutar, 2003).

In the communication, the personalities, prejudices, awareness about communication and experiences of the recipient and the source are important. In organizational communication, group differences among organization employees, the perspective of communication with the manager's subordinates play a decisive role in effective communication within the organization (Konti, 2011). In this case, when we look at elementary schools, how effective are managers, how can they communicate with teachers, what measures are they taking in order to communicate effectively, do they show interest, are they equal, do they contribute to their progress, respond to their expectations, answer these questions? communication is about how strong it is (Öner, 2000).

The manager's realization of the goals of the school is related to how much he / she can manage teachers, students and parents (Umur, 2011). The manager must be in effective communication with all members of the school in line with the continuity and objectives of the school. The more effective and effective the communication between the teacher and the manager, the higher the level of success in their tasks (Witte, & Rogge, 2014). The administrator should also manage the communication within the school taking into account the characteristics of the people for the purposes of the school (Özünlü, 2007). Managers, being aware of the communication with the teachers and taking measures to bring about this, lead to the effective and powerful manager-teacher communication.

Method of Research

The screening model was used in this study. In the process of communication between the manager and the teacher in primary schools, possible situations that may be encountered were transformed into questionnaire statements and the views of teachers about these statements were tried to be described. It has been tried to be tested whether the views of teachers about gender, age, branch, vocational seniority, graduated faculty, education level, communication skills and whether or not the teacher opinions have changed significantly depending on the location of the school.

Universe and sample

The population of the study consists of 1263 teachers working in the secondary education schools of the Ministry of National Education in Nicosia in the TRNC in the 2017-2013 academic year. The sample of the study consists of 198 teachers in various branches of secondary schools in Nicosia in the 2017 - 2018 academic year. In this study, simple random sampling method was chosen. All Simple random sampling is a sampling type in which all elements in the universe have the chance to be equally selected. In simple random sampling, the number of respondents from each of the element types in the universe is left to chance with all of them.

Data Collection

The questionnaires were applied to the teachers working in primary schools in the Nicosia District of the Turkish Republic of Northern Cyprus. 250 of the questionnaires were given to the teachers. In schools, a questionnaire was first shown to the principals and the teachers were provided to fill their courses in a way that they would not disrupt their lessons.

Results

Table 1. F and % Values for Teachers Gender Variable in the Sample Group

Gender	<i>f</i>	%
men	95	44,6
women	103	55,4
Total	198	100,00

In Table 1, 95 of the teachers in the sample group (44.6%) were male and 103 (55.4%) were female and 198 were primary school teachers. Table 1 shows that female teachers are more than male teachers. It can be said that the profession of teaching is mostly due to the fact that women prefer more because they devote more time to their private life.

Table 2. F and % Values for the Age Variable of the Teachers in the Sample Group

Year	<i>f</i>	%
21 – 25	31	%16,0
26 – 30	45	%30,5
31 – 35	38	%20,7
36 – 40	30	%12,2
41 – 45	28	%8,5
46 – 50	15	%7,0
51 ve Üzeri	11	%5,2
Total	198	100,00

In Table 3, the teachers in the sample group; 31 (16.0%) were in 21 - 25 age group, 45 (30.5%) were in 26 - 30 age group, and 38 (20.7%) were in 31 - 35 age group, 30% (% 12,2) 36 - 40 age group, 28 (8.5%) 41 - 45 age group, 15 (7.0%) 46 - 50 age group, 11 (5.2%) 51 and over the age group. According to these results, it can be said that the teachers who make up the sample group are mostly in the 26-30 age group. Due to the fact that the district of Nicosia is in the compulsory education zone, there is a high number of teachers. The shortage of teachers indicates that the MoNE has more assignments to this region. It can be said that the 26-30 age group is caused by the high number of the first appointment.

Table 3. F and% Values for the Variables of the Teachers in the Sample Group

Branch	<i>f</i>	%
Classroom Teacher	99	59,6
Math teacher	15	7,0
Music teacher	4	1,9
Business Education Teacher	3	1,4
Foreign Language Teacher	12	5,6
Turkish teacher	17	8,0
Science teacher	5	2,3
Physical Education Teacher	3	1,4
Visual Arts Teacher	4	1,9
Pre-school teacher	2	,9
Other	34	9,9
Total	198	100,00

In Table 3, the sample group consisted of teachers, 99 (59.6%) Classroom Teachers, 15 (7.0%) Mathematics Teachers, 4 (1.9%) Music Teachers, 3 (1.4%) Business Education Teacher, 12 (5.6%) Foreign Language Teacher, 17 (8.0%) Turkish Teacher, 5 (2.3%) Science Teacher, 3 (1.9%) Visual Arts Teacher, 2 (0.9%) Pre-School Teachers and 34 (9.9%) other branches. According to these results, most of the teachers who make up the group are classroom teachers. Due to the structure of primary schools, the class teacher is more. It can be said that the percentage of classroom teachers is due to this reason.

Table 4. Communication Training of Teacher Communication in Primary Schools Results of t-Test Analysis for Import Variables

Bottom Dimensions	Gender	<i>f</i>	<i>x</i>	<i>ss</i>	<i>t</i>	<i>P</i>
Recognition of Personnel	Yeah, I got it.	79	3,56	,78	,865	,388
		119	3,46	,81		
Participation	No, I didn't.	79	3,59	,76	,587	,558
		119	3,53	,78		
Breakthrough	Yeah, I got it.	79	3,71	,64	,570	,569
		119	3,66	,71		
Equality	No, I didn't.	79	3,69	,71	,480	,631
		119	3,74	,76		
Total	Yeah, I got it.	79 119	3,64 3,60	,66 ,71	,426	,670

Table 4, the results of t-test analysis conducted in terms of the variable of communication education of manager-teacher communication in primary schools were given. In primary schools, there was no statistically significant difference ($p > .05$) in terms of the variable of communication training in the sub-dimensions of recognition, participation, influence and equality. Conscious conduction of communication contributes to an effective communication between the receiver and the transmitter. Consciousness of the communication and the training of the receiver or the transmitter about communication are effective in establishing a conscious communication. According to these results, there is no significant difference in the communication between the teachers who do not receive communication training with the teachers who have communication training in the sub-dimensions of

Staff Recognition, Participation, Influence, and Equality in the communication of managers and teachers in primary schools. Looking at the average scores, it is observed that teachers' communication with their managers is strong. Comparing the teachers who have received communication training with non-teachers, it can be said that the teachers who received communication training in total have a relatively stronger communication with their managers than others. As mentioned earlier, teachers who receive communication education communicate more effectively and consciously with their managers. However, the teachers who received communication training in the equality sub-dimension have lower mean scores than others. According to the teachers who have received communication training, the scale is considered to be more negative than the others according to the sub-dimension of the scale.

Table 4, Kruskal Wallis - H Test was applied in order to evaluate the teacher - teacher communication in terms of age - variable in primary - school schools. There was no significant difference in the sub-dimension of the effect of manager-teacher communication in primary schools. According to this result, it can be said that teacher - education manager communication is strong in the sub - dimension of teachers' influence. It can be said that primary school administrators influence teachers. However, when the age groups are compared, the average scores are lower than the other groups between the 26 and 30 age groups. It can be said that 26 - 30 age group is less affected in their managers than in the age group after 30 years of age.

A statistically significant difference ($p = ,000 < ,05$) was found in terms of the age variable of the teacher in the sub-dimension of the manager-teacher communication scale personnel recognition in primary schools. After this process, complementary comparison techniques were applied to determine which groups were determined by Kruskal Wallis - H. For this purpose, Mann Whitney - U test was applied. At the end of the study, it was determined that the teachers in the 31 - 35 age group were in favor of teachers in the age group of 31 - 35 years, between the ages of 21 - 25 and 26 - 30 years. According to this result, as the ages of the teachers increase, the scores in the sub-dimension of staff recognition increase. Age groups after the age of 31, managers can be said to have enough knowledge of the staff. A statistically significant difference ($p = ,005 < ,05$) was found in the sub-dimension of the participation of the teacher-teacher communication scale. After this process, complementary comparison techniques were applied to determine which groups were determined by Kruskal Wallis - H. For this purpose, Mann Whitney - U test was applied. At the end of the study, it was determined that the teachers in the 31 - 35 age group were in favor of teachers in the age group of 31 - 35 years, between the ages of 21 - 25 and 26 - 30 years. After this age group, the participation size increases from the points they get. According to this result, it can be said that as the age of the teachers increases, the administrators make their participation in the decisions to be taken.

A difference was found in the sub-dimension of manager-teacher discount scale in primary schools ($p = ,014 < ,05$). Wallis - Hrushevichen - Hitzen - Hörgensen -. This garment was administered the Mann Whitney - U test. It has been found that teachers in the age group of 31-35 years are in favor of teachers between the ages of 21- 25 and 26- to 30-year-old teachers. After this age group, the equality is increasing with the points they get from the items. According to this result, as the age of the teachers increased, the administrators were told that the teachers behaved equally.

A statistically significant difference ($p = ,002 < ,05$) was found between the teacher and teacher communication scale in primary school. After this process, complementary comparison techniques were applied to determine which groups were determined by Kruskal Wallis - H. For this purpose, Mann Whitney - U test was applied. At the end of the study, it was determined that the teachers in the 31 - 35 age group were in favor of teachers in the age group of 31 - 35 years, between the ages of 21 - 25 and 26 - 30 years. After this age group, they are increasing in all of the items. According to this result, it can be said that teachers' communication with their managers is stronger as their age increases.

In order to compare the opinions of teachers in terms of the manager - teacher communication branch variable in primary schools, Kruskal Wallis - H Test was applied in Table 5. In primary schools, there was no statistically significant difference ($p > .05$) between teacher - teacher communication scale personnel recognition, participation, influence, equality sub-dimensions and total. When the mean scores of the other branches of the scale are compared in the subscale of the scale, the average scores of the class teachers are lower than the average scores of the other branches. It can be said that the managers did not provide the participation of the class teacher in the decisions to be taken according to the other branches. Again, considering the total of the scale, the average score of the class teachers is lower than the other branches. In this respect, it can be said that communication between administrators and classroom teachers is weaker than other branches.

Table 6. To determine whether the differentiation of the manager-teacher communication in primary schools Kruskal Wallis - H Test Results

Bottom Dimensions	Education level	f	Xsıra	x	sd	P
Recognition of Personnel	Central School	99	112,83	17,511	2	,000
	School in Slum	55	78,17			
	School in Mass Housing	44	124,08

Equality	Central School School in Slum School in Mass Housing	99 55 44	106,68 84,37 128,64	14,744	2	,001
Total	Central School School in Slum School in Mass Housing	99 55 44	110,77 77,00 128,64	20,674	2	,000

In Table 5, the Kruskal Wallis - H Test was used to compare the views of teachers and teachers in terms of the neighborhood variable where the school is located in primary schools. There was a statistically significant difference ($p > .05$) between the levels of recognition, participation, influence, equality sub-dimensions of the teachers and the variables of the school where the school was located.

There was a statistically significant difference ($p = .000 < .05$) in terms of neighborhood variable where the school was located in the sub-dimension of manager teacher communication scale personnel recognition in primary schools. After this process, complementary comparison techniques were applied to determine which groups were determined by Kruskal Wallis - H. For this purpose, Mann Whitney - U test was applied. As a result of the application, it was determined that the teachers in the squatter region group of the difference were against the teachers in the squatter region group among the teachers in the center and in the school group within the mass housing units. According to this result, the average scores of the teachers in the squatter region group are lower in the recognition sub-dimension. The average scores of the teachers in the school group in the center and in the mass housing, respectively, increase in the recognition sub-dimension of the staff. It can be said that the managers working in the schools in the slum area are less familiar with their teachers than the other administrators in other central and mass housing.

There was a statistically significant difference ($p = .000 < .05$) in terms of the district variable where the school is located. After this process, complementary comparison techniques were applied to determine which groups were determined by Kruskal Wallis - H. For this purpose, Mann Whitney - U test was applied. As a result of the application, it was determined that the teachers in the squatter region group of the difference were against the teachers in the squatter region group among the teachers in the center and in the school group within the mass housing units. According to this result, the average scores in the sub-dimension of participation of teachers in the squatter region group are lower. The average scores of the teachers in the school group in the central and mass housing units are increasing. It can be said that the administrators working in the schools in the slum area did not provide the participation of the teachers in the decisions taken in the school according to the school administrators in other central and mass housing units.

There was a statistically significant difference ($p = .000 < .05$) in terms of neighborhood variable where the school was located. After this process, complementary comparison techniques were applied to determine which groups were determined by Kruskal Wallis - H. For this purpose, Mann Whitney - U test was applied. As a result of the application, it was found that the difference was in favor of the teachers in the school group within the mass housing, the teachers in the squatter region group and the teachers in the central school group in favor of the teachers in the school group within the mass housing. According to this result, the mean scores of the teachers in the squatter region and the central school group are lower in the sub-dimension of influence. It can be said that the school administrators in the mass housing affected teachers more than the managers working in schools in the other center and squatter districts.

There was a statistically significant difference ($p = .001 < .05$) in terms of the district variable where the school was located. After this process, complementary comparison techniques were applied to determine which groups were determined by Kruskal Wallis - H. For this purpose, Mann Whitney - U test was applied. As a result of the application, it was found that the difference was in favor of the teachers in the school group within the mass housing, the teachers in the squatter region group and the teachers in the central school group in favor of the teachers in the school group within the mass housing. According to this result, the average scores of the teachers in the slum area and the central school group are lower than those of the public housing group. It can be said that school administrators in public housing behave more equally to teachers than other group managers.

There was a statistically significant difference ($p = .000 < .05$) between primary school administrators and teacher communication. After this process, complementary comparison techniques were applied to determine which groups were determined by Kruskal Wallis - H. For this purpose, Mann Whitney - U test was applied. As a result of the application, it was determined that the teachers in the squatter region group of the difference were against the teachers in the squatter region group among the teachers in the center and in the school group within the mass housing units. According to this result, the communication with the teachers in the squatter region group is poor compared to the other group managers.

Conclusion And Recommendations

In the field study conducted with primary school teachers; It was observed that the gender of the teachers and the teacher - teacher communication did not affect the teacher - teacher communication significantly. However, when the mean scores of male teachers and female teachers are compared, the average scores of male teachers are higher. In this case, it can be said that male teachers have stronger communication with their managers than female teachers. In the case of Karlatirs Tuzla, it was concluded that male teachers were more powerful than their female teachers.

In primary and secondary school administrator-teacher communication, the average score between the teachers who received communication training from teachers and those who did not. When the arithmetical average of the scores of the teachers who received communication training with the teachers who did not receive communication training, the average scores of the teachers who received communication training were higher. In this case, teachers who receive communication training are more able to communicate with their managers than teachers who do not receive communication training. Teachers receiving communication training in the research conducted by Karli have stronger communication with their managers than the teachers who do not receive communication training.

Significant differences were observed in all sub-dimensions of primary school administrator-teacher communication, between teachers, in central schools, in schools in squatter region, in schools in public housing. The reason for the differences in all of the sub-dimensions was the same. According to the teachers working in the center and mass housing, the teachers working in the slum area are weaker. According to the teachers working in the schools in the central schools, the communication with the administrators is stronger. Teachers who work in schools in mass housing schools have stronger communication with their managers than teachers working in schools in squatter districts and teachers in central schools. In the study conducted by Karli, only the squatters and schools in the central region were used, so the results were compared between the two.

As the seniority of teachers and teachers in primary school teachers' seniority increase, their communication with their managers is also strengthened. When we look at the sub-dimensions of the seniority of the professional seniority only a significant difference was found in the sub-dimension of the staff recognition. When the sub-dimension of personnel recognition is examined, the seniority of the teachers is strengthening their communication with their managers over 6 years. Teachers' 1-5 years professional seniority and 21 - 30 age groups. Increasing the age of the teachers and their seniority naturally strengthens their communication with their managers. In his profitable research, he concluded that the communication of the teachers with the administrators was strengthened after the 1 - 5 year professional seniority group.

A significant difference was found in the sub-dimension of personnel recognition in terms of the faculty variable of the elementary school administrator-teacher communication. This difference arises from graduates of the Faculty of Education. According to the teachers who graduated from the Faculty of Education, the administrators of other faculties graduated from the managers, managers think that the staff does not know enough. There was no significant difference in the other sub-dimensions. Generally speaking, the change in the faculties that teachers have graduated affects the communication with their managers. In his profitable research, he concluded that the change of faculties that teachers had graduated did not affect manager - teacher communication.

Arithmetic averages of the teachers' responses to the manager - teacher communication scale according to the sub-dimensions, the sub-dimension of the staff recognition is 3.51, the sub-dimension of participation is 3.57, the sub-dimension of influence is 3.69, the sub-dimension of equality is 3.72, and the total is 3.62 . Looking at these arithmetic averages, manager - teacher communication is strong. However, when the sub-dimensions are compared, the highest value is in the sub-dimension of 3.72. It can be said that administrators behave equally to teachers in primary schools. The lowest value is 3.51 in the sub-dimension of personnel recognition. The value of 3.51 corresponds frequently to the scale. In this case, managers can be said to recognize the staff. Collecting is 3.62. The score of 3,62 is 116. The lowest and the highest 160 points can be obtained. In this case, it can be said that the communication of manager and teacher is strong in the primary schools with 116 points.

Abstract

This paper shows the intertwining of experiential learning, reflection of life events and motivation. It also reveals that crucial to reflection is being able to see the 'two selves' in the way memory recall transpires, which affects one's interpretation. Through the narratives of selected women leaders of a national women's organization in the Philippines, the dualities of self-meanings in one's self-reflection were clarified, which when deciphered, leads to better decisions and solutions to problems. The role of motivation is integrated as a significant push for action.

Introduction

Reflecting on experiences and learning from them has been a general process and a usual track in education – informal or formal. Similarly and connectedly, experiential learning becomes part of the whole process. Experiential learning has always been associated with adult education, lifelong learning, self-directed and informal learning based on practical occurrences in life. Valuable lessons can be derived from all these. In fact, experiential learning has been a well-trodden area of research in adult education and community organizing. Adult experiences are most often shared through story-telling. Our childhood, whatever our nationalities are, somehow contains stories told by grandparents and/or older people we have encountered. In the Philippines, there is what is called, "Mga Kwento ni Lola Basyang" – translated as, The Stories of Grandmother Basyang, where at certain time of the day, children in the neighborhood would gather around the grandmother to listen to her stories. Stories are narrated as they are and as they come when conditions permit among adult friends, children, neighbors and relatives.

Stories, being sources of knowledge, when re-told can be part of learning, if we know how to make use of them. Beyond learning, they become community wisdom and village history. Stories and narratives go through reflections, remembering, recalling past experiences and most often end in extracting and culling out what lessons have been gained. It has become a pattern of inquiry in qualitative research to make respondents re-tell events, notice highlights, and cull out life lessons. Narrating life events legitimizes experiences as sources of knowledge and lay down kaleidoscopic visions of shared memories. Narratives vary depending on the specific focus in life we want to know. This article puts to fore narrations of women community leaders referred to here as the learners.

The study used the results of a SWOT analysis workshop and leadership orientation cum interview and narration and first-hand data put together as the data sources (DALUYONG, 2015). These were culled out basically through reflections. During the workshops, the community women leaders were allowed to do reflection, deep recall and consultation with their peers. The researchers aimed to explore these narratives, to get into their thoughts, impressions, and self-assessments of their experiences.

The paper, specifically, aims to:

1. Understand how DALUYONG (a national organization of rural women) women leaders see themselves, the transformation process from being homemakers to community leaders;
2. Weave and make sense of these narratives towards deciphering what make up for their happiness and well-being (which from the narratives could be two different things); and
3. Share a community/national development model that may provide some energy and insights for a more inspired and reconfigured work of DALUYONG.

On Experiential Learning: Narration, Dualities And Reflexivity

This section sets the theoretical and conceptual underpinnings of the study. Some themes are highlighted to show how they influence the analytical framework.

Learning is a process -

When one narrates, the subject undergoes a process of reflection. For Fenwick (2001), this puts the subject as the main actor in the process of life recall and making meaning of life events. In here, memories are surfaced and given new meanings based on one's interpretation, how they were able to see those experiences in the now context. Through reflection, the subject recalls and tries to remember events that occurred in one's past. Part of it is weighing or valuating the importance of what transpired and gauging the effect of those events in one's overall life situation. As reflection takes place, one cannot avoid recalling memories beyond one's own. Aside from self, families, friends and relatives, organizational and workplace memories come out as well.

Fenwick considers experiential learning as a "process of human cognition" (Fenwick 2001). She further defines 'cognition' as broadly similar to 'learning.' She sets the question then for us to think 'what manner of learning can be conceived that is not experiential.' Because Fenwick avers experience can be through deep thought (reflective) and awareness of body movements (kinesthetic), both conscious and unconscious, and overall dynamics of life events of the subjects.

Learning by Doing -

It creates new knowledge emanating from action-interactions of people (Dewey 1938). As early as 1938, John Dewey already broached the idea of 'learning by doing.' Linking experience and education, he believes in the 'hands on' approach and experiences can be sources of learning, but also avers that not all experiences educate. In order for learning to take place, the experience must have continuity, where the learner must know how to connect certain aspects of the new learning with what she/he already has. Secondly, there should be interaction. The learner should be actively engaging with his/ her environment checking lessons gained. This is Dewey's idea of coherence of experiences.

In Vince and Reynolds (2007), learning from organized groups can be managed. As one reflects, the possibility of encountering two levels of reflections and outcomes can appear. While one is reflecting on one's personal life, the group or organizational dynamics where the learner is involved, surface as well (Vince and Reynolds, 2007). The incorporation of reflecting on the organization provides the possibility of finding or discovering untapped unconscious, even emotional forces which the subjects never realized were part and parcel of the influencing factors in their lives.

In Gherardi and Poggio (2009), very clearly the stance of feminism as an approach to research is through narration of stories. They sat with women managers and allowed them to talk about the dynamics inside the organization they are in. As a tool of expression, narrative was very effective. The women participants in retrospect rolled out their stories, recalling, analyzing the past events related to their work, thought out the meanings for them of their respective experiences. For Gherardi and Poggio (2009, page 56) Narrating is a way of "re-appropriating experience," recalling and reconstructing to put together past events in one's life. By recalling, the subjects are given the opportunity to a renewed projection, interpretation, and making meanings. In essence, it becomes a "practice of transformation, reflection, reconstruction, recognition and re-structuration of the self" (Gamelli, 1995 in Gherardi and Poggio, 2009).

Fenwick (2001) likewise, inquires into how life experiences are understood. Gherardi and Poggio (2009) see this as the learner's interpretative perspectives. What they see, how they see them, inevitably entails meaning configurations of their own reflections.

Introspection during narration can result in deepening analysis of organizational dynamics, thus under covering grounded and hidden conflicts. These conflicts may not be the learner's own personal experience, but that of the organization's operational settings, possibly finding out organizational flaws. Recounting 'signs and traces' of events are pieces of puzzles that when put together by the narrator can give a complete picture. Findings of conflicts, pose threats and uncertainties. But on the other hand, these findings can commence a re-direction of how the organization will be run.

Learning and gendered leadership -

Leadership has been associated with the male functions, roles and competencies. But taking off from a feminist perspective of experiential learning, narration and reflexivity, we ensue experiences of women as not just personal and organizational roles. In learning by doing, gaining experiences with new knowledge, skills and attitude, the

female narrators are actually ‘re-designing their self-esteem’ (Piccardo 1998 in Gherardi and Poggio, 2009) as a person with value added to note. This new form of leadership is relational and constructive. It veers away from the ‘inborn’ nature of a leader. Rather, it considers leadership to possibly emanate from amongst co-workers, co-participants, co-members. Leadership in this way is something interpersonal, not individualistic.

Leadership is also a situated practice, meaning, it cannot be taken out of context. There has to be interactions, both verbally (whatever the language is) and physically. Interactions are not simply ‘transactional’, which mostly male leaders do, but ‘transformational’ where relationality is given weight, to promote positive interactions, trust, and collective ends. Gendered leadership shares power, exercises control by the group, not control over the group. Chodorow (1978 in Gherardi and Poggio, 2009) avers that women gained this capacity to relate and enhance affective skill thru primary socialization and communication with others whereby they are exposed to attending to listening, sharing stories and experiences, and expressing concerns naturally. These activities, across time, have become society’s expectations and socially-created assignments to women (e.g., child-rearing, physical and psychological family care, negotiating, settlement of conflicts and even finding building block solutions to problems. However, at the societal level, even organizational, they rarely practice these capacities, as most often, men are identified as leaders. The lack of opportunity to employ formal authority in an organization, for example, led women to adapt the strategy of feeling their way thru, as they anticipate reactions from others they relate with.

In some societies though, women leadership was more associated with spirituality and being religious leaders (like the babaylans in the Philippines). But the babaylans’ capacities overflowed beyond spirituality when they were also recognized as healers, shamans, seers, and community ‘miracle workers.’

Contradiction in realities in learning experiences -

Britzman (2003) explains the ‘contradictory realities’ in learning. She specifically used teaching as the direct experience observed and analyzed. She theorizes that when teachers teach, they are ‘shaped by their work’ and ‘shaping their work’ at the same time. Applying and associating this with other types of work, we can similarly say that the contradiction is in - how the processes of the work affect the worker (‘express something about the subjectivities of the worker’), and how the worker construct their working identities. Put in a different light, Britzman (2003) pursues that ‘learning to teach is like teaching itself’ - one transforms in the process of teaching, the ‘teachers construct themselves, while they are being constructed by others.’ It is like a process of becoming: a time of ‘formation and transformation.’

When we teach, it is not rooted on producing and imparting knowledge alone, but we are projecting a public image of ourselves. One is expected to be custodians – enforcing school’s rules, communicates textbook knowledge, gives grades to students, and manages discipline norms. Unseen are – the ways teachers translate the contents and their experiences, their creativity in innovating facilitation of understanding the subject matter, culling out and working out students’ concerns, and balancing the requirements of the curriculum and the teacher’s desire to impart ‘what it means to know’ (Britzman, 2003).

Adding our insights on Britzman’s thoughts, we would refer to this as reflexivity in teaching or the dialectics of teaching, where teachers undergo the spiraling process of teaching-learning-theorizing-teaching – and learning again, but as they undergo the spiral process, they elevate their status in terms of quality – in the way/s of teaching, the ways of being teachers, the content/s or substance of knowledge learned and shared.

Engaging Our Two Mental Operating Systems

In TED Talk 2010, Daniel Kahneman talked about ‘our two selves.’ This was of great interest to the researchers particularly in linking it with experiential learning, narratives and reflections. In his presentation, Kahneman surfaced the concepts of ‘the experiencing self’ and ‘the remembering self.’

In recalling one’s life story, one can talk of the ‘experiencing self’ which is re-living the present. One can also talk of the ‘remembering self’ that keeps the record of the story of his/her life. The remembering self tells the story through our memory. In telling a story, Kahneman (2010) emphasizes three elements that define it – changes, significant moments and endings. For him, endings are very important because they dominate the story, they are usually retained, hence, most remembered.

Kahneman in his book, *Thinking Fast and Slow* (2011), also talks of two mental operating systems which were originally proposed by two psychologists, Keith Stanovich and Richard West. System 1 operates much quickly, with not much effort and sense of control. System 2 is done with more mental effort, like doing complex mathematical computations requiring more concentration before making a choice.

Juxtaposing them with the experiencing self and the remembering self, Kahneman views them as ‘System 1 relates with the experiencing self’; and ‘System 2 relates with the remembering self.’ System 1 is quick to express what it thinks is. As Kahneman would say, the experiencing self answers the query: “Does it hurt now?” On the other hand, associated with the remembering self, System 2 is not as quick to decide what is or how is, but it takes more effort to recall carefully what transpired, goes back to the stock of memories of the past, and answers the question: “How was it, on the whole?”

Juxtaposing further, when people try to recall past experiences, i.e., community engagements as an organizer, one’s life as an educator, a community development manager, a human resource specialist, an education development specialist, they recall in two ways, the ‘remembering self’ and the ‘experiencing self.’ The remembering self is the ‘story-teller’ when one recalls past experiences. Remembering entails narrating stories. What defines a story? For Kahneman, a story contains changes, significant moments, and endings. Emphasizing further, the importance of ‘endings’ in a story, when we recall thru our remembering self, we value much the ‘endings.’ This is the one that we remember, hence, the one that makes decisions.

Our insight on the matter, by linking it with experiential learning, memories recalled include what have been done and the learning from them – good or bad. But learning most often come in positive notes. Aware of the not so good experience, we try to cull out our learning from it and learning always comes as positive effects on one’s life. The ‘learning’ is realized as the ‘ending.’

The ‘experiencing self’ has no voice when we choose what decision to take. According to Kahneman (2010), “We don’t choose between experiences. We choose between memories of experiences.” To remind, it is the ‘remembering self’ that takes stock of memories.

So applying this to perceptions of ‘happiness’, Kahneman further clarifies, ‘the experiencing self’ sees ‘happiness’ as the moments of the experience, complications across process, how happily a person has lived and emotions felt over time. While ‘the remembering self’ talks about ‘how satisfied and pleased the person is when she/he recalls their lives.’ Hence, to emphasize Kahneman, we have to critically learn to decipher the distinction between ‘happiness of the experiencing self’ and the ‘satisfaction of the remembering self,’ if we need to use them for policy decision-making.

A Study Of Lived Experiences Of Rural Women Community Development Workers

This paper uses Kahneman’s ‘two selves’ in analyzing the experiences, learning, happiness and satisfaction of certain organized rural women leaders in the Philippines. The women’s organization is called DALUYONG. It was organized in 2003 by the Philippine Rural Reconstruction Movement (PRRM), one of the oldest and biggest non-government organizations in the country, so far. Its scope cuts across 13 provinces, 58 municipalities/towns with 5,146 members.

13 Provinces	Members	58 Municipalities (Towns)
Ifugao	302	3
Nueva Vizcaya	223	4
Nueva Ecija	106	5
Bataan	1,210	4
Cavite	201	4
Albay	18	5
Camarines Sur	450	6
Camarines Norte	300	4
Quezon	520	6
Marinduque	232	5
Camiguin	250	5
Negros Occidental	242	3
North Cotabato	1,092	4
TOTAL	5,146	58

Table 1.

Why study DALUYONG and look into its experiences –

The inclusion of DALUYONG in the study posits a form of theorizing, which is the ‘search for or making meanings’ emanating from real life experiences. This is a combination of critique, constructivism, and interpretative forms (Britzman, 2003). It is done largely thru narration of experiences, viewed as an advantage because even if lived experiences are not recoverable, they can be re-told thru ethnographic narratives (Brodkey, 1987). As Brodkey says, ‘ethnography is the study of lived experience.’

DALUYONG is eighteen (18) years old. It laid its foundations across thirteen (13) provinces, covering 58 municipalities, with 5,146 members. The expanse and extent of women organizing are amongst – farmers, fishers, traders, local and small entrepreneurs. After 18 years, the researchers wanted to know if the leaders (Executive Committee representing the provinces) are satisfied with their accomplishments and experiences, as a whole; and specifically, are they happy as women leaders.

The researchers sat down with seven (7) of the Executive Committee leaders (2 were absent). To start and reflect on their journeys, the participants were asked the question: Are you happy now as a woman – within the family, the organization, and the community and/or the country? This was done to sort of give the women leaders brief time to reflect on their journeys as community leaders.

In summary, the answers expressed were:

- (1) Empowered women - ‘Yes’ they are happy as ‘empowered women’ compared to when they were not members of DALUYONG. Now, they have broader and deeper knowledge about life in different aspects – socio-cultural context of women’s oppression and gender inequality; the complexities of the political situation of the country and its governance; and the economics of resources a country has, its usage and equitability of benefits to affect the poverty situation they are in, plus the others in similar case.
- (2) Awareness of women’s rights - They are now aware of their rights as women, in the context of their respective households, local-based organization, and the community.
- (3) Confident of their capacities - They are more confident of what they can do, especially as members and officers of their organization, representing their respective provinces to the Executive Committee. Most of them have been with DALUYONG for over 10 years. It is in DALUYONG that they have become more learned in terms of public speaking, engaging with officials in the local government when they have to raise their local issues in the community, and dealing with other organizations. They are now positive influence on others; a realization of how much their minds can reach (comprehensively), and able to link and synthesize multi-concerns like: poverty, environmental integrity, abuse of natural resources, corruption in governance, etc.
- (4) Citizenship - Contributing to the community in terms of identifying problems, finding solutions, e.g., family health and nutrition, food security; gender relations and counseling; coordinating with the church, school, youth and senior citizen-support activities.
- (5) Community recognition - Gained the respect and recognition of people in their respective barangays and other organizations.
- (6) Resource mobilization - They learned to make/write project proposals to start up social enterprises for DALUYONG members.

Meeting The Two Selves –

Kahneman’s theory of the two selves and Brodkey’s search for meaning/s approach can be used in understanding the narratives from each woman-leader based on recalled experiences and how Saemaul Undong (South Korea’s successful community development model) served as inspiration and motivation.

In telling the story of looking back at past experiences, Kahneman explains that what we recall are memories of our experiences which the storyteller narrates. He emphasized the point that what really defines or gives identity and meaning/s to a story are: changes, significant moments and endings. These elements are found in the ‘remembering self’ rather than the ‘experiencing self’ because it is the former that holds the stock of memories. The latter is more aware of what exist in the present yet can recall the past.

The ‘Remembering Self’ And Satisfaction –

So when asked if they are happy, the women leaders recall the memories of the changes that transpired in their lives – from being ordinary, not-so-knowledgeable housewives (according to them), or simply a farmer’s wife and mother to their children, extending unpaid labor, helping out in the farm to augment family food on the table, or a fisher’s wife selling fishes. If not sold, she dries and salts the fish for longer shelf life adding value to them. The recollection focusing on the transformation/changes in their lives were significant moments. From being silent, learning how to teach and organize other women, discussing community issues, engaging the local government, negotiating their needs, and tapping resources for community projects.

All the expressed themes mentioned above (i.e., empowerment, awareness of women's rights, confidence in one's capacities, citizenship, community recognition, and resource mobilization) are enormous changes and very significant moments in the women leaders' lives. It was their 'remembering self' doing the recall. They were just happy to narrate the memories they had, like trainings, meetings, orientations, the knowledge and skills learned, the feelings of elation from getting recognition in their communities, and the feeling of empowerment.

But there seems to be a hanging question in their mind. Were they satisfied? Following Kahneman further, another element that defines a story is the ending. For these women, at the outset, empowerment could be the ending. As part of experiential learning, this ending dominated in their narratives.

The 'Experiencing Self' And Happiness -

But is it really the end? Or is there something more for these women leaders? Apparently, we observed and looked deeper into the recent SWOT (strengths, weaknesses, opportunities, threats) results previous to the narration session. Noticeable are expressions of 'dissatisfaction' despite 'happiness.' Happiness and satisfaction are the expressed realities from stock memories of changes in the women's lives. These are their achievements. These are significant moments of being recognized in the community, memories of places they have been to, people they have met and projects they worked on, which contributed to economic gains. Despite expression of happiness of their past lives, there is dissatisfaction when they thought of the here and now. It is the experiencing self conveying this feeling.

In DALUYONG's case, happiness and satisfaction is experiencing and seeing solutions resolving existing concerns. Hence, the ending is yet to be realized. The ending seems to be never-ending because it is a moving target continuously rolling out. This is what the 'experiencing self' encounters in the present. In other words, one can be happy with good memories but may not yet be satisfied.

In matters of public welfare, banking on Kahneman's thought, "we should not mistake happiness as a substitute for welfare" (2003). DALUYONG's strategic goals of sustained growth and development and better quality of life are something for the 'experiencing self' to get. Decisions on social and public welfare, he is saying, should be based on what the 'experiencing self' sees.

In summary, the SWOT results were:

STRENGTHS: The national council and executive committee regularly meet; 85% of local formations still operating; strong links with local government units (LGUs); active in issue advocacy and lobbying; participating in conferences, seminars, trainings; has operating social enterprises but yet to enhance packaging and marketing aspects; accredited by the municipal and provincial government; can participate in LGU decision-making thru the local development councils.

WEAKNESSES: Wearing out of membership expansion; ageing leadership; no ready second-liners; low spirit and enthusiasm of some members; some field chapters stopped regular meetings; some members are unreachable (no more contact and update from DALUYONG chapters in the provinces of Negros Occidental, Cotabato, Camiguin, Ifugao, Nueva Vizcaya); overlooking the potential of resources available in the areas; certain policies need revisions, still weak in product promotion and market sustaining.

OPPORTUNITIES: access to participation in open planning and budgeting from barangay to regional levels thru the bottom-up-budgeting (BUB); passing into law of the Magna Carta for Women; chance to develop more gender and development champions; presence of financial network supportive of women's advocacies and projects (e.g., councilors, barangay/village captains, mayors, governors).

THREATS: non-readiness to climate change that can hit farm crops, properties and other resources; bureaucratic system that could deter processes of engagements with government; changes in administration may not favor flagship projects; negative effects of ASEAN integration.

Dissatisfaction And The Motivational Elements

DALUYONG leaders are hoping for 'better quality of life' for their communities. However, there is a part in their overall reflection that spurs the 'low spirit and enthusiasm' causing frustrations and dissatisfaction as a result of unrealized goals and objectives. At this point, South Korea's Saemaul Undong (SMU), a successful community and national development model, was narrated to the women leaders. Infusing the Saemaul Undong's spirit of diligence, self-help and cooperation, in the context of South Korea's history of recovery from ground zero after the Korean War, the immediate response was remarkable.

Saemaul Undong (SMU) is one classic approach to rural development which first unfolded in South Korea, during the presidency of Park Chung Hee in the 1970s. Saemaul Undong is a New Village Movement launched by President Park in the 1970s. It is a community-driven development (CDD) program which highlighted people-centeredness. It harnessed people's participation with shared vision, shared burden, working together, making sure women participated. SMU's overall aim is to overcome endemic rural poverty in Republic of Korea (ADB 2012).

"The spirit of diligence is to promote healthy work ethics and to emphasize one's voluntary and active involvement in development activities. The spirit of self-help means choosing one's own work and taking responsibility of one's own life. The spirit of cooperation stimulates a sense of community which necessitates harmony and mutual help, not to mention its contribution to increased work efficiency" (Chung 2009).

The leaders responded with heightened interest and enthusiasm that led them to immediately pilot Saemaul Undong learning session in a barangay (village) in Marinduque province. The women in that village who participated in the session, inspired by the SMU sharing, immediately requested for a practical learning session on natural farming.

Reconnecting with the 'experiencing self', the intervention was the element to recharge, recoup the strength and dwindling spirit of women leaders, to search for that feeling of satisfaction from their community development efforts. It made them reflect and digress from a 'high-headed' to a 'down-to-earth' mindset, one of which is to return the savings culture among the members, as savings can be the seed of growth of the local economy.

The South Korean SMU experience posed as the lynchpin to the leadership's revival of spirit. The sharing on SMU was an 'aha' moment. It showed the leaders that their goals are achievable and provided valuable insights on the how-tos. The SMU gave them hope and encouragement

Conclusion

DALUYONG women leaders in their ten years of service have learned a lot from their experiences. They conveyed that they felt happy when they remembered their experiences as community leaders because there have been positive changes and significant moments in their lives where they gained knowledge, skills and respect from their communities. According to Kahneman's 'two selves', the 'experiencing self' expressed happiness felt at that moment. On the other hand, DALUYONG women leaders also expressed some frustration and dissatisfaction when they reflected on their experiences because the realization of their organization's goals (i.e., improving the lives of their members and communities) have not yet been significantly addressed. The 'remembering self', according to Kahneman, keeps and recalls experiences as a life story which has three elements that define it – changes, significant moments and endings. The endings are very important because they dominate the story and are usually retained and most remembered. The story of DALUYONG women leaders says experiences which transpired still cannot provide the satisfaction they are looking for because the ending that they desire (i.e., realization of DALUYONG's goals) is still unrealized.

The SMU intervention served to motivate the weakening spirit of some DALUYONG members, which pushed them to commit more, regain their footing as they see clearer direction for the organization and achievability of DALUYONG's goals.

Abstract

The purpose of this study is to explore social practice and meaning of social practice through a multicultural mentoring activity, which is part of college students' volunteer activities. To this end, I interviewed ten students. The results of the study are as follows. First, they recognized that a variety of people must live together in a multicultural society. Second, Mentors and mentees have experienced a variety of experiences throughout mentoring activities and have learned to learn and grow. Third, the students participating in the mentoring program learned the joy of volunteering and sought more meaningful activities. Fourth, the students are always thinking about whether their activities are an activity or a social activity. Fifth, the excellence of a person's right to judge and wrong in life accomplishes an inner achievement.

Keywords: *Social Practice, Multi-cultural Mentoring Activity, Internal Achievements, Community, Global Citizenship.*

Introduction

People try to do socially beneficial and meaningful activities as life becomes rich. Through social activities such as volunteering, We try to enrich and enrich other people's lives as well as social activities. Likewise, university students try to do useful and rewarding activities through college life. MacIntyre(1984) defined Social benefit as social practice. He said that he regarded social practice as a collaborative human activity, and that these activities were formed and maintained in various ways to maintain society. Therefore, social practice should be beneficial to the community, not to mention what is naturally found in our lives.

Hirst(1993) said that the social rule should be respected in order to practice social practice. That is, it is necessary to judge right and wrong about whether or not one's activities are activities for the community before doing so.

University students' volunteer activities should also be considered and implemented primarily in terms of benefit from the community. Thus, university students' volunteer work begins with a good mind to contribute to society and community as a prospective social worker. It is necessary to search for activities that are more difficult to help people with disabilities than I do, but it is necessary to discover how they grow up and explore and reflect on how they grow up. In other words, exploring how college students achieve social fulfillment through various volunteer activities is an important task for a wide variety of people.

Therefore, in this study, we intend to explore social practice and meaning of social practice through a multi-cultural mentoring activity, which is part of university students' volunteer activities. Hopefully, it will serve as a basis for enhancing the social practice of college students.

Theoretical Background

2.1 Multi-cultural mentoring through social practice

Scholars are discussing various aspects of human conduct and practice. First of all, Schatzki(2001) divided the behavior into a form of life according to the concept of human behavior and practice. In addition, Miller said that the practice of separating humans from internal and external lines is divided into internal and external lines, and humans act differently according to their purpose. Also, MacIntyre(1984) emphasized that the most important thing in social practice is virtue, and fulfilling the virtues of virtue, my enemy achieved the public good. Social practice of social workers can form a healthy community in societies where social and community members form public good works of society. The realization of the inner values of the inner values is realized through the participation of the participants (Yoo Jae-bong, 2002).

The social practice of many people is mainly accomplished through volunteer work. University students also perform volunteer work for their environment and do a healthy act for society as a preliminary social worker. Volunteering activities in colleges have changed dramatically as society has changed. Though most volunteer

activities such as volunteer work, medical services, and educational services were used in the past, online volunteering has increased due to the development of the internet or the network. Among university students who are popular among university students, university students can benefit from their ability to extend their skills and engage in activities related to their careers. In particular, Multi-Cultural mentoring is a form of community outreach and a form of social practice in Korean society.

Multi-Cultural mentoring is an educational ministry program designed to support students from multi-cultural families who grow up in Korean society. Multi-Cultural mentoring is a collaborative mentoring of Korean college students, whose mentors are comprised of middle and high school students in middle and high schools, and college students, students, students, students, students, students, and students in their spare time. Multi-cultural mentoring is a collaborative effort between mentors and mentees. When cooperative activities continue, they form the best performance and the best minds of each other, creating the best mental health conditions (Kim Young-soon, 2010). The social practice of realizing the community's multi-cultural mentoring activities has led to social activism for the community to cooperate with the community's public offerings. In view of this, Park Mi-sook(2016) regarded that the multi-cultural mentoring activities were a social practice in the sense that multi-cultural mentoring activities are a cooperative activity for social minorities in society, as well as mentors and mentalities. Multi-cultural mentoring is also a source of everyday life for university students and learning the outcomes of learning in everyday life (Yoo Young-man, 2006).

Research Method

3.1 Collecting research participants and data

The participants chose 10 college students who were willing to participate in the study and voluntarily participate in the volunteer work. University students are mainly students participating in a multicultural mentoring program hosted by the University of Incheon in Incheon, and include the students of Educationl College students as well as students. The general information of the participants is as follows .:

<Table 1> Characteristics of participants

Research participants	Major	Gender	School Grade	Mentoring area	Mentoring Experience
Participants 1	Social Education	Woman	Middle	City	Three years
Participants 2	Education	Woman	Middle	City	Three years
Participants 3	Social Education	Woman	Middle	City	Two years
Participants 4	Social Education	Woman	Elementary	Farming village	Two years
Participants 5	Korean Language Education	Woman	Elementary	Farming village	Two years
Participants 6	Education	Woman	Middle	City	Two years
Participants 7	Social Education	Man	High	City	Two years
Participants 8	International Trade	Man	High	City	Two years
Participants 9	Social Education	Woman	Middle	City	Two years
Participants 10	Public Administration	Man	Elementary	City	Two years

The study explores the meaning of social practice through multi-cultural mentoring in South Korean society, which is becoming a multicultural society. From September 2015 to March 2016, the study conducted in-depth interviews of university students who participated in multi-cultural mentoring activities to analyze their experiences.

3.2 Method for research

Data collection for research was conducted in depth interviews after receiving consent from university students participating in the study. The in-depth interview was conducted by one or two participants in the study. The interview session was conducted in an hour and a half, and the interview venue was held in a quiet cafe. The atmosphere of the interview was free of charge and the interview was suspended when the data was saturated. All recorded materials were recorded in transcription and filed into files.

The data analysis was conducted by keyword actions centering on key themes. The analysis process continued to be repeated continuously and analyzed by the analysis participants by sending analyzed contents to the participants. In addition, they tried to improve the feasibility of research, including sending analyzed materials to fellow qualitative researchers.

Results

The results of the study are as follows.

4.1 Living together

It is important to recognise that a variety of people must live together in a multi-cultural society when it is changing into a multi-cultural society. It is important for all members of society to recognize each other's diversity and to coexist with their culture together. University students attending Multi-Cultural mentoring activities have recognized that the various social phenomena of Korean society should be understood to recognize diverse social phenomena and recognize each other's diversity in order to coexist. Mentors are also important to mentor the Mentoring, but have sought to develop skills to understand and support each other in diverse societies. Through this, everyone learned that they should live together.

I want to let my mentee know what to do with the other person, to think about it, to look at it, to make it happen, to make it happen. (Research participants 1)

At first, I was terrified because I was a multi-cultural group. Because of the idea of multiculturalism, I think it's not just discrimination, but it's kind of like that. I have come to understand multi-cultural people and I have changed my eyes. (Research participants 8)

4.2 Growth with each other

Volunteer work is also helpful for those who volunteer, but those who participate in volunteer work feel fulfilled by volunteering to participate in volunteer work. Mentoring mentors lead to mentoring motivation through mentoring, mentoring students, mentoring, and challenging students to demonstrate their ability to learn their own learning skills, such as mentoring, mentoring, and mentoring. Both Mentors and mentees have experienced a variety of experiences throughout mentoring activities and have learned to learn and grow.

I think it's true that I'm growing up with someone I love to be seen as someone I love, rather than just believing in what I love to believe, rather than believing in what I love. (Research participants 5)

I think it's grown a lot through Mentoring. I feel good because I have changed my mind to use the mentee and watch the mentee in order to use the mentee and watch the mentee. (Research participants 10)

4.3 Expandign service consciousness

Those who do not feel satisfied through volunteer work are no longer interested in volunteer work. However, volunteer work that affects her life and value is sought to do another volunteer work. A mentor who participates in this multi-cultural mentoring will know that his small powers empower others. Through these efforts, he participated in other volunteer activities and tried to act for the socially difficult people. The college students participating in the mentoring program learned the joy of volunteering and sought more meaningful activities.

You have to do something active. Volunteer work or personal affairs don't do volunteer work. That's why I want to help others if I think about it. (Research participants 2)

At first, mentoring time is thought to be a mystery, and it is interesting to have a sense of humor rather than to fulfill the concept of volunteering and to fulfill a sense of humor rather than in middle and high schools. (Research participants 9)

4.4 Establish a sense of community

We consider ourselves constantly question how to live, and thinking about their roles and responsibilities in relationships with others (Chang Yun-su, 2014). Thus, undergraduates are always thinking about whether their activities are an activity or a social activity. College students recognize that multicultural mentoring activities help students learn from multicultural families, as well as academic support for school life. College students recognize that this activity is aimed at reducing the outflow of multicultural families from multicultural families. The college students who participated in the multi-cultural mentoring ceremony have given a chance to rethink the community's broader community through mentoring. It protects the socially weak from such small things and strives to maintain the community well.

While growing up in the middle of learning, they grow bigger, but they grow bigger. And I want to see something bigger than me, and if that happens, I want to do something like that.

(Research participants 3)

Because of the multi-cultural mentoring, we have to pay attention to those who are alienated from the public. Having a sense of community, whether it's reflective or mentoring or mentoring, doesn't mean that you can form a community in society. (Research participants 6)

4.5 Excellent through internal achievements

The excellence of a person's right to judge and wrong in life accomplishes an inner achievement. (Aristotle) Aristoteles is said to be a person who can distinguish between good and bad things by dividing them into a good thing and not doing anything good, such as social practice, which is the source of a healthy society, which is the source of a healthy society. College students who participated in Multi-Cultural mentoring also showed their inner achievements through mentoring activities, which showed excellence. Also, many students were worried about changing society and realizing a good society.

My activities are always worrying about society, and I'm looking for answers to him. If the mentee changes both the mentee and the mentor, it can be both parallel to the two, but I'm doing the latter, which makes me change the society. (Research participants 4)

I don't think it's possible to reflect on the fact that I reflect and reflect on my values and pursue my values, and that I will not be able to form a good society when I come to society or where I come from. (Research participants 7)

Conclusions

The study seeks to explore the meaning of social practice through mentoring activities in multi-cultural mentoring. For this reason, the following conclusions were concluded by interviewing 10 college students who participated in the mentoring process.

First, college students who participated in multi-cultural mentoring have realized that various people must coexist and live together through mentoring. Secondly, through multi-cultural mentoring activities, the mentor was growing inward and internally inside. Third, college students participating in volunteer activities were expanding their sphere of service through multi-cultural mentoring activities. Fourth, college students who participated in multi-cultural mentoring were aware of what life was for, and hoped everyone would be happy, through the internal achievements of the community.

The study leaves college students with the opportunity to realize that their value has become an opportunity to realize their values and establish a community line through multi-cultural mentoring activities. These studies suggest that university students should provide opportunities and environments to provide diverse service activities.

Abstract

This research was designed to explore the factors and indicators of digital leadership among executives who are working for Thai primary schools under the administration of Nong Bua Lamphu Primary Educational Service Area Office. Researchers utilized mixed mode design using a combination of quantitative and qualitative methods to collect data. Firstly, researchers interviewed three academic and policy experts to identify digital leadership factors. This is followed by a quantitative survey design that involved a total of 580 respondents comprised of executive members and teachers were selected as respondents. The ratio between of samples was 20:1 meaning that 20 samples to each parameter. Since this research involved 29 parameter, thus the required sample size would be 580 samples. Findings of this research revealed that digital leadership was performed at high level. Specifically, digital leadership factors were identified in descending order as follow: (i) demonstrating social morals and law compliance; (ii) brand creation; (iii) communication and public relations; (iv) learning how to use digital tools; (v) opportunities to learn and develop skills of using technology; (vi) career development, and (vii) assessment and evaluation. This is followed by exploratory factor analysis to determine the suitability of the identified factors. Findings of the exploratory factor analysis showed that a Kaiser-Meyer-Olkin value is 0.975 which was greater than 0.05 and the Bartlett's Test of Sphericity indicated that a Chi square of 35352.776 meaning that the correlations are significant at 0.05 level. In addition, finding of the factor extraction via Principal Component Analysis (PC) involved rotating of the core factors showed that there are 10 factors with Eigen values between 1.027 and 33.649, and give a variance of 65.929 percent. Finally, digital leadership factors in descending are identified as establishment of a technological network, creation of innovative environment that foster technological learning, ethics of technological use, ability to use digital devices, brand creation, inclusivity in planning, professional development, exploration and selection of precise and up-to-date information, compliance to digital information law and safety regulations, and evaluation.

Keywords: *Digital leadership; executive members; primary schools*

Introduction

For the past 10 years, hundred of billions of Thai bahts are funneled into technology initiatives and resources in school district throughout Thailand. As these tools become more prevalent in schools, it is school executives that will make the success of such innovative programs and ultimately help to determine if the monetary investments were worthwhile. School executives that exhibit digital leadership will undoubtedly have a higher return on such investments in technology (Office of the Civil Service Commission, 2017). Current school society moves into information age, professional learning will occur digitally, and that professional learning will be more dedicated to a digital learning for students. If a school executive is unable to create a digital culture, his or her school will struggle. Moreover, teachers have to develop the skills necessary to help students succeed in the new digital economy, if that capacity does not spread throughout the school, and if the school lacks the tools needed for teachers to effectively teach in the digital world, ultimately, students will suffer (Tang & Somprach, 2015).

Current school organizations need a completely different kind of leader that is a digital leader or executive. A digital executive is expected to build teams, keep teachers connected and engaged, and drive a culture of innovation, risk tolerance, and continuous improvement (Abbatiello, Knight, Philpot, & Roy, 2017). According to Tang and Somprach (2015) emphasized that high performing schools need digital leadership because it is a team effort and digital leaders are able to work together with teachers, complement each other, and function as a team. Hence, Abbatiello et al. found that the most critical need is to develop digital capabilities of leaders. Their study found that only five percent of organizations perceived as they have strong digital leaders in place, according to their 2017 Global Human Capital Trends survey respondents. However, there are 72 percent of respondents showed a sign of positive change as they are developing or starting to develop new leadership programs focused on digital management.

To require primary school executives to undergo transformation to embracing the digital educational world is crucial. Firstly, the executives need to recognize that they need to become digitally fluent and ensure that they are able to integrate digital thinking into their everyday management (Tang & Somprach, 2015). In addition, Sheninger (2014) highlighted that digital leadership has to take into account the recent changes such as ubiquitous, connectivity, open-source technology, mobile devices, personalization which represent a dramatic shift from how schools have been run and structured for over a century. Thus digital leadership is defined as establishing direction, influencing others, and initiating sustainable change through the access of information, and establishing relationships in order to anticipate changes pivotal to school success in the future. It requires a dynamic combination of mindset, behaviors, and skills that are employed to change and/or enhance school culture through the assistance of technology.

The target set for digital Thailand is to create opportunity and social equality so that 100 percent of Thai population will access to the Internet as a standard public service (Realizing digital Thailand, n. d.). Since the Royal Thai Government has identified to build a digital economy and society as a priority in order to transform Thailand into a digital leader within the ASEAN Economic Community, researchers would like to explore and determine the digital leadership factors and indicators. Therefore, researchers aimed to analyze digital leadership of primary school executives in Nong Bua Lamphu, Thailand.

Method

Researchers employed a mixed mode design to collect the quantitative and qualitative data using multiple ways to explore the research problem. It means a combination of different modes of collecting data for a single research. Survey design was employed utilizing questionnaire as a method to collect quantitative data. Researchers begin to collect qualitative data followed by a collection of quantitative data to achieve the sequential explanatory of the collected data. Researchers intend to use the quantitative data analysis from Exploratory Factor Analysis to validate the suitability of the digital leadership factors and indicators from the findings of a qualitative study at the first phase (Creswell, 2014).

There were three academic and policy experts who participated in in-depth interviews at the first phase. At the second phase, a total of 580 respondents comprised of executive members and teachers were selected as respondents. A multistage sampling technique followed by proportional simple random sampling technique was administered to select samples according to the two groups namely executives and teachers. Hair, Back, Babin and Anderson's (2013) proposed that the proper ratio of samples is 20:1 or 20 samples per one parameter. Since this research involved 29 parameter, thus the required sample size would be 580 samples. On this line of reasoning, simple random sampling technique was utilized to select 580 of executives and teachers to fulfill Hair et al. (2013) suggestion that sample size should not less than 100.

This research was initially started with studying the literature to identify the factors and indicators of digital leadership. This is followed by interviewing three academic and policy experts to validate the identified factors and indicators of digital leadership. The qualitative interview data was analyzed using content analysis. A survey questionnaire was used and administered in the Thai language to ensure that the respondents could understand about the statements. This survey questionnaire method benefits this study in terms of obtaining data more efficiently as time, energy, and costs would be minimized (Wyse, 2012), hence provides an excellent means of measuring attitudes and orientation in a large population which can, therefore, be generalized to a larger population (Gay, Mills, & Arirasian, 2012). Researchers used exploratory factor analysis to evaluate the suitability of the identified digital leadership factors and indicators from the phase before.

Findings

Findings of this study are presented based on the research aim that is indicated above. The initial result is the descriptive results related to the background of the 580 respondents from the second phase. This is followed by the identification of the digital leadership factors and indicators from the interview findings. Finally, finding from the exploratory factor analysis is presented.

Descriptive findings of background of respondents

A total of 580 respondents participated in the survey showed that most of them are 378 females (65.17%) and 202 males (34.83%). The respondents were comprised of 514 teachers (88.62%), 61 school directors (10.52%), and five vice directors (0.86%). Generally, there are 414 respondents (71.38%) who have more than 10 years of working experience, with the remaining 137 respondents (23.62%) who have 3 to 10 years working experience, and 29 of them (5%) have less than 3 years of working experience.

Qualitative and quantitative findings of digital leadership factors

Based on the qualitative findings from the three academic and policy experts, researchers found that there are seven key factors namely (i) demonstrating social morals and law compliance; (ii) brand creation; (iii) communication and public relations; (iv) learning how to use digital tools; (v) opportunities to learn and develop skills of using technology; (vi) career development, and (vii) assessment and evaluation. The overall digital leadership and its seven key factors were perceived by the 580 respondents as highly implemented.

Exploratory factor analysis of the digital leadership factors

Findings of a Kaiser-Meyer-Olkin (KMO) value is 0.975 which was greater than 0.05, indicating that all the data and variables are sufficiently related and are suitable to further analyze according to the research aim. Besides, the Bartlett's Test of Sphericity indicated that a Chi square of 35352.776 meaning that the correlations are significant at 0.05 level. This showed that the correlation matrix of the variables was sufficiently correlated. Therefore, the correlation matrix is found to be suitable for factor analysis. Finally, finding of the factor extraction via Principal Component Analysis (PC) involved rotating of the core factors showed that there are 10 factors with Eigen values between 1.027 and 33.649, and give a variance of 65.929 percent.

Findings of factor rotation and definition explanation

Identified factors were orthogonal rotated using the varimax method in order to clarify the variables thus enable to explicate the 10 factors of digital leadership in descending order as follows:

- i. The establishment of a technological network factor consisted of five indicators that required the executives to
 - Create platform and network for consultation;
 - Establish both internal and external technological network to open opportunities for organizational administration;
 - Support teachers and staff via technology;
 - Foster cooperation for learning development, and
 - Establish a technological network to share information, news, and knowledge.

All the indicators of the establishment of a technological network factor were weighted within 0.346 to 0.666.

- ii. The creation of innovative environment that foster technological learning factor was comprised of 13 indicators that required the executives to
 - Persuade students to learn new things;
 - Develop methods to improve students' memorization of whatever they learned;
 - Motivate and attract attention of students;
 - Support and assist students to accept their personal value;
 - Reasonably administration;
 - Act as positive role models;
 - Representing good behavior and creativity to staff, students, and parents;
 - Classroom environmental management that facilitating learning;
 - Managing external environment to facilitate learning;
 - Accept staff differences and diversities;
 - Integrating knowledge to lead innovation;
 - Support initiation and creativity at work using technology, and
 - Applying knowledge and new innovations in educational management.

All the indicators of the creation of innovation environment that foster technological learning factors were weighted within 0.434 to 0.685.

- iii. The ethics of technological use factor was included nine indicators and weighted within 0.481 to 0.688 as the executives:
 - Are not allowed to use technology to track their staff's personal life;
 - Are not allowed to access personal information of their staff or students;
 - Espouse ethics and morality in data management;
 - Use data with a high level of precision and accuracy;
 - Build and develop school database;
 - Transparent and scrutinize their administration using technology;
 - Use technology holistically in administration;
 - Use technology in punctual administration, and
 - Choose uses of technology that responsive mostly to staff's and students' needs.
- iv. The ability to use digital devices factor encompassed 10 indicators and weighted within 0.414 to 0.730 which required the executives to:
 - Use social media;

- Have portable electronic device skills;
 - Use online technology to delegate and communicate for work;
 - Have basic computer knowledge, understanding, and abilities;
 - Be good role models for applying technology within school administration;
 - Use digital technology as a key tool in school administration;
 - Persistently use new technological tools in administration;
 - Support the use of technology in learning courses and course management;
 - Use technology in meetings, discussions, and giving advice, and
 - Use technology to build and develop tools for school administration.
- v. The brand creation factor consisted of 10 indicators and weighted within 0.425 to 0.718 that required executives to:
- Raise staff's spirits;
 - Celebrate successful staff
 - Show sympathy, kindness, and generosity to staff, other group members, and community;
 - Promote a positive image of the school;
 - Establish trust in the name and school brand;
 - Praise students, staff, and organization including themselves for their identities;
 - Contribute to society;
 - Build a system that allowing staff and students' participation according to their identities;
 - Define strategy and planning that affecting school identity, and
 - Evaluate staff and students corresponding to school identity.
- vi. The inclusivity in planning factor consisted of six indicators and weighted within 0.433 to 0.737 that required:
- Executives and committee to represent the community to publicize school efficiently;
 - Executives invite school committee or local organizations to act as school communication team and public relations committee;
 - Executives offer opportunities for parents and community to plan and work together to publicize the school;
 - Staff participates in planning, forming principles, and determining the means to publicize the school;
 - Executives and staff meet and plan together, and
 - Executives survey ideas to consider when setting goals.
- vii. The professional development factor was comprised of seven indicators and weighted within 0.458 to 0.621 that required executives to:
- Provide and develop an online networking system;
 - Develop teachers and staff to be knowledgeable, experienced, and skilled with technology;
 - Set up courses to develop digital knowledge;
 - Support staff and students in developing their abilities to use technology by allowing the use of school technological network within the surrounding area and community;
 - Develop media and software to serve as the information and learning center;
 - Set clear goals for digital learning, and
 - Assign learning methods and delegate digital knowledge management.
- viii. The exploration and selection of precise and up-to-date information factor was comprised of three indicators and weighted within 0.432 to 0.587 that required executives to:
- Monitor precision and reliability of data before conducting communication or public relations;
 - Continuously examine and evaluate the precision and suitability of school information, and
 - Appoint staff to survey, analyze, and collect data appropriately for publicizing the school.
- ix. The compliance to digital information law and safety regulations factor consisted of six indicators and weighted within 0.351 to 0.523 that required executives to:
- Choose to use copyrighted technology legally;
 - Practice ethics while using digital technology;
 - Persistently use digital technology to generate work and innovations;
 - Manage information networking as part of management work;
 - Put security system in place for staff's information access, and
 - Choose technology use to administrate via various devices.
- x. The evaluation factor consisted of seven indicators and weighted within 0.454 to 0.795 that required executives to:
- Use a program or application to reduce expenses in conducting staff and student evaluations;
 - Use a program or application to control and track school operations;
 - Support the development of various programs or applications for learning assessments;

- Develop a program or application to facilitate work evaluations of their staff;
- Use technology to collect interviews data;
- Use technology to collect general data, and
- Use technology to store data

Discussion And Conclusion

Findings of this research showed that digital leadership factors are correlated to empirical information. These 10 digital leadership factors are identified as establishment of a technological network, creation of innovative environment that foster technological learning, ethics of technological use, ability to use digital devices, brand creation, inclusivity in planning, professional development, exploration and selection of precise and up-to-date information, compliance to digital information law and safety regulations, and evaluation. This finding is found to be in line with Abbatiello et al.'s (2017) and Tang and Somprach's (2015) findings. Both past research findings indicated that digital leadership has to be included team efforts such as working collaboratively with teachers, staff, students, parents, and community, complement each other hence functioning as a team.

Based on the findings, researchers would like to suggest to the Thailand Ministry of Education to encourage the establishment of more technological network in order to gather resources and knowledge among executives and teachers. Moreover, executives also should build internal and external environment to support and motivate students in inquiring new knowledge, as well as teachers and the community in building environment that facilitating technological learning. As a result, this will affect students' accomplishment and upgrade the quality of education. Furthermore, executives must practice morality in digital technological use in order to serve as a good example for teachers, staff, and students so that they will use technological tools safely without causing any ethical problems to others. On top of that, executives must have the ability to use and integrate digital tools to benefit school administration including social networking. Future research should channel to develop indicators of digital leadership using confirmatory factor analysis and structural equation modelling in order to provide deeper investigation in the area of digital leadership.

In conclusion, school executives today face greater pressures as the speed of technology accelerates. Therefore, the role that executives should play will continue to change, becoming even more digital-focused and team-centric. A focus on school organizational practice, including culture and organizational design, will become an ever-more important part of leadership development. Despite this more challenging environment, executives will be asked to execute at a higher level than what the researchers found in the findings and ensure that their school organizations do not lag behind in the digital transformation.

Abstract

Innovative school is a school that developing new creative adaptations and incorporating its working style and learning management to create effective education management. Learners have the highest skill development. Teachers and educational personnel focused as innovators. Therefore, the school has educational competitiveness and sustainable value for its organization. The purpose of this research was to studies the components of innovative primary school in Thailand. Data was collected by 2 methods were using: 1) analysis the innovative school 185 documentary sources; and 2) studies in the 7 innovative schools model. The research found that: there are relatively few innovative school education, especially in Thailand. Innovative schools in primary school consisting of 7 components are 1) challenge of shared vision 2) flexible structure 3) innovator team 4) innovative strategic 5) innovative behavior 6) culture and open climate and 7) open communication.

Key words: *Innovative school, primary school, Thailand*

Introduction

Schools are important units for instructing and developing national personnel, especially since childhood is a time of learning that requires a supportive environment, including both good personnel and place.

Therefore, schools in the 21st century must adapt to learning trends and changes, requiring continuous development in a variety of skills, especially information technology, which plays a great role at present and will continue to in the future. Such skills can guide and encourage students to learn independently at any time. A new era of educational institutions does not aim to produce consumers but create producers.

Education in the era of Thailand4.0 aims to teach children to create innovative products or aims to reach so-called organizational productivity in order to accomplish innovation for the country. The Ministry of Education must be the leader that works along with schools, which are direct-operating units in charge of not only managing education for students" gaining of knowledge and analytical thinking, synthesizing, and interpreting skills, but also encouraging students to create lifelong innovations.

The above aims are consistent with the belief that the value of people is derived from their work performance and meeting these aims will also solve the problem of consumerism, which has been a persistent issue in Thai society. Meeting such ideals begins with supporting educational institutions to produce innovations. This leads students to have analytical thinking and become learners for innovation. Success or failure lies in the basic education of primary and secondary educational institutions. Pitune Silarat (2016) included the following elements for succeeding in becoming innovative schools under the concept of "Changing Education Paradigms for the 21st Century Skills:" 1) Access: All Thai people must be able to access quality education according to the same standards; 2) Equity: All educational institutions must provide education to all learners effectively and equally based on the set standards; 3) Quality: A quality education system must be able to develop learners to achieve their full potential; 4) Efficiency: An effective education management system must be cost- effective and facilitate successful educational investment; 5) Relevancy: The education system must be responsive to the dynamics of a changing world. (Ministry of Digital Economy and Society and The Association of Thai ICT Industry, 2017.

In Thailand, both public and private organizations have a variety of ideas for building innovative schools. Regarding a successful and well-known model for innovative schools, Darunsikhlalai School of King Mongkut's University of Technology Thonburi integrates situations associated with globalization into their learning management by implementing "constructionist learning," which is based on a learning theory by Prof. Seymour Papert from the Media Lab of MIT, and a vision of a "learning organization" as developed by Peter Senge from the Sloan School of Management, MIT, while acting in accordance with the National Education Act B.E. 2542. Both great teachers mentioned above have spent more than 20 years inventing teaching methods and organizational management paradigms for the modern world. Darunsikhlalai School, meanwhile, aims to develop learners, facilitators, administrators, personnel, and parents in order to aid in developing learners to meet their full potential by cultivating ideas of "Learning How to Learn" and "Thinking about Thinking." Ideas can be cultivated in learners at a young age (tacit knowledge). When they grow up, academic knowledge and English requirements are fulfilled. Then at upper secondary level, learners are developed with career-based learning. After that, they can be evaluated according to methods set by the Ministry of Education, and their passion for learning can be measured. This process is meant to guarantee that students are interested in lifelong learning, demonstrate leadership for change qualities, and develop good relationships with their colleagues while going to work with a positive mindset.

If general schools are developed into innovative schools, the students will be able to apply their knowledge in practice by inventing new products using analytical thinking skills and by synthesizing new ideas for society. In addition, students will be able to develop a sense of being producers rather than consumers. This will help Thai society reject consumerism. Thailand needs people with new ideas to create new products in order to balance its dependency with independence and to prepare itself for globalization. Such people can lead Thailand to overcome its weaknesses and move forward toward sustainable economic and social development.

The purpose of this study was to investigate primary schools in Thailand in order to identify components of innovative schools. The components will be analyzed in order to create a model for developing innovative schools in Thailand.

Research Objectives

The purpose of this study was to investigate innovative primary schools in Thailand

Methodology

This was a qualitative study consisting of 3 phases, as follows:

- 1) The researcher reviewed 185 documents regarding innovative schools to gather data on components of innovative schools and then categorized the data into groups based on similarity of meaning and concept.
- 2) The researcher studied data derived from schools that had been accepted as innovative schools. The schools included six overseas schools and one Thai school which had become successful after participating in a program and which had also been awarded. Purposive sampling was used to ensure that all selected schools were proper representatives of innovative schools in general.

The data collection process included field data collection, decoding of successful school practices, interviews with school stakeholders, and a summary of each school which covered a comprehensive overview of all aspects of education management for grouping components of innovative schools. The percentages and summaries of the 7 innovative school representatives revealed the components and behavioral indicators of innovative schools for primary schools as shown in Figure 1

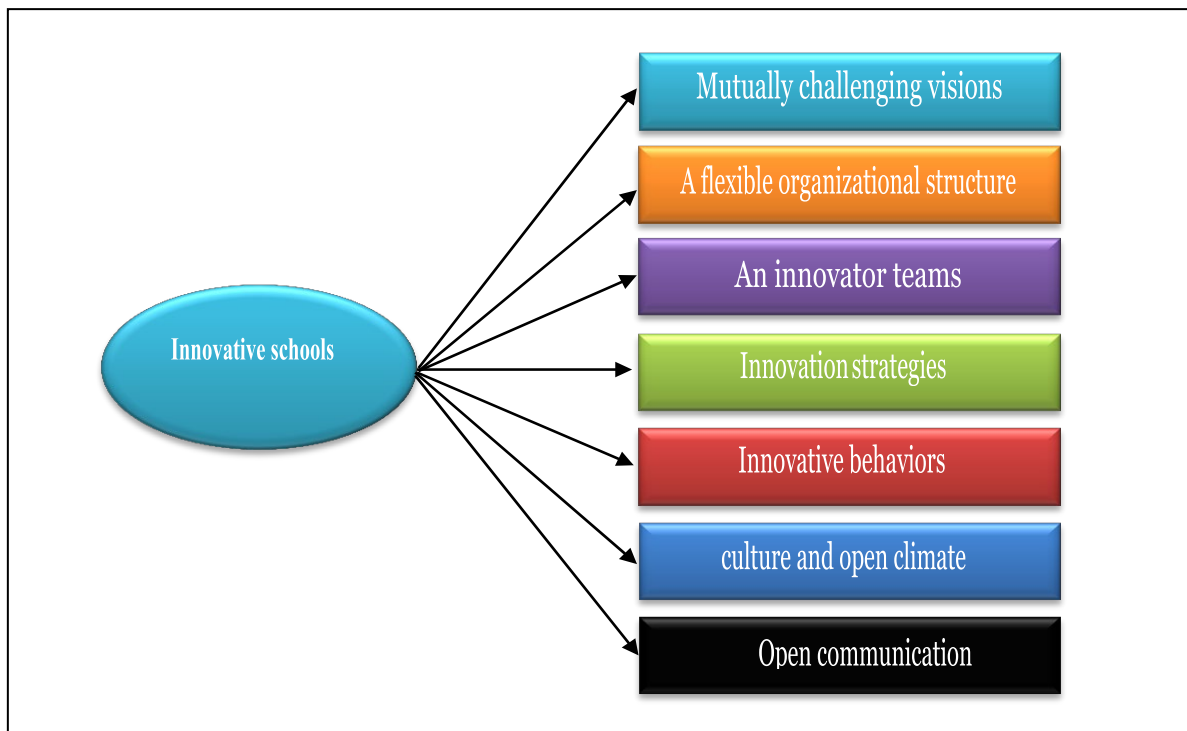

Figure1: Components of innovative primary schools

Table 1: Synthesis of innovative school indicators as aligned with components

Components	Operational Definitions	Indicators
1. Mutually challenging visions	Personnel sets a clear image for success for the organization in the future, and personnel show bonds of love toward the organization. Personnel commit to working together, prepare to support the work to take it in the same direction, and utilize their knowledge, experience, and skills, as well as databases from both past and present. Most importantly, they use innovations in their work in order to achieve the organization's future-oriented goals.	1. A clear image of success for the organization 2. Bonds of love 3. Work is supported to take it in the same direction 4. Integration of innovations into work in order to achieve goals
2. A flexible organizational structure	Structure of working divisions or departments is set in a flexible way to facilitate adaptation to all changes in the organization free of controls. Working divisions are also granted freedom in self-administration, work autonomy, and opportunity for generating innovative creations. The personnel are excellent in a variety of disciplines. The organization decentralizes decision-making power to the personnel.	1. Able to adapt to changes 2. Control-free 3. Freedom granted to working divisions 4. Self-administration 5. Excellency in a variety of disciplines
3. An innovator team	The personnel of the organization are able to gather and transfer information appropriately, create new mechanisms for developing the organization continuously, and support the application of new ideas. In addition, they are proficient in generating creating innovations; possess and apply skills, ideas, questions, observations, interactions, and experimentation; and demonstrate courage in initiating new ideas and taking risks for the sake of implementing sensible changes. Moreover, they express perseverance, imagination, interpersonal skills, and reflection, and they enjoy challenges, continuous learning, and self-improvement. They are achievement-driven, have a variety of interests and motives, are skilled in analytical thinking and teamwork, and are open-minded and accepting of different ideas. Finally, they are enthusiastic and enjoy learning, are self-motivated, are troubleshooters when faced with obstacles in the organization, and do not fear mistakes or failure.	1. Creativity 2. Application of new ideas 3. Proficiency in innovation 4. Analytical-thinking 5. Courage to initiate new ideas or apply new mechanisms 6. Interpersonal skills 7. Outcomes and achievements 8. Self-motivation 9. Troubleshooting 10. Acceptance of mistakes or failures
4. Innovation strategies	Directions, processes, steps, or guidelines are put into practice for the sake of generating excellent innovation. Flexibility and adaptability are also applied toward constant change, both within the educational institution and in the context of the outside world.	1. New methods 2. Excellence in innovation 3. Flexibility 4. Environmental analysis and setting of strategies

Components	Operational Definitions	Indicators
5. Innovative behaviors	The personnel show clear signs of creativity; have freedom in thinking and expression in order to exploit novel processes through active practice; and seek opportunities that contribute to the growth and success of the organization. In addition, personnel are expected to be pioneers, initiating changes or experimentation. Moreover, they analyze opportunities, improve situations, swiftly respond to threats, and integrate all experiences into new productivity, contributing to research, solutions, and inventions. They also transfer knowledge to other colleagues in the organization for further development.	1. Creativity 2. Freedom of ideas 3. Seeking of opportunities 4. Pioneering 5. Risk-taking for change 6. Analysis of opportunities 7. Swift response to threats 8. Contributing success to the organization
6. culture and open climate	Personnel are aware of the organization's support for creative ideas, freedom of thought, making queries, and participation in work-related goal setting. They also feel satisfied with job details and feel free to generate innovation. In addition, they are given opportunities to try out new methods for working, and they feel secure when participating.	1. Support for work 2. Freedom to express ideas 3. Freedom to ask questions 4. Participation in goal setting 5. Satisfaction with job details 6. Freedom to generate innovation 7. Security in participation
7. Open communication	The organization has a process and freedom for exchanging ideas, feelings, and desires among executives and personnel stakeholders, who all aim to achieve the set goals and have a mutual sense of ownership toward the organization. Consequently, personnel are inspired to generate innovation and appreciate any vision that contributes to innovative creations. In addition, personnel feel relaxed working under their supervisors and among colleagues, leading to close and strong relationships for developing innovations together.	1. A process for exchanging ideas, feelings, and desires 2. A mutual sense of ownership toward the organization 3. Freedom to exchange ideas 4. Inspiration 5. Flexible attitudes 6. Strong and close relationships 7. Awareness and understanding of changes in environment 8. Influence over personnel's attitudes and behaviors 9. Feelings of relaxation at work

Conclusion

This study on innovative primary schools in Thailand found few studies on innovative schools, especially those in Thailand. Components of innovative schools consist of 1) mutually challenging visions, 2) a flexible organizational structure, 3) an innovator team, 4) innovative strategies, 5) innovative behaviors, 6) an open atmosphere and culture, and open communication. Educational institutions that achieve all seven elements with collaboration

from all personnel are likely to become innovative schools, which can maximize a school's potential and lead to empirical productivity for students.

Results and Discussion

The present study found 7 components of innovative primary schools, as follows:

1. Setting mutually challenging visions is indicated by: 1) collectively setting a vision for the organization's success, 2) having support and bonds at work, 3) having support that takes work in the same direction, and 4) the organization's prioritization of applying innovations to success.

Setting mutually challenging visions is an important component and prerequisite for innovative schools. It is illustrated with messages of determination toward promoting creativity and innovation, both of which are sciences for learning (Senge, 2006). Katutura (2010) also believed that the message and words of the vision affect work. The factor that makes the organization so successful is the ability to visually share the goals of the personnel, which attracts personnel.

A mutually challenging vision is, therefore, beneficial for all personnel (Dvir et al., 2004), for it causes innovation to become a core competency of the organization. In addition, Vicharn Panich (2007) explained that to have a mutual vision is a matter of unity that will make the organization incredibly powerful, contributing to a psychological phenomenon that leads members of the organization to dedicate themselves to the organization's work (commitment and conviction).

The organization's mutual vision affects the beliefs, values, and dreams of the personnel, as well as the acceptance of the vision by members of the organization. It is an agreement approved by all the staff. It is also a learning tool at both the individual and organizational levels, which generates enthusiasm and continuous empowerment. In addition, West-Burnham (2010) stated that vision is important for schools, as it places emphasis on all aspects of the organization, promotes community values, and is the foundation for actions that will lead to school improvement.

2. With regard to having a flexible organizational structure, the following indicators were found: 1) adaptation to change, 2) control-free management, 3) freedom within working divisions, 4) independent teamwork, and 5) a diversity in professional personnel.

An effective innovative school must be a research and development center for innovations and have a flexible organizational structure in order to adapt to new environments and opportunities. It also has rules that promote innovation. In addition, it has a decentralized structure that contributes to the decision-making power of the personnel in their work and independent teamwork in generating innovations. The members of the team are comprised of people with knowledge and expertise in various fields to provide a diversity of ideas, skills, and knowledge. This is consistent with Sununta and Bechter (2001), who found that organizational structures correlate in the opposite direction to levels of innovation in organizations. In other words, if the organization has a very mechanical structure, it will have less innovation. Their research suggests that organizations should reduce hierarchical structures, as well as minimize divisions, to promote innovation in the organization.

3. Concerning having an innovator team, indicators include: 1) creative thinking, 2) application of new ideas, 3) expertise with innovative creations, 4) idea-association skills, 5) courage to initiate new ideas and mechanisms, 6) interpersonal skills, 7) achievement- and outcome-based goal setting, 8) self-motivation, 9) problem solving skills, and 10) ability to face failures and mistakes. Sustainably innovative schools require capable personnel who have lifelong self-learning and teamwork skills. Schools must develop their personnel to become innovators with the capacity to create innovations. That is, they must be learning schools, and school leaders must believe in the value of their human resources, recognizing them as a priceless asset of the organization (Paron Israsena Na Ayudhya, Online). The key qualification of the innovator is their venturesome character. They must be the first person to take action, invent, learn about technology, admire innovation, initiate quality relationships with other organizations, understand and apply complex technical knowledge, and handle uncertain situations during the innovation development process. Wasan Sutthawart (2014) found that a basic educational innovator in the government sector is a person who initiates, invents, creates, and supports techniques, methods, tools, processes, and work which are innovations and also implements such innovations in their work and passes them on to the educational management system. These innovations are beneficial, valuable, and appropriate for developing and solving problems in basic education in the government sector.

4. The indicators of innovation strategies include: 1) new methods, 2) innovative excellence, 3) flexibility, and 4) environmental analysis and strategy-setting. The administrators of innovative schools must create strong strategies for developing innovations and have project plans or activities with the collaboration of all personnel. Strategies must support creativity and new work processes that facilitate change, as well as research for organizational development. In addition, school leaders must assess innovative practices, improve learning development, support financial resources from administrative departments, follow up on and assess work systematically and continuously, and create innovative strategies in order to seek new methods. Furthermore, educational management should be operated in accordance with set visions and policies. Proper innovative strategies must be created. Scholarships and rewards should be presented to personnel who create innovations or who meet guidelines and practices for innovative excellence.

5. The indicators of innovation behaviors are: 1) creativity, 2) freedom of ideas, 3) opportunity seeking, 4) pioneering, 5) initiating change, 6) analyzing opportunities, 7) swiftly responding to threats, and 8) creating success for the organization. Innovation behaviors are essential and all school personnel are required to demonstrate such behavior. When all personnel at a school show these behaviors, their school will have an explicit culture of innovation creation. Proper characteristics of personnel with innovation behaviors include high self-motivation, enthusiasm for learning, and innovative creativity, and such personnel should set realistic goals and visions that are achievable without fear of failure (Nicholson and West, 1988; Rushton and West, 1988; Linden, 1990). They can see opportunities for generating innovation from present conditions. Besides knowledge and ability, they need to have the determination to succeed in generating innovation.

6. The indicators of culture and open climate consist of: 1) support for work, 2) freedom of ideas, 3) freedom to express ideas, 4) freedom to ask questions, 5) participation in setting goals, 6) satisfaction with job details, 7) freedom to generate innovations, and 8) security in participation. An organization with an innovative atmosphere basically has open communication, which reveals strong relationships among the personnel. Conflicts rarely occur, and personnel have the courage to take risks consistently. In addition, personnel do their work in a highly independent manner. They are always allowed to initiate new ideas. With an innovative atmosphere, personnel show high levels of satisfaction with their work. To promote an innovative atmosphere, the organization's culture must not emphasize formality, and the organization should have a horizontal structure (Dolphin index). This is consistent with Laegreid et al. (2011), who revealed that the occurrence of innovations in Norway had a positive relationship with organizational cultures that valued action-taking by means of awarding personnel who were actively hands-on in their work. This method led to the personnel having the courage to take risks, apart from demonstrating teamwork, the ability to take swift action, and having the patience to experience failure. Such an atmosphere helps lead to effective innovation generation (Caldwell and O'Reilly, 2003). Furthermore, Brown and Moberg (1980) stated that an organizational atmosphere does not only support expectations of the members, but also strengthens the personnel's good attitudes, satisfaction, and loyalty toward the organization.

7. With respect to open communications, its indicators are: 1) a process for exchanging ideas, feelings, and desires; 2) feelings of ownership toward the organization; 3) freedom to exchange ideas; 4) feelings of inspiration; 5) flexible attitudes; 6) development of powerful relationships; 7) understanding and awareness of changes in environment; 8) influence over attitudes and behaviors of personnel; and 9) feelings of relaxation. Communication at work is an important element and tool for making the organization become successful. If an educational institution wants to increase its potential, it is necessary to implement strategies concerning communication among the personnel. Therefore, choosing the right communication processes for each organization's culture is a powerful mechanism for change and innovation. There should be a variety of accessible forms and channels of communication for the personnel in the organization. Communication, in addition, should be extensive, open, and promoted for intercommunication with other organizations in order to exchange ideas. This way of communication is consistent with a study by Siripak Sirito (2016), which investigated innovation organization of higher education institutions in Thailand and found that communication is a supporting factor for innovative organization. Moreover, Tidd and Pavitt (2001) have also disclosed that communication factors promote innovative organization, and a study by Upasana and Abhishek (2009) revealed that communication was a basic factor leading to innovative organization.

Abstract

The objective of this research was to synthesize the elements of SuperLeadership for private school administrators in Khon Kaen, Thailand. The criteria for determining the sample group was the function of the number of parameters or factor analysis which was 360 private school administrators consisted of 45 administrators and 315 teachers. The data-collecting instruments were the set of five-leveled questionnaires in 46 questions and the reliability was 0.983. The data analyzed by confirmatory factor analysis. The result of this research found the 4 main elements of SuperLeadership for private school administrators in Khon Kaen that were 1) Become a self-leadership which had 3 sub-elements; creating inspiration, self-value and good relationship 2) Model self-leadership which had 3 sub-elements; vision and ideology, Morality and Emotional Intelligence 3) Empowerment which had 4 sub-elements; Authorization and responsibility, Awareness and information exchange, Trust and reliability and Respect each others. and 4) Create a self-leadership culture which had 4 sub-elements; Love and bond, Practice, value and belief, Involvement in organization development and Welfare. With the empirical data found that the index of harmonization of SuperLeadership for private school administrators in Khon Kaen were Chi-square = 63.28, df = 49, P-Value = 0.084, RMSEA = 0.028, SRMR = 0.014, CFI = 0.997, and TLI 0.995.

Keywords: *SuperLeadership; self-leadership; Empowerment; Private School*

Introduction

The changing situations and economic and social trends inside and outside the country inevitably affect the determination of national education development including private education. The private educational system has to be adjusted according to social demands and to be able to compete in the changing context. In terms of educational development in the country, which is defined in the constitution, national strategy and the development plans of the country, including related policies and law, affect the directions and strategies of private educational development that has to be corresponding to reality, be continual, and solve problems that have not been successfully solved. An important principle of the private educational development needs involvement and responsibility in educational management and development by considering the differences of students and schools in order to strengthen the private educational development methods (private educational development plans B.E.2017–2021, 2016).

While private education plays an important role in the country's educational management and lessens the burden in the government's educational management, private schools still encounter problems and difficulties in educational management that are not solvable, which are: 1) problems in private educational management from policies, regulations, limitations, and the government's support, 2) problems of the school staffs who come and go through the bureaucratic teacher recruitment, 3) problems of the administrators who take care of the private education that is changing all the time; thus making it difficult to follow the policies and private educational development continually, 4) problems of staffs in regional organizations are less compared to number of schools that have to be taken care of, 5) problems about social conditions that affect the private education, and the private schools have to compete in quantity and quality with both state and private schools. So, smaller or less quality private schools are facing the problem of budget and fail as well as the economic crisis that causes some private schools to reduce their sizes and finally close down (Suwisut, 2014). The previously mentioned problems and

difficulties of the private educational management pause the private schools' quality improvement from being successful. In terms of administration, each private school is different in various ways according to the problems they are encountering including strong and weak points of internal environment and organizational structure especially human resources problems that affect the private schools' sustainable existence as well as external environment – economic, social, cultural, and political environment under the situations that always change.

In the context of private educational management, the administrators are the key to the school progress and solutions including the improvement of the management to match up with other countries. If compared with the state school management, the administrators can change things during their terms or until retirement. However, private school administrators will play a different role as a founder of the schools; private school administrators are “the creators” of the school, and it is essential to find someone to carry on the ideology for the future as well as staffs who will follow the same ideology to successful administration and management. Super leadership is considered a new leadership for today's private educational management; it is a leader who creates a leader that can be a role model and a consultant about improvement - someone who will be trusted by staffs, be independent, be able to develop critical and creative thinking concepts, and build leadership qualities in the staffs. Therefore, the important role of a leader is to create a leader – a role of private school administrators is not only produce work but also people with the capacity to carry the organization forward and compete in the future. Private educational management requires sustainable existence; thus, the administrators have to do more than leading their staffs. They have to be able to carry on the duty and more in the future.

As mentioned previously, it can be seen that to develop the education with quality and respond to the trends of today's world, a leader is the key factor in organization's management and development. New generation leaders have to face many problems, so they need suitable leadership to lead the organization to its goals as the leader is the life and energy of the workplace; the leader can persuade, decide, plan, motivate, and lead the staffs in the organization to work together most effectively (Somprach, 2017). A leader suitable for situations and problems in private school context is then necessary to have “SuperLeadership” – to build self-leadership in the staffs. The leader is a role model of self-leadership in order to create a self-leadership culture. The important compositions of the super leadership are: (1) to build self-leadership in the staffs and team, (2) to be a good role model of self-leadership, (3) to exercise their power with the staffs, and (4) to lead in self-leadership culture to make the staffs believe that they have high capacity and abilities to succeed in any difficult and challenging situations (Tawinkarn, 2015). Be able to invent innovations or new things useful for the school, and be able to develop quality education based on the changing world. Moreover, the leader involves directly in the creativity, development, and important motivation for the changes and effectiveness in the school. Hence, it is vital for the administrators to have SuperLeadership. For these reasons, the researchers are interested in studying the SuperLeadership of private school administrators by synthesizing the compositions and use the acquired data in the development of the administrators in Khon Kaen private schools for SuperLeadership and use as basic data in the determination of private school development as well as useful application to the organization and institute. The most important thing is to develop or build human resources as new generation leaders who will be the key to private educational development, as well as the society and the country development in the future.

Literature Reviews

The definition of Super Leadership

Manz&Sims (2001) define SuperLeadership as administrating behavior of a SuperLeader beyond the leadership. A leader will help followers find ways to use their abilities and find their value. The SuperLeadership provides power to the followers and can make them become self-leaders. Furthermore, Jeffery (2003) states that a SuperLeadership is a leading role in facilitating in shared leadership – the super leader will give the power to their teams and trust them to complete the assigned tasks and develop self-leader skills, which is corresponding to David (2005), who gave a definition of a SuperLeadership as a leadership applied to staffs or teams to help them manage themselves, reflecting thoughts of someone who can lead other people into self-leadership instead of being a leader using a traditional way of order. To be a successful leader, one has to be a coach and facilitator and help the staffs at work and build a team to self-lead so that the staffs and teams can show their abilities and capacities.

Moreover, Wisavasookmongkol (2012) defines a SuperLeadership as a leader that leads others to be able to self-lead. The leader is the teacher and teaches the staffs to develop their critical thinking concept and use it as a way to self-develop until they are confident and independent enough to be a self-leader. A SuperLeader inspires people to inspire themselves, and when they have a chance to self-lead, they will be able to improve themselves most effectively. This is relevant to Sanrattana (2014)'s belief that some academics are SuperLeaders, and it links to “power over” meaning that one has more power than the other or they have power over the other. This is the old concept of administration and does not correspond to the new one that focuses on shared power; it is thus called “SuperLeadership” that focuses on leading others to lead themselves. In addition, Tawinkarn (2015) also explains

that there are 7 steps to Super Leadership which are: 1) become a self-leader, 2) model self-leadership, 3) motivate self-set goals, 4) create positive thought patterns, 5) self-leadership through reward and constructive reprimand, 6) promote self-leadership through teamwork, and 7) facilitate self-leadership culture.

To conclude, from the previously mentioned definitions, a SuperLeadership is a behavior or quality of an administrator to create ways to lead the staffs to lead themselves in order to lead others, support them in the development and team build to show their potential independently. The administrator has to be a good role model in self-leadership until it becomes a culture of self-leadership of the staffs and teams.

Compositions of SuperLeadership

Manz & Sims (2001) define the compositions of SuperLeadership as follows: 1) build self-leadership, 2) be a role model of self-leader, 3) exercise power, 4) expand positive energy, 5) support the staffs, 6) build super leadership, and 7) promote the culture of self-leadership.

Jeffery (2003) explains the role of SuperLeadership and its compositions as follows: 1) being a role model of self-leadership, 2) strategy to support self-leadership, 3) motivation to learn from mistakes and avoid punishment, 4) listen more and speak less, 5) promote initiation and creativity, 6) promote self-independence and interdependence without depending on only others, and 7) encourage the staffs in the teams to be able to solve problems and decide by themselves.

David (2005) points out that there are 6 behaviors that show the SuperLeadership which help the staffs and teams to be able to manage themselves: 1) encourage the staffs and teams to support each other and increase teams' potential as well as promote the team members to be aware and compliment other members in the team, 2) promote self-evaluation and teams' involvement in the evaluation in order to follow and evaluate the work, 3) encourage the staffs and teams to present their work, 4) promote good culture of helping team members and participate in behavior examination, 5) encourage the staffs to expect from their teammates to increase the effectiveness of the team, and 6) encourage the staffs to practice before operation.

Chareonwongsuk (2007) says that the SuperLeadership is behaviors of administrators to prepare themselves before leading the organization and be aware of the necessity to lead others using appropriate power to reach the set goals: 1) prepare to self-lead, 2) build a leader, 3) exercise power, 4) expand positive energy for goals, 5) reinforce the participants, 6) build leadership, and 7) create self-leadership culture.

Sanrattana (2014) explains behaviors of SuperLeadership that the followers will follow to finally be self-leaders and the compositions can be summarized as follows: 1) developing environments that promote positive attitudes, 2) enable employees to set personal goals, 3) encourage observation and comment amongst subordinates, and 4) encourage members of a group to support and motivate one another.

Tawinkarn (2015) explains behaviors of SuperLeadership and it can be summarized as the following compositions: 1) be a consultant and adviser, 2) encourage by asking questions, 3) lead others to have self-leadership, 4) make less imperative statements and listen more, 5) encourage the colleagues to be able to tell their mistakes without punishment, 6) train the colleagues to think and speak logically, and 7) encourage the colleagues with creative words.

Sripranam (2016) concludes the compositions of SuperLeadership as follows: 1) build self-leadership, 2) be a role model of self-leadership, 3) exercise power, 4) expand positive energy, 5) support and reinforce the staffs, and 6) create self-leading culture.

Chaisamoot (2016) states the definition that leads to categorizing compositions of the Super Leadership as follows: 1) self-leadership development, 2) inspiration for self-development, 3) creativity promotion, 4) responsibility and self-confidence building, 5) positive thinking, 7) problem solving by oneself, 8) sufficient knowledge development to practice self-leadership.

From the study, synthesis, and analysis of the principles, concepts, and theories about SuperLeadership by Thai and international scholars, as previously mentioned, the researchers have selected 5 compositions most frequently mentioned of SuperLeadership of the administrators as a conceptual framework: 1) Become a self-leadership, 2) Model self-leadership, 3) Empowerment and 4) Create a self-leadership culture.

Research Objectives

To synthesize the compositions or factors of the SuperLeadership of private school administrators in Khon Kaen, Thailand.

Method

This is a descriptive research, and the participants are 400 administrators and 2,875 teachers in Khon Kaen private schools, 2017 academic year, which are 3,275 participants in total. The sample group of the participants comprises of 45 school administrators and 315 teachers in the same academic year. They were selected randomly using multi-stage sampling. The research method is as follows:

Size of the sample group uses criteria according to a number of parameters or factors in factor analysis (Hair et al., 2010). In the topic of factor analysis, he mentioned that a sample group should not be less than 50 participants. In general, a researcher will determine the size of a sample group by comparing the proportion with the studied variable such as 5:1, 10:1, or 20:1; nevertheless, it should not be less than 100 people. The size of the sample group in this study is about 10 people per 1 parameter (there are 36 parameters with the 10:1 proportion). That makes 360 people in total for the sample group.

Multi-stage sampling is applied for the research sampling. Firstly, stratified random sampling is applied according to the sizes of the schools respectively, and then simple random sampling is applied to have a representative sample group. The size determination of a subsample group is according to the proportion of the sample group of the schools.

A questionnaire is used as a research tool to collect the data; it is developed according to the objective of the research, document synthesis, related research, and research conceptual framework. The questionnaire is divided into two parts: part 1 is a checklist asking about the respondents' status comprising of 5 questions, which are about sex, age, education, position, school size, and work experiences; part 2 is a 5 rating-scale asking about the compositions of the SuperLeadership.

The researchers have developed and examined the quality of the research tool for data collection following these steps: 1) study concepts, theories, documents, and research about SuperLeadership of the private school administrators and determine the structure of the research tool, 2) Scope the content that will be used to develop a questionnaire according to the objectives and present the proposal to the supervisor, 3) develop a questionnaire to collect data, 4) present the questionnaire to 5 experts to examine content validity, wording, and any other things that should be revised following the Index of item Objective Congruence or IOC: select the questions with the index value from 0.50 and up (Phanphariek, 2010). After calculating, the questionnaire has the index value between 0.60 – 1.00. The researcher then revises the questionnaire after receiving suggestions from the experts and supervisor, 5) examine the reliability of the questionnaire – the researcher uses 30 copies of the revised questionnaire to pilot with private schools in Khon Kaen that are not in the sample group to examine the reliability of the tool. The calculation of Cronbach's alpha coefficient equals alpha coefficient of the whole questionnaire, which is 0.983.

The researcher analyzed primary data of the sample group from the questionnaire part 1 (sex, age, education, position, school size, work experience) by calculating frequency and percentage. The analysis of the questionnaire part 2 is to find the compositions of the SuperLeadership of Khon Kaen private school administrators, and the statistics used in the data analysis is: 1) the status of the respondents of the questionnaire (\bar{X}) and standard deviation (S.D.) to analyses average value of the SuperLeadership of the private school administrators in Khon Kaen, 2) the suitability analysis of the compositions of the SuperLeadership of the private school administrators in Khon Kaen by calculating average values using criteria in index selection for setting in the model which will be tested; average value equals or is more than 3 and distribution coefficient equals or is less than 20% (Konkarn, 2004), 3) confirmatory factor analysis by testing the consistency of the model, the relation of the structure, compositions, and setting weight value for sub-variables from data analysis from the questionnaire and to investigate the consistency of the research model. This model is a theoretical model that the researcher has developed from the confirmatory and empirical factor analysis, and 4) the examination of the consistency of the research model and empirical data – even though the first data analysis does not meet the criteria, the researcher would adjust the model according to the criteria from Wiratchai's framework (2002). Therefore, the researcher used the criteria to examine the consistency between models that the researcher had developed with empirical data concluded in Table 1.

Table 1. Statistical values used in the consistency examination of the models of the relation of the structure according to the hypothesis and empirical data

Statistical value used	Acceptance level
1. Chi-square statistics (χ^2)	(χ^2) without significance or p – value higher than 0.05 shows that the model is consistent.
2. Chi-square per Degree of freedom (χ^2/df)	> 2 shows that the model is well consistent. 2.00 – 5.00 shows that the model is fairly consistent.
3. Root Mean Square Error of Approximation (RMSEA)	> 0.05 shows that the model is consistent with the empirical data.
4. Comparative Fit Index: CFI	> 0.95 and up shows that the model is well consistent. 0.90 – 0.95 shows that the model is fairly consistent.
5. Tucker-Lewis Index: TLI	> 0.95 and up shows that the model is well consistent. 0.90 – 0.95 shows that the model is fairly consistent.

6. Standardized Root Mean Square Residual (SRMR)	≥ 0.08 shows that the model is consistent with the empirical data.
--	---

Results

This study collected data from 360 administrators and teachers who work in private schools in Khon Kaen. The participants were selected through multi-stage sampling and the sizes of the school following by simple group sampling. The result of the primary data analysis of the respondents showed that 45 people out of 360 were school administrators, and 315 were teachers. Most of them were female (75.80 %) aged between 25-40 years old; most of them graduated with bachelor's degree (74.20%), and their work experience is between 5-10 years (36.90%). The confirmatory factor analysis of the model indicating SuperLeadership of the private school administrators in Khon Kaen is a result from the consistency examination of the model of the SuperLeadership indicators with empirical data by analyzing the confirmatory factors. The results of the data analysis are as follows: $\chi^2 = 63.208$, Df = 49, $\chi^2 / \text{Df} = 1.290$, P-Value = 0.084, RMSEA = 0.028, SRMR = 0.014, CFI = 0.997, TLI = 0.995.

Figure 1. Model of the assessment of the SuperLeadership indicators of private school administrators in Khon Kaen, Thailand

The consistency index of the SuperLeadership indicators assessment model of the Khon Kaen private school administrators meets the criteria. When consider Chi-square value (χ^2) = 63.208, degree of freedom (Df) = 49, Statistical significance (P-Value) = 0.084, it shows that the Chi-square is not statistically significant. When root mean square error of approximation (RMSEA) = 0.028, Standardized Root Mean Square Residual (SRMR) = 0.014, Comparative Fit Index (CFI) = 0.997, Tucker-Lewis Index (TLI) = 0.995, it shows that the model is consistent to the empirical data as shown in Table 2.

Table 2. Consistency Index of the SuperLeadership Indicators Model of the Private School Administrators in Khon Kaen, Thailand

TLI	Criteria	Analysis Result	Result
$\chi^2 - \text{Test}$	No sig. P > 0.05	$\chi^2 = 63.208$ Df = 49 P-Value = 0.084	Pass
χ^2 / Df	< 2.00	1.290	Pass
RMSEA	≤ 0.05	0.028	Pass
SRMR	≤ 0.08	0.014	Pass
CFI	≥ 0.95	0.997	Pass

TLI	≥ 0.95	0.995	Pass
-----	-------------	-------	------

The factor analysis of the SuperLeadership of the private school administrators in Khon Kaen found that the composition with the most factor loading is empowerment ($\beta = 0.990$) with predicting coefficient value (R^2) = 0.980. The second compositions are create a self-leadership culture ($\beta = 0.986$) with the predicting coefficient value (R^2) = 0.973 as well as model self-leadership ($\beta = 0.973$) with the predicting coefficient value (R^2) = 0.948. The composition with the least factor loading is become a self-leadership ($\beta = 0.924$) with the predicting coefficient value (R^2) = 0.854 as shown in Table 3.

Table 3. The Confirmatory Factor Analysis of the SuperLeadership of the Private School Administrators in Khon Kaen, Thailand

Compositions	Factor Loading			Predicting Coefficient (R^2)	Factor Significance (FS)
	β	S.E.	t		
1. Become a self-leadership	0.924	0.016	57.832	0.854	0.012
2. Model self-leadership	0.973	0.009	106.853	0.948	0.010
3. Empowerment	0.990	0.006	156.694	0.980	0.005
4. Create a self-leadership culture	0.986	0.007	146.161	0.973	0.009

The result of the confirmatory factor analysis of the SuperLeadership of the private school administrators in Khon Kaen shows that in the overall sub-compositions of the SuperLeadership of the private school administrators in Khon Kaen, the factor loading is between 0.754 – 0.909, which can be thoroughly described as follows:

1. Become self-leadership: the sub-compositions with the most factor loading are self-value building (Factor Loading = 0.827) and creating inspiration (Factor Loading = 0.797).

2. Model self-leadership: the composition with the most factor loading are vision and ideology (Factor Loading = 0.838) and morality (Factor Loading = 0.822).

3. Empowerment: The compositions with the most factor loading and 2 sub-compositions with equaled factor loading are authorization and responsibility, trust and reliability (Factor Loading = 0.909) followed by respect of each other (Factor Loading = 0.878).

4. Create a self-leadership culture: the compositions with the most factor loading are love and bond toward the organization (Factor Loading = 0.933), followed by organization development involvement (Factor Loading = 0.897) as shown in Table 4.

Table 4. The Confirmatory Factor Analysis of the SuperLeadership of the Private School Administrators in Khon Kaen, Thailand

Compositions	Factor Loading			Predicting Coefficient (R^2)	Factor Significance (FS)
	β	S.E.	t		
1. Become a self-leadership					
1.1 Creating inspiration	0.797	0.025	31.986	0.636	0.164
1.2 Self-value	0.827	0.022	37.023	0.684	0.167
1.3 Good relationship	0.792	0.023	33.853	0.627	0.172
2. Model self-leadership					
2.1 Vision and ideology	0.838	0.018	47.392	0.703	0.129
2.2 Morality	0.822	0.020	41.575	0.675	0.104
2.3 Emotional Intelligence	0.805	0.021	38.603	0.649	0.098
3. Empowerment					
3.1 Authorization and responsibility	0.909	0.011	84.143	0.826	0.180
3.2 Awareness and information exchange	0.875	0.014	63.119	0.766	0.149
3.3 Trust and reliability	0.909	0.010	87.657	0.826	0.113
3.4 Respect each others	0.878	0.014	62.401	0.771	0.157
4. Create a self-leadership culture					
4.1 Love and bond	0.933	0.008	111.597	0.870	0.207
4.2 Practice, value and belief	0.896	0.012	77.343	0.804	0.157
4.3 Involvement in organization development	0.897	0.012	77.987	0.805	0.154
4.4 welfare	0.754	0.024	30.951	0.569	0.049

Discussion

The factor synthesis of the SuperLeadership of the private school administrators in Khon Kaen and the examination of the consistency of the SuperLeadership indicators model of the private school administrators in Khon Kaen with the empirical data for the SuperLeadership factor synthesis are from the document and related research synthesis. To acquire the compositions and indicators of the SuperLeadership of the private school administrators in Khon Kaen, the SuperLeadership of the private school administrators in Khon Kaen comprises of 4 compositions which are: 1) Become a self-leadership with 3 sub-compositions and 10 indicators, 2) Model self-leadership with 3 sub-compositions and 9 indicators, 3) Empowerment with 4 sub-compositions and 14 indicators, and 4) Create a self-leadership culture with 4 sub-compositions and 13 indicators. That makes 4 main compositions, 14 sub-compositions, and 46 indicators of the SuperLeadership. The result of the basic statistical analysis of the suitability of the SuperLeadership indicators of the private school administrators in Khon Kaen met the criteria and can be used in the analysis of the confirmatory factor as the next step. Moreover, the result of the consistency examination of the SuperLeadership indicators model of the private school administrators in Khon Kaen and the empirical data show that the consistency index of the model met the set criteria. When Chi-square value (χ^2) = 63.208, degree of freedom (Df) = 49, statistical significance (P-Value) = 0.084, it means that the Chi-square is not statistically significant; Root Mean Square Error of Approximation (RMSEA) = 0.028, Standardized Root Mean Square Residual (SRMR) = 0.014, Comparative Fit Index (CFI) = 0.997, Tucker-Lewis index (TLI) = 0.995 meaning that the indicators model is consistent to the empirical data.

It can be concluded that the SuperLeadership indicators model of Khon Kaen private school administrators is consistent to the empirical data, which is the developed indicators consistent to the school context. The factor loading of the 4 main compositions is positive and statistically significant at 0.01 level. The order is as follows: 1) empowerment ($\beta = 0.990$), 2) create a self-leadership culture ($\beta = 0.986$), 3) model self-leadership ($\beta = 0.973$), and 4) become self-leadership ($\beta = 0.924$) respectively. This shows that the SuperLeadership indicators comprise of these 4 compositions (empowerment, create a self-leadership culture, model self-leadership, and become self-leadership). Generally, there are 14 sub-compositions with factor loading between 0.754 – 0.909. The order of the highest to the lowest factor loading compositions with their descriptions is as follows:

1. The empowerment: it is found that the composition with the most factor loading has 2 sub-compositions that have equal factor loading which are authorization and responsibility and trust and reliability (Factor Loading = 0.909) followed by respect each other (Factor Loading = 0.878).
2. Create a self-leadership culture: the composition with the most factor loading is love and bond toward the organization (Factor Loading = 0.933) followed by involvement in organization development (Factor Loading = 0.897).
3. Model self-leadership: the composition with the most factor loading is vision and ideology (Factor Loading = 0.838) followed by morality (Factor Loading = 0.822).
4. Become a self-leadership: the composition with the most factor loading is self-value building (Factor Loading = 0.827) followed by inspiration (Factor Loading = 0.797).

Discussion And Conclusion

From the research result in each issue according to the objective, it can be explained about the related concepts to confirm the result as follows

- 1) The synthesis of the SuperLeadership of Khon Kaen private school administrators is from the synthesis of the document and related research and to acquire the compositions and indicators of the SuperLeadership. There are 4 compositions: 1) become a self-leadership with 3 sub-compositions and 10 indicators, 2) model self-leadership with 3 sub-compositions and 9 indicators, 3) empowerment with 4 sub-compositions and 14 indicators, and 4) create a self-leadership culture with 4 sub-compositions and 13 indicators. That makes 4 main compositions of the SuperLeadership, 14 sub-compositions and 46 indicators. The result of the consistency examination of the indicators model of the SuperLeadership of Khon Kaen private school administrators with the empirical data found that the TLI of the model met the criteria, so the model is consistent to the empirical data. That is, the synthesized compositions are consistent to the Khon Kaen private school context because the researcher studied and reviewed conceptual theories about SuperLeadership variously and concisely. Therefore, the research result of the compositions of the SuperLeadership is as set by the researcher and also corresponds with Manz&Sims (2001), who proposed a behavior practice that aims for self-leadership. A leader will have to build self-leadership to be able to lead themselves and others, to be a model of self-leader, behave well and empower the staffs, and to build self-leading culture by creating love, faith, impression, and bond toward the organization – sharing the sense of belonging and desire to involve in the organization development. This also corresponds with Chareonwongsuk (2007), who states that the SuperLeader has to prepare to be a good leader, to make the staffs leaders by passing on visions and be a good role model, empower by encouraging the staffs' potential to make the most of them, believe that the staffs can carry out the leader's tasks, build self-leading culture and encourage the staffs to be

open-minded, listen, and share responsibilities and goals of success together until the bond and sense of belonging occur. The result also corresponds with the research result of Jitsangawong (2016), who studied the relation between the SuperLeadership of school administrators, inspiration to work of teachers and the effectiveness of the school under Chachoengsao Primary Educational Service Area Office 1 and found that the SuperLeadership of the school administrators in this area is positively related to the effectiveness of the school. This could be because the school administrators apply leadership and encourage the staffs to be a self-leader, be a role model of a self-leader, encourage them to set their goals, have positive thinking, facilitate self-leadership, support self-leadership by forming a committee, facilitating and creating culture of leaders and motivation to work for teachers, and positive relation between the teachers' performances and school's effectiveness. This is because the school administrators encourage and inspire the teachers to work by providing good welfare to help the teachers work successfully and the school be as effective as planned.

2) The result of the consistency examination of the model of the SuperLeadership indicators of the private school administrators in Khon Kaen with the empirical data that should be taken into account is the composition with the most factor loading, which is the empowerment. This shows that this composition is the most important to the SuperLeadership building of the private school administrators in Khon Kaen. Moreover, because the empowerment is an interaction between administrators and staffs resulting in the development of their potential in terms of coordination and performance of the staffs - allowing them to reach their responsibilities and achievements independently and offer a change for them to decide and evaluate their own performance in every step. This results in the progression of their assigned tasks as well as the administrators follow, advise, and observe the performances of the staffs to provide knowledge and information they truly need. The administrators should also increase the staffs' performances and offer an opportunity to involve in organization development planning, to build trust and respect each other by accepting the value of the work and the performances of the staffs. This corresponds to Tracy (1990), who explains the compositions of the empowerment for the staffs called "Pyramid" of power, which is essential and related continuously as follows: 1) responsibility, 2) power and duty, 3) excellence standard, motivation provision for the staffs to succeed, 4) training and development according to the staffs needs for their skills and confidence, self-value promotion and inspiration in learning without the resistance of changes, 5) sharing knowledge and information, 6) information exchange, which is the promotion of better performance, showing the staffs whether they need improvement and encourage them to perform better and give them dignity, 7) awareness by praising and evaluating their performances for more power and better welfare. When the staffs understand their values, they will be happy and inspired to work or service more effectively, 8) reliability, 9) failure awareness by helping them understand that a failure is a positive experience. So that they can make a plan and expectation for failure, 10) respect each other.

Recommendation

From the research results of the synthesis of super leadership compositions of Khon Kaen private school administrators, there are suggestions as follow:

Policy: The analysis and synthesis of SuperLeadership including qualities and compositions are suitable for private school context in Khon Kaen to develop administrators and the heads of the departments, which is useful to the policy makers and the private schools under their control to succeed.

Application: The compositions of the SuperLeadership of the private school administrators in Khon Kaen can be used to improve the leadership of the private schools and as a guideline for management development, promotion and support for administration system base in the future, which affects the sustainable existence and quality of the schools.

Further Research: The compositions of the SuperLeadership of the private school administrators in Khon Kaen can be used for further research and development (R&D) in the future, and there should be a study about the SuperLeadership in other contexts, such as private schools in Northeast region or state schools with different contexts to develop the Super Leadership that is suitable for each school's scenario.

dawtha@kku.ac.th

Abstract

This research aims to analyze factors of teacher leadership in World-Class Standard Schools under Secondary Educational Service Area Office 27. The research instrument was a five scale rating questionnaire with reliability 0.985. The sample group included 500 teachers from World-Class Standard Schools who had been selected by using the stratified random sampling technique. Factor analysis of teacher leadership in World-Class Standard Schools was conducted by using Mplus for Windows. The results are as follows:

The results of confirmative factor analysis on teacher leadership in World-Class Standard Schools within Secondary Educational Service Area Office 28 revealed that the model significantly correlated with the empirical data. The consistency index value was $\chi^2 = 105.635$, $df = 87$, P-Value = 0.085, TLI = 0.996, CFI = 0.998, RMSEA = 0.021, and SRMR = 0.018. The value of factor loading of teacher leadership was positive, with statistical significance at the level of 0.01. The value of six factors was between 0.870-0.995. The highest factor loading was the professional learning community, followed by child-centered instruction, participation in development, the role model in teaching, transformational leaders, and self-development with factor loading at 0.995, 0.927, 0.910, 0.906, 0.900, and 0.870, respectively. The reliability of each factor was 99.0%, 85.9%, 82.9%, 82.1%, 80.9%, and 75.7%, respectively.

Keywords: *Factor Analysis, Teacher Leadership in World-Class Standard Schools, Factor loading*

Introduction

The administration of “World-Class Standard School” must be driven by the director of the Education Service Area office, the school director, teachers, and other educational staff in order to achieve the proposed concrete goals. According to the quality of administration management of World-Class Standard School, there was a network development aimed at producing students capable of being world citizens. The factor that most directly affects student development is teachers in World-Class Standard Schools. Hence, teachers are expected to meet academic excellence and be able to apply research-based learning in the classroom. This factor will help support and promote the Administration of World-Class Standard School achieve their goal distinctively. The teacher, through participation in administration processes, is an essential factor in terms of educational administration movement. This statement coheres with The Office of the Education Council (2008) which mentions that the quality of teacher affects the quality of educational management, which directly affects the quality of students. Therefore, the teacher’s development in World-Class Standard School is important for student improvement which is the goal of the project. According to the academic study, in terms of teacher development, teacher development is focused on the creation of teacher leadership. Leithwood & Duke (1999) identified six types of teacher leadership: instructional, transformational, moral, managerial, participative, and contingent. On the other hand, Suranna & Moss (2002) studied teacher leadership in teaching and learning, and found that good teacher leadership demands high quality teachers who engage in curriculum development, provide suggestions to colleagues, work collaboratively with others and their principals, and represent organizations on either internal or local levels. York-Barr & Duke (2004) has synthesized research, and the results show the important characteristics of teacher leadership, which are coordinating and managing school or district curriculum, participating in school change or improvement, being involved in professional development of colleagues, contributing to the profession, engaging in parent and community involvement, and encouraging and coordinating teacher education. Office of the Basic Education Commission (2010) mentions that there are five indicators of teacher leadership in basic education. These are Adult Development, Dialogue, Change Agency, Reflective Practice, and Concern for improving pupil achievement. Moreover, Apharat Ratchapat, Wirot Sanrattana, and Paisan Suwannoi (2011) have developed teacher leadership indicators for teachers in basic education. They concluded that there are four indicators of teacher leadership for teachers in basic education: 1) self-development and the professional learning community, 2) the role model in teaching, 3) the participation in development, and 4) the transformational leaders. It can be seen that factors or guidelines to enhance teacher leadership are various. Advanced statistics research needs to be conducted so as to determine each factor of teacher leadership. Yuth Kaiwan (2014) described that a statistics analysis technique needs to be carried out in order to retrieve appropriate factors. This is called factor analysis.

Studying educational and teacher leadership development in World-Class Standard School by using factor analysis is an important method towards administration quality improvement for World-Class Standard School. It will benefit educational development at the current era which focuses on learners’ global competitiveness. It is also consistent with the “World-Class Standard School” project presented by Office of the Basic Education Commission of Thailand in order to enhance learners’ characteristics according to The Basic Education Core Curriculum B.E. 2551 (A.D. 2008), including youth development for the 21st century as a Thai citizen, ASEAN citizen, as well as members of the world community. (Pimpan Dechakup and Payao Yindeesuk, 2015).

Hence, research has shown the importance of the study Factors Analysis of Teacher Leadership in World-Class Standard School Secondary Educational Service Area Office 27. The results of the study can be used in self-development and other benefits towards educational organizations and relevant sectors.

Research Objective

To conduct confirmative factor analysis (CFA) on teacher leadership in World-Class Standard Schools within Secondary Educational Service Area Office 27.

Scope of the Study

1. The population of the study was 1,499 teachers in World-Class Standard Schools in Secondary Educational Service Area Office 27, academic year 2015. The sample group consisted of teachers who were selected by using sample size determination with parameters. Advanced statistics such as sample size determination with parameter 20:1 were used in factor analysis (Hair, Black, Babin, & Anderson, 2010). There were 24 parameters; hence, 480 samples were derived. The sizes of the sample groups were then adjusted according to the criteria of Comrey & Lee (1992). The sample group size in this study can be classified as excellent, with 500 teachers from world-class standard schools.

2. The variable in the current study was teacher leadership for World-Class Standard Schools which was retrieved from literature reviews, relevant researches, the analysis and synthesis of previous researches and the concepts of scholars. The model was created to test the correlation between the model and the empirical data of teacher leadership in World-Class Standard Schools. The model of teacher leadership in World-Class Standard Schools consisted of the following: 1) Self-development, which consists of three indicators: having vision in self-development, having confidence in self-development, and being able to develop themselves by self-learning; 2) Transformational leaders, which consist of three indicators: having vision in transformation, being a learning person, and being accepted; 3) Participation in development, which consists of three indicators: having vision in self-development, teamwork, and networking; 4) The professional learning community, which consists of three indicators: being a teacher leader in the professional learning community, supervision and counseling, and sharing knowledge to the professional learning community; 5) The role model in teaching, which consists of three indicators: applying a variety of different teaching methods, promoting a learning atmosphere, and promoting self-directed learning; and 6) Child-centered instruction, such as learning process, planning lessons, and authentic assessment.

Literature Review

Leithwood & Duke (1999) indicates that there are six characteristics of teacher leadership: being instructional leaders, being moral, being transformational leaders, being managerial/strategic, being participative, and contingency.

Snell & Swanson (2000) have conducted qualitative research involving teacher leadership. The research lasted for two years and it was concluded that there are three main reasons contribute to teacher leadership: 1) expertise, 2) reflection and empowerment, and 3) collaboration.

Katzenmeyer & Moller (2001) mentions that there are three main dimensions in teacher leadership:

1) Leadership of development of other teachers and students: taking the role of a facilitator, coach, mentor, trainer, curriculum specialist, creating new approaches, leading study groups.

2) Leadership of operational tasks: keeping the school organized and moving towards its goals, through roles as Head of Department, action researcher, member of task forces.

3) Leadership through decision-making or partnership, such as being a member of school-improvement teams, committees, instigator of partnerships with business sectors, higher education institutions, and parent-teacher associations.

Suranna & Moss (2002) studied teacher leadership in teaching and learning and found that there are five indicators contributing to teacher leadership: being a good teacher, engaging in curriculum development, providing suggestions to colleagues, working collaboratively with others and their principals, and representing organizations on either internal or local levels.

York-Barr & Duke (2004) has synthesized researches, and the results show the important characteristics of teacher leadership, which are coordinating and managing school or district curriculum, participating in school change or improvement, being involved in professional development of colleagues, contributing to the profession, engaging in parent and community involvement, and preservice teacher education.

Reichardson & Sarah (2006) has identified characteristics and responsibilities of teacher leaders. They mentioned that although formal roles for teacher leaders do still exist, the new role of teacher leaders today is rather informal and gained from classroom experience. Teacher leaders implement these informal roles in ways such as: 1) sharing their own classroom practices and personal expertise, 2) developing themselves and mentoring new teachers, 3) modeling collaboration, 4) taking care of their students, and 5) understanding the discrepancy between the school's mission and actual practice.

Boyd (2011) investigated the administrators' perceptions on teacher leadership. He claims that the characteristics of teacher leadership consist of 1) Quality Development for Excellence, 2) Educational culture preservation in institutions 3) the role model in teacher leadership, and 4) knowledge exchange cultivation and factors that influence leader development.

Kiranh (2013) conducted research on principals' perceptions related to teacher leadership. The results showed that there are four characteristics of teacher leadership: 1) institutional development, 2) professional development, and 3) collaboration with colleagues.

Office of the Basic Education Commission (2010) mentioned that there are five indicators in teacher leadership in basic education which are described as follows:

1) Adult Development refers to the level of maturity needed to be a teacher, such as being considerate, assessing self-evaluation on behavior towards students and others, having self-discipline and having social responsibility. Teacher should also appreciate other people's ideas and their work, including encouraging relationship-building and working collaboratively to achieve goals.

2) Dialogue, building interaction, and conversation: Participating in creative conversation with others, while focusing on both student learning and professional development through listening, speaking, and asking questions. Being flexible, open-minded, and able to listen to different ideas to find a new way of creating creative conversation.

3) Change Agency: Focusing on immediate situations and link them to the vision, goals, and mission of the educational institute. Initiating transformation and creating innovation. Motivating others to learn. Working collaboratively to improve learners, develop the institution and the professional learning community, including working with others in a new system.

4) Reflective Practice: Working deliberately because teacher's behavior represents the correlation between student learning and learning management.

Teacher should support their colleagues' ideas and participate in creating or developing innovation.

Teacher should be able to use multiple assessment techniques for self-evaluation and institution administration.

5) Concern for improving pupil achievement refers to teacher's behavior in setting challenging goals and authentic learning standards that can be achieved by students. Teacher should be able to provide holistic information about students to their parents, and listen to parents' opinions about their expectations on student learning outcomes. Teacher should accept responsibility to know and check student information in order to improve pupil achievement. Conducting research or constructing body of knowledge to help solve problems or develop new guidelines to improve student achievement systematically.

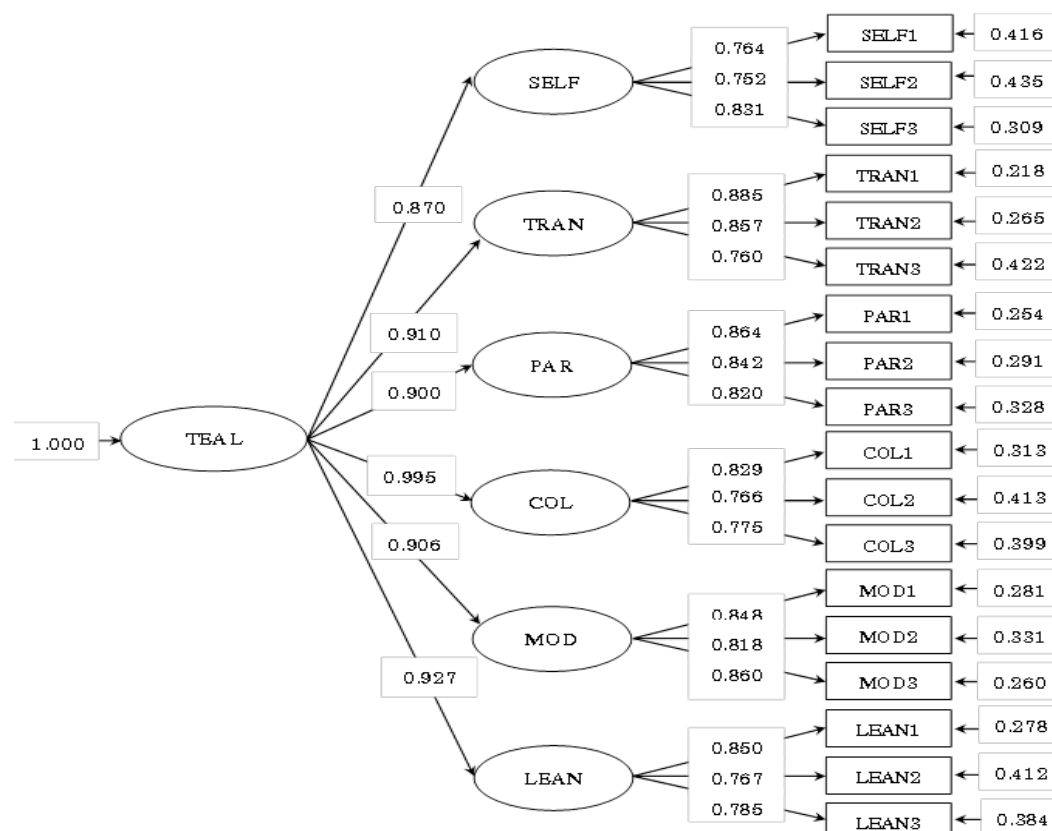

Research Methodology

The research procedures were divided into two phases. **Phase 1** was the factor development of teacher leadership in World-Class Standard School. A document analysis was used as a tool to compile the major factors and their subcomponents. To confirm the developed factors, five experts were interviewed. After that, the confirmed factors were outlined and were used as research tools. The research instrument was a five scale rating questionnaire, consisting of 91 questions. Content validity was approved by five experts. Index of Consistency of the questions was between 0.80 - 1.00. After the questionnaire was improved according to the experts, it was used with 30 teachers in World-Class Standard Schools in other Secondary Educational Service Areas. **Phase 2** consisted of the quality assurance of major factors and the subcomponents of teacher leadership in World-Class Standard Schools.

Data was collected by using a five-scale rating questionnaire with a reliability level of 0.985. 500 questionnaires, or 100% of the questionnaires, were completed by the sample groups who were teachers in World-Class Standard Schools. Both descriptive statistics and inferential statistics were used for data analysis by using SPSS for Windows. M-Plus for Windows was used to analyze Descriptive Statistics, frequency, percentages, mean, and standard deviation. Second order confirmatory factor analysis was conducted to verify the consistency of models with empirical data by using a Chi-Square Test (χ^2), Chi-Square Correlation (χ^2/df), Comparative Fit Index (CFI), Tucker Lewis Index (TLI), Standard Root Mean Square Residual (SRMR), and Root Mean Square Error of Approximation (RMSEA).

Results

According to confirmatory factor analysis on teacher leadership in World-Class Standard Schools within Secondary Educational Service Area Office 27, the model significantly correlated with the empirical data with consistency index value $\chi^2=105.635$ $df=87$, P-Value=0.0849, TLI=0.996, CFI=0.998, RMSEA=0.021, and SRMR=0.018. The value of factor loading of teacher leadership in World-Class Standard Schools within Secondary Educational Service Area Office 27 was positive. The value of the six factors was between 0.870-0.995 with a statistical significance of 0.01. The highest factor loadings were the professional learning community, child-centered instruction, the participation in development, the role model in teaching, the transformational leaders, and self-development, respectively, as shown in figure 1.

Discussion

The two minor factors that most directly affect this study are lesson planning and authentic assessment, with Correlation Coefficient at 0.798. These two components focus on ensuring students become World Citizens, which is the objective of World-Class Standard School. The dominant characteristic of World-Class Standard School students is the ability to build academic knowledge by themselves through Independent Study (IS) on a topic in which they show interest. In course design or lesson planning, teachers normally use teaching methods that focus on specific learning skills, such as information retrieval, interviewing, Knowledge Inquiry, and arguing. The teacher then acts as a developer of important learning skills in students by motivating students to think as active learners rather than passive learners. Authentic assessment techniques such as reflective thinking are based on classroom environment and student action. The assessments divide student quality into four levels: excellent, good, fair, and poor. Boonleang Thumthong (2011) claimed that teaching is a process of both teaching and learning, and activities and should be consistent with the curriculum. Four steps need to be completed in order to evaluate the efficiency of the curriculum. These are institution curriculum development, course design or lesson planning, teaching and learning activities, and evaluation and assessment. The final step, evaluation and assessment, should be designed before planning the lesson in order to set the goals of the curriculum. Hence, the assessment is directly related to lesson planning because it reflects student improvement in learning, which is the objective of the lesson and curriculum. The above statement is consistent with Jatuphum Ketchatturat (2014), who claimed that classroom assessment and evaluation is integrated in the teaching process. The results of an assessment should reflect both teacher's teaching processes and student achievement. An assessment is an important resource used to improve student achievement. Course design and assessment connect the teaching and learning processes. In addition, Rapin Posrie (2009) claimed that authentic assessment should be related to both teaching and learning. The design of a course or lesson plan should include and lead directly to authentic assessment. Students should be evaluated from what they have been taught, which will reveal their competency. Tisana Khammani (2008) said that authentic learning is a teaching process in which the teacher designs a course or plans a lesson to encourage students to learn in real-life situations. Students work cooperatively to solve problems using different techniques and teacher uses authentic assessment to evaluate their learning outcomes.

Factor Loading of every factor is higher than the average. The highest factor loading was the professional learning community (0.995), child-centered instruction (0.927), the participation in development (0.910), the role model in teaching (0.906), the transformational leaders (0.900), and the self-development (0.870). The result conforms to the World-Class Standard School evaluation guidelines, sector 7, which focuses on the outputs. These outputs consist of curriculum and process, students, personnel, leadership and organization management, finance, and the capacity of services. It can be seen that the first three factors can be developed through teacher leadership. The results of factor loading of teacher leadership in World-Class Standard School Secondary Educational Service Area Office 28 confirmed that the six factors of teacher leadership are consistent with World-Class Standard School evaluation guidelines based on the Office of the Basic Education Commission of Thailand. Moreover, the mentioned factors also conform to the results of education reform in order to improve the efficiency and the quality of education, and to be able to

produce students in a learning society. The teacher is an important factor in knowledge formation and knowledge transfer. The teacher plays essential roles in learning and education reform (Office of the Basic Education Commission of Thailand, 2007). Teacher is a key mechanic in the development of students' quality. As a result, teacher leadership is necessary in terms of institutional development.

This coheres with Harris (2002), which found that teacher leadership is the main factor of institutional development due to its positive influence towards self-confidence and organization. Sureerat Phuttanatein and Prompilai Buresuwan (2009) have studied models of teacher leadership capacity in basic educational institutions, the results revealed that both leadership capacity and teacher leadership directly and positively affected teacher effectiveness and indirectly affected their effectiveness through the school climate. So, the success of school not only depends on director leadership, but also on teacher leadership. The teacher can be classified as an important variable in instructional development, and also affect student achievement. Hence, the six factors of teacher leadership in World-Class Standard Schools are significantly important. They also have a higher factor loading than the criterion.

4. According to teacher leadership in World-Class Standard Schools in Secondary Educational Service Area Office 27, the factor with the highest factor loading is the professional learning community (0.995). Currently, the institutional management focuses on the development of Professional Learning Community which is similar to the learning organization. The aim of Professional Learning Community is to create school culture which focuses on teacher leadership and sustainable institutional development (Kanokorn Somprach, 2016). Nevertheless, World-Class Standard School is an educational innovation of Office of the Basic Education Commission of Thailand aimed to develop educational institutions to meet the world standard. So, the management framework of World-Class Standard School may differ from other institutions in order to meet the world standard and be equivalent to the academic quality of institutions with similar curricula or other academic excellence in leading countries. Schools should organize curricula that promote excellence and meet students' needs. Vocational curriculum, Mathematics, and Science should also be taught in English. In terms of teacher's quality, teacher should have both knowledge and teaching expertise. In addition, teachers should be able to communicate in the second language as well as apply electronic media in class activities. Teacher should be able to exchange their teaching experience at the international level and be able to apply research methodology, including educational innovation in order to constantly develop students. Most importantly, school management should meet the criteria of Thailand Quality Award in order to develop the ability of the school towards the world standard or the standard of countries with high education standards. The reason for this development is to ensure students become World Citizens, whose abilities include academic excellence, the ability to communicate in at least two languages, be progressive in thinking, produce work tasks creatively, and collaborate with other world citizens (Office of the Basic Education Commission of Thailand, 2012). Therefore, institutional management, especially teacher's roles should be changed according to world standards, which include the following: organization culture, assessment and evaluation, and building interaction among colleagues. Teachers who can speak second languages should transfer knowledge through communication continually. Teachers in the institution would be able to use a second language to communicate in their daily lives. In addition, teachers should develop student learning through research, supervision by other teachers, administration, and the education service area. The supervision should focus on professional community development and improve institutional management systems internationally. Teachers should use their abilities to develop a professional learning community which can lead to the process of teacher leadership. They can then become professional leaders who can provide supervision, counsel, and transfer knowledge to their colleagues. Kanokorn Somprach and Nichanan Khaorat (2015) studied the effects of distributed leadership affecting the professional learning community in educational institutions. The results showed that the process of collaboration between teacher and administrator towards superior practices focuses on student learning. It helps to build a school culture that develops teacher leadership and institution continually. Pim-on Sod-iun (2012) claimed that the aim of the institutional development that the teacher and administration continuously focuses on is to promote student learning by having a shared vision and goal, working collaboratively, learning and applying knowledge, creating an organization culture, and exploring new ideas through action and research. Teacher, administrator, students, and parents work collaboratively to find the best way to develop the institutions. This will lead to teacher leadership, aiming at sustainable school development. Vicharn Panich (2011) defined the professional learning community as the presence of admiration to other professionals who have a shared vision. The community learns cooperatively and applies their knowledge creatively. This consolidation encourages both the motivation to learn and to improve as a professional in order to meet the learning standard of other learners, with help from the learning community.

In terms of value, this is called professional development. The aim is to develop colleagues and relevant sectors until they are able to manage the institution effectively and sustainably.

Recommendations

1. Suggestions for research implementation:

1.1 The current study can be used as data for The Office of the Basic Education and Educational Service Area for the evaluation of professional teacher development for World-Class Standard School. Factors retrieved from confirmatory factor analysis will be used for the evaluation of teacher efficacy. It can also be used as criteria for master teachers in World-Class Standard School.

1.2 According to the results of the confirmatory factor analysis of teacher leadership in World-Class Standard School, there are six factors that influence quality teacher leadership. They are ranked from highest to

lowest factor loading as follows: the professional learning community, the child-centered instruction, the participation in development, the role model in teaching, the transformational leaders, and the self development. These factors were consistent with empirical data, affecting teacher leadership for World-Class Standard School. Hence, directors of World-Class Standard School and relevant sectors should pay attention to or set policy for teacher development in accordance with the findings from this study in order to improve teacher leadership for World-Class Standard Schools.

1.3 The results of this study can benefit educational service areas, training institutions, or teacher training institutes by presenting information and guidelines for course development for teacher leadership to reach desired characteristic goals. Six factors were used in course design for teacher training.

2. Suggestions for further research:

2.1 Qualitative research on teacher leadership for World-Class Standard School should be conducted since the current study focused on variables that show the level of behavior of teacher leadership in World-Class Standard Schools. Therefore, qualitative research would be beneficial in terms of offering an explicit explanation of teacher leadership in World-Class Standard Schools.

2.2 Further research and development on teacher leadership in World-Class Standard Schools should be executed since it was revealed that factors related to teacher leadership, such as the professional learning community and child-centered instruction, have a high factor loading. If the above factors are implemented in teacher leadership, the effect of World-Class Standard School on students will enhance, and World-Class Standard School's evaluation will improve, according to Thailand Quality Award.

2.3 The current study investigated teacher leadership in World-Class Standard Schools. Data was only collected from teachers in World-Class Standard Schools. Data from other sample groups, such as directors and educational personnel in World-Class Standard Schools, would be worth collecting, in order to acquire other useful information.

Özet

Fen bilgisi öğretmen yetiştirme programlarının içerik olarak temel alanlarından birisi biyolojidir. Biyoloji alanında fen bilgisi öğretmeni olarak sahip olunması gereken bilgi ve becerilerin kazanılmasında öğretmen adaylarının belirli bir çabayı göstermeleri beklenmektedir. Ancak öğrenmeye ilişkin kişilerin amaçlarını dolayısıyla performanslarını etkileyen çeşitli faktörler bulunmaktadır. Eğitim araştırmaları bu faktörleri ortaya çıkararak öğrenmenin daha verimli olmasını amaçlamaktadır. Eğitim araştırmalarının üzerinde yoğunlaştıkları öğrenmeyi etkileyen önemli faktörlerden birisi de motivasyondur. Motivasyon, bir davranışın başlamasını tetikleyen, davranışın gideceği yolu belirleyen, davranışın güçlü olmasını sağlayan ve davranışın gerçekleştirilme istikrarlılığını sağlayan faktör olarak nitelenebilir. Öğrenmeye ilişkin motivasyonu açıklamayı amaçlayan çeşitli teoriler bulunmaktadır. Bu teorilerden güncel olanları, beklenti- değer teorisi (expectancy- value theory), sosyal bilişsel teori (social- cognitive theory), atıf teorisi (attribution theory), kendi karar verme teorisi (self-determination theory), hedef yönelim teorisi (goal orientation theory) şeklinde sıralanabilir. Bu çalışmada fen bilgisi öğretmen adaylarının biyoloji öğrenmeye ilişkin amaçlarını belirlemek amacıyla bir motivasyon ölçeği geliştirilmesi amaçlanmıştır. Geliştirilecek ölçeğin dayanağı olarak hedef yönelim teorisi seçilmiştir. Bu teoriye göre kişiler öğrenme için gösterdikleri çabaları çeşitli amaçlar doğrultusunda gerçekleştirirler. Teoriye göre öğrenme amaçları kuramsal olarak “Uzmanlaşma Hedefi”, “Yaklaşma Performans Hedefi” ve “Kaçınma Performans Hedefi” şeklinde sınıflandırılmıştır. Uzmanlaşma amacını benimseyen bireyler yeteneklerini ve yeterlilik seviyelerini artırma eğiliminde iken performans amacını benimseyen bireyler yeteneklerini ispat etme eğilimi içerisindeyler. Performans amacını benimseyen bireyler; öğretmen ya da ebeveynlerini mutlu etmek, sınıf ortamında başarılı bir öğrenci profili göstermek ya da kendisini değerli hissetmek amacıyla en iyi öğrenci olmaya ‘yaklaşma’ eğilimi gösterebilir. Aynı zamanda bu öğrenciler; yeteneksiz görünmek, başarısız bulunmak ya da aptal izlenimi vermekten ‘kaçınma’ eğilimi de gösterebilirler. Bu kuramsal çerçeve doğrultusunda ölçek maddeleri yazılmıştır. Ölçek maddeleri Türkçe ve içerik bakımından alan uzmanlarının görüşleri doğrultusunda gerekli düzeltmeler yapılmıştır. Biyoloji Öğrenme Motivasyon Ölçeğinin deneme uygulaması 2017-2018 güz döneminde Kastamonu Üniversitesi Eğitim Fakültesi, Necmettin Erbakan Üniversitesi Ahmet Keleşoğlu Eğitim Fakültesi ve Erzincan Eğitim Fakültesi bünyesinde öğrenim gören 581 fen bilgisi öğretmen adayıyla gerçekleştirilmiştir. Ölçeğin uygulanmasından elde edilen veriler açımlayıcı faktör analizi kapsamında temel bileşenler analizi (principal component analysis) ve promax döndürme tekniği ile değerlendirilerek ölçeğe ait faktör sayısı ve ölçek maddelerinin faktörlere dağılımı belirlenmiştir. Bu analize göre Biyoloji Öğrenme Motivasyon Ölçeğinin, varyansın %65’ini açıklayan dört faktörden oluştuğu belirlenmiştir. Ölçek maddelerinin faktörlere dağılımı incelendiğinde maddelerin dağılımının ölçeğin dayandığı Hedef Yönelim Teorisi ile uyumlu bir şekilde gerçekleştiği tespit edilmiştir. Bu sonuca göre ölçeğin faktörleri “Uzmanlaşma Hedefi”, “Kaçınma Performans Hedefi”, “Duyuşsal Odaklı Yaklaşma Performans Hedefi” ve “Bilişsel Odaklı Yaklaşma Performans Hedefi” şeklinde isimlendirilmiştir.

Abstract

Flipped Classroom methodology has strongly introduced in the classrooms of different educational levels, but above all in the University. This methodology could be defined as the reversal of roles in the classroom, where the student acquires theoretical knowledge outside of the classroom and becomes a space for resolving doubts and cooperative work. Thus, this paper analyzes the experience carried out at the University of Granada with students of the Master's Degree in Secondary School Training where Flipped Classroom methodology has been applied. The research methodology used is quantitative, so that an ad hoc questionnaire on a Likert scale was used to obtain the data. Among the obtained results, it is observed that the students perceive an improvement in their academic performance and the improvement of the different personal and social skills. Finally, it can be concluded that this kind of experiences where the Flipped Classroom methodology is applied favors the development of skills depending of subject taught and the field of knowledge.

Keywords: *Flipped Classroom, Higher Education, ICT, Teaching Methodology.*

Introduction

In recent years, the Flipped Classroom methodology is being implemented in the classrooms of different educational levels, which it is defined as the flipped of roles in the classroom, where the student acquires the theoretical knowledge outside and the classroom becomes a propitious space for resolving doubts and cooperative work (Castilla et al., 2015). Therefore, the student previously works the contents outside the school context from the use of digital tools to develop them later in the classroom.

On the other hand, the origin of this methodology born in the concern of two teachers to oppose school absenteeism, likewise they began to record their presentations with audio to offer as support material to students (Sánchez, Solano, & González, 2016). From this experience they realized that this teaching method favored the development of certain benefits, among them those highlighted by the pioneers Bergmann and Sams (2012) and collected in Gértrudix and Rivas (2015), Zainuddin and Hajar (2016) and Rincón (2016): development of a collaborative learning environment, dynamizes the role of students, actualization of the teaching role, allows autonomous learning, fosters student skills and facilitates the deployment of interactive participatory tasks. These advantages associated with the Flipped Classroom methodology can be verify in different investigations carried out (Huesca, 2016; Opazo, Acuña, & Rojas, 2016; Díaz, Martín, & Sánchez, 2017; Sacristán et al., 2017; Mingorance et al., 2017) in which its acquisition becomes evident.

In keeping with Miragall and García-Soriano (2016) among the features of Flipped Classroom we find:

- The content is previously worked.
- Students acquire an active role in their learning. This methodology is based on in constructivism and in the social learning theory (González et al., 2017).
- Significant learning occurs.
- The teachers acts as a guide and is aware of the students' knowledge.

Therefore, taking into account these considerations there is a change of roles in relation to the traditional master class model, in which students are merely a receiver of contents and the teacher is limited to transmitting

information. On the other hand, the Flipped Classroom change this situation around and the students acquire a leading role in their learning, while the teachers act as a guide facilitating the learning content. So that in its implementation the teacher selects a series of videos that can be coupled with questions that the students consult outside the classroom, with the possibility of writing down the individual doubts to take them later to class. In the same way, previously working on the subject, it is possible to form cooperative groups in class to reinforce the content among equals.

Finally, it should be noted that the relevance and effectiveness of this methodology depends largely on the type of content of the subject taught, so Barao and Palau (2016) emphasize that in the mathematics subject it is complicated to implement the Flipped Classroom in all teaching units. Consequently, it is the teacher's task to know how to apply this methodology to combine it with face-to-face and extensive explanations in those contents that present difficulties in the autonomous learning of the students.

Methodology

In this paper, a descriptive quantitative methodology has been used (Hernández, Fernández, & Baptista, 2016), with the purpose of knowing the experience on the implementation of the Flipped Classroom methodology. The sample was composed by two groups of students of the Master's Degree in Compulsory Secondary Education and Baccalaureate, Vocational Training and Language Teaching, specialty of Mathematics and Geography and History of the University of Granada, to which the Flipped Classroom methodology has been applied in the development of class sessions on the subject of "Society, Family and Education" during the 2017-2018 academic year.

Thus, it has been used a questionnaire, prepared ad hoc, based on a Likert scale of 4 levels as a data collection instrument: Items 1-8 (1 = Totally disagree, 2 = Disagree, 3 = Agree, 4 = Totally agree) and item 9 (1 = Very unsatisfactory, 2 = Unsatisfactory, 3 = Satisfactory, 4 = Very satisfactory). Although the original questionnaire consists of 26 items, for this paper we have selected the 9 items corresponding to the development of skills and satisfaction of the experience developed, where it is revealed the degree of student accordance with this methodology [Table 1]. In relation to the reliability of the questionnaire the analysing of the 9 items show a reliability index of 0.91 (Cronbach's alpha coefficient).

The sample was composed of 82 students in total, 42 from the specialty of Mathematics and 40 from Geography and History. The data were analysed with the statistical program SPSS in its version 24, which has allowed to perform various statistical-descriptive operations to obtain the percentage of response in each item according to the Likert scale.

Table 1: Questionnaire items on the development of skills and student satisfaction with the Flipped Classroom experience.

Q1	Academic performance
Q2	Development of creativity and innovative ideas in teaching
Q3	Development of metacognitive skills
Q4	Development of social and personal skills
Q5	Greater knowledge and learning through teamwork
Q6	Increase of my interest and personal motivation towards the subject
Q7	Acquisition of a comprehensive knowledge, practical, transferable to other subjects and to reality
Q8	I prefer to work through active methodologies such as Flipped Classroom as opposed to traditional teaching methods (master lesson)
Q9	The global assessment of my learning experience with this teaching methodology

Results

In relation to the characteristics of the sample ($n = 82$), if we look at the gender it has been composed of 55% (male) and 45% (female). On the other hand, the age of the participants is diverse: among the 19-23 years is 32% of the students, 24-28 years (44%), being the age where the largest population is concentrated, 29-33 years (13%), 34-38 years (5%) and more than 39 years (6%) [Figure 1].

Figure 1: Percentage of age of the students.

Regarding the answers to the questionnaire, each item obtains its own scores that, although they vary among them, are similar percentages in the different values [Figure 2 and Figure 3]. Thus, in the question about "Academic performance" (Q1), the answers have been totally disagree (4.9%), disagree (26.8%), agree (61%) and totally agree (7.3%). With measures of central tendency referring to the mean: 2.71, media: 3, mode: 3 and a standard deviation of 0.67 points. In the "Development of creativity and innovative ideas in teaching" (Q2), totally disagree (4.9%), disagree (15.9%), agree (62.2%) and totally agree (17.1%). Mean: 2.91, media: 3, mode: 3 and standard deviation: 0.72 points. In "Development of metacognitive skills" (Q3), totally disagree (6.1%), disagree (25.6%), agree (52.4%) and totally agree (15.9%). Mean: 2.78, median: 3, mode: 3 and standard deviation: 0.78 points. In "Development of social and personal skills" (Q4), totally disagree (4.9%), disagree (13.4%), agree (64.6%) and totally agree (17.1%). Mean: 2.94, median: 3, mode: 3 and standard deviation: 0.70 points. In relation to "Greater knowledge and learning through teamwork" (Q5), totally disagree (2.4%), disagree (25.6%), agree (54.9%) and totally agree (17.1%). Mean: 2.87, median: 3, mode: 3 and standard deviation: 0.71 points. In "Increase of my interest and personal motivation towards the subject" (Q6), totally disagree (6.1%), disagree (23.2%), agree (59.8%) and totally agree (11%). Mean: 2.76, median: 3, mode: 3 and standard deviation: 0.73 points. Following with the data obtained, in the question "Acquisition of a comprehensive knowledge, practical, transferable to other subjects and to reality" (Q7), totally disagree (2.4%), disagree (17.1%), agree (64.6%) and totally agree (15.9%). Mean: 2.94, median: 3, mode: 3 and standard deviation: 0.65 points. And finally, in "I prefer to work through active methodologies such as Flipped Classroom as opposed to traditional teaching methods (master lesson)" (Q8), totally disagree (3%), disagree (20.7%), agree (51.2%) and totally agree (24.4%). Mean: 2.96, median: 3, mode: 3 and standard deviation: 0.77 points.

Figure 2: Percentage of responses based on the Likert scale of question 1-4.

Figure 3: Percentage of responses based on the Likert scale of question 4-8.

Finally, in the final question about "The global assessment of my learning experience with this teaching methodology" (Q9), the results have been very unsatisfactory (2.4%), unsatisfactory (15.9%), satisfactory (62.2%) and very satisfactory (19.5%) [Figure 4]. With a mean: 2.99, media: 3, mode: 3 and standard deviation of 0.67 points.

Figure 4: Percentage of student satisfaction with respect to the Flipped Classroom experience.

Discussion And Conclusions

In relation to the answers of the participants, these are homogeneous in all the items as it reflects the low standard deviation, less than 0.8 points in all of them. Therefore, according to the median and mode, the answers are accumulated in the value 3 (agree), thus highlighting a positive perception in the application and development of the Flipped Classroom methodology. Thus, the participants consider the improvement in academic performance in the same line as the pioneers Bergmann and Sams (2012), which highlight the Flipped Classroom as a method for improving learning.

Likewise, the fact of giving the students autonomy in carrying out the tasks (Miragall, & García-Soriano, 2016) affects the development of creativity, as confirmed in this experience. Regarding the development of personal and communication skills, these are enhanced by teamwork that favours the Flipped Classroom (Huesca, 2016, Mingorance et al., 2017), in the same way that the percentage of student agreement is 81.7% (social and personal skills) and 72% (teamwork).

On the other hand, the fact that the Flipped Classroom methodology promotes the active role of students and the flipped of roles, displacing the teacher to a secondary level, incurs the student's intrinsic motivation (70.8% of agree), as González et al. (2017) indicates. In this sense, the acquisition of knowledge is amplified due to the combination of the motivational and significant learning components developed by the student (Díaz, Martín, & Sánchez, 2017) and is perceived in this experience (80.5%).

Finally, the general assessment of the students is satisfactory with an agreement percentage of 81.7%, where the students' preference is shown for working with an active methodology such as the Flipped Classroom versus the master class. In short, the students' general perception of the experience and skills developed with the Flipped Classroom, both in this paper and in those previously done (Opazo, Acuña, & Rojas, 2016; Sacristán et al., 2017), make this methodology a powerful resource for improving the teaching-learning

In consideration, with the development of this work on the implementation of the Flipped Classroom methodology has responded to the objective raised about knowing the experience of the Masters' degree students on this methodology. Likewise, the different items raised provide relevant data of the Flipped Classrooms' virtualities to enhance diverse personal, academic and social skills. So that not only the academic dimension of the student is affected, but the experienced skills are transferred transverse to other facets of life. However, it is important to highlight the importance of working with future teachers on innovative methodologies such as the Flipped Classroom, since experiences of this type empower and provide teachers with resources so that in the future they can be implemented in their classrooms. However, it is of vital importance to know the didactic content of the subject, since as indicated by Barao and Palau (2016) some disciplines require a more deliberate and directed treatment, as in this case the specialties of Mathematics and Geography and History. Therefore, in these subjects it is necessary to combine the Flipped Classroom with other resources that help to understand the key concepts

and favour the autonomous learning of the student.

In summary, the Information and Communication Technologies (ICT) converge in teaching methodologies that place the focus of attention on the student and foster their autonomy in learning. The Flipped Classroom methodology is found in this line, incurring multiple benefits for teaching, such as those cited in the previous studies of other authors and those collected in this experience.

Fransa Milli Kütüphanesi'nde Kayıtlı İki Elyazması Kitabın Gerçek İsmi Ve Yazarı Üzerine

Tuna TUNAGÖZ

Dr. Öğr. Üyesi, Ç.Ü. İlahiyat Fakültesi İslam Felsefesi Anabilim Dalı
ttunagoz@cu.edu.tr

Özet

Bu bildiride Fransa Milli Kütüphanesi'nde kayıtlı Arapça iki elyazması eserin (Bibliothèque nationale de France, Arabe 1454, 1455) gerçek ismi ve yazarı araştırma konusu edilmiştir. Zikredilen elyazmaları aynı kitabın iki ayrı kopyasıdır ve 1455 numaralı nüsha, 1454'den istinsah edilmiştir. Kütüphanenin resmi sitesine göre, eserin ismi *Kitâbü'l-Cem' beyne'l-Milel ve'n-Nihal ve Mesâliki'n-Nazar fî Mesâliki'l-Beşer*'dir ve yazarı meçhuldür. Kütüphanedeki Arapça elyazmaları üzerine hazırlanan kataloglar da aynı bilgileri vermektedir. Başka bir eserde ise yazar olarak Ebû Hâmid el-Gazzâlî gösterilmiştir. Araştırma, gerçek yazarın tespit edilen bütün eserlerinin elyazmalarına dayalı olarak eldeki bilgileri tashih etmekte ve yeni verilere ulaşmaktadır. Buna göre; dinler ve düşünceler tarihine yönelik Eş'arî bakışa sahip bu kitabın gerçek ismi *Kitâbü Mesâliki'n-Nazar fî Mesâliki'l-Beşer*'dir. Müellifi ise Memlûk felsefî kelimcilerinden Muhyiddin Ömer b. Hızır b. Ömer el-İsfahânî'dir. Müellifin bunun dışında üç eseri daha bulunmaktadır: İbn Sînâ'nın Meşşâi felsefesinin eleştirisine adanan *Kitâbü Ta'cizi'l-Müsta'ciz*; yine dinler ve düşünceler tarihine yönelik Eş'arî tahliller ve değerlendirmeler yapan *el-Kavâidü'l-Bedriyye fî Akâidi'l-Beriyye* ile *Kitâbü Dekâiki'n-Nazar fî Hakâiki'l-Beşer*.

Anahtar Sözcükler: Fransa Milli Kütüphanesi, Arabe 1454, Arabe 1455, *Kitâbü Mesâliki'n-Nazar fî Mesâliki'l-Beşer*, Muhyiddin Ömer b. Hızır b. Ömer el-İsfahânî.

I. Eserin Gerçek İsmi

Bildiriye konu edilen eserin Fransız Milli Kütüphanesi'nde iki ayrı yazması bulunmaktadır (Arabe, nr. 1454, 1455). 1454 numaralı nüshanın ferağ kaydı yoktur. Diğer nüsha olan 1455 ise, 15 Şaban 1103/2 Mayıs 1692 tarihinde Süleyman b. Ya'kûb tarafından Paris'te bir önceki nüshadan kopyalanmıştır (1455: 74a).

Her iki nüsha da eseri *Kitâbü'l-Cem' beyne'l-Milel ve'n-Nihal ve Mesâliki'n-Nazar fî Mesâliki'l-Beşer* olarak kaydetmiştir. Başlıktaki “el-cem’ beyne’l-milel ve’n-nihal” (dinler ve düşünce akımlarını bir araya getirme/uzlaştırma) kısmının eklemeye olduğunu düşünüyorum ve bu hususta birkaç kanıt ortaya konabilir:

Öncelikle, 1454'ün zahriye sayfası, bahsedilen kısmın müstensih tarafından yapılan bir eklemeye olduğuna dair kuvvetli işaretler taşımaktadır. Bu bölümde büyük karakterlerle yazılan “kitâb” kelimesinin devamına ve altına, toplamda iki kez, “el-cem’ beyne’l-milel ve’n-nihal” kelimeleri yazılmış (1454: 1a); bu metni olduğu gibi kopyalayan 1455 de bu başlığı tekrarlamıştır (1455: 1a). Bunlara binaen kütüphane katalogları eseri yukarıdaki eklentili biçimiyle kaydetmiştir (De Slane, 1883-95: 279; Vajda&Sauvan, 1985: III, 319).

İkinci olarak, yazar bu eserini İslâm'ın hakikatin yegâne temsilcisi olduğunu ispat etmek amacıyla kaleme aldığını söylemektedir. Fakat “el-cem’ beyne’l-milel ve’n-nihal” (dinler ve düşünce akımlarını uzlaştırma) ismi, yazarın dinler ve düşünce sistemleri arasında bir sentez yapmaya çalıştığını ima etmekte ve yazarın asıl yaklaşımı açısından çelişki üretmektedir: “Ben âlimlerin hiçbirisinin, bir dinin veya düşünce akımının dayandığı temeli ispat edecek veya çürütecek biçimde, uyumlu ve aykırı hususlara dair gerekenleri bir araya getiren bir kitabına rastlayamadım. (...) Durum bu olduğu için, dinlerin ve düşünce akımlarının özelliklerini ana hatlarıyla anlatacağım, onların durumlarını bir dinin veya düşünce akımının dayandığı temeli ispat edecek veya çürütecek biçimde özetleyeceğim kısa bir eser yazmayı aklıma koydum. Kitabın yazılış nedeni budur. Tâbi olan da muhalefet eden de bu kitapla hidayete erişir. Bundan daha büyük bir fayda yoktur.” (1454: 5a-6a; 1455: 4a-5b).

Son olarak, müellif, metinde kitabın ismini çok net biçimde “*Kitâbü Mesâliki'n-Nazar fî Mesâliki'l-Beşer*” olarak kaydetmektedir: “(...) Bu kitabı bu sebeple yazdım ve içine bu ifadeyi yerleştirdim. Onu ne kısa ne geniş olarak telif ettim. Ona dört mukaddime ile başladım ve onu beş baba ayırdım. Ona, “İnsanoğlunun İzlediği Yollar Hakkında Değerlendirmeler Kitabı” (ve *semmeytühü Kitâbe mesâliki'n-nazar fî hakâiki'l-beşer*) adını verdim.” (1454: 3b; 1455: 3a).

II. Eserin Gerçek Yazarı

Her iki yazma da müellifini ismiyle değil, lakaplarıyla anmaktadır: “Te'lîfû Huccetü'l-İslâm Muhyi'l-Mille ve'l-Hakk ve'd-Dîn (İslâm'ın Hücceti, İnananların, Hakkın ve Dinin Yaşatıcısı)” (1454&1455: 1a). Bu elbette çok müphem ve yanıltmaya müsait bir tasvirdir. Öyle ki, “Huccetü'l-İslâm” lakabının varlığı, Ferdinand Wüstenfeld'in *Die Academiën der Araber und ihre Lehrer* isimli çalışmasında, bu eseri Gazzâlî'ye nispet etmesine neden olmuştur (1837: 19). Bu tespit iki bakımdan hatalıdır: Wüstenfeld'in çalışmasının kaynağı İbn Kâdî Şühbe'ye (ö. 874/1470) ait *Tabakâtü's-Şâfiyye*'dir ve bu kaynakta Gazzâlî'ye bu isimde eser atfedilmemiştir (1997: I, 326-328). En önemlisi, *Kitâbü Mesâliki'n-Nazar*'ın ilerleyen sayfalarında Gazzâlî'den ve vefatından bahsedilmektedir (1454: 5a; 1455: 4a). Bu ise yazarın Gazzâlî olmadığını, onun gerçek müellif tarafından bir diğeri olarak mevzu bahis edildiğini göstermektedir. Bu husus, Fransa Millî Kütüphanesi'nin Arapça yazmalarının kataloglarını

hazırlayan ve Gazzâlî'nin eserleri üzerine çalışmalar yapan araştırmacılar tarafından da fark edilmiş ve eserin Gazzâlî'ye aidiyeti reddedilmiştir (De Slane, 1883-1895: 279-280; Bouyges, 1959: 147, n. 252; Bedevî, 1977: 375; Vajda&Sauvan, 1985, III, 319-320). Fakat bu çalışmalarda eserin gerçek sahibine yönelik bir işaret yoktur. *Mesâlikü'n-Nazar fî Mesâliki'l-Beşer* başlığıyla bu eserden bahseden *İzâhu'l-Meknûn* da sadece eserin ismini anmakla yetinmiştir (t.y.: II, 473).

Bütün bunlar çözmemiz gereken bir aidiyet sorununun habercisidir ve elimizde kayda değer bir veri yoktur. Eğer daha önce yaptığım bir çalışma olmasaydı, bundan ötesine dair kelam edebilmek benim içinde mümkün değildi (Tunagöz, 2016). Sözü daha fazla uzatmadan bu çalışmamda farklı bölümlerde yer alan temel bulguları ifade edip ardına kanıtlara yer vermenin anlamlı olacağını düşünüyorum:

Müellif, Memlûk Kahiresi'nde yaşayan Eş'arî kelamcı Muhyiddin Ömer b. Hızır b. Ömer el-İsfahânî'dir. Eserlerindeki işaretlerden, bu âlimin hicri sekizinci yüzyılın ilk çeyreğinde sağ olduğu anlaşılmaktadır. Müellifin bildiriye konu olan dışında üç eseri daha mevcuttur: Din ve düşünce tarihini Eş'arî bakış açısıyla değerlendiren *el-Kavâidü'l-Bedriyye fî Akâidi'l-Beriyye (İnsanların İnançları Hakkında Bedreddin'e Sunulan Esaslar)* ile *Kitâbü Dekâiki'n-Nazar fî Hakâiki'l-Beşer*'in (İnsanoğlunun Hakikat İddiaları Hakkında Titiz Değerlendirmeler Kitabı); son olarak İbn Sinâ felsefesinin eleştirisine hasredilen *Kitâbü Ta'cizi'l-Müsta'ciz* (Üstün Olduğunu Sananın Âcizliğini Ortaya Koyan Kitap).

İlk önce eserlerin kendi müelliflerini nasıl andığı hususu ile ilgilenelim. Daha önce de belirtildiği üzere, *Kitâbü Mesâliki'n-Nazar* yazarını “Muhyiddin” olarak anmıştır (İsfahânî, 1454: 1a). *Kitâbü Dekâiki'n-Nazar*, bu lakapla “Ömer b. Hızır b. Ömer el-İsfahânî” ismini birleştirmiştir (İsfahânî, 813: 1a). Birisi, doğal olarak “Muhyiddin” lakabına sahip pek çok müellif olduğunu, bu iki metni ve yazarı eşleştirmemiz için başka delillere ihtiyacımız olduğunu söyleyebilir. İtiraz yerindedir, fakat metinler arası karşılaştırma yoluyla bizlere açık bir bağlantı kurma imkânı sunacaktır: *Kitâbü Mesâliki'n-Nazar* ve *Kitâbü Dekâiki'n-Nazar*, ilgi alanı, üslup, konu dizimi ve ulaştığı sonuçlar bakımından örtüşmektedir. Aynı durum yazarlarını sadece “Ömer b. Hızır b. Ömer el-İsfahânî” olarak anan *Kitâbü Ta'cizi'l-Müsta'ciz* ve *el-Kavâidü'l-Bedriyye* için de geçerlidir (1181: 1a; 1037: 1a). Metinler arasındaki mutabakata dair pek çok örnek ortaya konabilir. Öncelikle, *Mesâlikü'n-Nazar*'da yer alan uzunca bir pasaj diğer üç kitapta neredeyse birebir tekrar edilmektedir:

Kitâbü Mesâliki'n-Nazar, 1454, 67b-68a:

“Bunun kanıtı şudur: Bu fertler –ki fert fertleştiren ilintilerle çevrili türsel suretten ibarettir– bilinebilir değilse biz hiçbir şeyi bilemeyiz. Çünkü dıştaki mevcutlar, Zeyd, Amr, gökyüzü, su ve diğerleri gibi fertlerdir. Eğer fertler biliniyorsa onları bilmek türü bilmekle mümkündür. Çünkü fertler de türden ve onu çevreleyen ilintilerden ibarettir. Türü bilmiyorsak bu fertleri bilemeyiz. Türü biliyorsak, fertlere dair bilgimiz ya zorunludur –ki bu zorunlu olarak yanlıştır– ya da akıl yürütmeye dayalıdır. Türün bilinmesini sağlayacak akıl yürütme, onun unsurlarının tamamına değinecek tanımlardır. Türün unsurlarından birisi ise yüksek yalın cinslerdir, fakat yüksek cinsler apaçık biçimde bilinmezler. Çünkü filozoflar yüksek cinsleri betimlemiş ve betimlerinde ihtilaf etmişlerdir. Durumu böyle olan şeylerin apaçık olması imkânsızdır. Bunlar akıl yürütme ile de bilinmezler. Çünkü onların hakikatlerini ve cevherlerini kuşatan, yalnızca tam tanımlardır; yüksek cinslerin ise yalınlıklarından dolayı ne tam ne de eksik tanımları vardır. Dolayısıyla yüksek cinslerin hakikatleri bilinemez. Yüksek cinsler, fertlere kadar kendi altında yer alanların hakikatlerinin cüzleridir. Yüksek cinsler, altındakiler ve fertler bilinemezler. Biz yalnızca fertleşmeyi ve fertleşmeyi sağlayan ilintileri bilir ve bu ilintilerin gerisinde bundan başka bir şey olduğunu anlarız.”

Kitâbü Ta'cizi'l-Müsta'ciz, 1181, 3a-4b:

“Özetleyici anlatıma gelince, şöyle diyoruz: Filozoflar ve diğerleri, ilahî hakikatler şöyle dursun, bu fertleri anlamak ve tasavvur etmekten bile âcizdir. Bunun delili şudur: Bu fertler –ki fert, fertleştirici ilintilerle

el-Kavâidü'l-Bedriyye, 1037, 94b-96a:

“Bunun kanıtı şudur: Bu fertler bilinebilir değilse biz hiçbir şeyi bilemeyiz. Eğer biliniyorlarsa onları bilmek türleri bilmekle mümkündür. Fertler de türlerden ve onları çevreleyen ilintilerden ibarettir. Türleri bilmiyorsak fertleri bilemeyiz. Türleri biliyorsak, fertlere dair bilgimiz ya zorunludur –ki bu zorunlu olarak yanlıştır– ya da akıl yürütmeye dayalıdır. Türlerin hakikatlerini eksiksiz biçimde ortaya koyacak akıl yürütme, onların unsurlarının tamamına değinecek tanımlardır. Tanımların unsurlarından birisi ise yüksek yalın cinslerdir; fakat yüksek cinsler zorunlu biçimde bilinmezler. Çünkü filozoflar yüksek cinsleri betimlemiş ve betimlerinde ihtilaf etmişlerdir. Durumu böyle olan şeylerin zorunlu olması imkânsızdır. Bunlar akıl yürütme ile de bilinmezler. Çünkü onların hakikatlerini kuşatan, yalnızca tam tanımlardır; yüksek cinslerin ise ne tam ne de eksik tanımları vardır. Dolayısıyla yüksek cinslerin hakikatleri bilinemez. Yüksek cinsler, fertlere kadar kendi altında yer alanların hakikatlerinin cüzleridir. Yüksek cinsler, altındakiler ve fertler bilinemezler. Biz yalnızca fertleşmeyi ve fertleşmeyi sağlayan ilintileri bilir ve bu ilintilerin gerisinde bundan başka bir şey olduğunu anlarız.”

Kitâbü Dekâiki'n-Nazar, 813, 68a-68b:

“Bunun kanıtı şudur: Bu fertler –ki fert fertleştiren ilintilerle çevrili türsel suretten ibarettir– bilinebilir değilse biz hiçbir şeyi bilemeyiz. Çünkü dıştaki mevcutlar, Zeyd, Amr, gökyüzü, su ve diğerleri gibi

çevrili türsel doğadan ibarettir. Fertleri bilmiyorsak hiçbir şeyi bilemeyiz. Çünkü dıştaki mevcutlar bu fertlerdir; yani Zeyd, Amr, gökyüzü, su ve benzerleridir. Eğer fertleri biliyorsak, onları bilmek türleri bilmekle mümkündür. Fertler de türlerden ve onları çevreleyen ilintilerden ibarettir. Türleri bilmiyorsak fertleri bilemeyiz. Türleri biliyorsak, fertlere dair bilgimiz ya zorunludur –ki bu kesin olarak yanlıştır– ya da akıl yürütmeye dayalıdır. Türlerin hakikatlerini eksiksiz biçimde ortaya koyacak akıl yürütme, türlerin tüm unsurlarına değinecek tanımlardır. Tanımların unsurlarından birisi ise yüksek cinslerdir, fakat yüksek cinsler apaçık biçimde bilinemezler; bu durum açıktır. Çünkü filozoflar yüksek cinsleri betimlemiş ve betimlerinde ihtilaf etmişlerdir; dolayısıyla yüksek cinsler düşünceyle bilinemezler. Çünkü hakikatleri kuşatan, yalnızca tam tanımlardır; yüksek cinslerin ise, yalınlıklarından dolayı, ne tam ne de eksik tanımları vardır. Dolayısıyla yüksek cinslerin hakikatleri bilinemez. Yüksek cinsler, fertlere kadar kendi altında yer alanların hakikatlerinin birimleridir. Yüksek cinsler, altındakiler ve fertler bilinemezler; [bilinebilen tek şey] fertleşme ve fertleşmeyi sağlayan ilintilerdir. Biz bu ilintilere dair birtakım şeyler duyumsar, bu ilintilerle [ilişkileri] arasında bağlantı olduğunu kavrar ve bu ilintilerin gerisinde başka bir şey olduğunu anlarız.”

fertlerdir. Eğer fertler biliniyorsa onları bilmek türü bilmekle mümkündür. Çünkü fertler de türden ve onu çevreleyen ilintilerden ibarettir. Türü bilmiyorsak bu fertleri bilemeyiz. Türü biliyorsak, fertlere dair bilgimiz ya zorunludur –ki bu zorunlu olarak yanlıştır– ya da akıl yürütmeye dayalıdır. Türün bilinmesini sağlayacak akıl yürütme, onun unsurlarının tamamına değinecek tanımlardır. Türün unsurlarından birisi ise yüksek yalın cinslerdir, fakat yüksek cinsler apaçık biçimde bilinmezler. Çünkü filozoflar yüksek cinsleri betimlemiş ve betimlerinde ihtilaf etmişlerdir. Durumu böyle olan şeylerin apaçık olması imkânsızdır. Bunlar akıl yürütme ile de bilinmezler. Çünkü onların hakikatlerini ve cevherlerini kuşatan, yalnızca tam tanımlardır; yüksek cinslerin ise yalınlıklarından dolayı ne tam ne de eksik tanımları vardır. Dolayısıyla yüksek cinslerin hakikatleri bilinemez. Yüksek cinsler, fertlere kadar kendi altında yer alanların hakikatlerinin cüzleridir. Yüksek cinsler, altındakiler ve fertler bilinemezler. Biz yalnızca fertleşmeyi ve fertleşmeyi sağlayan ilintileri bilir ve bu ilintilerin gerisinde bundan başka bir şey olduğunu anlarız.”

Ayrıca, İsfahânî'nin *Kitâbü Ta'cîzi'l-Müsta'viz* dışındaki üç eseri “mîlel ve nihâl” literatürüne aittir. Müellifin bu eserleri yazım amacı, tüm dinleri ve düşünce akımlarını değerlendirip hak dinin ve takip edilecek tek düşüncenin İslâm olduğunu ispat etmektir. Bu nedenle diğer üç eser arasında, özellikle de *el-Kavâidü'l-Bedriyye* ile *Kitâbü Mesâliki'n-Nazar* arasında önemli yakınlıklar vardır. Üç eserin içeriğine ve konu dizimine yönelik aşağıdaki betimleyici tablo bahsedilen yakınlığı ve yer yer tekrarları açıkça göstermektedir:

el-Kavâidü'l-Bedriyye, 1037:

[Mukaddime] (1b-5a)
Birinci Asıl: İslâm (5a-23a)
İkinci Asıl: Hristiyanlar (23a-49a)
Üçüncü Asıl: Yahudiler (49a-59a)
Dördüncü Asıl: Mecûsiler (59b-61a)
Beşinci Asıl: Sâbiîler (61a-63a)
Altıncı Asıl: Felsefî Görüşler (63a-69a)
Yedinci Asıl: Dehrîlik (69a-69b)
Sekizinci Asıl: Sofistlik (69b-71a)

Kitâbü Dekâiki'n-Nazar, 813:

[Mukaddime] (1b-5a)
Birinci Asıl: İslâm (5a-27b)
İkinci Asıl: Hristiyanlar (27b-65b)
Üçüncü Asıl: Yahudiler (65b-82a)
Dördüncü Asıl: Mecûsiler (82a-84b)
Beşinci Asıl: Sâbiîler (85a-87b)
Altıncı Asıl: Felsefî Görüşler (87b-97a)
Yedinci Asıl: Dehrîlik (97a-97b)
Sekizinci Asıl: Sofistlik (98a-99a)

Kitâbü Mesâliki'n-Nazar, 1454:

Birinci Mukaddime (4b-5a)
İkinci Mukaddime (5a-6a)
Üçüncü Mukaddime (6a-7a)
Dördüncü Mukaddime (7a-8b, 2a-2b)
Birinci Bab: Hz. Muhammed'in (sas) Peygamberliği (2b, 10a-68b)
İkinci Bab: Hristiyanlar (69a-73b)
Üçüncü Bab: Müsevîler (73b-81b)
Dördüncü Bab: Mecûsiler (81b-84b)
Beşinci Bab: Felsefî Yapılar ve Düşünceler (84b-93a)
Altıncı Bab: Dinlere ve Düşünce Sistemleri Hakkında Daha Önce Anlatılanların Değerlendirilmesi (93a)

Son olarak, müellifin tüm kitaplarında, metinlerin aynı zihnin ürünü olduğunu gösteren üslup, yöntem ve tahlil birliği bulunmaktadır (Karşılaştırma için bkz. İsfahânî, 1037: 1b-3b, 88a-98b; 1181: 1b-5a; 1454: 1b, 2a-2b, 5b-6a, 7b-14b, 64a-74a; 813: 1b, 3a-3b, 62b-71a). Bütün bu hususların *Kitâbü Mesâliki'n-Nazar*'ın Muhyiddin Ömer el-İsfahânî'ye aidiyetini ispatladığı kanaatindeyim.

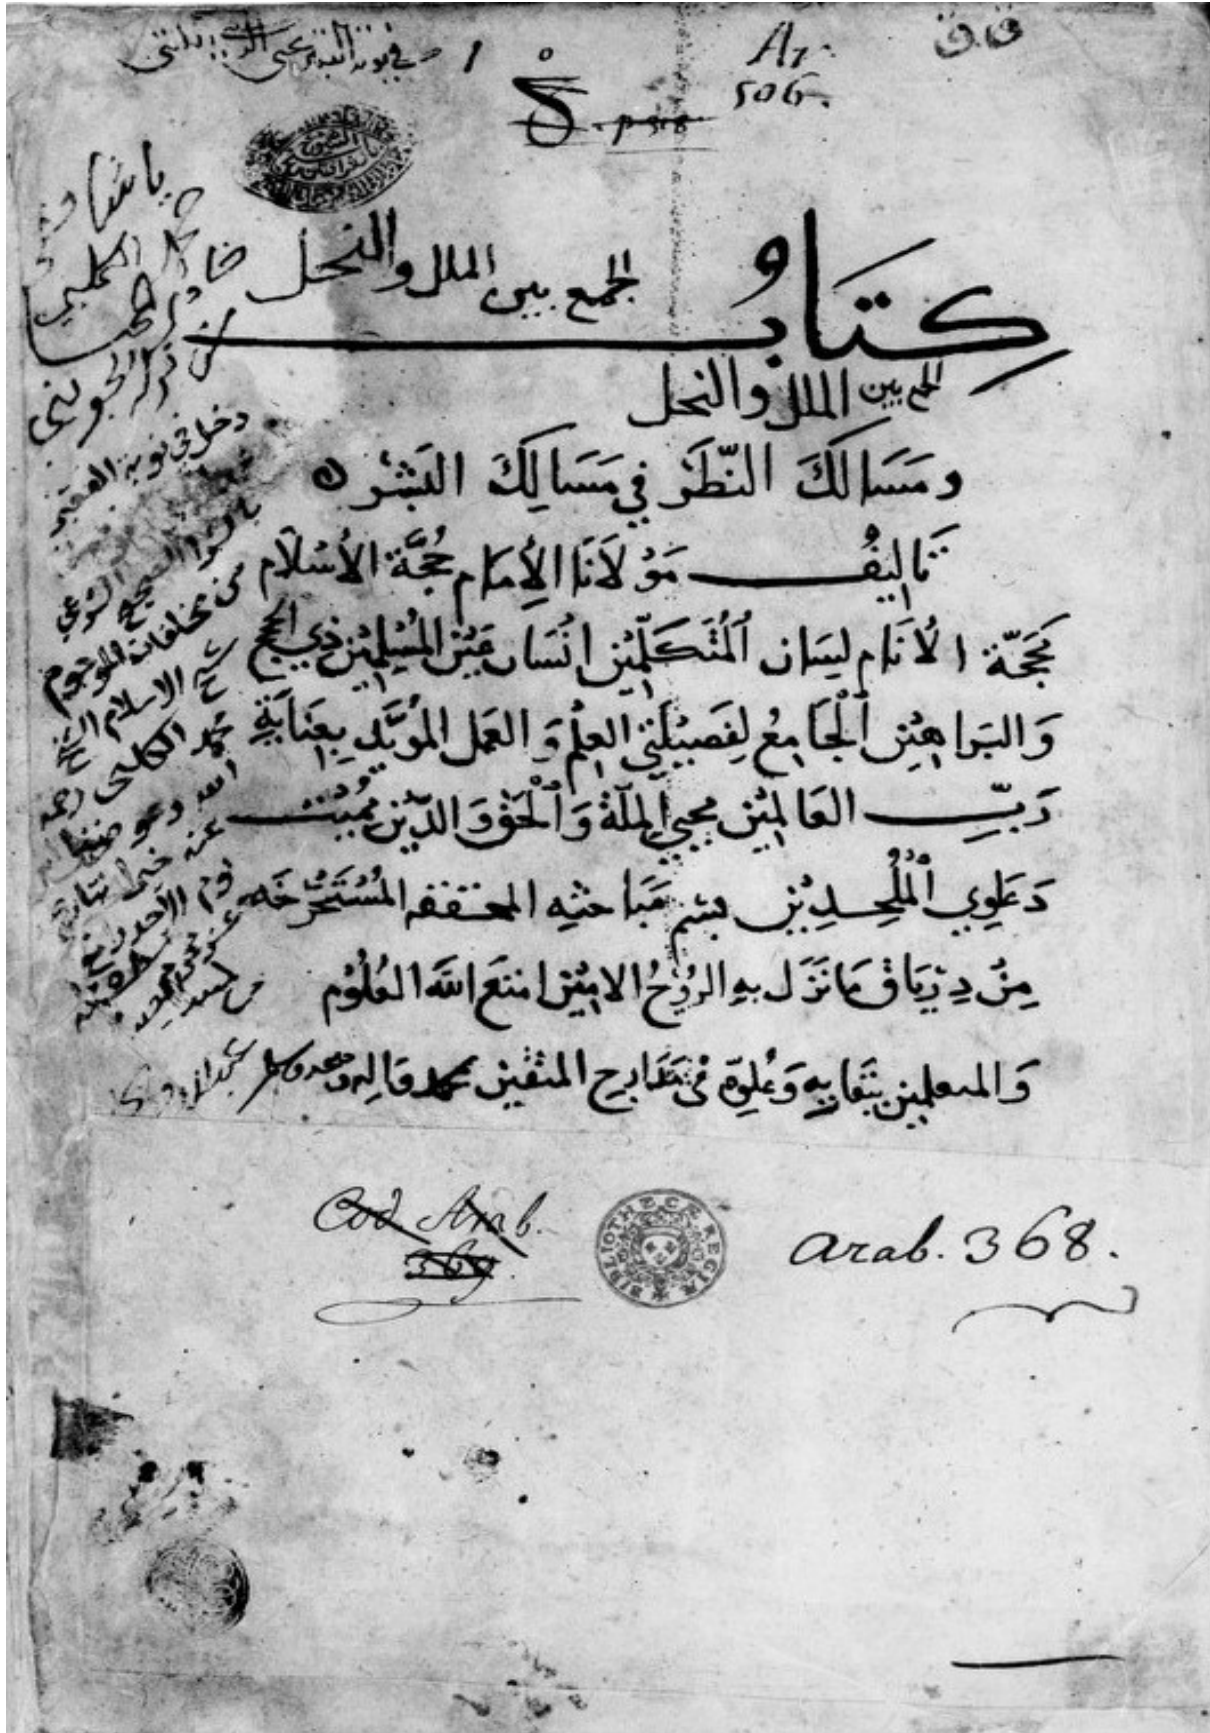

Sonuç

Bibliothèque nationale de France'da kayıtlı, Arabe 1454, 1455 numaralı yazma kitapların gerçek ismi *Kitâbü Mesâliki 'n-Nazar fî Mesâliki 'l-Beşer*'dir. Başlıktaki “el-cem’ beyne’l-milel ve’n-nihal” (*dinler ve düşünce akımlarını bir araya getirme/uzlaştırma*) kısmı muhtemelen müstensihe ait bir ilavedir. Eserin müellifi, Muhyiddin Ömer b. Hızır b. Ömer el-İsfahânî'dir. Yazarın yaşam öyküsüne dair şimdilik tatmin edici bir bilgi yoktur. Eserlerinin yazmalarından elde edilen ipuçlarıyla Memlük Kahiresi'nde ikamet ettiği ve hierî sekizinci yüzyılın ilk çeyreğinde hayatta olduğunu söylemek mümkündür. İsfahânî'nin üç eseri daha bulunmaktadır: *el-Kavâidü 'l-Bedriyye fî Akâidi 'l-Beriyye*; *Kitâbü Ta'cizi 'l-Müsta'ciz*; *Kitâbü Dekâiki 'n-Nazar fî Hakâiki 'l-Beşer*.

From Cultural To Intercultural: A New Dimension In Foreign Language Education

Tilda SAYDI
tildasaydi@adu.edu.tr

Abstract

The principal aim of this paper is to present how the notion of culture in foreign language teaching and learning has evolved into interculturality concept. After an overview of research of cultural competence pedagogy incorporated in foreign language teaching, we deal with competence based cultural training as a pedagogical approach with the main mission of providing intercultural competence within foreign language learning. For this purpose, this study examines teaching handbooks that deliver examples of how to design intercultural teaching together with language learning for classroom applications. The findings reveal that, as of today, intercultural concept is still vaguely defined even though teachers seem to be aware of its very recent integration into foreign language teaching and learning. To achieve this purpose, we offer a proposal concerning the content of intercultural competence through foreign language learning education for more meaningful and functional intercultural education within language learning.

Future Directions And Practices Of Lifelong Education Support System For Individuals With Developmental Disabilities

Soonyoung Hwang

Dept. Of Special Education Pusan National University South Korea

Sejin Cha

Dept. Of Special Education Pusan National University South Korea

Sejin86@Naver.Com

Abstract

The Purpose Of This Study Is To Find A Component And Support For The Development Of Lifelong Education Support System For Adults With Developmental Disabilities. The Research Method Was Delphi Survey, And 22 Experts Participated Twice. The Result Of Delphi Research Are As Follows. First, Vocational Education Programs For Adults With Developmental Disabilities Should Be Centered Around Independent Living Skills, Community Life Skills, Working Posture, Work Safety, And Interpersonal Relationships In The Workplace. Second, Vocational Education Programs For Adults With Developmental Disabilities Should Utilize On-The-Job Training And Internships. Third, Support Measure For The Lifelong Education Support System Is To Establish A Delivery System For Lifelong Education For The Disabled, Which Is Unified Among The Relevant Ministries And Agencies, To Expand The Practice And Internship For The Disabled, And To Secure Additional Budget For The Disabled.

Introduction

Lifelong Education Means That All People Receive Education Throughout Their Lives(Jo & Park, 2015). It Is Even More Important In Modern Society, Where It Is Required To Adapt To Rapidly Changing Cultural, Technological And Social Phenomena Every Day. In The Sense That It Supports The Ability Of Individuals Who Have Not Been Acquired In The School Curriculum To Continuously Develop Their Ability To Play A Social Role In Adulthood, It Is More Necessary Education For Persons With Developmental Disabilities Who Still Have Cognitive, Psychological And Social Limitations In Adulthood(Cho & Kim, 2016). In Other Words, Lifelong Learning For People With Developmental Disabilities Can Function As A Foundation For Promoting Vocational And Social Participation, Beyond Mere Personal Ability Development.

In The Republic Of Korea, The Percentage Of People With Disabilities Participating In Lifelong Learning On Job Skills Is Very Low, At 1.4%(Ministry Of Health & Welfare, 2012). Because There Are Many People Who Want To Participate, But It Is Impossible To Participate Because Of Lack Of Related Programs, Facilities, Infrastructure And Budget(Yoon. Et Al., 2010). To Improve This, It Is Necessary To Develop And Operate A Lifelong Education Program For The Disabled By Area Of Lifelong Education. In Particular, Career-Related Lifelong Education Programs For People With Developmental Disabilities Can Be A True Meaningful Program When It Includes Self-Management Skills Such As Job Skill Skills, Personal Treatment, Mobility, Sociality, Self-Advocacy, And Self-Determination(Song & Yoo, 2015). The Purpose Of This Study Is To Provide Support For Vocational - Related Lifelong Education For Adults With Developmental Disabilities And Provide Them As Basic Data To Support The National And Local Community. Specific Research Issues Are As Follows.

1. What Are The Specific Measures For Basic And Occupational Programs For Lifelong Learning For Adults With Developmental Disabilities?
2. What Are The Specific Measures For The Job-Lifelong Education Support System For Adults With Developmental Disabilities?

Research Method

We Used The Delphi Method To Gather Opinions From Expert Panels. The Panel Consisted Of Experts In Special Education, Vocational Rehabilitation, Social Welfare(Master's Degree Or Above, 3+ Years Experience) And Parents Of Adults With Developmental Disabilities. Based On The Focus Group Interview (Fgi) Of The Expert Group And The Previous Research, The First Questionnaire Consisting Of 128 Items Was Prepared. A Total Of 2 Surveys Were Conducted And E - Mail Was Used. The Contents Of The Collected Data Were Categorized And Analyzed Using The Spss 21.0 Program. Results Were Examined By Frequency, Percentage, Mean, Standard Deviation, Skewness, Interquartile Range, And Content Validity Ratio.

Results

Basic Vocational Education Program

Among The 11 Areas(Independent Living Skills, Academic Skills, Self-Esteem, Community Life Skills, Assistive Technology Device Utilization, Interpersonal Relationships, Work Posture, Work Safety, Work Practice,

Occupational Hygiene, Employment Success Stories) And 32 Items Related To Basic Vocational Education, The Items That Showed High Necessity Are Health Care, Money Management, Stress Management, Interpersonal Relationship, And Asking For Help From Others. The Details Are Shown In <Table 1>.

Table 1: The Distribution Of Responses To The Needs Of Elementary Vocational Education Program Components

Items		M	Sd	Conver gence	Agree ment	Cvr
Independent Living Skills	Health Care	4.90	.32	1.00	.00	1.00
	Money Management	4.60	.70	.80	.50	.80
Self-Esteem	Stress Management	4.70	.48	.80	.50	1.00
Community Life Skills	Interpersonal Relationship	4.80	.42	.95	.13	1.00
	Asking For Help From Others	4.60	.52	.80	.50	1.00

Professional Vocational Education Program

Among The 13 Areas(Reading And Writing Documents, Computing Ability, Self-Management Skill, Job Function, Computer Utilization, Job Aptitude And Employment Counseling, Employment Support, Job Preparation, Preparation For Certification Acquisition, Field Practice And Internship, Resource Utilization Education, Fund Management Education) And 30 Items Related To Professional Vocational Education, The Items That Showed High Necessity Appeared As Conflict Management, Stress Relief, Time Management, Field Practice, And Support Through Related Organizations. The Details Are Shown In <Table 2>.

Table 2: The Distribution Of Responses To The Needs Of Professional Vocational Education Program Components

Items		M	Sd	Conver gence	Agree ment	Cvr
Self-Management Skill	Conflict Management	4.10	.57	.94	.13	.8
	Relieve Stress	4.20	.63	.75	.50	.80
	Time Management	4.20	.63	.75	.50	.80
Field Practice And Internship	Field Practice	4.40	.84	.75	.63	.60
Resource Utilization Education	Support Through Related Organizations	3.90	.57	.94	.13	.60

Establishing Lifelong Education Support Systems

Among The 16 Measures For Establishing Lifelong Education Support Systems For The Job, The Items That Showed High Necessity Are Unified Lifelong Education Delivery System, Dedicated Manpower Deployment, And Budget Securing. The Details Are Shown In <Table 3>.

Table 3: The Distribution Of Responses To Appropriateness Of The Measures To Support Lifelong Education

Items	M	Sd	Conver gence	Agree ment	Cvr
Establishment Of A System For Lifelong Education For Disabled People With Unified Administrative Departments And Agencies	3.90	.32	1.00	.00	.80
Placement Of Vocational Education Personnel In Existing Lifelong Educational Institutions For The Disabled	4.00	.67	.88	.25	.60
Additional Budget For Vocational Education For The Disabled	4.00	.00	1.00	.00	1.00

Conclusions

The Essential Job Skills Are Required For Employment, But Additional Skills Related To Social Adjustment Are Also Required To Maintain A Career. In Particular, Adults With Developmental Disabilities Have A Large Gap Between Life Age And Cognitive/Social Age, So Technology Related To Social Adaptation Should Be Supported By Lifelong Education For The Whole Life. Therefore, Vocational Education For Adults With Developmental Disabilities Can Lead To Longer-Term Employment Retention If They Are Combined With Contents That Improve Basic Social Skills Such As Cooperation With Colleague At Work And Interpersonal Relationships.

Developmental Disabled Have A Limited Ability To Generalize, So It Takes A Lot Of Time And Effort To Apply The Skills Acquired In The Classroom To The Field. Therefore, It Is Necessary To Actively Consider The Internship And On-The-Job Training As A Way To Learn And Apply The Technology Directly In The Field.

Even If Measures Are Taken To Revitalize Vocational Education At The Level Of Lifelong Education For Adults With Developmental Disabilities, It Would Be Difficult To Guarantee The Effect If Lifelong Education Is Provided With Temporary Support. Therefore, Policies, Laws, And Research That Ensure Continuous And Gradual Support Need To Be Implemented In Parallel. Finally, It Is Necessary To Educate And Arrange A Highly Specialized Workforce, As It Is An Education To Teach A Professional Area Of A Job To A Person Who Has A Special Support Requirement Called A Developmental Disabled Person. Through This, A Concrete Curriculum And Support Measures Will Be Developed, And The Know-How Can Be Systematically Communicated.

Geleneksel Türk Dini İnancında Tabiat Hiyerofanilerinin Fenomenolojik Tahlili¹

Prof. Dr. Münir YILDIRIM²

Prof. Dr. Asım YAPICI³

Özet

Türk dini inancı ve kültüründe tabiat hiyerofanilerine çok sık rastlanır. Bunlar aynı zamanda Yer Su ya da Yer Sub anlayışı çerçevesinde de tanımlanır. Türkler, dini tarihlerinde kadim zamanlardan itibaren tabiatla bir takım güçlerin bulunduğu inanıyor ve onları kutsuyorlardı. Türklerin sahip olduğu bu inançlar, tabiatla mevcut dağ, ağaç, taş-kaya, su gibi nesnelerin birer ruhlarının bulunduğunu tasavvur etmekteydi. Bunun yanında güneş, ay, yıldız ve gök gürültüsü, şimşek gibi şeyler de birer semavi ruh şeklinde tasvir edilmekteydi. Türklerin tabiat kültürleri etrafında kendini gösteren bu hiyerofanilerle (kutsalın ifşası) ilgili tecrübeleri ortaya inanç yumağı şeklinde kendini göstermiştir. Bu bağlamda bu hiyerofanilerin tabiaattaki izdüşümleri çeşitli nesneler şeklinde ortaya çıkmaktadır.

Anahtar Kelimeler: *Geleneksel Türk Dini, Tabiat, Hiyerofani, Kutsal.*

Amaç

Çalışmadaki amaç Geleneksel Türk Dini İnancında önemli bir yere sahip olan tabiat hiyerofanilerini (kutsalın tezahürlerini) fenomenolojik metotla incelemektir. Bu çerçevede asırlarca teşekkül etmiş olan Türk Dini inancını Dinler tarihi perspektifinde ele almak imkan dahilindedir. Dolayısıyla hedef Türk kültürüne ve bilimsel araştırmalara katkı sağlamaktır. Bu çalışmada Türk dini tarihi sürecinde tabiat nesnelerindeki kutsalların ifşası gözlemlenecektir.

Tabiat hiyerofanileri olarak isimlendirdiğimiz bu kutsalın tezahürleri Türklerin tarih içerisinde hangi dini inanışlara sahip olursa olsun benzer nitelikte kendini açığa vurmuştur. İşte bu çalışmada bu elde edilen parametreler üzerinden yorumlandırma çabasına girilecektir. Bu çalışmada Dinler Tarihinin temel metotları olan deskriptif, karşılaştırma ve fenomenolojik yöntemler uygulanacaktır. Bu araştırmanın ana konusu geleneksel Türk dini inancındaki tabiat hiyerofanilerinin fenomenolojik tahlilidir. Kuşkusuz zengin Türk dini tarihi geleneğinde sadece tabiat hiyerofanileri mevcut olmayıp bunun yanında diğer önemli kutsalın tezahürleri de görülmektedir. Ancak bu tabiat hiyerofanileri Türk insanının tarihinin her aşamasında inanç noktasında adeta et-tırnak gibi birliktelik göstermiştir. Bu yüzden tabiat hiyerofanileri Türk dini tarihinde ayırt edici bir öneme sahiptir.

Türklerin dini tarihlerinde çeşitli dönemlerde tabi oldukları dini sistemler içerisinde tabiat hiyerofanilerini özgün bir biçimde açığa çıkardıkları görülmektedir. Öyle ki saf halde dini inanışların dağ, taş, ağaç, su gibi tabiat nesnelerinde ifşa olunan görüntüler tahlil edilecektir.

Bu çalışmanın yaygın etkisi öncelikle Türk kültürüne ve Dinler Tarihi disiplinine olacaktır. Zira Türklerin sahip oldukları dini inanışların tabiat hiyerofanilerinde ifşası Türk Milletinin eşsiz zenginliğini ortaya koymaktadır. Dolayısıyla bu çalışmadaki katma değer başta Türk kültürü olmak üzere Türk akademisyasına da katkı sağlar niteliktedir.

Geleneksel Türk Dini

Geleneksel Türk Dini tabiriyle, Türklerin eski inanışlarını ve bu inançların diğer dinlere girdikten sonra da ister bağımsız isterse mensup olunan dinin bir inancıyla bütünleşik şekilde bulunsun, tarihten günümüze mevcut Türklere özgü inançlar kastedilmektedir (Eroğlu, 2017, s. 174). İşte bu noktada geleneksel Türk dini inancı olarak isimlendirilen bu inanışta belli başlı dini kavramlar ön plana çıkmaktadır. Bunlar arasında en yaygın olanları Gök Tanrı, Umay ve Yer Su inanışlarıdır.

Tanrı

Geleneksel Türk Dini inanışının merkezinde Gök Tanrı kavramı bulunmaktadır. Bundan mühlhem eski Türk inancı Gök Tanrı odaklı bir din biçiminde de sunulmuştur. Buradaki gökten maksat azamet, yücelik, ulaşılmazlık ve tazim anlamındadır. Kendisine tapınılan varlık mavi gök değil Yüce Tanrıdır. Ayrıca Gök Tanrı inancı tarihi süreçte bütün Türk boylarında görülen bir olgudur. Gök Tanrının kendine özgü vasıfları da bulunmaktadır. Bunlardan birisi, yaratıcı ve mutlak kudret sahibi olmasıdır. Her şeyi yaratan, hükmeden olduğundan Türklerde hakan iktidarını Tanrı'dan almaktadır. Hakan'ın iktidar alması Tanrının kut vermesiyle mümkündür. Bundan dolayı Türklerde hakan Tanrının kut verdiği kişidir. Bunun tabii sonucu olarak da hakanın Tanrı iradesiyle çıkmasında olduğu gibi inmesinde de Gök Tanrının iradesi bulunmaktadır. Yine evrensellik, bengü ve mengü de Gök Tanrıya ait sıfatlar arasındadır (Eroğlu, 2017, s. 175-178).

¹ Bu çalışma Ç.Ü. BAP koordinasyon biriminin SBA-2017-8337 proje koduyla desteklenmiştir.

² Çukurova Üniversitesi İlahiyat Fakültesi Dinler Tarihi Anabilim Dalı Öğretim Üyesi

³ Çukurova Üniversitesi İlahiyat Fakültesi Din Psikolojisi Anabilim Dalı Öğretim Üyesi

Türkler en eski tarihlerinden itibaren inançlarının merkezine hep Tanrıyı yerleştirmiştir. Hatta tanrı tabiri Türk dini tarihinde en eski kavram olarak da bilinmektedir. Her ne kadar Türklerde animist, natürist, totemist inanışlar mevcut olsa da her şeyi denetleyen, yaratıcı, kut verici bir Tanrının varlığı kabul edilmiştir. Türk topluluklarındaki Tanrı inancı diğer inançlar değişim gösterse de temel arketip olarak sürekli devam etmiştir. Türkler inandıkları bu tanrıyı ait oldukları coğrafi ve kökene göre farklı şekillerde isimlendirmişlerdir. Nitekim daha çok Gök tanrı biçiminde olsa da Tangara, Tengere, Tingir, Tura, Tengri vb. adlarla çağırılmışlardır (Tümer-Küçük, 2009, s. 115).

Yer Su (Yer Sub)

Geleneksel Türk dini inancında Tanrı anlayışıyla birlikte en sık rastlanan dini olgulardan biri de hiç şüphesiz Yer Su kültürüdür. Bu kült kendisini daha çok tabiat inanışları olarak gösterir. Nitekim Orhun Yazıtlarında “Yer Sub” şeklinde geçmekte ve Türklerin tabiatındaki varlıklarda gördüğü ruhları ifade etmektedir. Tabiidir ki Türkler hayatını idame ettiği yerlerdeki tüm tabiat nesnelerinde çeşitli ruhların yaşadığına inanmaktaydı. Bu ruhların çeşitli biçimlerde tabiatındaki nesnelerde tezahür etmesi beraberinde hiyerofanileri yani kutsalın açığa çıkmasını da getirmekteydi. İşte Türkler etraflarındaki dağ, taş, ağaç, orman, su, ırmak, ateş ve bir takım gök cisimlerindeki nesnelere kutsallık atfederek orada bir hiyerofani ortaya çıkarmış ve bunları da çeşitli ritüellerle dini hayatlarında gerçekleştirmişlerdir.

Kutsalın açığa çıkması ya da kendisini çeşitli tabiat varlıklarında ifşa etmesi hiyerofani tabiri ile ifade edilir (Eliade, 1976, s. 26). Hiyerofaniler tabiatı şahit olunan her türlü nesnelerde açığa çıkabilmektedir. Esasında nu nesnelerde normal olmayan, gizemli, sıra dışı, kudretli ve alışılmamış bir güç ortaya çıkmaktadır. Tabiatındaki bu tezahürlere saygı duyulmakta ve aynı zamanda onlardan korkulmaktadır. Bu bağlamda Geleneksel Türk dini hayatında da bu tür kutsallıklara ve onların açığa çıkması olan hiyerofanilere çok sık rastlanmaktadır. Zira daha önce de ifade edildiği gibi Yer Su kültürü çevresinde oluşan inanışlar Türklerdeki tabiat hiyerofanilerini gözler önüne sermektedir (Yıldırım, 2017, s. 240).

Geleneksel Türk dini inancında ortaya çıkan tabiat hiyerofanilerini dağ, taş, su, ırmak, ateş, gök ve ağaç gibi nesnelerde görmek mümkündür. Bunların her birinde Türklerin dini hayatındaki tabiat hiyerofanilerini şahit olunabilmektedir. Burada dağ ve ağaç hiyerofanilerini örnek vererek dini anlamlılığı ve ona yüklenen kutsallık açıklanabilir. Tabiatındaki varlığı ile bulundukları ortama ihtişam ve güç katan çevre unsurlarının başında hiç şüphesiz dağlar gelmektedir. Arkaik dönemlerden itibaren dağlar dinlerde tanrıların makamı ya da tanrıya en yakın mekândır. Bu algılayışa paralel bazı dağlara azamet ve heybetinden dolayı tanrı adları verilir. Dağlar, kozmik anlamda evrenin ya da dünyanın merkezi, vahiy ve vizyona ulaşma yeri ve tanrısal bir mekândır. Kozmik dağlar, tapınakların inşasında da model alınır ve inşa edilen tapınak kozmik dağı simgeler (Yıldırım, 2016, s. 134-136). Ağaçlara kutsallık atfedilmesiyle değişik dini ve kültürel algılarda evren ağacı, bilgi ağacı, göksel ağaç, hayat ağacı ve kozmik ağaç gibi tabirler kullanılır. Ağaçların özellikle belirli ağaçların kutsallığı inancı, insanları bir ağaç ruhunun bulunduğu kanaatine sevk eder. Bu çerçevede ağaçların, ağaç ruhları veya ağaç perileri ile ruh taşıdığına inanılır. Ağacın farklı din ve kültürlerdeki kutsallığı göksel ağaç, insanlık ağacı, hayat ağacı gibi isimler almasına da neden olur. Türkler, başta dini törenler olmak üzere pek çok gerekli malzemeyi kayın ağacından karşılar. Kamların yapmış olduğu dini törenlerde davulun kasnağı, sopası, kurban ayınındaki direkler ve çadırlarda ana direği kutsal kayın ağacından yapılır. Ağaç, hayatın ötesinde bir ruh, güç, kudret ve aşırı saygı gösterilen bir kutsiyettir (Tanyu, 1988, s. 456).

Sonuç

Geleneksel Türk Dini, Türklerin en eski dönemlerinden itibaren tarihi süreçte kendilerine has olan dini inanışlarını ifade etmektedir. Bu bağlamda Türler başta Tanrı olmak üzere Yer Su kültürü olarak bilinen tabiat inanışlarında kendilerine ait bir dini inanç sistemi geliştirmişlerdir. Bu dini sistemin en yüksekinde Tanrı, çoğu zaman Gök Tanrı olmak üzere diğer tanrı isimleri yer almıştır. Bunun yanında daha çok hayat tarzları ve yaşanan ortam çevresinde ortaya çıkan tabiat inanışlarında dini hayatlarını sürdürmüşlerdir. Bu dini ortamda tabiatındaki nesnelere kutsallık atfederek onlardaki hiyerofaniler karşısında bir takım anlamlı ritüeller meydana çıkmıştır. Tüm bunlardan anlaşılan Türklerin tarihleri boyunca kendilerine özgü bir dini sistemi inşa ettiği gerçeğidir.

Abstract

In this study, the effects of the use of video games on English vocabulary learning were investigated by utilizing the video game “Trace Effects”. The study was implemented through the participation of 60 students (31 female, 29 male) who were enrolled in a private high school in Diyarbakır/Turkey, in 2015-2016 academic year. In this research, quasi-experimental research design was used for the quantitative part of the study and experimental and control groups were formed by using cluster convenience sampling method. The test which was used as pre-test and post-test in this study was prepared by using the vocabularies which were selected from the first four units of the video game “Trace Effects”. Data obtained from the test were analyzed by using parametric and non-parametric tests in SPSS statistical program. In addition, the qualitative data of the research were collected through semi-structured interviews. The results of the research showed that the video game application had a significant effect in favor of female students in terms of academic achievement on English vocabulary learning when the gender variation is taken into consideration.

Introduction

The use of technology in teaching English in classrooms has become widespread in recent years. The concept of digital game-based learning using video games in foreign language teaching has also become a topic of interest to educators and researchers all over the world. The use of video games and other digital technologies in language environments by associating with language learning has created the discipline of “educational technology” by combining education and technology disciplines. “The study of every level of linguistic system has changed because of the technology” (Chapelle, 2003, p.20). Vocabulary learning has also changed by the help of the technology use in educational context. Since the first years of CALL (1970s-1980s), vocabulary learning has always been “a favorite subject in computer assisted language learning (CALL) programs” (Ma, 2009, p.173). With the development of technology and its use in the classes, vocabulary learning with technology has been popular with CALL (computer assisted language learning) and CAVL (computer assisted vocabulary learning), Blended Learning and also digital-game based learning.

The use of computer technology in foreign language learning has many advantages for both teachers and students. The main advantages are increasing their academic achievement (Panourgia, 2000; Lee, 2000), strengthening language acquisition (Galavis, 1998), increasing self-confidence of learners (Lee, 2000), lowering anxiety levels (Chapelle, 2001; Levy, 1997; Siskin, 1999) and enabling student-centered, collaborative learning (Lee, 2000). But motivation is at the forefront of the most expressed advantages of the technology use in educational environment. Lee (2000) indicates that students can become motivated to the classes through entertainment and games. When Warschauer and Healey (1998, p.60) express the advantages of computers for teaching foreign languages, they use the term “fun factor”; this “fun factor” is the main source of student motivation.

One of the most fundamental sources of “the fun factor” is the games. With the developing technology, the use of games and teaching in different educational environments has also led to the emergence of digital game based learning model. Educational games are “software that enables students to learn lessons by using the game format or develop their problem solving skills” (Demirel, Seferoğlu and Yağcı, 2003, p.141). The change of the game sector and the technology and the games also provided new concepts related to games. Some of them are used in place of each other, others have different meanings on their own, and video games, digital games and computer games are seen to be used interchangeably in the literature.

Because of the theories of education and the familiarity of the students with technology, nowadays technology and language teaching are increasingly focusing on the fact that learning can also take place in virtual reality video games. Particularly the games that have been specifically developed for language learning purposes have attracted more attention and offer greater success (Bikowski, 2012, p.4).

The vocabulary has a great proposition in terms of language learners as it forms the basis of language (Coady & Huckin, 1997; Nation, 2001, Read, 2000). Specializing in vocabulary learning means specialization in a foreign language and it is the most important determinant of this specialization (Nation, 2001; Read, 2000). Linguists tend to describe vocabulary knowledge either according to the “breadth/dept” dimension or the “reception/production dimension. Breadth and depth essentially concern declarative knowledge whereas reception and production are fundamentally concerned with procedural knowledge. The learner is consciously increasing the number of words and the features needed in order eventually to be able to use them automatically both receptively and productively (Ma, 2009, p.50). Vocabulary learning is one of the most important aspects of second language learning; however “it is the learning for L2 lexical items (individual words or multi-word items) that requires so much effort, considerably more, in fact, than grammar” (Ma, 2009, p.173).

Gender differences and English language learning has also been a research topic in literature. Many studies show that female learners use more language learning strategies than male learners. However; it is not clear “whether females and males perform differently in terms of language comprehension”. In some studies it is seen that there is no significant differences between genders while in some studies there is (Bacon, 1992; Brantmeier, 2003 cited in Saidi & Al-Mahrooqi, 2012).

The aim of this study is to investigate possible effects of video games in terms of gender variable on English vocabulary learning by the application of "Trace Effects" video game which is specially designed for English learning. In addition, it was aimed to investigate the views of the students according to the gender about the use of video games in EFL classes.

To be able to reach these aims the following research questions are answered in this study:

- 1) Is there a meaningful difference between vocabulary test scores of female and male learners who learn English vocabulary with
 - a. video games?
 - b. traditional methods?
- 2) From an emic perspective, how do learners of EFL view the use of video games as a language learning tool?

The Study

In this study, gender-specific effects of the use of video games on English vocabulary learning were investigated by the help of the video game “Trace Effects”. In addition, it was aimed to investigate the views of the students according to the gender about the use of video games in EFL classes. In order to be able to achieve these aims a mixed research method was used as the research method of the study. Mixed methods research is a method that focuses on “collecting, analyzing an mixing both quantitative and qualitative data in a single study or serious of studies” (Creswell & Plano Clark, 2011, p.5).

The quantitative study group of this study consist of 60 (31 female, 29 male) students enrolled in the 9th grade in 2015-2016 educational year of a private school in Diyarbakır. The students from two different classes were divided into experimental and control groups by cluster convenience sampling. In Table 1. participants of the study can be seen in detail.

Table 1.
The participants of the study

	Experimental Group		Control Group	
Gender	(f)	(%)	(f)	(%)
Female	15	50	16	53.3
Male	15	50	14	47.7
Total	30	100	30	100

As the tool game of the study “Trace Effects” video game was used. This game is a video game developed specifically for English learning for 12-16 year-old students by the US Department of State. It was used in this study as an educational tool. This game was chosen in this study as the educational tool because it was free to use and there was a few studies in the literature that used this game in their research studies in other countries. The doctoral dissertation of Bado (2014) with the title of “Video Games and English as a Foreign Language Education in Burkina Faso” is one of the first detailed study using Trace Effects video game as an educational research tool.

This study focused on the pedagogical integration of Trace Effects into the EFL classroom and perceptions of teachers and students about Trace Effects video game in EFL classes. The perceptions of the teachers and students in this study showed that the design of the Trace Effects video game is motivating and it can improve EFL listening, speaking, vocabulary and pragmatic skills.

In this research study the first 4 units of the game was played in experimental group with individual computers/laptops of the school. For the experimental group, the video game was used and video-game based activities were applied. For the control group, vocabulary teaching was done with traditional techniques. The words of the first four units were given to the students with their Turkish equivalents and then the vocabularies were practiced with memorization methods and various exercises. The application, took 2 hours a week, lasted a total of 8 weeks. As a pre-test and post-test in the research, a test which was prepared from the words in the video game was applied. The data was analyzed by SPSS statistical program and interpreted according to the gender.

As can be seen in Table 2., in the quantitative part of the study, pre-post test quasi-experimental design was used and the quantitative data was analyzed with parametric and non-parametric tests with SPSS statistical programme. In the qualitative part of the study semi-structured interview was used and qualitative data was analyzed by using content analysis technique.

Table 2.
The Methodology of the Study

	Quantitative	Qualitative
Instruments	Quasi Experimental Design Pre-Post Test (61 words 25 questions)	Semi-Structured Interview (6 principal questions) Female =6, Male = 9 (n=15)
Data Analysis	t-test (parametric) Mann Whitney U (non-parametrix)	Content Analysis Technique

In the preparation of the pre-post test, 61 vocabularies were chosen from the first 4 units of the game. A vocabulary achievement test with 25 questions was prepared and it was piloted before the main study. Item difficulty indexes (p) were 0.29-0.88, item discrimination indexes were all >0.20, KR-20 internal consistency was calculated as 0.87 and mean difficulty was 0.51. According to these results, as can also be seen in Table 3 and Table 4, it can be indicated that the test is reliable, valid and serves the purpose.

Table 3.
Descriptive Statistics (According to Gender)

Gender	Test	Kolmogorov-Smirnov			Shapiro-Wilk		
		Statistic	Df	Sig.	Statistic	Df	Sig.
Female	Pre-Test	,123	31	,200*	,978	31	,748
Male	Pre-Test	,116	29	,200*	,941	29	,107
Female	Post-Test	,133	31	,175	,961	31	,312
Male	Post-Test	,274	29	,000	,751	29	,000

Table 4.
Normality Distribution (According to Gender)

		Mean	Median	Std. D.	Range	Skewness St. Error	Kurtosis St. Error
Female	Pre-test	6.2258	6	2.12	9	0.219 0.421	-0.219 0.821
	Post-test	20.7419	21	2.04	10	-0.522 0.421	1.101 0.821
Male	Pre-test	5.8966	6	2.07	7	0.251 0.434	0.679 0.845
	Post-test	19.8966	20	2.71	14	-2.511 0.434	8.618 0.845

The Findings

The findings of the study are illustrated under the related research questions. Pre-test scores are normally distributed and to analyse them t-test was used. Post-test scores are not normally distributed ($p=0,00<0,05$). Therefore, Mann Whitney U was used as a non-parametric test to analyse the data.

The first research question is:

Is there a meaningful difference between vocabulary test scores of female and male learners who learn English vocabulary with video games?

To answer this question we analyzed whether there is a meaningful difference between pre-test and post-test achievement scores of the experimental group students who learn English vocabulary with the video game or not. The mean pre-test achievement scores ($X = 6.26$) of the female students in the experimental group were higher than the pre-test achievement scores of the male students in the experimental group ($X = 5.60$), but there was no significant difference between them ($p = .53$; $p > .05$). Accordingly, it can be stated that the students in the experimental group formed a homogeneous group and that the readiness levels of the groups of students (female and male) were similar before the application phase.

Table 5.
Experimental Group Pre-test (t-test)

Gender	N	X	SS	Sd	t	P
Female	15	6.26	1.83	28	.97	.53
Male	15	5.60	1.91	-	-	-

$P > .05$

When the results of the Mann-Whitney U test of the post-test scores were taken into account according to the gender, it was concluded that female students in the experimental group had a higher rank average of post-test achievement scores than male students, and this difference was statistically significant ($U = 63$; $P < .05$). According to this, when the gender variation of video game application in this study is taken into consideration, it has been seen that the video game application has a significant effect in favor of female students in English vocabulary learning.

Table 6.
Experimental Group Post-test (Mann-Whitney U)

Gender	N	Sum of	Mean Rank	U	Z	P
Female	15	282	18.80	63	-2.185	.029
Male	15	183	12.20			

As the second research question the following question was tried to be answered:

Is there a meaningful difference between female and male learners who learn English vocabulary with traditional methods? To answer this question first of all it was tried to be answered whether there is a meaningful difference between the pre-test and post-test achievement scores of the control group students who learn English vocabulary with the traditional method or not. The pre-test scores of the control group were normally distributed. Independent groups t-test was used to analyze the pre-test scores. However, post-test scores were not normally distributed. Mann-Whitney U test was used to analyze the post-test scores of the control group.

Table 7.
Control Group Pre-test (t-test)

Gender	N	X	SS	Sd	T	P
Female	16	6.18	2.42	28	-.031	.76
Male	14	6.21	2.25			

$P > .05$

As can be seen in Table 7., there is no significant difference between the groups ($p = .76$; $p > .05$). Female and male students of the control group were homogenous at the beginning of the study. When the post-test scores of

the control group students were taken into consideration that can also be seen in Table 8., there was no statistically significant difference between the achievement scores of male and female students ($U = 96.5$; $P > 0.05$). Taking into consideration the average of the rankings, it can be said that the female students have a higher rank average in the traditional method than the male students (16.47) but this difference is not enough for a statistically significant difference.

Table 8.
Control Group Post-test (Mann Whitney U)

Gender	N	Sum of	Mean Rank	U	Z	P
Female	16	263.50	16.47	96.5	-.669	.504
Male	14	201.50	14.39			

With the following research question quantitative data was supported with qualitative data:

From an emic perspective, how do learners of EFL view the use of video games as a language learning tool?

The views of the experimental group participants were investigated with a semi-structured interview. The answers of the participants to the questions of semi-structures interviews were analyzed with content analysis technique by coding the common points.

First of all it was asked to the students whether they play video games outside the school or not. 10 learners (2 females, 8 males) answered this question as “yes” and 5 of the learners (4 females and 1 male) said “no”.

Table 9.
Do you play video games outside the school?

	Frequency (f)	Learners
Yes	10	(2 Females, 8 Males)
No	5	(4 females, 1 male)

Following this question students were asked “If yes, what kind of video games do you play?” It can be seen in Table 10. that female learners prefer playing games outside school less than males. Male learners prefer playing more action games outside the school.

Table 10.
What kind of video games do you play?

Female (f)	Male (f)
Trivia Crack (1)	World of Warcraft (5)
Candy Crush Saga (1)	Street Fighter (4)
	GTA (3)
	Call of Duty (2)
	Trivia Crack (1) ; Knight Online (1); Marvel
	Contest of Champions (1); Assassin’s Creed (1);
	Far Cry (1); Shadow Fight (1);
	Batman: Arkham (1)

Students were also asked “What are the most important advantages of using video games in your English lessons?” They replied that video games “increase motivation (f=4), make learning easier (f=4), enable audio-visual learning (f=3), provide a fun learning environment (f=3), improve english knowledge (f=2), improve self-confidence in learning (f=1) and understandable (f=1). It is clear that both female and male learners think that there are advantages of using video games in EFL classes.

Table 11.
What are the most important advantages of using video games in your English lessons?

Codes Used	Frequency	Learner
Increase Motivation	4	1 Female, 3 Males
Makes Learning Easier	4	3 Females, 1 Male
Enables audio-visual learning	3	1 Female, 2 Males
Provides a fun learning environment	3	3 Males
Improve English Knowledge	2	2 Males
Improve self-confidence in learning	1	1 Female
Understandable	1	1 Female

Some of the quotations that learners uttered according to the advantages of using video games are as follows:

"We can learn more easily. Lessons are fun and time passes fast "(S8, female)

"Since games can also be played individually, it helps students learn autonomously and each student can learn according to their own pace" (S12, male)

"There is no loss of motivation while learning a language with a video game. Without going to another country, you can discover word patterns by replacing yourself with the character in the game. "(S3, male)

As another interview question students were asked "Are there any disadvantages / obstacles of the use of video games in English lessons?" The defined codes from the answers of the students are lack of technological infrastructure (f=7), time problem (f=3), may cause health problems (f=1) and may cause habits (f=1). Both female and male learners indicated disadvantage or barriers of the use of video games in English lessons.

Table 12.
Are there any disadvantages / obstacles of the use of video games in English lessons?

Codes Used	Frequency	Learner
Lack of Technological Infrastructure (hardware, software problems)	7	1 Female, 6 Males
Time Problem	3	3 Males
May cause health problems	1	1 Female
May cause habit	1	1 Male

Some of the quotations related to the disadvantages/obstacles of the use of video games in English lessons are as follows:

«It may cause health problems in our eyes. If I look at the screen a lot, my eyes are aching» (S15, female).

"Although there is no disadvantage, I can say that there is technological insufficiency as an obstacle. The computers sometimes do not work well to play the game"(S11, male).

Learners were also asked "Is it effective to learn English with video games?" and if yes, "how is learning with video games effective? It is obvious in Table 13 that all of the interview participants answered this question as "yes". Their answers to the question "how is learning with video games effective? were coded as "increase motivation (f=8), enable autonomous learning (f=6), improve vocabulary knowledge (f=4), facilitate using the language in a practical way (f=4), improve learning and pronunciation skills (f=3), enable audio visual learning (f=2), enable permanent learning (f=2), increase curiosity (f=1), and enable learning with fun (f=1). Both female and male learners demonstrated similar views about the effectiveness of learning English with video games.

Table 13.***Is it effective learning English with video games?***

	Frequency	Learners
Yes	15	6 Females, 9 Males
No	-	-

Table 14.***If yes, how is it effective learning with video games?***

Codes Used	Frequency	Learners
Increase motivation	8	1 Female, 7 Males
Enables autonomous learning	6	4 Females, 2 Males
Improves vocabulary knowledge	4	2 Females, 2 Males
Make easy using the language in a practical way	4	2 Females, 2 Males
Improves learning and pronunciation skills	3	1 Females, 2 Males
Enables audio visual learning	2	1 Female, 1 Male
Enables permanent learning	2	2 Males
Increase Curiosity	1	1 Male
Enables learning with fun	1	1 Female

Some of the quotations participants' answers about the effectiveness of learning with video games are as follows:

"When we used this game in the class, I participated in a more motivational way. Because learning English with the game made me have more fun "(S10, female).

"This game has developed my pronunciation. When I finished playing the game, the speeches and pronunciation of the characters were still in my mind "(S5, female).

"I think it's very effective. You can learn on your own easily. I also think that learning is more permanent"(S6, male)

"Improving my vocabulary knowledge is enough. It is definitely a positive effect " (S9, male).

Students were also asked some questions about the video game application and vocabulary knowledge. As an interview question students were asked "Do you think that your English vocabulary knowledge increased with "Trace Effects" video game application? If yes, how your English vocabulary knowledge increased with "Trace Effects" video game application. According to the answers of the participants except for 1 (S12), all of the other participants of the interview (f=14) said that their English vocabulary knowledge increased with "Trace Effects" video game application. Common codes that were defined are as follows: increasing permanent learning (f=9), recalling vocabulary better (f=7), creating easy and practical learning environment (f=4), enabling learning more vocabularies (f=3) and fostering continuous learning (f=1).

Table 15.***How your English vocabulary knowledge increased with "Trace Effects" video game application?***

Codes Used	Frequency	Learners
Increased permanent learning	9	3 Females, 6 Males
Made easier recalling vocabulary	7	7 Males
Created easy and practical learning environment	4	4 Females
Enabled learning more vocabularies	3	2 Females, 1 Male
Continuity made easier learning	1	1 Male

Some quotations related to these interview questions are as follows:

"By playing the game, you get lost after a while. At that moment the vocabularies are starting to be familiar. You realize that English is not difficult to understand and it is not difficult to speak. "(S1, female)

"A game with simple words. I had my vocabulary knowledge. It did not affect me in this regard, but for the beginners I think they are very appropriate words. "(S12, male)

"A very useful game, makes learning easy and my vocabulary knowledge has improved a lot. " (S2, female)
"English is not difficult to understand and it is not difficult to speak. " (S1, female)
"It made it easier for us to learn the same words constantly by playing the same game and seeing and hearing similar words and phrases from the same character." (S6, male)
"I learned more vocabulary with this game and I remember almost everything." (S9, male)

Conclusion

In this study, the effects of the use of video games on English vocabulary learning were investigated based on gender variable. The results of this study show that both control and experimental groups and both female and male students were successful. However, when the gender variation of video game application in this study is taken into consideration, it has been seen that the video game application has a significant effect in favor of female students in English vocabulary learning in experimental group. In addition it was also observed that there is no significant difference between female and male learners of the control group who learned English vocabulary with traditional methods.

In this study the views of the students about the use of video games as a language learning tool was also investigated. With semi-structured interview questions the views of the volunteer participants of experimental group were investigated. According to the results of semi-structured interviews, female learners do not seem to like playing video games outside school while male learners prefer playing video games outside school more and they also like adventurous action games.

The advantages of the video game use in English classes that were uttered by interview participants are "enabling autonomous learning, increasing vocabulary knowledge, increasing motivation and making learning easy". The disadvantages and obstacles that the interview participants indicated are "lack of technological infrastructure, time problem, maybe causing health problems and maybe causing bad habits". The effects of "Trace Effects" video game on vocabulary learning were also asked. They indicated that this video game application increased permanent learning, made recalling vocabulary easier, created easy and practical learning environment, enabled learning more vocabularies, and continuity in the game made learning easier for students.

Both female and male learners perceive that video game use in EFL classes enable autonomous learning, increase vocabulary knowledge, increase motivation, make learning easier, enable audio-visual learning, provide a fun learning environment, improve English Knowledge, and improve self-confidence in learning. These perceptions cannot be generalized because they are restricted only to the research group of this study. Other qualitative and quantitative research is needed in order to substantiate these findings.

Özet

Bu çalışmanın amacı, güzel sanatlar eğitimi bölümü öğrencilerinin öğretmenlik mesleğine yönelik tutumlarının farklı değişkenler bağlamında incelenmesidir. Bu çalışma, bir kamu üniversitesinin Eğitim Fakültesi Güzel Sanatlar Eğitimi Bölümü'nün Resim-İş Eğitimi Ana Bilim Dalı ve Müzik Eğitimi Ana Bilim Dalı'nda 2017-2018 öğretim yılının bahar yarıyılında öğrenim görmekte olan öğrencilerin katılımıyla gerçekleştirilmiştir. Araştırmada veri toplama aracı olarak Üstüner (2006) tarafından geliştirilen "Öğretmenlik Mesleğine Yönelik Tutum Ölçeği" kullanılmıştır. Ölçek toplamda 180 öğrenciye uygulanmıştır. Elde edilen veriler sınıf düzeyi, cinsiyet, mezun olunan lise türü ve öğretmenlik uygulaması dersi değişkenleri bağlamında analiz edilmektedir. Çalışmanın analiz süreci devam etmektedir. Bu nedenle araştırmanın bulgu ve sonuçlarına sözlü sunumda yer verilecektir.

The aim of this study is to examine the attitudes of the students of fine arts education department on teaching profession in the context of different variables. The study group of this research contains the students who receive education at one of the public universities' Faculty of Education, Department of Fine Arts, Art Education Programme and Music Education Programme on spring semester of the 2017-2018 academic year. In this research "Attitude Scale of Teaching Profession" which was developed by Üstüner (2006) was used as the data collection tool. The scale was applied on 180 students in total. The collected data is being analyzed in the context of the grade level, gender, type of graduated high school, teaching practice lesson variables. The analyze process of the study is still proceeding. Therefore, the findings and the results of the research will be included in the oral presentation.

Health Communication Of Modern Human

Abstract

After meeting their basic needs such as food, shelter and security, human beings have shifted to meet the needs for healthier and longer lives in modern life. Especially the development of technology is the main cause that increases this desire. Because the development of technology forces the tools used in communication and health services to develop and diversify while forcing individuals to be more conscious about health. Modern people who are forced by communication tools to be healthy and to live a healthy life apply to these communication tools again as primary reference resources to raise awareness about health and to get information about the provision of health services. How modern people use these communication tools to become conscious about health and whether this use varies according to age, gender, occupation, education, income level and marital status reveals a situation that needs to be investigated. For this purpose, a field survey was conducted on 428 subjects using simple random sampling method in Konya city center with face-to-face survey technique. Results of the research suggest that health news is mostly followed by television, a second or third doctor is consulted in the treatment of diseases, health-related views of famous experts on television(Canan Karatay, İbrahim Saraçoğlu, Ahmet Maranki etc.) are modestly respected and all these can change depending on demographic characteristics,

Keywords: Health, Communication, Health Communication, Communication Tools, Modern Human

1. Introduction

In the modern societies of today, human beings need exchange information with each other, learn and share the information they acquire since they have adopted communal life. This need necessitates the communication between them. Briefly, communication is the processes of producing, narrating and interpreting information or exchange of information between two systems (Dökmen 1996: 19-20) and the efforts to create a common ground (Sever 1998: 51). As stated by Watzlawicks et al., “non-communication is almost impossible” in the organisms of modern societies of today (cited by Anık 2009:3). Namely, people definitely encounter the exchange of information, the limitless number of sources of information are transferred by the physical or cultural surrounding environment (Anık 2009:3) through the instruments which broadcast face to face massively. This occasion is mostly conducted by the mass communication instruments.

Mass communication which is formed when the expertized institutions which employ technological devices the symbol-based contents to massive and large populations (Oğuz 2012: 121) is defined as the process of transmitting information, thoughts and attitudes to a large community (Yumlu 1994: 16). The instruments of mass communication are as follows; newspapers, journals, radio, television (Işık 2013: 9), video, tapes, records, cinema, books, theater, posters, leaflets, telephone, telegraph, graffiti (Yumlu 1994: 22) internet and social media.

The health sector which performs population-oriented production and determines the individuals at various socio-economic levels (Gordon and Edwards 1997: 23) is one of the sectors which needs mass communication and face to face communication in order to access to more people and gain achievement (Uludağ 2010: 68). Infact, scientific researched related to the issue indicate that lack of communication between the patients and doctors consists 70% of the inadvertent cases (Kurtz, Silverman and Draper 1998: 7). “The increasing interst of the individuals on the issue of health” and the expansion of the tendency towards “healthy life” can be regarded as one of the factors which triggers this occasion (Okay 2007: 15).

Communication tools and environments, which are more or less effective in all decisions that modern people have taken in their everyday lives, are object of curiosity to be investigated on how much they are used for health issues. In order to reach the research results in this subject, a face to face questionnaire survey technique was applied to 428 people living in the central districts of Konya province. This research, limited to those living in Konya city center, is important because it is one of the rare studies in the area.

2. Methods

2.1. The Implementation of the Research and Sampling

A field survey was conducted on people living in the central districts of Konya province (Meram, Karatay, Selçuklu) so as to reveal the communication preferences of today's people on health. Simple random sampling method was used in the research. For this purpose, a questionnaire was conducted on people aged 18 and older living in the center of Konya, who agreed to participate in the survey. The data that were essential for field research

were obtained by face-to-face survey technique with 442 people. As a result of the preliminary examinations of these surveys, 428 questionnaires were analyzed.

2.2. Data Collecting Instruments

In order to reveal the communication preferences of the people on the health issue, a questionnaire form consisting of 2 sections was prepared to be applied on the residents of Konya province center. In this study, the reliability of the questionnaire (Cronbach's α) was calculated to be 0.92. In the first part of the survey, there are closed-end questions to clarify what means of communication people use, how they behave to make a decision for the treatment of the diseases and how much they trust famous health care professionals on TV.

In the second part of the survey, there are questions about the socio-demographic characteristics of participants such as age, level of education, family's monthly average income, occupation, gender and marital status.

Before the questionnaire was implemented in the field, three specialists examined it for face validity (logical validity) and it was subjected to the necessary regulations in line with their recommendations. It was also subjected to pre-test on 35 people in order to be able to observe the clarity of the questionnaire and other problems that may be encountered in the field, and it was made ready to be applied after the last checks.

2.3. The Analysis of Data and the Implemented Tests

The field survey was conducted through face-to-face interviews with people living in Konya city center between 19-28 February and 2018. The obtained data were processed in electronic environment using SPSS 15.0 statistical program.

In the analysis of the data; frequency analysis was used to show percentages of the answers of the participants; Chi-square analysis was used to determine the significant relationship related to socio-demographic variables such as age, gender, education level, average monthly income, occupation, marital status. In the Chi-square test, those with a level of significance lower than $p < 0.05$ were assessed.

Basic questions of the study are:

Question 1: Where do you get the news about health most?

Question 2: When deciding on the treatment of the disease, which source do you trust most?

Question 3: How much do you trust famous healthcare people on TV?

3. Findings And Interpretations

This study, which aims to determine what means today's people use and trust most to get information about health, contains the results obtained from the survey data conducted between 19-28 February 2018 on people living in Konya city center. Since it is intended to come to a conclusion on the interpretation of the data, the characteristics of the participants and their answers to the questionnaire were assessed.

3.1. Demographic Characteristics of the Participants

The demographic characteristics of the 428 participants who agreed to participate in the survey are given below. The survey was conducted between 19 – 28 February 2018 using the simple random sampling method and face to face questionnaire technique in Konya city center. The first of these demographic characteristics is the age range of the participants.

27.8% of participants were in the age range of 18-25, 20.3% were in the age range of 26-35, 23.1% in the age range of 36-45, 16.4% in the age range of 46-55, 9.1% in the age range of 56-65 and 3.3% were people over 66 years old (See. Table 1). The data show that age distribution in the study is balanced and provides data for analysis.

Table 1: Age range of the participants

Age	Frequency	Percent	Valid Percent
Between 18-25	119	27,8	27,8
Between 26-35	87	20,3	20,3
Between 36-45	99	23,1	23,1
Between 46-55	70	16,4	16,4
Between 56-65	39	9,1	9,1
66 and older	14	3,3	3,3
Total	428	100,0	100,0

When we look at the educational levels of the participants, it is seen that 19.6% of them had primary school education, 14.0% of them had secondary education, 41.4% had high school education and 25.0% had university education (See Table 2). According to this result, it can be said that the participants have the capacity to represent the society in terms of education level.

Table 2: Educational level of the participants

Education Level	Frequency	Percent	Valid Percent
Primary school	84	19,6	19,6
Secondary school	60	14,0	14,0
High school	177	41,4	41,4
University	107	25,0	25,0
Total	428	100,0	100,0

When the average monthly income of the participants' families is considered (See Table 3); it is seen that maximum 41.1% of population has income between 1501 TL – 3000 TL; following that, 24.1% has income between 3001 TL - 4500 TL, 19.4% has less than 1500 TL, 7.7% has between 4501 TL – 6000 TL, 4.0% has income of 7501 and more, and 3.7% has income between 6001 TL - 7500 TL. According to this result, most of the families in the society (60.5%) have average income of 3000 TL or less.

Table 3: Average monthly income of participants' families

Average monthly income of families	Frequency	Percent	Valid Percent
Less than1500 TL	83	19,4	19,4
Between1501-3000 TL	176	41,1	41,1
Between 3001-4500 TL	103	24,1	24,1
Between4501-6000 TL	33	7,7	7,7
Between6001-7500 TL	16	3,7	3,7
7501 TL and more	17	4,0	4,0
Total	428	100,0	100,0

Looking at the occupational distributions of the participants (Table 4), it is seen that maximum 19.9% of them are students, 18.9% of them are housewives, 16.8% are workers, 15.2% are civil servants, 10.3% are self-employed, 8.2% are tradesmen, 6.5% are pensioners, 1.6% are businessman, 1.2% are unemployed. The farmers have the smallest rate by 0.7%. 0.7% of them did not give an answer to this question.

Table 4: Occupations of the participants

Occupation	Frequency	Percent	Valid Percent
No answer	3	,7	,7
Worker	72	16,8	16,8
Civil servants	65	15,2	15,2
Self-employed	44	10,3	10,3
Tradesmen	35	8,2	8,2
Businessman	7	1,6	1,6
Pensioner	28	6,5	6,5
Housewife	81	18,9	18,9
Student	85	19,9	19,9
Unemployed	5	1,2	1,2
Farmer	3	,7	,7
Total	428	100,0	100,0

When looking at the gender distribution of the participants (See Table 5), it is seen that 48.1% of them are female and 51.9% are male. This result suggests that the research was done in a balanced manner in terms of gender.

Table 5: gender distribution of the participants

Gender	Frequency	Percent	Valid Percent
Female	206	48,1	48,1
Male	222	51,9	51,9
Total	428	100,0	100,0

As for marital status of the participants (See Table 6), we see that 59.1% of them are married, 36.4% are single and 4.4% are widow.

Table 6: marital status of the participants

Marital status	Frequency	Percent	Valid Percent
Married	253	59,1	59,1
Single	156	36,4	36,4
Widow / widower	19	4,4	4,4
Total	428	100,0	100,0

Means Of Communication Followed For Health Issues

After the developments in the field of communication, communication tools and methods have diversified today. In this diversity, what communication tools are followed for health news reveals a situation that needs to be investigated and known. For this purpose, when the participants were asked "Where do you get health news from?", the respondents gave the answer of "Television" with the highest rate of 42.5%; and following that, they gave the answer of internet at the rate of 29.2%, social networking at the rate of 14.3%, inner circle at the rate of 11.0%, newspaper at the rate of 1.4%, magazine at the rate of 0.5% and radio at the rate of 0.5%. 0.7% of them did not give an answer to this question. (See Table 7). This situation shows that health news is mostly followed by Television, Internet and Social Media.

Table 7: Means of communication followed for health news

Where do you get the news about health issues most?	Frequency	Percent	Valid Percent
No answer	3	,7	,7
Internet	125	29,2	29,2
Social networking	61	14,3	14,3
Television	182	42,5	42,5
Radio	2	,5	,5
Newspaper	6	1,4	1,4
Magazine	2	,5	,5
Inner circle	47	11,0	11,0
Total	428	100,0	100,0

Where health news is mostly received often includes significant differences according to age factor ($X^2=123,416$; $p<,05$). When the participants were asked to determine where they got the health news most; 32.0% of those who answered as internet were in the age range of 18-25, 30.4% of them were between 26-35, 20.8% were 36-45, 8.0% were between 46-55, 8.0% were between 56-65 and 0.8% were 66 and older; 49.2% of those who answered as social networking were in the age range of 18-25, 24.6% of them were in the range of 26-35, 16.4% were between 36-45, 8.2% were between 46-55, 1.6% were between 56-65, 0.005 were 66 and older; 19.2% of those who answered as Television were in the age range of 18-25, 11.5% of them were in the age range of 26-35, 25.3% were between 36-45, 26.9% were between 46-55, 13.7% were between 56-65 and 3.3.% were 66 and older; 50.0% of those who answered as radio were in the age range of 26-35, 50.0% of them were between 46-55; 16.7% of those who answered as newspaper were in the age range of 18-25, 33.3% of them were between 26-35 and 50.0% of them were between 36-45; 50.0% of those who answered as magazine were in the age range of 18-25, 50.0% were between 26-35; 23.4% of those who answered as inner circle were in the age range of 18-25, 19.1% of them were between 26-35, 29.8% were between 36-45, 10.6% were between 46-55, 6.4% were between 56-65 and 10.6% were 66 and older. According to this data, the rate of getting health news from the internet and social media decreases as the age increases.

Table 8: Means of communication followed for health news in terms of age

		Crosstabulation

$X^2 = 123,416$; $df = 35$; $p = ,000$

Significant differences also appear between where the health news is mostly received and gender factor ($X^2 = 16,415$; $p < ,05$). Accordingly, when the women were asked where they received the news about health issues, 1.0% of them did not give an answer to this question. However, 27.2% of them answered as internet, 12.6% answered as social networking, 50.5% answered as television, 0.5% newspaper and 8.3% inner circle. They did not mention radio or magazine. As for men, while 0.5% of them did not answer this question, 31.1% of them answered internet, 15.8% answered social media, 35.1% television, 0.9% radio, 2.3% newspaper, 0.9% magazine and 13.5 % inner circle. According to these results, television is the most common tool to get the news about health matters for men and women. However, men make use of internet for this to a considerable extent. For 'getting health news from inner circle', the rates are higher in men than in women.

Table 9: Means of communication followed for health news in terms of gender**Crosstabulation**

		Gender?		
		Female	Male	Total
Where do you get the news about health issues most?	No answer	2 66,7% 1,0% ,5%	1 33,3% ,5% ,2%	3 100,0% ,7% ,7%

	Television	104 57,1% 50,5% 24,3%	78 42,9% 35,1% 18,2%	182 100,0% 42,5% 42,5%
	Radio	0 ,0% ,0% ,0%	2 100,0% ,9% ,5%	2 100,0% ,5% ,5%
	Newspaper	1 16,7% ,5% ,2%	5 83,3% 2,3% 1,2%	6 100,0% 1,4% 1,4%
	Magazine	0 ,0% ,0% ,0%	2 100,0% ,9% ,5%	2 100,0% ,5% ,5%
	Inner circle	17 36,2% 8,3% 4,0%	30 63,8% 13,5% 7,0%	47 100,0% 11,0% 11,0%
	Total	206 48,1% 100,0% 48,1%	222 51,9% 100,0% 51,9%	428 100,0% 100,0% 100,0%

$X^2 = 16,415$; $df = 7$; $p = ,022$

There are significant differences between where the health news is mostly received and marital status ($X^2 = 39,039$; $p < ,05$). Accordingly, when they were asked the question 'where do you get the news about health issues most?', while 0.8% of the married did not answer this question, 26.1% of them said internet, 11.1% said social networking, 48.6% said television, 0.8% radio, 1.6% newspaper and 11.1% inner circle. There wasn't an answer for magazine. While 0.6% of the single did not give an answer to this question, 37.8% of them answered as internet, 20.5% of them answered as social networking, 28.2% television, 0.0% radio, 1.3% newspaper, 0.0% magazine and 10.3% inner circle. As for widows, 5.3% of them answered as social networking, 78.9% television and 15.8% inner circle. There was not an answer for internet, radio, newspaper and magazine. According to this result, it can be said that the married and the widow use television most to get health news; and the single ones prefer internet.

The Most Reliable Resource To Make A Decision For Treatment

Today's modern people have the opportunity to get service from various places about their health problems because of the facilitation of communication and the increase of health service alternatives. This diversity of possibilities requires knowing "how the patients who decide to treat the disease make a decision " if any disease is encountered. For this reason, in our study, the question 'What resource do you trust most to make a decision for the treatment?' was asked. When we look at the answers of the participants, 57.7% of the participants said that they trust the information of the second or third doctor, 27.6% trust the information of the first doctor who diagnosed, 9.8% trust their inner circles with the same disease, 3.3% trust the information on the internet, and 1.4% trust the information of the medical specialists on TV; however, 0.2% did not give an answer to this question (See Table 11). According to this result, it can be said that the majority of today's people (57.7%) decide the treatment of serious diseases after they trust the information they get from the second or third doctor rather than the first doctor.

Table 11: The most reliable source of information about the treatment of the disease

Which source of information do you trust most when you decide to treat your disease?	Frequency	Percent	Valid Percent
No answer	1	,2	,2
The information of the doctor who diagnose	118	27,6	27,6
The information of the second or the third doctor	247	57,7	57,7
My inner circle with the same disease	42	9,8	9,8
The information on the internet	14	3,3	3,3
Medical specialists on TV	6	1,4	1,4
Total	428	100,0	100,0

Confidence Level In Famous Health Care People On Tv

The publications of the mass media on health are attracting attention of almost every segment of society; it also forms the basis for the emergence of some famous people in the field of health. Canan Karatay, Ibrahim Saraçoğlu and Ahmet Maranki are some of them. However, it is curious to what extent the individuals in society trust the opinions of these famous people they are constantly watching on TV. To determine the confidence level of the citizens in these famous people on TV, the question 'how much do you trust the health-related opinions of famous experts (Canan Karatay, Ibrahim Saraçoğlu, Ahmet Maranki, etc.) who appeared on TV?' was asked. When looking at the answers of the participants (See Table 12), it is seen that 32.5% of them said 'I trust', 25.0% said 'I don't trust', 20% 'no idea', 13.8% 'I never trust', 7.5% 'I trust very much', and 0.5% did not give an answer. When the resulting data are generally evaluated, it can be said that 40.0% of the society are confident in the opinions of the famous experts in the TV about the health, at various levels, and 38.8% of them do not trust the health related opinions of these famous experts on TV, at various levels.

Table 12: Confident level in the health-related opinions of famous experts on TV (Canan Karatay, İbrahim Saraçoğlu, Ahmet Maranki etc.)

How much do you trust the health-related opinions of famous experts on TV? (Canan Karatay, İbrahim Saraçoğlu, Ahmet Maranki, etc.)	Frequency	Percent	Valid Percent
No answer	2	,5	,5
I never trust	59	13,8	13,8
I don't trust	107	25,0	25,0
No idea	89	20,8	20,8
I trust	139	32,5	32,5
I trust very much	32	7,5	7,5
Total	428	100,0	100,0

The level of confidence in health-related views of famous healthcare professionals on TV includes significant differences according to age factor ($X^2=50,362$; $p<,05$). 50.0% of those who answered the question 'how much do you trust the health-related views of famous people on TV (Canan Karatay, İbrahim Saraçoğlu, Ahmet Maranki etc.) were in the age range of 18-25 and the other 50.0% were in the age range of 26-35. 32.2% of those who answered 'I never trust' were in the age range of 18-25, 28.8% were between 26-35, 20.3% were between 36-45, 11.9% were between 46-55, 5.1% were between 56-65 and 1.7% were 66 and older. 37.4% of those who answered 'I don't trust' were in the age range of 18-25, 19.6% were in the age range of 26-35, 23.4% were between 36-45, 10.3% were between 46-55, 6.5% were between 56-65 and 2.8% were 66 and older. 36.0% of those who said 'no idea' were in the age range of 18-25, 19.1% were in the age range of 26-35, 16.9% were between 36-45, 16.9% were between 46-55, 10.1% were between 56-65 and 1.1 % were 66 and older. 18.0% of those who said 'I trust' were in the age range of 18-25, 18.0% were in the age range of 26-35, 28.1% were between 36-45, 21.6% were between 46-55, 11.5% were between 56-65 and 2.9% were 66 and older. 6.3% of those who said 'I trust very much' were in the age range of 18-25, 18.8% were in the age range of 26-35, 25.0% were between 36-45, 21.9% were between 46-55, 12.5% were between 56-65 and 15.6% were 66 and older. “

The resulting data show that as people age, the percentage of them who say 'I never trust' is falling. In other words, it can be said that younger people have less confidence in the health-related views of TV-famous health-care professionals, and older people trust them more than young people do.

$X^2=50,362$; $df=25$; $p=,002$

There are significant differences in level of confidence in the health-related opinions of famous experts on TV in terms of occupational factor ($X^2=71,347$; $p<,05$) ($X^2=71,347$; $df=50$; $p=,025$).

33.3% of those who did not mention their jobs and left 'what is your job?' question unanswered said 'I never trust' and 66.7% of them said 'I don't trust'. 15.3% of the workers said 'I never trust', 36.1% of them said 'I don't trust', 15.3% 'no idea', 29.2% 'I trust', 4.2% 'I trust very much'; 13.8% of the civil servants said 'I never trust', 24.6% said 'I don't trust', 26.2% no idea, 30.8% 'I trust', 4.6% 'I trust very much'; 2.3% of self-employed people did not answer this question, however, 20.5% of them said 'I never trust', 13.6% of them said 'I don't trust', 22.7% no idea, 36.4% 'I trust', 4.5% 'I trust very much'; 5.7% of tradesmen said 'I never trust', 14.3% of them said 'I don't trust', 11.1% no idea, 42.9% 'I trust', 20.0% 'I trust very much'; 28.6% of the businessmen said 'I never trust', 14.3% of them said 'I don't trust', 14.3% said 'no idea', 32.1% 'I trust', 20.0% 'I trust very much'; 14.3% of the pensioners said 'I never trust', 14.3% 'I don't trust', 25.0% 'no idea', 42.9% 'I trust', 14.3% 'I trust very much'; 8.6% of the housewives said 'I never trust', 16.0% said 'I don't trust', 18.5% 'no idea', 43.2% 'I trust' and 13.6% 'I trust very much'; 1.2% of the students did not give an answer to this question. However, 14.1% of them said 'I never trust', 37.6% said 'I don't trust', 23.5% 'no idea', 21.2% 'I trust' and 2.4% 'I trust very much'; 40.0% of the unemployed said 'I never trust', 20.0% of them said 'no idea' and 40.0% of them said 'I trust'; 66.7% of the farmers said 'I don't trust' and 33.3% said 'no idea.'

With reference to the results of the answers given by the participants, including different levels, it can be understood that the majority of the farmers (66.7%), students (51.7%), and the workers (51.4%) did not trust the health-related views of famous experts on TV; however, it is seen that the majority of the tradesmen (62.9%) and housewives (56.8%), including different levels, trust the health-related views of famous experts on TV.

There are significant differences in level of confidence in the health-related opinions of famous experts on TV in terms of marital status factor ($X^2=26,570$; $p<,05$). While 0.4% of the married people did not answer the question 'how much do you trust the health-related opinions of famous experts on TV? (Canan Karatay, İbrahim Saraçoğlu, Ahmet Maranki etc.)', 12.3% of them said 'I never trust', 21.3% said 'I don't trust', 17.8% 'no idea', 38.3% 'I

trust' and 9.9% 'I trust very much.' Whereas 0.6% of the single people did not answer the question, 16.0% said 'I never trust', 31.4% said 'I don't trust', 26.9% 'no idea', 22.4% 'I trust', 2.6% 'I trust very much'. 15.8% of the widow people said 'I never trust', 21.1% 'I don't trust', 10.5% 'no idea', 36.8% 'I trust' ad 15.8% said 'I trust very much.'

Considering these replies of the participants, it can be concluded that the married (48.2%) trust the health-related opinions of the famous health experts on TV more than the single (25.0%) do, including different levels.

$X^2 = 26,570$; $df=10$; $p=,003$

Conclusions

As a result of the evaluation of these data obtained by the face-to-face survey method, when **we look at the most common communication means to follow health news;** *Today, it is seen that the health news is mostly followed by Television, Internet and Social Media. This follow-up varies according to age, gender and marital status.

- The rate of getting health news from the internet and social media decreases as the age range of people in society increases.

-Both women and men use TV most to get the health news. Men, on the other hand, use the internet as well as television to a considerable extent.

- Men are more likely to use "inner circle" to receive health news.

- According to marital status, it is seen that the married and the widow prefer TV most to get health news; and the single use the internet.

* When deciding on the treatment of serious diseases, the majority of modern people trust the opinion of the second or the third doctor to start the treatment rather than the first doctor who diagnosed.

Nowadays health programs and the experts who appear in these programs are known by mass media and society. However, when looking at the information given by these experts and how people rely on them;

*Nearly half of the society trust the views of these experts on TV, and the other half don't trust them. This changes according to the occupation, age and marital status.

-According to age factor, young people rely on the opinions of famous experts on TV less than the older people do. The old believe in them more.

- Tradesmen and housewives, according to other professions, have more confidence in the health-related views of famous TV experts.

- As for marital status, it is seen that the married believe in these famous experts more.

According to these results, it can be seen that today's modern people still prefer TV to be informed about health issues, they trust famous health-care professionals on TV moderately, they don't trust the opinion of the first doctor they apply to and they prefer consulting two or more doctors to get treatment.

Abstract

Flipped classroom model is an instructional and pedagogical strategy which aims to make the time spent in the classroom productive. Learners in this model are engaged in basic level activities such as getting information at home, and they practice in the classroom under the guidance of the teacher. The aim of this study is to determine high school students' opinions about the use of flipped classroom. This is a case study in a qualitative research design. This study was conducted with 10 10th-grade high school students in a public high school in the west of Turkey's Black Sea Region in the 2017-2018 academic year. The study data were collected using a structured interview form which included open-ended questions. High school students' verbal explanations to the open-ended questions were analyzed using content and descriptive analyses. Results of the present research show that a majority of high school students had positive opinions about flipped classroom model. According to the students, the flipped classroom model has increased their learning, attention and persistence of the information. Students have indicated that their motivation and self-confidence are high. As a result, the flipped classroom model should be used in high school physics courses.

Keywords: *Flipped classroom model, physics teaching, high school students.*

Introduction

The rapid and innovative changes experienced in the technological and scientific fields in the 21st century have caused important changes in societies and individuals' perspectives towards education and their expectations from education. Advancements in the fields of knowledge acquisition and communications also influence the way of providing education, and the use of information communication technologies, such as computers, in learning environments becomes a necessity (Niess, 2005). Learning is completely achieved in learning environments where communication is effectively used and a communication-learning environment, along with the use of communication technologies, can also be effectively used outside the classroom environment. For example, the use of information communication technologies particularly in courses that are difficult to grasp, such as mathematics, is argued to be useful (Jones, 2000; Laborde, 1993; Marshall, Buteau, Jarvis, & Lavicza, 2012). New methods and models should be developed for more effective use of such technologies which are considered to be learning-assistive.

Considering the level of the information and communication technologies that have arrived in recent years, an innovative teaching model has gained popularity. This model, termed as the "Flipped Classroom Model" (Flipped Classroom), "flips" the traditional classroom paradigm and online educational tools. Flipped Classroom model enables students to learn the topics out of the classroom time with the help of previously recorded videos and various course materials, and also saves time to carry out activities in the classroom. Despite the fact that educators put to use this new teaching approach in countless different ways, the essential idea is to carry the basic teaching outside the classroom and subsequently to use the lesson hour for activities deepening the knowledge. As a result, students can be involved in group activities, laboratory practices or other active learning types in the classroom (Bergman & Sams, 2012, Lage, Platt, & Treglia, 2000, Stone, 2012; Tucker, 2012, Bishop & Verleger, 2013, Zownorega, 2013). This model is a learning-teaching method enabling students to carry out, mostly individually or as a group, problem solving activities on the topics they have studied individually in the classroom environment and to focus on the problems that most of them encounter in their individual learning. This method also gives an opportunity for teachers to deal with the learner one to one. Students are provided with an omnipresent opportunity to reach any knowledge by means of taking video records of the theoretical knowledge of the courses and transferring them to the internet environment (Gencer et al., 2014). The literature review showed that studies had been carried out in different fields to determine the effect of Flipped Classroom model on the learning process. In a high school located in Detroit, the US, Flipped Classroom model was applied in the courses of Math and English,

regarding the need for a change of model in order to support and enhance students' education. Teachers prepared three videos, each lasting 5–7 minutes, per week, required their students to watch these videos at home, and asked the students, who do not have the internet connection at home, to watch them at school. The teachers carried out interactive activities and implementations, and enriched the content in the classroom. The results showed that students' problem of not doing their homework was eliminated, the teachers were able to include more explanatory examples on the content, and helped their students about the topics they did not understand rather than reviewing the lesson. Moreover, the percentage of the students who failed in English decreased from 19% to 13%, and in mathematics from 50% to 44% (Strayer, 2011). Stone (2012) conducted a study with 400 university students in a biology course and 30 university students applied Flipped Classroom in the genetic disorders model by using short videos, reading, animations, and simulations and carrying out activities such as jigsaw implementations and case studies. This study found that the students in the flipped classroom had better exams scores and higher attitudes towards learning compared to those whom the same course was provided in the traditional way. Marcey and Brint (2012) compared the traditional and flipped classroom approaches in two different classrooms attending the introduction to biology course. Their results revealed that the students in the flipped classroom had higher scores on the exams and quizzes than their counterparts in the traditional classroom.

This study aimed to investigate the opinions of 10th-grade students on the implementation of Flipped Classroom model in the “pressure and buoyant force”, a 10th-grade physics course subject. In the traditional teaching methods which have been frequently used from past to present, the necessity to present the theoretical knowledge to students in the classroom environment leads to the lack of sufficient time for experiments and activities. Therefore, the teacher and students are unable to sufficiently communicate in the school environment and the students' opportunities to learn by doing-thinking is limited. A resistance is developed in students' minds in cases of encountering all concepts and events which they are not able to relate to their daily lives and thus maintain a negative attitude towards the course. This study is thought to contribute to the literature by setting forth how students' opinions regarding the physics course will change by Flipped Classroom model.

Method

This study was designed as a case study using a qualitative research perspective. The most essential characteristic of qualitative case studies is to investigate one or multiple cases in-depth (Yıldırım & Şimşek, 2008). In addition, case studies are the researches where a circumstance is defined and specialized based on space and time (Büyükoztürk et al., 2012).

Study Group:

In the present study, 10th-grade students (n=57) from a public high school in the Ereğli district of the province of Zonguldak, Turkey during the 2017–2018 academic year consisted the sample. The students were 16 years old, 33 of them were female and 24 were male. The data of the study were collected using the interviews of 10 students, 6 of whom were female and 4 were male. All the students took the physics course as a compulsory school subject for the first time.

Data Collection Tool:

A structured interview form developed to determine students' opinions on Flipped Classroom model was used to collect the data. The content validity of the form was ensured through consulting expert opinions, and the interviews were carried out with 10 students from the group where Flipped Classroom model was applied. Interview questions (four questions), which were developed within the scope of the study, were asked to the students in face-to-face interviews, then the data were collected. One of the interview questions was: What are the advantages of Flipped Classroom model over the traditional methods?

Implementation Stages:

In the study, a website which the students can make use of was primarily built. Tabs related to the course content, questions and announcements were added to the website. All of the students in the classroom were provided to access to this site. The recommended period for the unit of Pressure and Buoyant Force is five weeks in the 10th-grade Physics curriculum. Therefore, the sub-headings in the topic were determined and lesson plans were developed accordingly. In addition, course materials on the topic (lecturing videos, pictures) were prepared and added to the website. The students were reminded of the importance of watching the videos, which should be watched at home according to each lesson plan, prior to the lessons. Short quizzes consisting of three questions on each video watched were made before at the beginning of the lessons. In the classroom environment, students were asked about the points in the video which are unclear or curiosity-evoking to them, and these points were clarified. In lesson hours, the students were taken to the laboratory. Since the theoretical lessons watched in the web environment, previously planned experiments were carried out in the laboratory environment, which were performed as group studies ensuring each students' participants, rather than the teacher's performance by demonstrations. The students developed experiment reports while doing the experiments and handed them to the teacher at the end of the lesson. Following the experiment, daily life problems regarding the topic were discussed in the classroom environment and the topic was reinforced by recapping the points that were watched and applied.

Data Analysis:

A structured interview form was used to collect the data. The form consisted of five questions was applied to some of the students (n=10) who were taught according to Flipped Classroom model. The interviews were verbally made and the students' responses were recorded with an audio recorder. The data of the study were collected within the scope of the questions presented in the form. The data, subsequently transcribed, were analyzed using content and descriptive analyses. In the content analysis, expressions used were included according to the frequency of students' responses and the frequency values were calculated according to the frequency of the repetition of these expressions independently of the number of the students.

Results

In this part, the results obtained using the structured interview form were investigated within the scope of the questions presented in the form, the content analysis was made and presented through tables and direct excerpts of the students' opinions.

1. Investigation of the opinions on whether Flipped Classroom model contributes to learning**Table 1:** Opinions on whether Flipped Classroom model contributes to learning and related frequency values.

OPINIONS	f
I felt that knowledge became catchier with the experiments and that I learned better.	3
I could understand the topic better through experiments.	2
I better understood since I had the opportunity to listen to the information in a quiet environment.	2
The information was permanently stored in my memory since we observed the experiments.	2
It became of great use to support the information with implementations.	1
I could understand the relationship between other topics.	1

According to Table 1, the students expressed that they were able to learn the topics in a more permanent and meaningful way and to better grasp the information they listened to in a quiet environment through video records within Flipped Classroom model. The students particularly touched upon the positive influence of carrying out the implementations by themselves and expressed that they were, therefore, able to relate the topics with others. Student S1 expressed his or her opinion on the contribution of Flipped Classroom model as follows: *"I can listen to the parts where I do not understand again and again. If I like, I can listen ten times. I can see, understand the topic better through experiments. We solve the questions altogether in the classroom. Performing activities is very good, I can understand better by observing."* In addition, Student S2 put forward his or her opinion on the contribution of lesson videos to learning as follows: *"This method is better compared to traditional methods. From my point of view, you see me sleepy in the lessons; however, this is not because I am uninterested in the lesson but I feel something holds me back. This does not happen when I listen to the lesson at home. Implementations are good but the friends in the groups should study in harmony."*

2. Investigation of the opinions on the advantages of Flipped Classroom model**Table 2:** Opinions on the advantages of Flipped Classroom model over the traditional methods and related frequency values.

OPINIONS	f
The experiments were visual and this helped me to understand the topic better.	4
The things I have learned recently became more permanent since we were able to make more experiments.	3
I could study my lesson with full of my attention in a quiet environment when I felt completely ready.	3
The lessons became more interesting and curiosity-evoking due to visual experiments.	3
Flipped Classroom model made the lessons less boring.	2
Learning the lesson on our own made us feel special and boosted our motivation.	2
We were able to listen to the lesson over and over again and found the opportunity to think by pausing the video.	2
The irrelevant conversation in the classroom negatively affected our motivation in the traditional methods. This did not happen in this model.	1
	1

I held myself back from asking unclear points in the classroom and asking the teacher to review these points. I did not experience this in Flipped Classroom.

According to Table 2, the students, mostly underlined, conducting experiment, in other words, implementation, regarding the advantages of Flipped Classroom model. According to the students these implementations led to a better understanding of topics, a more permanent learning, more appealing lessons and, therefore, an increased motivation to the course. The online theoretical courses were considered as another advantage by the students. Student S3 expressed his or her opinions on the lesson videos as follows: *"I can pause the video while watching it at home and have the chance to think why even if there is a point unclear to me. It was quite beneficial. It is not possible for me to forget something I have seen. What I have learned became really permanent. This method was very good for me."* Furthermore, Student S4 highlighted the contribution of the model to motivation as follows: *"The biggest advantage is that I can watch the video at home when I am ready. We sometimes reluctantly have to listen to at school."*

3. Investigation of the opinions on the disadvantages of Flipped Classroom model

Table 3: Opinions on the disadvantages of Flipped Classroom compared to the traditional methods and related frequency values

OPINIONS	f
Irrelevant things can intervene while listening to the lectures from the records; therefore, I had some difficulties to focus my attention.	2
I was unable to ask questions while listening to the lecture from the records in Flipped Classroom model.	1
I had some problems to access the video records due to technical problems.	1

According to Table 3, the students mostly underlined the lesson records which were previously prepared and included theoretical knowledge regarding the lesson as the disadvantages of Flipped Classroom model. They expressed that they had difficulties in staying focused while listening to the records and did not have the opportunity to ask their questions to the teacher face to face. They also pointed out the technical problems they encountered while accessing these records as a disadvantage of the model. However, students did not state any negative opinions on the implementation dimension of the model carried out in the classroom.

4. Investigation of the opinions on whether it is appropriate that the students make the implementations in Flipped Classroom model

Table 4: Opinions on whether it is appropriate that the students make the implementations in Flipped Classroom model and related frequency values.

OPINIONS	f
Doing experiments by ourselves made our knowledge rather permanent	3
Doing measurements and calculations in the experiments by ourselves made me understand the topic better.	3
During the implementations, I understood that I could also do something and what I was and was not capable of.	2
We were able to overcome some difficulties by discussing and cooperating within the group.	2
A sense of responsibility regarding studying at home was developed since we make the experiments by ourselves	2

Table 4 show that the students were of the opinion that doing experiments by themselves, rather than performing them by demonstration was significant for the permanence of their knowledge. They noted that doing measurements and calculations in the experiments by themselves was beneficial in terms of their better understanding of the topic. In addition, the students expressed that they were able to set their boundaries regarding the topic and to span these boundaries with the group studies, and added that their sense of responsibility and habits of studying had regularly improved. Student S5 stated his or her opinions on the gains of the implementations by students as follows: *"Studying the topic at home first developed a sense of responsibility. Carrying out activities as groups was quite beneficial and will also contribute to our future group studies. It is better to study as groups; we can cooperate a lot better. Instead of asking every unclear point to the teacher, we can express each other. This is good for us."* Another student (S6) expressed his or her opinions as follows: *"Previously, everything had been limited to what the teacher taught. In this model, I observed that I could also do something and learn on my own. We, together with our friends, built small images of events taken place in our lives and benefited from them a lot. We did our own measurements and calculations. This also improved us*

mathematically.” A different student (S7) mentioned that implementations made them disciplined: “The implementations yielded many advantages. We saw how to carry out an experiment, the implementation stages, and the possible results that can be obtained.”

Conclusion And Recommendations

In this study determining the opinions of 10th-grade students on the implementation of Flipped Classroom model in the “pressure and buoyant force”, a 10th-grade physics course topic, a vast majority of the students expressed positive opinions on this model. These opinions indicated that the topics were learned more permanently since the students made the implementations by themselves in the classroom, which could also lead to a boost in their motivation. The students also expressed that this model increased their interest in and curiosity towards the lesson and that they learned how to comfortably establish the relationships between the topics. The students had the opinion that making group studies in the implementations carried out in the classroom enhanced their sense of responsibility. The students had previously learned the theoretical knowledge by watching video recordings, which, therefore, provided the students to attend the course in a ready manner and offered the students an opportunity to make a review and gain knowledge in a comfortable environment. The inability to focus the attention, ask questions immediately and the face technical problems were among the few negative opinions on these recordings.

The results of this study were corroborated by the results of other studies. Davies et al. (2013) compared three different approaches in a study they carried out with 301 students. These approaches were the traditional teacher-centered teaching, simulation-based teaching and flipped classroom model approach. Their results indicated that the flipped classroom model approach is more effective than other approaches. Since this approach allows different teachings, it boosted students’ motivation and facilitated their learning. Aşıksoy and Özdamlı (2016) conducted a study with university students within the scope of the physics course and found that the success of the students taught in a flipped classroom was significantly higher than that of their counterparts who were taught in traditional classrooms. They attributed the students’ ability to watching lecturing videos anytime they liked at their own pace as the factor creating this difference. In the same study, significant differences were found in students’ motivation and self-efficacy and a vast majority of the students expressed that the useful aspects of the technologies had been more frequently used through this model, and that performing lessons in this way had made them happy and the lesson less boring.

In light of the results of the study, the followings can be recommended:

1. Flipped Classroom model can be applied to other physics topics by developing topic contents and more interesting activities.
2. Flipped Classroom model can be used in different course contents at every stage of formal education from middle school to higher education. At this point, it can be recommended that in-service teachers receive training on the model.
3. STEM activities can be used at the in-class implementation stage of the model.
4. Lesson videos, visuals, and pictures prepared by the experts on the topic and activities that can be performed can be uploaded to Educational Informatics Network (EBA) and can, therefore, be made available to all teachers. Therefore, problems stemming from the differences related to teachers, regions, teaching techniques, environments and schools can be minimized.
5. Further studies can be conducted to evaluate the effectiveness of the model at different grade levels and courses, and results of related qualitative and quantitative data can be collected.

Abstract

School dropouts are a problem with which educational systems have been struggling over the last years. This issue, that may jeopardize the quality of the school institution and of the education system itself, tends to get more and more serious and may be related to the students' Quality of Academic Life (QAL) and to the formal nature of the learning processes. To identify the relationship between the Quality of Academic Life and higher education students' dropout intentions and to analyse the impact of some socio-demographic variables on higher education students' dropout intention were the main objectives that were defined for this study.

A quantitative, cross-sectional, descriptive and correlational study was conducted. In order to collect the data that will be used in our study, we used a questionnaire that allowed us to gather information about the demographic characterization of the students and of their parents and the Brazilian *Reasons for Higher Education Dropout Scale* (M-ES; 2015). The sample consists of 891 students from polytechnic higher education institutions who were attending courses in different scientific fields. Participants are mostly female (68.2%), with a mean age of 19.68 years (± 2.34 years). Students who are ≤ 19 years old are those who show a better quality of life in dimension that involve their personal and interpersonal lives, their study conditions, their institutional life and their overall quality of life. Female students exhibit higher ratings when they refer to the quality of their personal life, their career, their study conditions, to their institutional and their overall quality of life, while male students reveal a better interpersonal quality of life. The causes of school dropout in higher education are multiple and the implementation of interventions that can provide students with an easier and better academic and institutional integration are increasingly important, a procedure that will involve the strengthening of the support provided by the academic services in order to better monitor and optimize processes and to provide more information about the requirements of academic life.

Introduction

According to Azevedo and Faria (2001), the transition from secondary education to higher education is one of the most important phases in the whole cycle of academic experiences. This phase provides students with an environment which is very different from what they have already known throughout their lives so far, and may constitute a challenge and, at the same time, may represent some sort of a threat, since it requires the adoption of work strategies and personal time management strategies that often represent potential stress and emotional tension-inducing factors (Azevedo & Faria, 2006). These changes may represent the first step that will lead to the autonomy of a young person who is on his way to adulthood, since he/she will be expected to show responsibility in situations that will involve the management of their residence, of their meals, of their allowance and they will still have to be responsible enough to find time for their studies (Lucas, 2014). This is a complex phase in students' lives, mainly due to external factors: the fact that they had to leave their parents' house and find a new place to stay, the fact that the level of difficulty they will meet is much higher and that their lifestyles have gone through great changes. These factors can often lead to depression and emotional *distress* problems, among others (Brites Ferreira, Seco, Canastra, Simões-Dias & Abreu, 2011).

Lifelong training and the enrolment that will allow students to attend a new place of formal learning (usually far away from home) transform their academic experience into a phase that will favour the acquisition of a range of transversal skills that will contribute to the enrichment of the students' personal and academic growth, as long as the quality standards are ensured (Pedro, 2013).

The structures of the institution, the education policies, the curricular and programmatic units, the services and the environments themselves are regarded as determining factors that may have an impact on the students' cognitive and affective changes (Ferreira, 2009).

A higher education institution should provide its students, both at an academic and at a social level, with a feeling of well-being and a quality of life that will surely contribute to their happiness and overall well-being. That way, other contexts of life should be valued as well, namely all those that involve leisure, training, work, sports, culture and science, because the quality of academic life depends, above all, on the quality of the experiences and of the conditions provided by the academy, both at a pedagogical and at an institutional level. (Barros, 2002) regards well-being as one of the dimensions of life that will play a crucial role in determining general happiness, satisfaction with life or subjective well-being. The quality of academic life bears, therefore, a close relationship with the need for satisfaction and with the experiences that create positive emotions throughout students' academic journey (Pedro, 2013). It should be noted that, and according to the same author, this feeling encompasses both the cognitive assessment of the university life and the affective experiences, experiences that will positively

influence the students throughout their academic life. Students' satisfaction has a positive impact on their motivation, their school loyalty and on their enrolment and thus becomes an essential need that higher education institution will have to meet (Elliot & Shin, 2002; Schertzer & Schertzer, 2004). Academic management, learning support facilities (such as libraries and computer centres), physical facilities (such as classrooms, laboratories, social spaces), social infrastructures (cafeterias, student housing, healthcare offices, sports centres and student support offices) and other external aspects related to students (such as their economic capacity and easy access to public transportation) are dimensions of paramount importance when time comes to assess the quality of academic life. (Leckey & Neill, 2001), (Harvey, 2003).

Thus, the quality of academic life can be assessed in terms of feelings of overall satisfaction with the student's experience of university life (Sirgy et al. 2007; 2010).

Pedro (2013) claims that the increasing importance attached to the quality of academic life should not be strictly centred on the course, on the student's educational path and on the subsequent graduation, but that it must, above all, be directed towards an evolutionary process of learning that is the result of all the experiences arising from all the dynamics and from the extracurricular, associative, civic, sports, cultural, social, technical, scientific and investigative contexts and environments that took place both inside and outside the higher education institutions. This author concludes that academic life must be understood as a formal active training journey that deeply influences its protagonists learning process and life path.

Satisfaction with life is the students' subjective perception of their own life that includes the cognitive judgments and the emotional reactions to the contexts where they belong as well as the way in which they experience them. In turn, optimism is the perception of a positive vision of the future and the feeling of self-confidence that will allow students to implement their personal and collective projects.

In his study, Pedro (2013) claims that satisfaction with life correlates positively and moderately with the level of optimism, with positive self-esteem and with positive affections. Self-esteem and negative affections correlate negatively with self-esteem and satisfaction with life.

Method

The characteristics that define higher education and the students' quality of academic life are regarded as challenging factors in their academic transition and adaptation. These challenges can lead to failure or even dropout situations (Almeida, Casanova & Gonçalves, 2017). Taking these assumptions into account, our objectives were to identify the relationship between polytechnic higher education students' quality of academic life and possible dropout intentions and to analyse the impact of some socio-demographic variables on higher education students' quality of academic life.

We have developed a descriptive, correlational and analytical research, as our intention was, in addition to studying and describing the relationships between the variables, to analyze and explain the relationship between them. The articulation between the variables present in this study is displayed in a schematic/conceptual representation, where we can find the relationship between the independent variables (the students' socio-demographic variables, Almeida, Soares and Ferreira's (2002) Academic Experiences Questionnaire(QVA-R)) and the dependent variable (school dropout) (Figure 1).

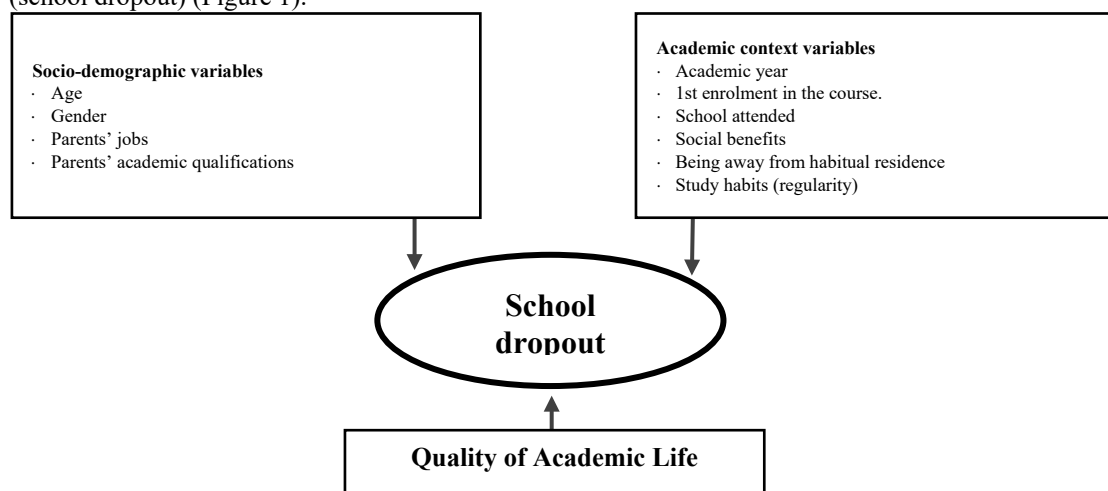

Figure 1- Schematic representation of the expected relationship between variables

For this study, we chose a purposive non-probability sample for convenience formed by 891 students who were attending polytechnic higher education institutions and research was conducted in four distinct areas: health, technology, education and agrarian studies.

To understand the personal, interpersonal and institutional processes experienced by students as they enter higher education, we used a shortened version of the academic experiences questionnaire (QVA-R), built and validated

for Portuguese Higher education students by Almeida et al. (1999). The main advantage of that short QVA version is the presence of a range of areas and items ranked according to the different dimensions that will be assessed and that stem from the answers provided by the students.

The definitive version of the shortened format of the QVA (QVA-R) consists of 60 items, in a five-point Likert-like format (1-Very untrue of me, Strongly disagree, Extremely unlikely ; 2- Untrue of me, Disagree, Unlikely; 3- Somewhat untrue of me, Neither agree nor disagree, Neutral; 4-True of me, Agree, Likely and 5-Very true of me, Strongly agree, Extremely likely) disposed in five dimensions (personal, interpersonal, career, studies and institutional).

The Personal dimension includes 13 items associated with personal perceived well-being and self-esteem and with other facets of the students' identity and *self* (Seco et al., 2005, quoted by Fernandes, 2011). The second dimension, the Interpersonal dimension, gathers items related to the building of friendship and intimate relationships, to students' involvement in extracurricular social and/or associative activities, systematized in a factor that will deal with a more interpersonal aspect of their academic adaptation and that will include 13 items (Seco et al., 2005, quoted by Fernandes, 2011). Taking into account the contents of its items, the third dimension, the Career dimension, essentially assesses the students' adaptation to the course and to their career projects. This factor consists of 13 items and describes the students' satisfaction with the choice of the course they are attending, the kind of perception they have of the socio-professional achievements they may obtain once they graduate and the existence of vocational project related to the course. The fourth dimension includes items associated with the study and with time management, in other words, the kind of behaviours that will be assessed refer to curricular and learning situations. This QVA-R dimension includes 13 descriptive items about the students' study skills and routines, about their use of the library and of other learning resources. The last dimension integrates a set of items related to the students' adaptation to the institution and to their new environment. This dimension, the Institutional dimension, includes 8 items associated with the students' interest in the institution they are attending, their interest in pursuing their studies in that institution or with their perception of the quality of the services and of the facilities the institution makes available to its students (Seco et al., 2005, quoted by Fernandes, 2011). The studies developed with the QVA-R have proven the good psychometric qualities of the scale in terms of validity and fidelity. In fact, the items' internal consistency coefficients (Cronbach's alfa) present acceptable values in a significant set of works that have been conducted to assess the difficulties experienced by students in the transition into college and/or during their academic journey (Almeida et al., 1999).

In our study the scale was composed of 35 items. It was subjected to confirmatory factor analysis and has demonstrated the validity of its structure in five dimensions: Personal (F. 1); Study (F. 2); Interpersonal (F. 3); Career (F. 4); Institutional (F. 5); (c Figure 2).

Figure 2 – Model with modification indices

Findings

The sample consists of 891 students of polytechnic higher education institutions with a minimum age of 17 years and a maximum of 40 years, with a mean age of 19.68 years (± 2.34 years), which corresponds to a coefficient of variation of 11.89%, a value that suggests low dispersion. Among male participants, who represent 31.8% of the sample, the minimum and maximum age fluctuate between 17 and 32 years, while in the group composed of female participants, who represent 68.2% of the sample, the minimum age is 17 and the maximum is 40. Men ($m = 19.97$ years ± 2.39 years) are slightly older than women ($m = 19.55$ years ± 2.32 years). The values of skewness and kurtosis reveal that the age variable doesn't exhibit a normal distribution since the skewness and kurtosis values reveal leptokurtic curves and skewed to the left, both for the global sample and for both genders.

Table 1- Statistics regarding age, according to gender

Gender	N	Min	Max	M	SD	CV (%)	Sk/error	K/error
Male	283	17	32	19,97	2,39	11,96	13,62	16,38
Female	608	17	40	19,55	2,32	11,86	36,71	98,40
Total	891	17	40	19,68	2,34	11,89	37,15	85,49

The 19 year old age group represents 28.2% of the sample (21.6% of them are male participants and 31.3% are female elements) with statistically significant differences ($X^2 = 15,242$; $p = 0,000$) among female students who are 19 and males students who are ≥ 20 years old.

As for the father's academic qualifications, the highest mean value was obtained by those who have completed basic education (43.5%), a percentage that corresponds to 37.4% of male students' parents and 46.4% of female students' progenitors. As far as the mother's academic qualifications are concerned, we found out that 36.8% have finished their basic education.

Table 2 – Sample socio-demographic characterization according to the participants' gender.

Gender	Male		Female		Total		Residual		X ²	p
Variables	N° (283)	% (31,8)	N° (608)	% (68,2)	N° (891)	% (100,0)	1	2		
Age										
≤18 years old	89	31,4	210	34,5	299	33,6	-9	9	15,242	0,000
19 years old	61	21,6	190	31,3	251	28,2	-3,0	3,0		
≥20 years old	133	47,0	208	34,2	341	38,3	3,7	-3,7		
Father's academic qualifications	N° (278)	% (32,0)	N° (590)	% (68,0)	N° (868)	% (100,0)				
Basic education	104	37,4	274	46,4	378	43,5	-2,5	2,5	11,044	0,004
Secondary education	104	37,4	219	37,1	323	37,2	0,1	-0,1		
Higher Education	70	25,2	97	16,4	167	19,2	3,0	-3,0		
Mother's academic qualifications	N° (277)	% (31,4)	N° (605)	% (68,6)	N° (882)	% (100,0)				
Basic Education	97	35,0	228	37,7	325	36,8	-0,8	0,8	6,731	0,035
Secondary Education	88	31,8	226	37,4	314	35,6	-1,6	1,6		
Higher Education	92	33,2	151	25,0	243	27,6	2,5	-2,5		

Evidence also shows that 7.3% of the students enjoy a student employee status and 43.43% have a scholarship. As for statistics regarding the quality of academic life, the minimum and maximum indices range between 0.00 and 24.29 for the overall sample. The dimensions with a higher mean value are the Institutional dimension (Mean = 69.85; ± 20 , 44Sd) and the Career dimension (M = 68.72; ± 16 , 19Sd) with moderate coefficients of variation (29.26% vs. 23.55%). The lowest mean value was found for the Personal dimension (M = 46.17; ± 20 , 09Sd) with a coefficient of variation of 43.51%, which indicates a high dispersion when compared to the average. The quality of overall academic life has a Mean value of 60.46; ± 10 , 02Sd, with a coefficient of variation which indicates a low dispersion (16.57%).

Table 3 – Statistics about the Quality of Academic Life

Quality of Academic Life	N	Min	Max	Mean	SD	CV (%)	Sk/err or	K/error
Personal Dimension	891	0,00	100,00	46,17	20,09	43,51	1,58	-0,18
Interpersonal Dimension		12,50	100,00	66,91	16,17	24,16	-2,06	-1,27
Career Dimension		6,25	100,00	68,72	16,19	23,55	-5,21	2,44
Study Dimension		3,57	100,00	57,99	14,33	24,71	0,30	4,20
Institutional Dimension		0,00	100,00	69,85	20,44	29,26	-4,63	-0,58
Quality of Academic Life (overall)		24,29	100,00	60,46	10,02	16,57	3,09	4,38

It is observed that the highest percentages found in relation to gender were obtained by female students: 61.4% show poor quality of academic life, 69.6% show intermediate quality of Academic life and 72.6% a good quality of academic life, with statistically significant differences ($X^2 = 7,454$; $p = 0,024$) between male students and with poor quality of academic life and female students with good quality of academic life.

In relation to age groups, most of the students who show low quality of academic life can be found among the participants who are 20 or over (39.8%) and among those who are under 20 (35.2%). Many of the students who are 20 or older also show appropriate quality of academic life (39.2%). The same happens with students who are 18 or less: 30.1% of them exhibit appropriate quality of academic life. In the group of students with a good quality of academic life we can find both younger students (38.0%) and older students (35.0%).

The highest mean values correspond to students who are attending technology and management courses where 35.2% of the students reveal poor quality of academic life, 34.7% of them show appropriate quality and 29.5% good quality of academic life.

In relation to the quality of academic life depending on whether or not students have a student employee status, evidence shows that the highest mean value is obtained by students who do not enjoy that status: 91.1% of those students exhibit poor academic life quality, 95.5% of them show appropriate quality of academic life and 89.5% of them seem to have good quality of academic life, with statistically significant differences ($X^2 = 9.279$; $p = 0,010$) between students who don't have their student employee status and who show intermediate quality of academic life and those who have the student employee status and who show good quality of academic life.

After carrying out an analysis of the data in relation to the students who have a scholarship, we can observe that 36.0% of them have poor quality of academic life, 43.5% appropriate quality of academic life and 43.9% of them show good quality of academic life.

It can also be noted that the most expressive mean values correspond to students who are living away from their habitual residence: 66.1% of those students reveal poor quality of academic life, 69.1% intermediate quality of academic life and 72.2% good quality of academic life.

During the data analysis carried out according to the students' study habits (namely in aspects dealing with how often/how much and how long they study) evidence shows that most of those who show poor quality of academic life admit that they don't study on a regular basis, on the contrary they state that they only study "occasionally". Students who adopt this kind of study behaviour are those who show the highest percent of intermediate quality of academic life (38.0%). The second highest percent of intermediate quality of academic life is seen among students who study "frequently" (35.9%), with statistically significant differences ($X^2 = 25,054$; $p = 0,000$) between students who study on a regular basis ("frequently") and who show good quality of academic life and those who study "occasionally" and show poor quality of academic life.

After analyzing the results according to the parents' academic qualifications (father/mother), evidence proved that the group of students with poor quality of academic life is mostly formed by youngsters whose fathers have merely completed their basic education (42.1%). Evidence also shows that the fathers of students who show good quality of academic life have graduated from high school (39.4%). In relation to the results obtained according to the academic qualifications of the students' mothers, it was clear that most of the students who show poor quality of academic life are those whose mothers have finished their secondary education (39.4%); most of the students who reveal intermediate quality of academic life are young people whose mothers have completed their basic education (38.9%) and those who express good quality of academic life have mothers who have left school as soon as they have completed their basic education (35.3%).

The first dimension of school dropouts to be studied through multiple regression analysis is the Organizational dimension. The results indicate negative correlative values for the Career dimension ($r = -0.019$) and for the Institutional dimension ($R = -0.018$).

The second dimension to be studied is the Life Management dimension. The results point out negative correlative values for the Interpersonal dimension ($r = -0.008$). Statistical evidence is found in the Career dimension ($P = 0,000$), Study dimension ($P = 0,018$) and Institutional dimension ($P = 0,011$).

The third dimension to be studied is the Profession/Career dimension. The results indicate negative correlative values for the Interpersonal dimension ($r = -0.053$), Career dimension ($r = -0.116$), for the Study dimension ($r = -0.059$) and Institutional dimension ($R = -0.073$). Statistical evidence is found in the Career dimension ($P = 0,000$), in the Study dimension ($P = 0,039$), and in the Institutional dimension ($P = 0,015$).

The fourth dimension to be studied is the Relational dimension. The results indicate negative correlative values for the Interpersonal dimension ($r = -0.091$), Career dimension ($r = -0.125$), Study dimension ($r = -0.014$) and Institutional dimension ($R = -0.125$). Statistical evidence is found in the Career dimension ($P = 0,000$), Study dimension ($P = 0,039$) and Institutional dimension ($P = 0,015$).

Finally, school dropout intention was studied using multiple regression analysis as well as the overall dropout intention. In table 5, we can find all the correlations obtained with the different variables analysed in each of the different dimensions and whose results indicate negative correlative values for the Age ($r = -0.063$), Gender ($r = -0.078$), Interpersonal dimension ($r = -0.032$), Career dimension ($r = -0.038$) and Institutional dimension ($R = -0.036$).

School dropout intention is influenced by Age ($P = 0,030$), and Gender ($p = 0,010$), by the Personal dimension ($P = 0,025$) and the Emotional Perception ($P = 0,021$) of the quality of academic life.

Table 5-Pearson's correlation coefficient between independent variables and dropout intentions in different dimensions: organizational, life management, profession/career, relational and overall school dropout.

	Organizational		Life Management		Profession/Career		Relational		Overall school dropout	
Variables	R	P	R	P	R	P	R	P	R	P
Personal Dimension	0.051	0.065	0.016	0.318	0.052	0.061	0.115	0.000	0.066	0.025
Interpersonal Dimension	0.031	0.174	-0.008	0.402	-0.053	0.057	-0.091	0.003	-0.032	0.171
Career Dimension	-0.019	0.288	0.114	0.000	-0.116	0.000	-0.125	0.000	-0.038	0.129
Study Dimension	0.052	0.059	0.070	0.018	-0.059	0.039	-0.014	0.334	0.017	0.311
Institutional Dimension	-0.018	0.298	0.077	0.011	-0.073	0.015	-0.125	0.000	-0.036	0.143

Conclusion

Many students who enter higher education have positive expectations about academic experiences. However, the confrontation between the imaginary images and the expectations they had created and built over the last years of secondary education does not always correspond to reality. This contrast can definitely interfere with the kind of quality of academic life they will be experiencing in this new stage of their lives. It is during their first year that students tend to realize how wrong they were about this new life of theirs and that their expectations start to fall apart. This is also during that first year that the students experience the greatest difficulties in adapting to this new reality and to its requirements, that they start experiencing poorer school performance due to the new quality standards they have to meet. These newly found difficulties often lead to school dropouts (Nunes & Garcia, 2010). The same authors stress that those new academic and social requirements, in association with other personal concerns, support the construction of strategies that will be used to solve problems and tasks that have to do with personal, interpersonal and academic management. That way, entering higher education also represents a clear possibility of carrying out personal projects, even if the realization of such projects means that we have to overcome personal and contextual disruptions.

In this study, we have tested a structural model that allowed us to assess the impact that some dimensions of the quality of academic life, such as the Personal dimension, the Study dimension, the Interpersonal dimension, the Career dimension and, finally, the Institutional dimension, have on higher education students' dropout intentions. The studies we had the chance to analyze unanimously maintain that the transition to higher education represents a decisive moment in the students' academic journey, and may have a positive or negative impact on their academic performance, quality of life and may create negative environments that can lead to dropout situations (Ferreira; Fernandes, 2015; Moreira et al., 2015; Rabelo, 2017).

Our results show that the quality of academic life of higher education students relates to their well-being, but that this factor is only one of the many dimensions of life that will play an important role in determining their general happiness, satisfaction with life or their subjective well-being. It should be noted that the quality of academic life encompasses both the cognitive assessment of life (which has to do with the degree of satisfaction of life experienced in higher education) and the affective experiences that positively influence students throughout their academic life. School dropout intention is influenced by age and by gender and by the personal dimension and the emotional perception of the quality of academic life. Therefore, these variables should be considered when the institutions are developing intervention plans whose aim will be to promote some sort of institutional affiliation or institution loyalty among their students, or in other words, plans that will prevent students from leaving the institution shortly after they had been admitted.

Abstract

Background: The promotion of students' academic success has been a growing concern for higher education institutions, a responsibility that should have an impact on the reduction of failure and dropout rates, as well as on the general improvement of the students' training and on the development of their skills competencies and on the students' graduation rates.

Objectives: Our general objective was to identify the factors that interfere in the dropout intentions of the students who attend the Polytechnic Institute of Viseu. Specifically, we sought to identify socio-demographic variables, organizational and profession/career factors that may have an impact on higher education students' dropout intentions and to analyze the relationship between them.

Method: Quantitative, cross-sectional, descriptive and correlational study. A socio-demographic characterization questionnaire was applied to the students and the Brazilian "Reasons for Higher Education Dropout Scale" (M-ES; Ambiel, 2015) was also used. The sample is composed of 891 higher education students attending different organic units in a Polytechnic Institute. The elements of the sample were predominantly female (68.2%), with a mean age of 19.68 years (\pm 2.34 years), with a predominance of older students (\geq 20 years) (38.3%).

Results: Our intention was to know whether or not gender will influence school dropout. It was possible to find out that male students consider the organizational dimension as an inherent element of school dropout, while female students indicate the profession/career dimension as the most important dimensions.

It turns out that the 19-year-old students are those who reveal more reasons that can lead them to school dropout, especially in terms of organizational and relational dimensions.

Conclusion: In view of these results, it is suggested that more measures should be implemented in order to contribute to the prevention / reduction of school dropout among higher education students. This strategy requires that the institution should be aware of the students' personal attitude, of their interest in learning, of their commitment and determination.

Keywords: *Higher Education; School dropout;*

Introduction

In Portugal, the democratization of education that allowed everyone to get access to a complete education has placed new challenges and assigned new responsibilities to higher education institutions, namely the need to make sure that all students are granted the same opportunities to stay at school as long as they need to complete their studies and to achieve academic success (Ferreira & Fernandes, 2015). For the same authors, these challenges have been, in recent years, particularly difficult to overcome, especially because of the economic crisis that the country and the European area are going through and the changes related to the Bologna process.

Increasingly regarded as a phenomenon of significant and growing importance, school dropouts in higher education have become the subject of studies and reflections, both by government agencies and higher education institutions. The current political guidelines that have been developed by the political systems and by a wide range of academic studies to deal with this phenomenon are clear examples of that concern (Lopes & Costa, 2012).

In this context, higher education institutions had to adjust to this new reality in order to be able to respond to the requirements of the Bologna process, particularly in relation to the curriculum reorganization of their courses, to learning outcomes, to teaching and evaluation methodologies, and at the same time, make their best to prevent school dropouts and to meet the "differences between the students' difficulties/potentials, background and aspirations" (Ferreira & Fernandes, 2015, p. 178). Bearing these challenges in mind, it is clear that the students' background and aspirations are the most difficult issues to deal with, due to the fact that this kind of phenomenon has not attracted much attention until recently, particularly media attention, and because of the difficulties that stem from trying to achieve "the creation of institutional responses that will ensure that all students, regardless of their social status, have conditions (and resources) that will allow them to remain in higher education institutions and to complete their studies" (Ferreira & Fernandes, 2015, p. 179).

After analyzing the Portuguese secondary and higher education completion rates, it is evident that they are below the OECD average. This observation should lead Portugal to rethink its strategies in order to be able to respond to those challenges and to ensure that all students can complete their higher education and training and to provide everyone with a quality and inclusive education that will meet the needs of the labour market. Thus, it is important to develop and implement measures that will improve the academic learning outcomes and the students' academic success.

Although the latest OECD report suggests that there is a need for new education policy models and for intervention programmes aimed at improving all education goals, these are macro systemic measures that cannot be implemented in specific contexts such as higher education institutions. These should be programmes that will ensure the involvement of all educational agents in the promotion of academic success and performance, that will foster the improvement of the relational environment in schools and contribute to greater personal, academic and professional satisfaction and that, at a micro systemic level, will be able to implement measures that will help increase the teachers' educational and teaching skills, improve the students' motivation and understanding, their need to get educated and to foster the corresponding and inevitable ambition to engage and actively involve themselves in the process that will lead to their academic achievement.

Over the last few years, the promotion of school success in higher education has been a fundamental objective of public policies and of higher education institutions alike and school failure and school dropout have to be regarded as serious concerns both for students who have to cope with such issues and for the higher education system and for Portuguese society as a whole, especially since there are currently a number of specific circumstances that we have to bear in mind, like, for instance, the increasing importance that are attached to higher qualifications in a society and an economy that values more than ever knowledge and innovation (Costa & Lopes, 2008).

School dropout means that a student leaves school without graduating or completing the educational training offered by the institution he was attending for reasons other than a desired transfer to another institution or some other serious motives (Ferreira & Fernandes, 2015). Enguita (2011, p. 263) claims that every time a student "does not achieve his school goals", he finds himself "facing a situation of failure and of possible dropout". Santos (2010, p. 7), based on his study, concluded that "school dropout is a problem that relates to an individual's behaviour and results in the decision to leave school without completing the level of education desired." The same author also refers that this is not a sudden decision, but instead the result of a long process of tensions, failures, adjustment problems and lack of interest in school. Santos (2010) adds that the early departure from school may demonstrate, on the one hand, that students do not attach great importance to the role school plays in their personal development and in its importance to provide them with the tools that will prepare them for active life and, on the other hand, a certain rejection of school that has not been able to motivate them, an assumption that may lead them to quit school and look for a job, to choose to live an idle life or even to delinquency. With that in mind, the same author argues that "only a multifactorial, multidimensional and systemic approach can help explain the phenomenon of school dropout, an approach that should always take into account the different realities in constant interaction: society, youngsters and school" (Santos, 2010, p. 15).

The Study

This is a descriptive, correlational and analytical study. The articulation between the variables that have been part of our study is presented in a schematic representation where we can witness the kind of relationship that exists between the independent variables (students' socio-demographic variables, academic context variables) and the dependent variable (school dropout intention) (Figure 1)

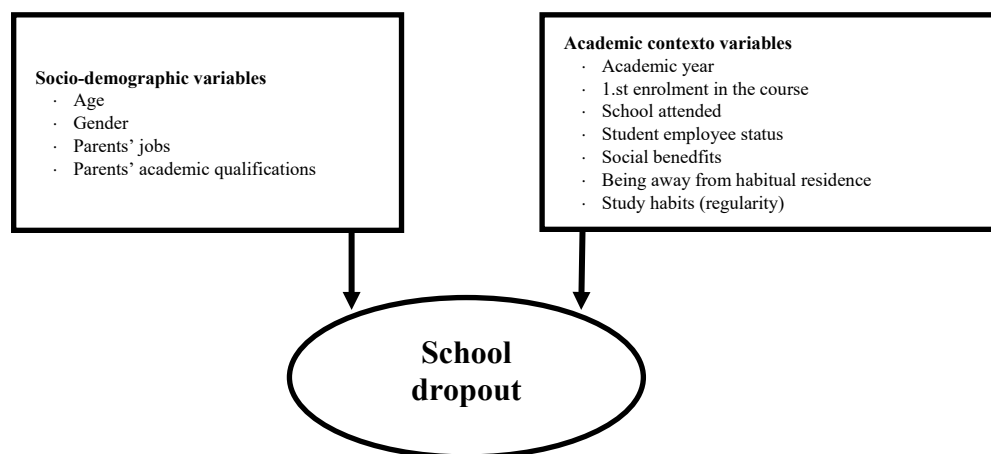

Figure 1- Schematic representation of the expected relationship between variables

For this study, we chose a purposive non-probability sample for convenience composed of 891 students who were attending a polytechnic higher education institution located in the central region of Portugal. Research was conducted in four distinct areas: health, technology, education and agrarian studies.

The data collection instruments that were selected are a demographic questionnaire applied to students and to their parents composed of 11 questions, 9 of which were used to gather information about student's personal information and 2 whose aim was to collect data related to the students' parents; a questionnaire about the students' academic characterization that included 6 questions (year of course, school attended, whether or not the student has a student employee status, social benefits, if the student had to leave his parents' house to attend this school and students' study habits); the "Reasons for Higher Education Dropout Scale" (M-ES; Ambiel, 2015), a standardized instrument in the form of an inventory that assesses the potential reasons (intention) that drive active students to leave their respective courses before graduation.

M-ES allows us to identify the reasons related to the structural and to the institutional functioning, to personal and family experiences, to the lack of financial support, to career, to academic performance, to interpersonal relationships and to autonomy that may be involved in higher education dropout intentions. Once the adaptation of the scale was concluded, we selected 4 factors: organizational factors, life management factors, relational factors and profession/career factors.

The following objectives were designed to guide our investigation: to identify which socio-demographic variables interfere with higher education students' dropout intention; to confirm how the academic variables (year of course, their 1st school year of enrolment in the course they are currently attending, their school, the students' status (student employee or not), the social benefits they are granted, whether or not they had to leave their habitual residence and their study habits) interfere in higher education students' dropout intention.

Findings

Age statistics reveal, for the whole of the sample, a minimum age of 17 years and a maximum of 40 years, with a mean age of 19.68 years (± 2.34 years) which corresponds to a coefficient of variation of 11.89%, a percent that suggests a low dispersion.

Among male participants, who represent 31.8% of the sample, the minimum and maximum age range between 17 and 32 years, while in the group of female participants, who represent 68.2% of the sample, the minimum age is 17 and the maximum is 40. Men ($M = 19.97$ years ± 2.39 years) are slightly older than women ($M = 19.55$ years ± 2.32 years). The values of skewness and kurtosis reveal that the age variable doesn't reveal a normal distribution since the skewness and kurtosis values reveal leptokurtic curves and skewed to the left, both for the global sample and for both genders.

As far as school dropout intention is concerned, data show that the minimum and maximum values for the overall scale range between 0.00 and 97.50 with a mean value of 36.84 ± 16.87 and a coefficient of variation with a high dispersion value (45.79%). The dimensions with a higher mean value are the life management dimension (Mean = 43.52 ± 22.31) and the profession/career dimension (Mean = 41.79 ± 18.97) both with high coefficients of variation (51.26% vs. 45.39%). The lowest mean value found is related to the relational dimension (Mean = 25.31 ± 18.58) and has a coefficient of variation of 73.40%. This value indicates a high dispersion compared to the average.

The students who show higher mean rank values in all dimensions, except for the relational dimension, are female. The results point out that girls seem to have a higher-than-average tendency to drop out of school, and reveal statistically significant differences in the life management dimension ($P = 0.000$) and in school dropout ($P = 0.032$) (table 1).

Table 1 –Mann-Whitney U Test between gender and school dropout intention

Gender	Male MR	Female MR	MWU	P
School dropout				
Organizational Dimension	429,73	453,57	81428,00	0,197
Life management Dimension	380,49	476,49	67493,00	0,000
Profession/ Career Dimension	429,61	453,63	81393,00	0,194
Relational Dimension	449,82	444,22	84950,50	0,762
School dropout (overall)	418,91	458,61	78366,00	0,032

Evidence shows that students who are ≤ 18 years are those who present more reasons to drop out of their course, notably in dimensions such as life management, profession/career and overall school dropout. However, 19 year-old students present a higher mean value in dimension such as organizational and relational dimensions (table 2).

Table 2 - ANOVA between age and school dropout intention

Age School dropout	≤ 18 years old		19 years old		≥ 20 years old		Total		f	p
	Mean	Sd	Mean	Sd	Mean	Sd	Mean	Sd		
Organizational Dimension	36,14	19,45	36,75	20,10	35,63	20,08	36,11	19,86	0,231	0,794
Life management Dimension	45,62	21,82	43,79	22,76	41,47	22,28	43,52	22,31	2,798	0,061

Relational Dimension	24,89	17,32	25,89	18,67	25,26	19,59	25,31	18,58	0,201	0,818
School dropout (overall)	37,50	16,59	37,11	16,98	36,05	17,05	36,84	16,87	0,641	0,527

As for the relationship between the father's academic qualifications and the students' school dropout intention, evidence clearly shows that the students whose fathers have higher academic qualifications are those who reveal a lower school dropout rate. On the other hand, students whose fathers have only concluded basic education reveal higher mean values in almost all dropout dimensions except in the relational dimension and overall school dropouts dimension where the highest values are obtained by students whose fathers had graduated from high school (table 3).

Table 3 - ANOVA between the father's academic qualifications and school dropout intention

Father's academic qualifications School dropout	Basic Education		Secondary Education		Higher Education		Total		f	p
	Mean	Sd	Mean	Sd	Mean	Sd	Mean	Sd		
Organizational Dimension	36,63	20,04	35,72	19,50	35,49	20,59	36,07	19,93	0,266	0,767
Life management Dimension	43,93	22,49	43,77	22,07	41,44	22,46	43,39	22,32	0,793	0,453

School dropout (overall)	36,83	16,72	37,03	16,76	36,21	17,80	36,78	16,93	0,130	0,878

Evidence shows that students who reveal higher mean values of school dropout intention in dimensions such as the profession/career, relational and overall school dropout dimensions are those whose mothers have a college degree. Students whose mothers completed secondary education show higher mean values of school dropout intention in dimensions such as the organizational and life management dimensions (table 4).

Table 4 - Kruskal-Wallis Test between the mother's academic qualifications and school dropout intention

Mother's academic qualifications School dropout	Basic Education	Secondary Education	Higher Education	X ²	p
	MR	MR	MR		
Organizational Dimension	434,76	445,96	444,75	0,364	0,833
Life Management Dimension	442,74	443,08	437,80	0,071	0,965
Profession/Career Dimension	438,32	439,52	448,31	0,244	0,885
Relational Dimension	424,60	440,57	465,31	3,573	0,168
School dropout (overall)	436,58	442,19	447,19	0,245	0,885

The results of the students' school dropout intention according to their field of study suggest that students who attend education-related courses are those who reveal higher mean rank values in all dimensions. It is important to mention that students who attend technology courses are those who have lower levels of school dropout intention.

Table 5 - Kruskal-Wallis Test between the field of study and school dropout intention

Fields School dropout	Health	Technology	Education	Agrarian	X ²	p
	RM	RM	RM	RM		
Organizational Dimension	450,33	440,37	455,73	444,65	0,480	0,975
Life management Dimension	434,38	430,90	479,37	431,35	7,082	0,132
Profession/Career Dimension	435,98	437,70	456,83	449,86	1,029	0,905
Relational Dimension	463,15	437,66	475,55	437,42	5,909	0,206
School dropout (overall)	449,20	432,45	473,99	439,90	3,179	0,528

It also became clear that students who were not granted a student employee status reveal a higher school dropout intention. They have obtained higher mean rank values in all dimensions, with statistically significant relevance in the Profession/ Career dimension ($P = 0,041$) (table 6).

Table 6 –Mann-Whitney U Test between the grant of the student/employee status and school dropout intention

Status (student/employee)	No	Yes	MWU	P
School dropout	MR	MR		
Organizational Dimension	447,88	422,15	25295,00	0,437
Life management Dimension	449,98	395,55	23566,00	0,100
Profession/Career Dimension	450,93	383,32	22771,00	0,041
Relational Dimension	444,48	465,27	25592,50	0,530
School dropout (overall)	448,85	409,81	24492,50	0,239

Students who do not enjoy social benefits seem to reveal a higher school dropout intention, with higher mean rank values in all dimensions. (table 7).

Table 7 –Mann-Whitney U Test between enjoying social benefits and school dropout intention

Social Benefits	No benefits	Enjoying benefits	MWU	P
School dropout	RM	RM		
Organizational Dimension	445,22	428,19	89852,00	0,324
Life management Dimension	438,62	437,16	93181,50	0,933
Profession/Career Dimension	442,58	431,78	91184,00	0,532
Relational Dimension	450,79	420,63	87047,00	0,080
School dropout (overall)	445,25	428,16	89840,50	0,323

The results of the relationship between students being far from their habitual residence and school dropout intention indicate that students who did not have to leave their habitual residence present higher school dropout intention rates in almost every dimension of school dropout, except for the relational dimension, in which the highest scores are obtained by students who left their parents home to study.

Table 8 –Mann-Whitney U Test between the fact that students are away from their habitual residence and school dropout intention

Away from home	Yes	No	MWU	P
School dropout	RM	RM		
Organizational Dimension	445,21	447,76	84216,00	0,891
Life management Dimension	445,95	446,10	84671,50	0,994
Profession/Career Dimension	439,77	459,96	80860,50	0,279
Relational Dimension	447,05	443,65	84052,50	0,855
School dropout (overall)	444,21	450,00	83599,50	0,756

As for the relationship between the students' study habits (how much , how often they study) and school dropout intention, results prove that students who admit that they study regularly show higher rates of school dropout intention in dimensions such as the organizational dimension, the life management dimension and the relational dimension. Students who only study "occasionally" are those who seem to have a greater school dropout intention and who show higher mean rank values in the profession/Career dimension and in the overall school dropout dimension (table 9).

Table 9 - Kruskal-Wallis Test between study habits and school dropout intention

Study Habits/Frequency	Frequently	Regularly	Occasionally	χ^2	p
School dropout	RM	RM	RM		
Organizational Dimension	439,30	458,51	443,81	0,789	0,674
Life management Dimension	455,77	456,40	429,74	2,201	0,333
Profession/Career Dimension	436,62	438,70	459,79	1,591	0,451
Relational Dimension	430,37	454,60	454,87	1,850	0,397
School dropout (overall)	441,31	452,66	454,83	0,258	0,879

Conclusions

Albuquerque (2008) states that the first year spent in a higher education institution is problematic for many students. Academic failure, dropouts and the apparent demotivation felt by many students are regarded as motives of great concern for higher education institutions and are clearly factors that raise inquietude and frustration among teachers and students alike. Bearing this in mind, the author developed a study whose main purpose was to understand how students who had been accepted in a course that was not their first option adapt to that circumstance and why they decide to accept that outcome and rule out a possible dropout situation.

Results have indicated that, through the academic activities they carry out during the course, students begin to realize the type of people they might come to work with and the profession or type of work they might choose for their future. That way, Albuquerque found out that the students' involvement in the course they are attending and the educational relationship they experience are the most relevant factors that will influence students' decision of leaving a course/higher education institution or that will, on the contrary, influence their decision of staying in the course/institution and of graduating.

The results obtained with the answers given to the first research question, through which we sought to discover which socio-demographic variables might have an impact on higher education students' school dropout intentions, reveal that male students grant a greater deal of importance to the relation between the organizational and the relational dimensions and school dropout intentions, while for female participants dimensions such as the life management and the profession/career dimensions have a greater impact on their dropout intentions.

Globally, female students are those who reveal higher indices of school dropout intentions, with a statistically significant difference obtained in the life management dimension. Our results stress how important it is to study the impact that the gender perspective might have on teaching and learning resources, an issue that was previously raised by Cavaco et al. (2015) who, in their study "Failure and School Dropout in a Gender Perspective", claimed that education and training public policies must be aware of the importance played by the gender dimension in the definition of strategies that will work to achieve educational success as a way to mitigate the risks of school dropouts.

The studies analyzed unanimously claim that the transition from secondary education to higher education represents a decisive moment in the students' academic journey and that it may have a positive or negative impact on their academic performance and create an emotional environment that may trigger situations of school dropout (Ferreira & Fernandes, 2015; Moreira et al., 2015; Rabelo, 2017).

Chickering (1969, quoted by Santos & Almeida, 2001, p. 206) emphasizes the role played by certain factors, namely "the institutional objectives, the size of the organization, the interactions established between the students and the members of the college community, teaching practices and the services and activities that are available to students".

That way, the kind of perceptions that students develop in relation to the *campus* are especially important for their academic integration and socialization and for the reduction of school dropout situations. Taking these results into account, we have to suggest the implementation of more measures that may contribute to the prevention/reduction of higher education students' school dropouts. This intervention requires that one should be aware of the students' personal attitude, their interest in learning, their commitment and determination and be ready to get involved. Being ready to provide support to students, to help them learn how to manage their academic journey and choices so they can overcome difficulties and increase their individual competencies, are great examples of such commitment.

Institutional actors should provide students with greater and more systemic monitoring opportunities. In addition, students should be granted greater financial support through scholarships, and the institutions should offer curricula/syllabus that are able to meet the requirements of the current labour market. We also suggest a greater intervention in the teaching and learning processes in order to improve students' learning, their school results and, consequently, the quality of their academic journeys. These are empowering measures that could lead to a higher education successful journey. Specific and general knowledge, study methodologies and intervention strategies must be developed and reinforced in order to allow institutions to reduce, or even completely prevent, higher education school dropouts.

Acknowledgments

This work is financed by national funds through FCT - Fundação para a Ciência e Tecnologia, I.P., under the project UID/Multi/04016/2016. Furthermore we would like to thank the Instituto Politécnico de Viseu and CI&DETS for their support.

How Do Formats And Information Presentation Modalities Influence Viewer's Recall, Recognition And Brand Awareness?

Mikyung KIM

Faculty of Media Communication Department
Chungwoon University, South Korea
mkqueen@chungwoon.ac.kr

Abstract

This paper tests through the five-minute video, which was produced in a Web content format reflecting the consumption patterns of young consumers in snack culture age. This study examines how do contents format such as documentary format and entertainment format, and information presentation modality such as visual modality and audio-visual modality influence viewers' memory and attitude for information through experimental research method. Depending on the contents format, significant differences were found in viewer's recall and attitude, except for recognition. For viewer's recall, the entertainment format ($M = 3.341$) was found to be more effective than documentary format ($M = 3.096$). For attitudes, documentary format ($M = 3.180$) showed a more positive attitude than the entertainment format ($M = 2.508$). The results of recognition and attitude were statistically significant based on information presentation modalities (visual, audio-visual), excluding recall. For recognition and attitude, the audio-visual information was higher than the visual information. The interaction effects of content formats and information presentation modalities on recall, recognition and attitude were not statistically significant ($F = .007, p = .932$). The interaction effects of content formats and information presentation modality on recall have been shown to be statistically insignificant. Two-way interaction effects of the contents format and information presentation modality to recognition were statistically significant ($F = 25.260, p < .001$). The effects of the interaction of contents formats and informational presentation modalities on attitudes were not statistically significant. Attitudes based on contents formats are different, but differences in information presentation modalities are not significant. Young consumer's focus on web contents is weakening. In this regard, consumers' recall and recognition and brand awareness of web content are important for enhancing the effectiveness of communication.

Keywords: format, visual, audio-visual info, recall, recognition, brand awareness

Introduction

The 'snack culture', which is the new culture consumption trend where people watch drama and entertainment with a short clip of 3 to 5 minutes regardless of the location, has settled in mobile media age. Young consumer's focus on web contents is weakening.

As the use of contents through mobile devices has spread, preference for media formats is changing. Young consumers usually use video clips that show three to five minutes of drama or entertainment instead of a 40-50-minute TV program.

The concentration of mobile content users is decreasing. Concentration is the ability to focus and immerse oneself in one place over a limited period of time. Concentration is a long-term memory of understanding, primarily in the left side of the brain. Memory is, moreover, an important element in the digital environment. As presented in the Limited capacity model of the processing of the mediated message in Lang (Lang, 2000, 2006), because the user's mental resources are limited, they experience a cognitive overload that fails to handle all of the information provided. As a result, users may actually consume content but not have the communication effect.

It is also widely linked to the storage of memories, which reconstructs key information to remember. They can cut, add, decorate and distort memories. This coordination is a working memory. The working memory forms the schema over time and remains the brand awareness. Memory is a major factor in checking the effectiveness of learning. Memory differs in influence according to information presentation modalities. A variety of new forms of information expression in mobile communication are used to integrate disparate information types such as video, text, and voice into a single medium. It is evolving from text-oriented to graphic, animation, and video. The concept of memory in cognitive processing of information presentation patterns in mobile environments is sometimes defined as the ability to properly position visual and auditory information within existing knowledge, experience, and conceptual understanding and context. In this regard, consumers' recall and recognition and brand awareness of web content are important for enhancing the effectiveness of communication.

This study examines how do contents formats and information presentation modalities influence viewer's recall, recognition and brand awareness for information. This paper sets up the docu-format and entertainment-format as the media contents format and measures recall, recognition and brand awareness depending on these formats. This paper divides the visual modality and audio-visual modality as the information presentation modalities and measures recall, recognition and brand awareness depending on the modalities.

Literature Review

Communication effect by contents format.

Formatting is the form and order in which the information is organized. In a broadcast program, the format refers to the essential elements, appearance and style of the program maintained throughout each episode of the series. The format of the past was understood as the basic idea, composition, and development process of a television series. The current format is conceptualized as a package containing all the programming, or as a strict meaning targeted for remake or traded through contract (Shim, Doobo, 2017).

The format for export consists of 'bible', 'flying producer' and 'business kit'. 'Bible' is a manual that details how to organize a program, which character is the right person for the MC, where the camera should be and how to size it. 'Flying producers' will be sent from the format exporting country to the format importing country. He & she is the advisor for the proper production of the program. 'Business kits' explain more in detail. It also provides a good position and how to promote programs. 'Business kits' also include a list of advertisers and the type of PPL.

Providing the same message in different formats can enhance the effectiveness of the message, not only because of increased access to the information, but also because people are interacting and interacting with the message in different ways. Depending on the type of message that major media such as newspapers and TV send out, the message's signifier is likely to change. Posters and magazines tend to present messages in language and visual strategies, but television tends to generate viewers' interest by providing more visual and auditory cues and maintain interest through reports of diversity and personal interest (McQuail, 2005). There is also a tendency to become less perceptive as a story by first becoming involved in entertainment elements. In particular, tension or expectations about the story make it difficult to contemplate the message in detail (Kim Soyeon, Lee Hyunou, 2007). A study on the communication effects of formats analyzed the impact of recall and recognition by comparing the pre and post program ad format and intermediate ad formats (Hong, Jongpil & Lee, Youngah, 2010). Research has found that the intermediate ad format recalls and recognizes a larger number of brand names and ad messages than the pre and post program ad format. The format of the intermediate ad format has been shown in a more effective way than the pre and post program ad format, as it facilitates the user's memory of advertisements.

Table 1 Comparison of contents format between documentary format and entertainment format

	Documentary format	Entertainment format
	<Knowledge Channel ㉔>	<SNL Korea Special Lecture>
Time	An average of five minutes	An average of five minutes
Configuration	Subtitles, Still Cut, Video	Subtitles, Narrative narration, Video
Format	A super-mini documentary	A mixed entertainment
Information Presentation Mode	Visual + audible(background tone)	Visual + audible(background tone + narration)

Communication effect by information presentation modalities.

Effectiveness studies based on message presentation modalities mainly deal with the effects between types of media, communicator, and messages. Message delivery forms appear to affect the understanding and persuasion of the message and attitude changes (Andreoli & Worschel, 1978; Chaiken & Eagly, 1976; 1983).

Mainly, message presentation modalities are divided into visual and auditory information. Researchers claim that using multiple informational formulas facilitates learning. They argued that providing learning to use both the hearing and vision of learners is more effective in memory and also activates working memory (Penny, 1989; Low & Serller). Some studies suggest that auditory information affects consumers' attitudes and behaviors and that visual information has a strong effect at the beginning of the message, but that auditory factors work strongly in the second half.

According to Limited capacity model of mediated message processing by Lang, because the mental resources that viewers use at a certain point in time are limited, when large amounts of information are presented, viewers experience cognitive overloads (Lang, 2000, 2006). The effect of news formats such as Pyramid shape and Reverse Pyramid shape: the pyramid shape of the time sequence was shown to influence the understanding and recall and recognition of viewers (Lang, 2000, 2006). Whether photos and graphics are inserted increases the viewer's news memory (Newhagen & Reeves, 1992; Lang, Newhagen, & Reeves, 1996; Fox et al., 2004). Depending on the format of the online and printed newspapers, news is perceived differently and the agenda provided are taken differently (Althaus & Tewksbury, 2000; 2002). Message presentation modality appear to affect understanding, persuasion, and attitude changes on the message (Andreoli & Worchel, 1978; Chaiken & Eagly, 1976, 1983).

Pavio's dual-coding theory (Pavio, 1990): As learning is presented as auditory and visual information, it is entered

into the human sensory memory, respectively. The auditory information is organized by the speech processing system and the visual information is organized by the visual processing system into images. These organized information creates responses through reference links to each other. It is more effective to present information using both visual and auditory at the same time than using either visual or auditory (Mayer & Anderson, 1991).

Cognitive Load Theory (CLT) starts with the premise that human cognitive capacity is limited. When visual and auditory information is presented in media usage learning, the learners will be able to process information without any cognitive load. Effective learning is interrupted when too much learning information is provided.

Cognitive Load Theory (CLT) describes as split-attention effect the phenomenon that too much information distracts the attention of the learners, which reduces learning effectiveness. Previous study compared groups of video + narration with groups of video + narration + subtitles. The result of the experiment showed that groups of video and narration had a high learning effect.

Subtitles are primarily concerned with information delivery, content understanding and attention focus. Text subtitles in advertisements are text coded information provided by the voice. The complexity of these information can lead to cognitive loads (Jung, Kihyun, 2003). News Ticker, a text-messaging information, was also found to have a negative effect on understanding and remembering news information (Lee, Hyemi et al, 2009).

Narration refers to "an explanation or explanation of a story from outside as the scene progresses, without showing up on a scene in a movie, a broadcast play, or a play". The sound effect is sound except speech, music, and commentary, or intentionally added sound.

Research Question

This study has several questions:

RQ1: What are the recall, recognition and attitude depending on the difference of content formats?

RQ2: What are the recall, recognition, and attitude depending on the difference of information presentation modalities?

RQ3: What is the recall, recognition and attitude depending on the interaction of content formats and information presentation modalities?

Research Methodology

The five-minute video, which was tested in this paper, was produced in a Web content format reflecting the consumption patterns of young consumers. As an experiment, we produced video related to the subject "fast food" in the modality of documentary like < knowledge channel © > and entertainment format like < SNL Korea>. The first experiment was composed by mashup the video of "Deep Tree" using the format of < Knowledge Channel © >, the representative content of EBS. The second is a 'fast food' conversation in the hit drama 'Dokkaebi', which is based on the format of "SNL Korea Special Lecture" by tvN. Information presentation modalities were presented as visual (video + subtitles) and audiovisual (video + subtitles + narration + music) information.

Variables

- Formatting refers to the essential elements, appearance, and style of a program and refers to a scheme or form that contains the core of a particular program.
- Information presentation modality refers to a combination of visual and visual information. Visual information is defined by images and subtitles, and audio-visual information is defined by images, subtitles and sounds.
- Memory is defined as working memory. Memory is divided into sensory, working and long-term memory. Working memory refers to the state in which information that progresses in any area of cognitive activity is stored temporarily. Memory related to information stored in temporary storage that is easily accessible for a short period of time without special effort and repetition. There are two ways to retrieve these memories. It is recall and recognition.
- Brand awareness is the amount of positive or negative emotion a person has about a subject (Thurstone, 1931). That is a learned predisposition to react consistently, and favorably and unfavorably to a target (Fishbein & Ajzen, 1975).

Research Result

The effect of viewer's recall, recognition and brand awareness depending on the contents format?

Depending on the contents format, significant differences were found in viewer's recall and attitude, except for recognition. For viewer's recall, the entertainment format like <SNL Korea Special Lecture> (M= 3.341) was found to be more effective than the documentary format like <Knowledge Channel©> (M=3.096). For attitudes,

<Knowledge Channel[ⓔ]> format (M = 3.180) showed a more positive attitude than the <SNL Korea Special Lecture> (M = 2.508).

Table 2 The effect of viewer's recall, recognition and brand awareness depending on the contents format

	Contents Format	Sample Number	Mean	SD	Difference of M	df	t	p
recall	Entertainment SNL	127	3.341	.770	.244	239	2.804**	p<.01
	Documentary KC [ⓔ]	114	3.096	.549				
recognition	Entertainment SNL	127	3.092	1.321	.244	239	2.854	p=.324
	Documentary KC [ⓔ]	114	2.913	1.380				
brand awareness	Entertainment SNL	127	2.508	.564	.179	239	.988***	p<.001
	Documentary KC [ⓔ]	114	3.180	.808				

The effect of viewer's recall, recognition and brand awareness depending on the information presentation modality

The results of recognition and attitude were statistically significant based on information presentation modalities (visual, audio-visual), excluding recall. For recognition, the audio-visual information (M = 3.455) was higher than the visual information (M = 2.575) and the audio-visual information (M = 2.968) was more apparent than visual information (M=2.706) in the attitude.

Table 3 The effect of viewer's recall, recognition and brand awareness depending on the information presentation modality

	Information presentation modality	Sample Number	Mean	SD	Difference of M	df	t	p
recall	Audio-visual	110	3.188	0.636	-.069	239	-.781	p=.435
	Visual	131	3.257	0.723

	Visual	131	2.706	0.751				

The effect of viewer's recall depending on the interaction of content formats and information presentation modalities

The interaction effects of content formats and information presentation modalities on recall, recognition and attitude were not statistically significant (F=.007, p=.932). The interaction effects of content formats and information presentation modality on recall have been shown to be statistically insignificant.

Table 4 The effect of viewer's recall depending on the interaction of contents formats and information presentation modality

	Sum of square	df	Mean Square	F-value
Contents formats(A)	1.397	1	1.397	.851

The effect of viewer's brand awareness depending on the interaction of content formats and information presentation modalities

The effects of interaction between content format and information presentation modalities were verified through a two-way ANOVA. The results showed that the two-way interaction effects of content format, visual and audio-visual modalities on brand awareness were not statistically significant ($F=3.698$, $p=.056$). Thus, the hypothesis of study was rejected. Although there is different brand awareness depending on the contents format, it seems that there is no interaction effect as there is no significant difference between the information presentation modalities (visual and audio-visual).

Conclusion

Depending on the differences in format, more 'fast food' words and key messages were recalled and recognized. It is shown that sending the same message in different formats can increase information accessibility and enhance message effectiveness. It is more effective to present information using both the visual and auditory at the same time than using either the visual or auditory modalities. This result demonstrates the dual-coding theory and split-attention effect.

It infers that recall and recognition function differently in memory in the process of processing information of human. Recall is the memory of direct withdrawal, and the recognition is the indirect withdrawal. The research result is interpreted although it is seen that entertainment format increases level of attention and sense of immersion, it does not help level of understanding. Although it is single visual information, recognition of images and text is not effective when they are overloaded. Thus, the double-information, audio-visual information is helping the recognition. These findings demonstrate a prior study (Moreno & Mayer, 2002) that provides additional sound to enhance acceptance. Brand awareness can affect long-term memory by cognition, emotion and behavior, and can be expected to form a priori trend to maintain a sustained response. The interaction between content formats and information presentation modalities has enhanced the recognition effect.

Research results have the following implication in terms of web content creation and acceptance. Entertainment format helps the recall and brand awareness. The audio-visual presentation modalities help the recognition and brand awareness. In order to be more receptive when producing web content, it will be important to store it in direct memory in fun and entertainment formats, and to increase the recognition through double information (audio-visual). These will also be useful in shaping brand awareness in the long run. The interaction between the content format and the information presentation modalities affected the recognition. Therefore, it is important to keep in mind in production because the interactions increase understanding.

Abstract

Plan of Action for the third phase (2015–2019) of the World Programme for Human Rights Education stipulates that all media professionals and journalists should be given equal human rights training opportunities. The paper presents results of research carried out through analysis of OHCHR Action Plan, Russian educational standards and survey of students of Journalism. The paper characterises current state of human rights training for journalists in Russian universities, analyses teaching experience and knowledge of human rights among future mass media professionals. The collected data allowed to identify challenges and to analyse the underlying causes. In conclusion, the authors make recommendations on the ways of modernising curricula on the given issue, including modules on contribution of journalists to the promotion and protection of human rights, in order to create a sustainable system of human rights training for media professionals and journalists able to function after the completion of the World Programme for Human Rights Education.

Keywords: *UN, human rights, education, higher education, Russian Federation, curriculum, training for journalists*

Introduction

In 2004 the UN General Assembly proclaimed the World Programme for Human Rights Education, which represents a continuously implemented global initiative, consisting of successive phases in order to provide human rights education in all sectors.

The United Nations determines human rights education as the process of lifelong learning and creation of awareness for all ages and all walks of life, disseminating knowledge, skills and behaviour to protect human rights. Education should be “directed to the full development of the human personality and the sense of its dignity, and enable all persons to participate effectively in a free society and promote understanding, tolerance and friendship among all nations and all racial, ethnic or religious groups, and further the activities of the United Nations for the maintenance of peace, security and the promotion of development and human rights” (United Nations Declaration on Human Rights Education, 2011). In the opinion of the United Nations High Commissioner for Human Rights Zeid Ra'ad al-Hussein, “education of any kind, if it is devoid of a strong universal human rights component, can be next to worthless when it should matter most” (UN High Commissioner for Human Rights, Zeid Ra'ad Al Hussein, 2015).

The principles of institutional autonomy and academic freedom underlie the strategies of all phases of the Programme. The first key strategy envisaged the inclusion of human rights in the laws on education and ensuring the merit-based equal access to higher education. The second one stipulated the inclusion of human rights as a cross-cutting theme in the process of studying all disciplines, as well as the development of interdisciplinary human rights training programmes.

The first and second phases of the World Programme envisaged the introduction of human rights education in primary, secondary and higher education. The target audience of the second phase (2010–2014) was civil servants, law enforcement officers and military personnel (World Programme for Human Rights Education, 2012; Progress Report on the Implementation of the World Programme for Human Rights Education, 2012). Summing up the results of the second phase of the World Programme, OHCHR asked states to propose initiatives on a further action plan. The third phase strategies were developed by OHCHR by examining the priority target sectors, thematic issues and target groups proposed by the states of Europe, Africa, Latin America, Asia, Australia and New Zealand. They demonstrated the diversity of respondents' approaches and priorities, reflecting national peculiarities. Opinions were received from 17 governments, 17 national human rights institutions, 6 international and regional intergovernmental organisations and 13 non-governmental organisations (Views of States, national human rights institutions, 2013).

One of the priority tasks of the third phase is the inclusion of human rights training courses in higher education programmes, especially in non-legal faculty programmes. The target group included representatives of different professions, i. e. law enforcement officers, state and municipal authorities, judges, prosecutors, police officers, investigators, security officials and the armed forces, representatives of business, members of NGOs, as well as specific groups of rights holders, especially inclusive, vulnerable groups - elderly people, people with disabilities, refugees, asylum seekers, minorities, indigenous peoples, indigent people, female victims of violence. Teachers and heads of educational institutions were in a particular focus.

The majority of respondents pointed to media employees, journalists and users of social networks as a new target audience, paying attention to their potential impact on society. They noted that it was necessary to improve the quality of journalistic work and awareness of journalists about their public duty. The respondents reported that according to surveys, people rarely had a clear idea of human rights and did not understand how they related to the injustice in their daily lives. Therefore, it was important that journalists and media workers who deal with information for the general public were included in the new target group.

In addition, the target audience is closely linked to the issue of human rights and the Internet. On the one hand, today the Internet is a platform for human rights violations, e. g. cyber bullying, the spread of hatred and intrusion on people's privacy. On the other hand, the Internet can be used as a powerful tool for human rights education and social change. Access to the Internet and technological literacy of the population are important for taking advantage of the Internet space for the dissemination of the Human Rights Education Programme (Third phase (2015-2019) of the World Programme for Human Rights Education, 2013).

Thus, the goals and strategies of the Action Plan for the third phase (2015-2019) were worked out after consultations with states. Its key goal is the human rights training of journalists and media professionals. It was noted that "journalism is constantly evolving" and today journalistic functions are performed by a wide range of individuals. It is not limited to professional reporters and analysts, but also bloggers and others who are "published in print, on the Internet or elsewhere." The third phase strategy stipulates that all journalists should be provided with equal opportunities to get human rights training and all journalists should have basic knowledge of human rights. The Plan details the human rights training programmes, which may include modules with information on the role of journalists in the promotion and protection of human rights (Plan of Action for the third phase, 2015).

Human rights training for journalists and media professionals should emphasise issues of equality and non-discrimination, combating violence, respect for diversity, tolerance, intercultural and interconfessional dialogue, as well as promotion of the universality, indivisibility and interconnectedness of all human rights.

Methodology

This research is descriptive, combining both qualitative data analysis and a quantitative survey. The authors analyse strategic documents of UN Programme for Human Rights Education, Russian federal educational standards, Bachelor's programme curricula and literature on education.

A student survey was undertaken in order to identify students' perceptions of the quality of human rights education and importance of this knowledge in their professional activities. The survey results were presented in table form and interpreted. The target group of the survey was made up of students enrolled in Bachelor's programmes in Journalism at Ural Federal University in Ekaterinburg, Russia.

The Study

Analysis of educational standards and study programmes

The principle of academic freedom enshrined in modern federal state educational standards for higher education allows every university to develop and decide on the content of educational programmes and curricula. However, as the researchers repeatedly noted, the freedom to choose disciplines led to the fact that courses related to human rights were excluded from the curricula, that had a negative impact on the implementation of the World Programme for Human Rights Education (Pavlenko, E. 2010. Glushkova, SI, 2014, Bogatyreva, 2016). The study of the Russian standards for Journalism programmes showed that they are not directly aimed at forming competencies related to the knowledge of human rights and freedoms and the ability to use it to protect the rights. Nevertheless, the standard provides for the formation of such important and necessary competences as the ability to "work in a team, to tolerate social, ethnic, religious and cultural differences", "to carry out the public mission of journalism", "to understand the meaning of freedom and social responsibility of a journalist and to follow them in professional activities". Special attention is paid to journalistic ethics. These competencies coincide with the main directions of the third stage of the World Programme for Human Rights Education (Order of the Ministry of Education and Science of Russia, 2014).

The study of Journalism curricula in Russian universities revealed that there was no special course on human rights, despite of their importance and value in the training of journalists. This course is not either mandatory or elective discipline.

Nevertheless, there are courses related to the topic of human rights. The Moscow State University and St. Petersburg State University teach a wide range of legal disciplines that touch on issues of tolerance, freedom of speech and information, the protection of dignity and intellectual property. These topics are covered by such disciplines as "The Right of the Mass Media", "Professional Ethics of Journalists", and "Foundations of Law", etc. In the course "Fundamentals of International Humanitarian Law", important professional topics are studied - journalist and war, journalist's rights in covering contemporary armed conflicts, features of media coverage of armed conflicts, as well as journalist's work in the zone of armed conflict.

All Journalism curricula include the course "Legal Studies" or "Fundamentals of Law", which provides a brief overview of the current Russian legislation. This discipline is taught for one semester and is designed for 36 hours of classroom hours (2 hours per week). Future journalists study directly human rights issues only within the framework of the topic "Constitutional Law of Russia". Such a limited approach to the study of human rights leads to the fact that students do not possess sufficient knowledge of the second chapter of the Constitution of the Russian Federation entitled "Human and Civil Rights and Freedoms", and they find it difficult to formulate European and international human rights standards and to name the main international documents on human rights..

The Journalism curriculum of the Ural Federal University includes a number of professional disciplines aimed at forming such important competencies for the journalist as tolerance for social, ethnic, cultural and confessional differences, social responsibility, understanding of the need for freedom of speech and information, e. g. courses on "Legal basis of journalism", "Law and the media", "The basics of the journalist's legal culture", "Tolerance in the media". It is worth highlighting the course "Journalism on the Internet", which is important for the training of a modern journalist. However, opposed to the above-mentioned universities, the course "International Humanitarian Law" is not taught in UrFU, although the survey of students showed their interest in the problems of modern international conflicts and their coverage in the media.

Student Survey

For the successful implementation of the third phase of the World Programme for Human Rights Education and the introduction of special courses for journalists in Russian universities, it is necessary to take into account the needs of the target group for which it was designed. It is important to investigate the level of knowledge of human rights on the part of students in Journalism, to find out the students' opinion on the need to study human rights for their future professional work. What human rights problems do they consider relevant? How do they relate human rights issues to the content of their future publications, TV programs, and projects? Which vulnerable groups need special protection and assistance from the journalistic community? To find out these questions, the authors of the paper carried out a survey among students in Journalism of the Ural Federal University.

Research/Study group

The survey was conducted among the selected group of students of first, second, third, and fourth years, studying Journalism at the Ural Federal University (Yekaterinburg, Russia) in 2017/2018 academic year. In total, 120 bachelor's students took part in the survey.

Data analysis

Answers to the first question showed that future journalists receive the first idea of human rights in the secondary school. The overwhelming majority of students answered that they got acquainted with the topic of human rights at school (82, 5%). At the same time, 21 respondents (17.5%) noted that the information received at school was fragmentary, and only two persons (1.6%) answered negatively. As it was noted in previous studies, in most Russian schools legal topics are included in the course "Social Studies".

The key issues for our study were questions on the human rights training of students in Journalism. It was important to find out how that knowledge changed during the studies at the Faculty of Journalism at the Ural Federal University. 79 respondents (66%) answered that human rights knowledge had enlarged, and 41 respondents (34%) gave a negative answer.

Table 1: Frequency distribution of answers to the question
‘What courses included issues of human rights and their protection?’

	Generalized groups of answers	Number of respondents (n)
What courses included issues of human rights and their protection?	Fundamentals of Law	43
	Legal Fundamentals of Journalism	25
	Laws and Mass Media	12
	Journalist Professional Ethics	12
	Fundamentals of Legal Culture of Journalist	11
	Tolerance and Mass Media (Fundamentals of Tolerance)	8
	Criminal Journalism	7
	Fundamentals of Journalism Theory	1
	History	2
	Political Studies	2
	Social Studies	1
	World Literature	1
	Fundamentals of Economics	1
	Law and Entrepreneurship	1
	I cannot name any course	1
	All courses included these issues	1
No answer		44

The majority of the respondents indicated the course "Fundamentals of Law", in which there are sections on the Constitutional Law of Russia and the constitutional and legal status of the individual. However, this course has a standard volume of 36 hours and this section takes between two and four hours. It is important to note that this question was answered only by those students whose knowledge, according to them, expanded during the time of their study at the university, and 34% of the respondents stated that they did not receive new information on protection of human rights. There was a comment, made by one of students who indicated the course "Fundamentals of Law" as a source of knowledge, that the content of the course duplicated the materials of the school course.

The diversity of these disciplines might mean that students did not receive systematic knowledge of human rights. Discipline, which widely and systematically acquaints with the topic of human rights, is absent in the Journalism curriculum. For example, in the Moscow State University, one of the mandatory disciplines is the "Fundamentals of International Humanitarian Law". At present, in the UrFU, the Journalism curriculum does not include this discipline, which, according to the dean of the faculty, has long been taught to future journalists. Unfortunately, after moving from Specialist to Bachelor degree and shortening the term of study from five to four years, this course had to be reduced. Thus, we can note a paradoxical situation. Prior to the implementation of the plan for the third phase and selection of journalists as the target group of the World Programme, the International Humanitarian Law course was present in the curriculum, and now this course has been eliminated due to a general reduction in hours.

A high percentage of students (65.8%) who responded positively to the question of acquaintance with the topic of human rights at university are not evidence of the quality of the gained knowledge. Thus, third year students of the Faculty of Journalism were invited to name the main international documents on human rights. Only five persons (7.5%) out of 65 respondents correctly identified the Universal Declaration of Human Rights of 1948 and the Covenant on Civil and Political Rights of 1966. 42 students (65%) could not name correctly the documents, and 18 persons (27.5%) left the corresponding columns blank.

The survey revealed the students' interest in the topic of human rights. For example, 78 respondents (65%) agreed that future journalists need broad knowledge of human rights and supported the inclusion of a special course on

human rights in curriculum. 16 students (13%) spoke against the introduction of the course, as many as did not answer.

The students who supported the introduction of the special course provided varying arguments for their answers. Table 2 presents their answers grouped into thematic groups.

Table 2. Frequency distribution of answers to the question
‘Why it is necessary to include special course on human rights into the Journalism programme?’

	Answers	Number of respondents (n)
Why it is necessary to include special course on human rights?	It is linked with the professional activity	30
	To be able to help people and characters of my publications	19
	Not to infringe the rights of the people I am writing about, not to trespass on the rights of other people	8
	Educational tasks	22
	It is necessary to know only rights of Journalists	5
	There is no need to introduce a special course, human rights issues should be touched upon in the framework of another courses	15
	To replace “Fundamentals of Tolerance”	1
	It is not the most urgent problem	1
No answer		28

Students associated, in one way or another, the need to introduce discipline on human rights with their future professional activities. Many questionnaires contained the idea of professional responsibility of a journalist, it was stressed that "the main object of the journalist's work is a person" and, therefore, journalist should know human rights. The ability to protect a person is a professional duty of a journalist, "it is important not to encroach on human rights" and to know "the boundaries of a journalist's professional activities". Journalists should "serve for the benefit of society and an individual", and if you do not know the human rights, you cannot help. At the same time, 38 respondents believe that the course on human rights should be mandatory, 45 respondents spoke for the elective nature of the discipline. A number of questionnaires indicated that all citizens should know about human rights, but in particular the journalists.

Most students believe that the topic of human rights protection is important and relevant on a global and national scale. Only five persons indicated other topics. Among them are global problems, hybrid war, development and conquest of space, the threat of war, international relations and migration problems. As for Russia, 110 respondents believe that the topic of human rights is incredibly relevant and necessary in Russia.

It was very important to find out students' attitude towards relevance of human rights in their professional activities. Are they ready to cover these topics in their articles, radio- and TV shows and in their publications on the Internet? 27 persons answered negatively, twelve respondents did not provide the answers and five students found difficulty to answer. Nevertheless, 76 students (63,3 %) are ready to raise these issues. Moreover, they commented their choice by indicating particular topics and social group whose rights are due to special attention. Table 3 [Table 3] presents answers to the question.

Table 3. Frequency distribution of answers to the question
‘What issue related to the human rights would you choose for your professional journalist activities?’

	answers	Number of respondents (n)
Topics of publications, plots and programmes touching upon human rights issues	Protection of rights of elderly people and people with disabilities	3
	Inequality and injustice	7
	Interesting topic	12
	Infringement and protection of citizens' rights	15
	Woman rights	4
	Rights of LGBT community	3
	Unjust laws	1
	Legal education, enhancement of legal culture	30
	It is sensitive and relevant topic in Russia	17
	Social and economic problems	11
Undecided (It is hard for me to say)		5
No answer		12
I would not choose this topic		27

As shown in Table 3 the main professional task for the future journalists is the development of legal culture of citizens, their legal education. The respondents indicated in the questionnaires that journalist activities “would help to educate the audience” and contribute to the popularisation of human rights topics in the Russian society, “it is important to attract attention of the society to the human rights issues, to be independent in one’s activities”. It is interesting that these answers mostly coincide with the main tasks of the third phase of the World Programme, i. e. to increase quality of journalist work and awareness of journalists about their public duty, including educating and providing information to the citizens. Students who answered negatively to the question wrote that they would not choose the human rights topic, because it is not interesting for them, there are more relevant and important subject; moreover, it already gets a lot of public attention. However, only five respondents provided these comments, while the remaining 22 students only said “no”.

The following question was linked with their professional activities as well. Students were asked to name the vulnerable group they would choose for coverage of human rights issues. The answers are presented in Table 4 [Table 4].

Table 4. Frequency distribution of answers to the question
‘Which vulnerable group would you choose for your journalistic plots?’*

	answers	Number of respondents (n)
Which vulnerable group would you choose for your journalistic plot	Women	39
	Children	23
	Youth	34
	Minorities	29
	Indigent people	37
	Victims of violence and war	39
	Senior citizens and people with disabilities	29
	LGBT	38
	Refugees	1
	Entrepreneurs	1
	Multi-child families	1
	Politicians and political activists	1
	Teachers	1

* *multiple choice was possible*

It represented interest to know which professional groups, according to the students, are needed a special human rights training. The answers were distributed in the following way:

Table 5. Frequency distribution of answers to the question:
‘Which professional groups need special human rights training?’*

	answers	Number of respondents (n)
Which professional groups need special human rights training?	Civil servants	84
	Judges, law prosecutors, investigators	91
	Policemen	70
	Parliamentarians	42
	Business Community	45
	Social welfare workers	74
	Teachers and medical staff	68

* *multiple-choice was possible*

It is worth noting that all students answered to the questions four and five, even those who refused to deal with human rights issues in their professional activities. The given tables reveal the awareness of the future journalists about the challenges that vulnerable groups face in Russian society.

It was important to find out the attitude of students towards World Programme for Human Rights Education. 34 respondents (28%) answered that they are aware of that Programme, while 86 persons (72 %) never heard about it. At the same time 106 students (88 %) supported the decision of the UN to choose journalists and mass media professionals as the target group for the third phase of the programme. 66 respondents (55 %) agreed with the inclusion of bloggers into the mass media professionals group.

In conclusion, students of the third year were asked to assess their knowledge of human rights on a five-point scale. This question was addressed to this category of students, because by that time they completed courses linked with human rights issue in general and journalist rights and journalists ethics in particular. 50 % of respondents assessed their knowledge as consistent, but with some gaps, 39 % believe that they possess general knowledge on human rights, 8,6 % assess it as very vague, and only one student consider it excellent. Students were asked to comment on their answers, but only 13% gave a try to explain their assessment. In our opinion, that explanation summarises the level of human rights training for journalists: "I have general ideas, because the training was «mutilated» and not consistent.

Conclusions

The research showed that the implementation of the third phase of the World Programme for Human Rights Training faces a number of challenges. Modern Russian standards for higher education do not envisage directly competences aimed at the solution of the tasks of third phase. There is no action plan for human rights education, approved by the Russian government, while there are some examples in other countries. Human rights courses are not adjusted to the Journalism curricula. Soft and hard skills of human rights protection are not directly included in Russian educational standard for Journalism studies.

As the survey results show, students do not possess enough knowledge on human rights. Only 7,5% of respondents could name the main international documents on human rights, at the same time 34% of students consider that their knowledge on human rights did no change during their studies at university.

At the same time some positive changes, linked with development of tolerance, dialogue, respect for diversity and human dignity, can be observed. The survey showed that students in Journalism are aware of public responsibility, intrinsic to their profession; they understand the importance of their future professional activities and link it with the human rights protection, as well as special role of journalists in legal education of citizens and development of their legal culture. For example, 63 % of respondents are ready to cover human rights issues in their articles and programmes. The vast majority of students were ready to protect rights of such vulnerable groups as woman, victims of violence and wars, LGBT community, etc.

Courses aimed at the development of such important skills for journalists as tolerance, respect for diversity, intercultural dialogue, fight with stereotypes and violence, are taught at Ural Federal University as it is required by the strategy of the third phase of the World Programme. Among them are "Professional ethics of journalist", "Fundamentals of tolerance", "Law in the activities of a journalist", "Journalism on the Internet". The latter course is particularly important for the implementation of the World Programme, one of the strategies of whose deals with the challenges of human rights on the Internet.

The authors of the article consider that the management of the university and the Journalism faculty in particular should use the interest of students in human rights issues and their readiness to improve their competences and knowledge in the field. The survey showed that the majority of students are ready to follow the course on human right, motivated, first of all, by their future work with people. Nowadays Russian higher education system allows creation of flexible curricula and learning paths. We believe that the use of these opportunities would allow inclusion of human rights issues in the programmes in Journalism and choosing individual learning paths by students.

İbn Sinanın Bilim Anlayışı

Prof. Dr. Sırrı AKBABA

Üsküdar Üniversitesi İnsan ve Toplum Bilimleri Fakültesi Psikoloji Bölümü

sirri.akbaba@uskudar.edu.tr

Özet

Öz görüşleriyle dünyaca tanınan bir filozof, bilimleri sınıflandırarak araştırma yöntemleri sunması ve dünya üniversitelerinde okutulan kitabıyla sağlık bilim adamı, uygulamasıyla ünlü bir hekim, açıkladığı hemen her konuyu tüm evren bağlamıyla ele alan bir aydın, dünya bilim sahasında saygın bir yer edinmesiyle, bilim ve felsefe tarihine mal olmasıyla, günümüzde de bilim insanlarına rehber olabilecek denli evrensel görüşleriyle inançlı bir Müslüman olarak tanınan İbn Sina, berrak, objektif bir gözlem ve derin bir tefekkür ile fikirler üreten, dünyaya ender olarak gelmiş olan şahsiyetlerdendir.

Günümüzde bilimsel gelişme, İbn Sina dönemiyle karşılaştırıldığında oldukça ileri bir düzeye ulaşmıştır. Sağlıklı bilimsel anlayışımızın ise bilimle aynı gelişimi gösterdiği söylenemez. Nitekim bilimin ürünü olan teknolojiyi bu gün insanlar birbirini öldürmek ve tabiata zarar vermek için kullanmaktadırlar. Bu nedenle önce bilim insanlarında ilkelere dönüşen, sonra da büyük halk kitlelerine sunulacak acil bir bilimsel zihniyete ve bu ihtiyacı giderici yeni paradigmalar üretecek düşünürlere ihtiyaç vardır.

Bilime ve bilimsel zihniyete yön veren kişiler, ürettikleriyle kendini dünyaya kabul ettiren kendinden önceki bilim insanlarını doğru tanıyanlardır. İbn Sina da diğer ünlü düşünürler gibi kendinden önceki filozof, bilim adamı ve düşünürlerden etkilenmiş, kendi dönemindeki inanç ve düşünceleri eserlerinde kullanmıştır. Bunlarla birlikte İbn Sina'nın günümüz bilim insanlarına ihtiyaçları olan bilimsel zihniyet konusuna esin kaynağı olacak büyük bir miras bıraktığı da açıktır. Yeni bilimsel zihniyet için İbn Sina'nın bilimsel bakış açısını yakından tanımak ve tanıtmak gerekmektedir. Çünkü İbn Sina özgün bilimsel bakış açısı ile bin yıl önceden bu günkü insanlığın ihtiyacı olan düşünceler sunmuştur.

Bu çalışmanın genel amacı; tüm evren ve insanlığın yararlanacağı sağlıklı bilimsel bir anlayışın oluşumuna öncülük edeceğine inandığımız İbn Sina'nın bilimsel zihniyetini bilim insanlarına tanıtmaktır.

Yukarıda verdiğimiz genel amaca ulaşmak için; İbn Sina'nın bıraktığı çok sayıdaki mirası içerisinden seçerek özetlediğimiz aşağıdaki konu başlıklarını genç bilim insanlarına açıklamak bu çalışmanın özel amacını oluşturmaktadır.

Aklı öncelemek,
Bilimlerin sınıflandırılması,
Bilimlerin birbiriyle ilişkisi,
İncelenen konuyu bağlamından koparmamak,
İnsanı evrenin tekliği ve bütünlüğü içerisinde değerlendirmek,
İnsanı, hem maddi hem de manevi yönleriyle birlikte incelemek,
Anahtar Sözcükler:İbn Sina, bilim anlayışı

Bilim

Bilindiği üzere bilim insan merakının ürünü olup, tanımaya ve çözmeye çalıştığı problemlerle birlikte başlamıştır. Günümüzde de bilim insanları aynı şekilde kafalarını meşgul eden bir problem ile işe başlarlar. Diğer bir ifadeyle bilim insanı bilinmeyenleri bilinir hale getirmeye çalışırken işe sorularla başlar.

Bilimsel Sorular İbn Sina, bilimsel sorularını temel sorular ve tikel sorular olarak iki başlık altında incelemiştir. (İbn Sina,2013d s.74):

Temel Sorular, Var olan ya da düşünülen her şeyi kapsayan genel sorulardır. Örnek olarak psikolojide tüm insanları içerecek temel kuralları belirleyen sorular tümel sorulardır.

İbn Sina tümel soruların sorulmasını mantıki sebeplerle bir sıraya koymuştur: Bir şeyi bilimsel olarak açıklarken ilk önce “o şey nedir”? sorusu ile başlanır. Sonra bunu “bu şey mutlak olarak var mıdır”? sorusu takip eder. Sonra “bu hangi şeydir”? sorusuyla devam edilir. Daha sonra “bu şey bilfiil olarak mı yoksa bilkuvve olarak mı vardır”? sorusu sorulur, en sonunda da “bu şey niçindir” sorusu sorulur. İbn Sina bu sıralamanın gerekçesini de şu şekilde açıklamıştır:

“O şey nedir? Sorusu, O şey var mıdır? Sorusundan önce gelmelidir. Çünkü o şeyin mahiyeti ve ismin mefhumunun (kavramının) mahiyeti (niteliği, içyüzü, özü) önce bilinmelidir. Diğer bir ifadeyle: Bir şeyin adını kavram olarak ele aldığımızda o kavramın ne olduğunun bilgisi, var olduğunu bilmemizden önce gelir. Bu şey mutlak olarak var mıdır veya şu hal ile mi mevcuttur? Bu soruyla tasdik amaçlanır. Bu hangi şeydir? Sorusuyla o şeyin kendi dışındaki şeylerden ayırt edilmesi talep edilir. Bu şey bil fiil (eylemli, gerçek) olarak mı var, yoksa bil kuvve (düşünce, Potansiyel) olarak mı vardır? Bu şey niçindir? Sorusuyla sebebin mahiyeti sorulmuş olur. Bu nedenle de bu şey bilfiil veya bil kuvve var mıdır? Sorusundan sonra geldiği konusunda hiç şüphe yoktur”.

Mantık yürütme insanın genel geçer yöntemi olduğu için; günümüzde de bilim insanları aynı yolu kullanmaktadırlar. Önce inceleme konusunun ne olduğuna açıklık kazandırılır. Sonra diğer sorulara geçilir: Psikolojiyi bilim sahasına çıkaran “yapısalcılık ekolünün savunucuları da, bu nedir? Sorusuyla işe başlamışlardır: Bu soruyla bilincin yapısının ne olduğu öğrenilmeye çalışılmıştır. Daha sonra ortaya çıkan Fonksiyonalistler, bilincin fonksiyonunu tanımaya çalışmışlardır. Diğer bir ifadeyle “bu niçindir? Sorusunu sormuşlardır.

Bu soruların sıralanışı, günümüz psikolojik danışma seanslarında da aynı sırayı takip etmektedir: Danışman, danışana soru tekniğini kullandığında önce “ne” sorusu ile işe başlar. “Niçin” kelimesi ile sorulan soru ise en sona bırakılır. Niçin sorusuna verilen cevapla, yaşananın içyüzü açığa çıkarılır. Bunun için de güven ortamının kurulmuş olması ön koşuldur. Bu sorunun cevabı güven duyulmayan kişilere verilmez. Aksi halde, “yorum” gibi ağır bir teknik sorusu olan “niçin” kelimesi, danışanda tedirginlik oluşturabilir.

İbn Sinanın yukarıda sıraladığı sorular, diğer bilimlerde de insan doğasının gereği olarak aynı sırayı takip eder: İnsan tanımadığı bir şeyi gördüğüne ilk olarak “bu nedir?” sorusunu sorar. Diğerleri ise sırasıyla bu sorudan sonra gelir. Buradan çıkaracağımız sonuç, İbn Sinanın daha bilime başlarken insan doğasını öncelendiği ve önemsediyordur. Bu çıkarımımız sadece insan doğası ile de sınırlı değil, İbn Sina, ister fizik isterse metafizik olsun incelediği bütün konularda doğal olana önem vermiş, bunun yanında doğal olmayana da karşılaştırmalı olarak tanıtmıştır. Mesela; yukarıya atılan bir taşın yukarı çıkmasının doğal olmadığını, yere düşmesinin ise doğal olduğunu; bedenın yaralanmasının doğal olmadığını ancak yaranın iyileşmesinin doğal olduğunu söylemiştir. Bunları da, taşın yukarıya çıkması ile bedenın yaralanmasının zorlama (arızı) sonucu olduğu için doğal olmadığını, atılan taşın tekrar yere düşmesinin ve yaranın iyileşmesinin ise o taşın ve bedenın dışarıdan zorlama olmadan özünde olandan kaynaklandığı için doğal olduğu, şeklinde açıklamıştır (İbn Sina, 2005).

Tikel sorular: Tikel sorular, bir türün yalnızca bir ya da birkaç bireyine ait olan sorulardır. Diğer bir ifadeyle tikel sorular cüz’ilerle ilgili sorular.

Bu şey nasıldır? Bu şey nerededir? Bu şey ne zamandır? Soruları tikel sorulardandır. Ali ile Ayşe’yi tanıtan kişisel özellikler daha çok tikel sorulara verilen cevaplarla elde edilmektedir.

Sonuç olarak; İbn Sina’nın asırlar önceden sınıflandırdığı “tümel ve tikel” sorular, günümüzde tüm bilim alanlarında kullanıldığı gibi, Psikoloji bilminde de gerek teorik bilgilere ulaşmak için gerekse uygulamada yararlanılmaktadır.

İnsan olmanın gereği olarak, tüm insanlarda ortak olan düşünme, hayatta kalma, yetkin olma, fizyolojik ihtiyaçları giderme gibi ortak nitelikleri tanımak için Psikoloji bilminde bireye özgü olandan ziyade, tüm insanları içeren tümel sorular sorulur. Yukarıdaki tikel sorularla da insanın bireysel farkları ortaya çıkarılarak o kişiye ya da sadece o gruba ait özellikler tanınabilir.

Bilimin Türleri ve Amaçları

İbn Sina bilimleri şu şekilde sıralamıştır:

1. Mantık ilmi, 2. Matematik ilimleri, 3. Tabiat ilimleri, 4. İlahiyat ve Metafizik.

İbn Sina, mantığı, önerme ve kavram mantığı şeklinde iki bölümde ayrıntılı olarak incelemiştir. Bilgi teorisi, bilim felsefesi ve mantık İbn Sina tarafından birlikte ele alınmıştır. Mantığı bilgi teorisi ve bilim felsefesiyle birlikte ele alışı, İbn Sina’nın hem her bir bilimin kendi içerisindeki bütünlüğe verdiği önemi, hem de her bir bilimin kendi sınırları dışına taşan yanının felsefe içerisinde incelenmesi gerektiği duyarlılığını göstermektedir.

İbn Sina bilimleri sınıflandırırken felsefeden başlamıştır. O’na göre, “Felsefi ilimler, ...teorik ve pratik olmak üzere ikiye ayrılır... Teorik bilimler, nefsin teorik gücünü yetkinleştirmeyi talep ettiğimiz ilimdir. Bu da kavram ve önerme bilgisinin oluşmasıyla gerçekleşir... Şu halde teorik ilimdeki gaye bir düşünce ve inancın oluşmasıdır. ... Pratik ilim ise... Amellerimiz olan şeyler hakkında teorik gücün yetkinleşmesinin... Bu sayede pratik gücün ahlakla yetkinleşmesinin talep edildiği ilimdir” (İbn Sina, 2013b, s. 2). Bu sözleriyle İbn Sina, sınıflandırmasının daha başlangıcında ikiye ayırdığı bilimlerin her ikisinin de insanın gelişip yetkinleşmesine hizmet için olduklarını vurgulamıştır. İnsanı odağa alan bu vurguya günümüzde ne kadar çok ihtiyaç duyulduğu hemen herkes tarafından bilinmektedir.

İbn Sina bu sınıflardan nazari (teorik) olan ilimlerin matematik, tabiat ilimleri ve metafizik olduğunu ifade etmiştir. İbn Sina Psikolojiye de tabiat felsefesi içerisinde yer vermekle birlikte nefsin bağımsız ve gerçek bir varlık (cevher) olduğunu ve ölümsüzlüğünü de savunmuştur (Alper ve diğ. 1999). Ahlâk ve siyaseti de ameli (pratik) ilimler olarak görür. O’na göre Nazari bilginin gayesi *hakikat*, ameli bilginin gayesi de *iyilik*dir. Hak ve hakikat arayışı diğer bir ifadeyle gerçeği bulma çabası, genelde insanın özelde ise bilim insanının doğasında bulunan bilme merakının ürünüdür. Pratik bilgilerin Amacı olan iyilik ise insanın doğasında çekirdek ya da öz olarak bulunsa da çevresi tarafından yeşertilmesi ve açığa çıkarılması gereken insanlaştırma sürecinin ürünüdür. İslam dini, insanın hak, hakikat ve iyilik üzere yaşamasını öğütlemiş ve inananları bu doğrultuda motive etmiştir. İslam inancının bu öğretileri sonucu; İbn Sina da kendinde var olan hakkı arama ve iyilik hedefi doğrultusunda çalışmayı gerek teorik gerekse pratik bilimlerin gayesi olarak görmüştür.

Eğitim Anlayışı

Eğitim algılama (idrak) etme ile başlar. Ele aldığı her konuyu en ayrıntısına kadar inceleyen İbn Sina, “idrak” dediği bilme sürecinde insanın en temel üç özelliğinden bahseder: Bilmek, İstemek ve yapmak (Alper ve diğ.1999):

Bilmek: Zihinde bilme süreci iki kaynağa bağlı olarak iki farklı şekilde gerçekleşir:

1)Soyutlama yoluyla gerçekleşen bilme: Fiziki varlıkların bilgisine bu yolla ulaşılır. Somut varlıkların bilgisi çeşitli soyutlama derecelerinden geçerek zihinde oluşur. Nesnel dünya verileri, zihinde çeşitli aşama ve işlemlerden geçerek bir kavram ve yargıya ulaşır.

1)Soyutlamaya gerek duyulmadan doğrudan kazanılan bilme: Manevi ve metafizik bir şeyin bilgisine bu yolla ulaşılır. Bu tür (metafizik) bilgiye ulaşılması için zihnin uyarıcı bir işaretle ona yönelmesi yeterlidir (Kaya,2014).

Bir şeyi bilmek çok önemlidir, ancak tam idrak etme konusunda tek başına yeterli değildir. İnsan bildiğini yaparak, onu daha üst düzeyde öğrenmiş olur. Şoför olmak isteyen bir kişi, vites, fren, direksiyon ve bunların işlevlerini bilerek öğrenmeye başlar. Teorik olarak bu öğrendiklerini, arabayı kullanarak uyguladıktan sonra şoför olma sürecinde bilme sürecini daha üst düzeye çıkarır. Profesyonel şoförlük ise, bildiklerini isteyerek tekrar etme oranıyla doğru orantılı olarak oluşacaktır. Neticede üst düzey bir algılama, bilme, bilmeyi isteme, bildiklerini istekli olarak uygulamanın ürünüdür.

Bilimlerin en önemli amacının iyi ve yetkin insan yetiştirmek olduğunu vurgulaması ve eğitimle insanların algı (idrak) düzeylerinin yükseltilmesi için yöntemler sunması İbn Sina’nın bilimi günümüzde olduğu gibi sadece bir şeyler üretmek için değil, insana yönelik yüce amacı olan araçlar olarak görmesindendir. Nitekim Ariflerin eğitimini ayrıca ele alan İbn Sina, kâmil insan yetiştirmenin farklı yöntemini de sunmuştur.

Aklı Öncelemek

İbn Sina insanı cansız, bitki ve hayvandan ayıran en temel özelliğin akıl olduğunu savunmuştur. Akli türlere ayırarak açıklamış ve “kutsi akıl” sahibi peygamberleri hariç tutarak, tüm bilim insanlarının araştırma yaparken mantıktan uzaklaşmalarını öğütlemiştir.

Bilim alanında akli devreye sokmadan yapılan çalışmalardan elde edilenlerin bilim olmadığını söyleyen İbn Sina, batı dünyasının günümüz pozitivist bakış açısı ile ürettiklerini tercüme ederek bilim yaptıklarını sananları, çağlar ötesinden uyarmıştır. Özgün akli devreye sokmadan orijinal ürün elde edilemediği artık hemen herkes tarafından da açık bir şekilde bilinmektedir.

İbn Sina’nın öncelediği akıl, 20.yydaki pozitivist akıldan farklıdır: İbn Sina, Algıyı duysal algı ve akli algı diye ayırarak; akli olanın sınırsız olduğunu, duysal algının ise az olduğunu söyleyerek akla daha fazla önem verdiğini göstermiştir. O’na göre haz ve elem vericiler görevlerini yerine getiremiyorsa bunun nedeni; o uyarıcılardan değil, insanın kendindendir. Bu tespiti bir örnek üzerinden açıklayacak olursak; herhangi bir hastalık belirtisi olan ağrı, insanı tedavi olmaya yöneltmiyorsa bu, ağrı duyusunun suçu değil, insanın bizzat aklını devreye sokmamasının bir neticesidir.

Bilimlerin Birbiriyle İlişkisi

Herhangi bir bilim alanında uzmanlaşmanın yararlı yolları bilinmektedir. Bunun yanında diğer bilimlerle işbirliğini sürdürmeyen bilim insanının kendini geliştiremediği de gözlenmektedir. İnceleme konuları farklı olan bilimlerin, inceledikleri herhangi bir konuyu açıklarken birbirinden yararlanmaları gerektiğini İbn Sina bizlere asırlar öncesinden bildirmiştir. O, fiziğin konusu olan maddeyi incelerken açıklanamaz bir aşamaya gelindiğinde onu metafiziğe havale etmiştir.

20. Yüzyıla damgasını vuran pozitivist bakış açısı, asırlaröncesinden İbn Sinanın önemine dikkatleri çektiği disiplinlerarası işbirliğinin ötelenmesine yol açmıştır. Bu nedenle 21. Yüzyıla girdiğimiz bugün bilimler arası işbirliği ya da “İnterdisipliner” çalışmalar, bilim sahasında daha yeni popüler olmaya başlamıştır.

İncelenen Konuyu Bağlamından Koparmamak

Bilimlerin felsefeden doğduğunu her bilim tarihçisi bilmektedir. Bu bilgiye rağmen bilimler felsefeden koparılarak incelenmeye devam edilmektedir. Bu, büyük bir çelişki olduğu gibi birçok hatanın da kaynağıdır. Çünkü incelenen, zemininden koparılmış şeklin doğurduğu yanlış ve eksik algılamalara sebep olmaktadır. İbn Sina’nın konuyu bağlamıyla birlikte inceleme şekli, gerek incelenenin araştırma alanını gerekse araştırma yapanın görüş açısını daraltarak meydana gelecek eksik anlaşılmalardan ve algılamalardan korumaktadır.

İbn Sina müzik konusunu incelerken; ondaki ritmik ahengi matematikle ilişkilendirmiş, musikinin matematiğin bir dalı olduğunu söylemiştir. Diğer bir ifadeyle bu gün bizim yaptığımız yanlışla düşmemiş, musikiyi bağlamı olan matematikten koparmadan açıklamıştır. Aynı ahengin evrende olduğunu da bildiği için matematiği de evren bağlamında incelemiştir.

İnsanın bağlamı ailesi, ailenin bağlamı bulunduğu mahalle, köy, şehir ve ülkedir. Ülkenin bağlamı ise nihayetinde dünya ve tüm evrendir. Kişinin davranışı, ailesi tanınmadan doğru bir şekilde açıklanamaz. Ailenin davranışı bulunduğu mahalle, köy, şehir ve ülkesi dikkate alınmadan açıklanamaz. Herhangi bir ülke de, dünya ve evren

içerisindeki psikolojik, sosyal, ekonomik, coğrafi ve ekolojik konumundan soyutlanarak doğru açıklanamaz. Sonuç olarak herhangi bir konu, bağlamından kopararak doğru tanınmaz ve tanıtılamaz.

İnsanı Evrenin Tekliği ve Bütünlüğü İçerisinde Değerlendirmek

İbn Sina'ya göre “Birbirinde son bulacak şekilde bulunan cisimler tek bir bütündür”. Tek bir âlem olduğunu ileri sürerek bu görüşün zıttını savunanların yanlışla sapmalarının iki nedenini İbn Sina şu şekilde açıklıyor (İbn Sina. (2010) s.77):

1. Doğa bilimine uygun ancak yanlış bir yöntem izlemişlerdir.
2. Doğa bilimine uygun olmayan ancak felsefi ve mantıksal olan bir yanlış yöntemdir.

Düşünürlerin ve bilim insanlarının düştükleri hata nedeni olarak gördüğü İbn Sina'nın bu iki maddesi aynı zamanda bilimsel yöntemlerde dikkat edilmesi gereken iki hususu da bizlere sunmuştur: 1. Bilimsel bilgi, felsefi ve mantık olarak yanlış olmamalı. 2. Bilimsel bilgiye götüren yöntem yanlış olmamalı. Nitekim yanlış mantık ve yanlış yöntem doğru bilgiye ulaşmanın engelleridir.

İbn Sina'nın “davranışları amaca yönelik olan tek bir evren fikri”, en önemli miraslarından. Evrendeki her bir varlığın diğerleri ile ilişkisi olduğu ve aralarında boşluk olmadığı tespiti, zamanında doğru okunmuş ve anlaşılmiş olsa idi insanlar çevreye bu kadar zarar verememiş olurlardı.

Psikanaliz, varoluşçu, davranışçı gibi diğer ekoller eleştiren Gestalt Psikolojisi, insanı bilinç, bilinçaltı, davranış v.b. gibi sadece parçaları ile tanıyamayacağını vurgulayarak; “gestalt” dedikleri anlamlı bütün ile tanınabileceğini savunmuştur. Bu görüşü İbn Sina, bin yıl öncesinden bizlere göstermeye çalışmış, hatta Gestaltçıların sunduğu görüşten çok daha büyük bir bütünlük içerisinde insanı tanıtmaya çalışmıştır. İnsanı ve diğer varlıkları ailesinden, büyüdüğü kültürel ve fiziki ortamdan, dahası dünya ve evrenden koparmadan incelemiştir. Evrenden bağımsız olmayan insandan ayrıntılı olarak söz etmiştir: Varlık olarak, cisim, suret ve cevher özellikleriyle hem metafizik hem fizik bilimlerine konu olan tüm yanlarıyla insanı anlamaya ve anlatmaya çalışmıştır.

Bu gün insanlığın içine düştüğü girdap, İbn Sina'nın bu bütüncül anlayışına sahip olamamaktan kaynaklanmaktadır. Bu bütüncül anlayışın yokluğu, önce maddi olarak gelişmiş ülkelerde sonrada gelişmiş ülkeleri taklit eden fakir ülkelerde insanlara bencilliği önemsetmiş ve tüm dünya insanlarına benimsetmiştir. Bencilliğin doğurduğu aç gözlülük, ötekileştirme, yalıtılmışlık ve yabancılaşma süreci, sadece insanlar arasında değil, tüm evrenden kopuk bir şekilde ve evrene zarar verici tarzda yaşanmaktadır. Bu şekilde kâr ettiğini sanan günümüz insanı, gerçekte ise en büyük zararı kendine vermektedir. Çünkü insan, diğer insanlar, dünya ve evren İbn Sina'nın tespit ettiği gibi tek bir varlıktır. Birine verilen zarar diğerlerine de verilmiş olur. İnsanlığın düştüğü bu acması girdaptan kurtulması, İbn Sina'nın bilim anlayışındaki bütüncül bilginin, tüm insanlarda inanca dönüşmesi ile mümkündür.

İnsanın Hem Nesnel (maddi) Hem de Öznel (manevi) Yönlerinin Oluşu

Psikoloji biliminin gelişmemiş olması genellikle insanın en son kendisini görebilmiş olması ile ilişkilendirilmiştir. Bu doğrudur, ancak psikolojide fazla ilerleyememenin tek nedeni değildir. Psikolojinin geri kalmasının en önemli nedeni; en son bilim oluşu yanında, insanın davranışları gibi sadece nesnel (maddi/objektif) yanı üzerinde araştırmaların yapılmış olmasıdır. Hâlbuki insanın öznel (sübjektif/manevi) yanı üzerinde de araştırmalar yapılmalıdır.

İbn Sina, cisimlerin hem objektif hem de sübjektif yanlarını incelemesine rağmen, bu gün bilim insanları öze suretten, iç duyulara dış duyulardan, gözlenmeyene gözlenenden, ruha bedenden daha az önem vermiş ve insanın sübjektif yanının tanınmasını ihmal etmişlerdir. Logo Terapinin kurucusu Victor Frankl, psikolojinin adını hak edebilmesi için isminin iki yanı olan hem ruha hem de anlama, gereken önemi vermesi gerektiğinin zorunlu olduğunu vurgulamıştır (Frankl,1999). Adler ise Terapisinde danışanı ve problemini doğru tanımak için onun öznel ve nesnel yanlarının önce ayrı ayrı, sonrada bu iki yanın bütünlleştirilmesini yöntemi içerisine koymuştur (Gerald Corey, 2005).

Bilimsel Anlayış İçerisinde “İtidalli” Oluşa önem verme

Mutedillik, İbn Haldun da olduğu gibi İbn Sinada da önem verilen bir kavramdır. Normal dışı olanlardan hareketle gerçeğin dışına çıkıldığı, iyi olanın normal olan üzerinden üretilceği hemen herkes tarafından bilinmektedir. Normal olan hem örneklem bakımından evreni temsil etme niteliğine sahiptir hem de bunun üzerinden doğru bilgilere ulaşmak daha çok olasıdır. Nitekim bu gün Freud'un psikolojik bulgularının en çok eleştirildiği yönü, verilerini normal insanlar üzerinden değil de haslardan derlemiş olmasıdır. Nitekim hasta insanlardan elde edilen veriler, hem sayı bakımından hem de nitelik bakımından diğer tüm insanları temsil etme gücüne sahip değildir.

Sonuç olarak: Yukarıda özetlemeye çalıştığımız İbn Sina'nın bilimsel yaklaşımı; kendisine sunulan ortam sayesinde bir taraftan kendinden önceki Aristo, Farabi gibi filozofları okumuş olması ve kendi dehasının ürünü, diğer taraftan da yaşadığı çağa damgasını vuran İlk emri “oku” olan İslami zihniyetin bilim sahasına yansmasıdır. Bilimi, insanların mutluluk aracı yapmaya çalışan İbn Sina'nın bilim anlayışına tüm dünya ve dahası evren ihtiyaç duymaktadır. Bu ihtiyacın giderilmesi, tüm insanlarda genelde evreni, özelde ise insanı merkeze alarak önemseyen bir zihniyet değişimi için eskimeyen eski düşünürlerimizi ve düşüncelerini tanımalı ve tanıtmalıyız.

Abstract

This article presents some of the results obtained in an investigation whose purpose is focused on the identification of the level of training and know-how that teachers, and future teachers of primary education (students who are studying the degree of primary education), have regarding the application of ICT for people with special needs. The investigation was done with a sample of 533 students that were studying in 11 public universities and 777 teachers from elementary schools from 17 communities from Spanish Autonomous Communities. As a strategy for collecting information, we employ two questionnaires made ad hoc, validated by the "Coefficient of expert competence" or "K coefficient". The level of reliability of the instruments was analysed using Cronbach alpha ($\alpha = 0.993$ and 0.992 respectively). The results of the work, from the information contained in the questionnaires, allow among the conclusions to highlight the low training of future teachers, as teachers currently working, with respect to the application of ICT for students with a disability. Likewise, detected the existence of a positive and significant relationship between training levels indicating both the future teachers and current teachers have and the degree of knowledge with respect to ICT to be applied with the people with disabilities.

İletişim Fakültesi Öğrencilerinin Televizyon Dizilerine Bağlılığı ve Günlük Hayatlarındaki Model Alma Eğilimleri

Prof. Dr. Aytekin İŞMAN

Kürşat ÖZMEN

Sakarya Üniversitesi Sosyal Bilimler Enstitüsü Doktora Öğrencisi

Özet

Televizyonun hayatımıza girmesi neredeyse bir asra yaklaştı. Bu arada diğer mecraları hızla geride bıraktı ve en popüler kitle iletişim aracı haline geldi. Popülerliğinin en önemli nedeni ulaşamadığımız arzuladığımız hemen hemen her şeyi evimize cam bir ekranla getirmesidir. Dünya üzerinde binlerce televizyon kanalı hemen hemen her beğeni ya da ilgi grubu için içerikler üretiyor ve bunların sayısı gün geçtikçe artıyor. Türkiye’deki yayıncılık macerası da dünyadaki gelişimi ile paralellik gösteren televizyonlar, artık evlerin, ofislerin hatta sosyalleşme mekânlarının vazgeçilmez birer eşyası haline geldi.

Televizyonun günlük hayatımızdaki yeri, kapladığı zaman kadar bu mecraı kullanma alışkanlıklarımız açısından da önemlidir. Eğlence, eğitim, bilgilendirme gibi birçok işlevi olan televizyon günümüzdeki en yaygın ve etkili kitle iletişim aracıdır. Hayatımızı etkileme şekli o kadar baskın bir hale geldi ki günlük işlerimizi bile televizyondaki ilgi alanlarımıza göre planlar hale geldik. Bugün bir oturma odası tasarlanırken artık çözülmesi gereken ilk sorun televizyonun yeridir. Televizyonun eşya seçiminde referans noktası haline gelmesi evdeki en önemli ve kıymetli zamanı ona ayırdığımızın da bir göstergesidir.

Bu kadar hayatımızın merkezine konumlandığımız televizyonda neler izlediğimizle ilgili birçok araştırma mevcut. Ancak reyting sonuçlarının da ortaya koyduğu gibi en çok ilgi çeken yapımlar diziler. Her akşam prime time’da yayınlanan diziler arasında kıyasıya bir rekabet var. Bu rekabetin kazananları aynı zamanda günün geri kalanının da kazananı olabiliyor. Çünkü insanlar, günün geri kalanında popüler dizileri konuşmaya, karakterleri yaşatmaya ve olayları çözümlemeye odaklanıyorlar. Bu etkileşim onların sosyalleşmesi, günlük hayatlarını şekillendirme ve karar almalarında etkili olabiliyor. Bu çalışma Russell, Norman ve Heckler’ın, “Televizyon Programlarına bağlılığın ölçülmesi” için geliştirdikleri yöntem üzerinden üniversite öğrencilerinin dizi izleme alışkanlıklarını ve günlük hayatlarına yansımaları Elihu Katz’ın kullanımlar ve doyumlar kuramı çerçevesi içinde ele almaya çalışmıştır.

Anahtar kelimeler:Televizyon, dizi, izleyici alışkanlıkları, bağlılığın ölçülmesi, kullanımlar ve doyumlar

Giriş

Toplumlar genişledikçe ve ortaya yeni ilişki biçimleri çıktıkça haberleşmenin boyutları da buna bağlı olarak değişmiş ve gelişmiştir. Kitle iletişimini bir sistematiğe ve etkileşime dönüştüren araçlar, önceleri yazılı eserler aracılığıyla gerçekleşmiş ancak teknolojiye bağlı olarak bunların kapsamı hatta ulaşım yani etki alanları genişlemiştir. Elektronik dalgaların mesaj taşıyıcı haline getirilmesiyle telgraf yayınları hızlı ve coğrafi koşullardan daha az etkilenecek haberleşmenin önünü açmış ancak daha sonra bu dalgaların aynı anda birçok kaynaktan alınabilmesi yani radyo dalgalarıyla gerçekleştirilmesi kitle iletişimini bir daha geri dönülemeyecek şekilde değiştirmiştir. Artık herkes evinde, iş yerinde dünyanın başka yerlerinden bilgileri zamanla küçülen elektronik kutulardan alabilme olanağına kavuşmuştur. Radyo yayıncılığı 20 yüzyılın başında dünya genelinde bir yayılımına ulaşmış. Ve artık evlerin baş köşesinde yerini almıştır (Harte, 2002, s. 12).

Bu kutulardan alınan mesajlara bir de görüntü eklenince insanoğlu, kitle iletişiminde rönesans dönemine girmiştir. 1930’lu yıllara uzanan bu hikaye, artık evlere dünyanın başka köşelerinden her şeyin konuk olması olarak da adlandırılmış ve söz konusu olanak yeni istek ve ihtiyaçlar ortaya çıkarmıştır (Gray & Bell, 2013, s. 2).

Aslına bakıldığında televizyon bir çamaşır makinesi veya bir ocak gibi bir evin temel ihtiyaçlarından biri değildir, insanlar pekala onsuz da hayatlarını sürdürebilir. Ancak geline nokta televizyon alımına yönelik planlar evlerin birçok ihtiyacından önce yapılıyor ve hatta odaların dizaynlarını bile bu seçimler belirlemektedir (Cavendish, 2007, s. 9).

Önceleri siyah beyaz başlayan televizyon serüveni renklendikçe, saatleri arttıkça ve bu nedenle de ekrana getirdiği çeşitlilik arttıkça, günlük yaşamın merkezine daha fazla yerleşmeye başlamıştır. Ancak görsel sanatların o dönemdeki en büyük aktörü sinema, varlığı için en büyük tehdit olarak gördüğü televizyonla önceleri yapımlarını asla paylaşmamıştır. Ancak zamanla bu kitle iletişim aracının etkisi ve yayılımına karşı duramayınca direnişini esnetmek zorunda kalmıştır (Cavendish, 2007, s. 25).

Türkiye, televizyon yayıncılığı ile ancak 20 yüzyılın ortalarında tanışabilmiştir. 1952 yılında İstanbul Teknik Üniversitesi Elektrik Fakültesi’nden bir grup akademisyen kişisel ve okulun olanaklarıyla kısıtlı bir televizyon yayını yapmaya başlamıştır. Daha sonra devlet televizyonu bu işe el atmış ve uzun yıllar Türkiye’de televizyon sadece kamu eliyle sürdürülmüştür. (Özçağlayan, 2000)

Özel sektörün televizyon yayıncılığına girmesi ise 1 Mart 1990 yılında uydu üzerinden yapılmaya başlanmıştır. O dönemde yasal bir düzenleme olmadığı için çok tartışılan bu televizyon kanalı ve yayınları ilerleyen yıllarda frekans ihaleleriyle birbiri ardına yayın hayatına girmiştir. Özel televizyonların yayına başlaması Türk televizyon yayıncılığını içerik anlamında çeşitlendirmiş ve Türk halkının günlük yaşamında renkli kutunun yerini inanılmaz boyutlarda artırmıştır (Özçağlayan, 2000).

Gelinen noktada bugün yapılan araştırmalar, ülkede boş zamanlarını değerlendirmek için toplumun yüzde 90'ından fazlasının ilk faaliyet olarak televizyon izlemeyi tercih ettiği ortaya çıkmaktadır (TÜİK, 2015). Hatta televizyon izleme oranları açısından Türk halkı dünyada ilk 15 arasındadır (Özertem & vd., 2014, s. 5). Bu zamanı ise kullanım şekilleri ise kişiden kişiye değişmektedir. Ancak en fazla seyredilen programlar genellikle prime time yani yoğun saatler veya televizyonculuk jargonunda belirtildiği gibi 'altın saatler'de yayınlanan programlardır. Televizyonların bu saatlerde en çok seyredilen programları ise dizilerdir. Televizyonun en çok izlendiği saatlerin neredeyse yüzde 70'ini televizyon dizileri kaplamaktadır (Özertem & vd., 2014, s. 9). Talebin boyutu arzı da şekillendirmekte ve her sezon televizyon ekranlarında 100'e yakın dizi yayına girmekte bunların yarısına yakını devam edecek düzeyde reyting yakalayamadığı için erken final yapmak zorunda kalmaktadır (Özertem & vd., 2014, s. 35). Sonuç olarak diziler Türk televizyon izleyicisi üzerinde günlük hayatı açısından önemli bir etkiye sahiptir. Türk televizyonlarında ilk dizi 1972 yılında yayınlanan bir Fransız yapımı Bedava Dünya Gezisi'dir. İlk yerli dizi yapımı ise yine TRT'de 1975'de yayınlanan Halit Ziya Uşaklıgil'in aynı isimli kitabından uyarlanan Aşk-ı Memnu'dur. 6 bölümlük bu denemeden önce genellikle yabancı yapımlar seslendirme ile izleyicinin beğenisine sunulmuş, daha sonra ise yerli yapımlar ardı ardına yayına girmiştir (Çelenk, 2010).

Amaç

Her araştırmanın amacı aslında hayattan bir kesit alarak elde ettiği verilerden anlamlı bir sonuca ulaşmaktır. Bu araştırmada da motivasyon bugün artık günlük hayatımızın önemli bir parçası haline gelmiş televizyon izleme alışkanlıkları ve bunun günlük hayatlara yansımaları tespit etmektir. Bu doğrultuda televizyon denilen kitle iletişim aracının aslında en etkili ve en çok izlenen yapımları seçilmiştir. En çok izlenenleri açmak gerekirse diziler, filmler, yarışma programları, haber-spor programları örnek olarak verilebilir. Ancak ölçümlenmek istenen şey bu iletişim aracıyla ortaya çıkan etki yani bağlılık olunca toplumun örnek alma noktasında en çok başvurduğu yapımların diziler olduğu bilinmektedir. Dolayısıyla da söz konusu yapımlardan hayatların nasıl etkilendiği ortaya konmak istenmiştir. Bu etki bazen bir duygu durumuna karşılık gelmektedir. Çünkü insanlar görece boş zaman olarak değerlendirdikleri periyodu iyi geçirmek motivasyonu söz konusu yapımları bazen gerçek hayattan kaçış ya da onunla yüzleşme olarak görebilmektedir. Daha önce yapılan araştırmalar (Russell, Norman, & Heckler, 2004) bazı dizileri seyretmenin sorunları unutmakta veya onları çözmeye yararlı olduğunu ortaya koymuştur. Araştırma ile elde edilmek istenen verilerden biri de bu yapımlardan ortaya çıkan esinlenme halidir. Bu bazen o prodüksiyonlarda kullanılan mekanlar, giyimler veya diğer günlük ihtiyaçlar olmaktadır. Dizilerden etkilenecek yapılan alışveriş veya tercihler bu araştırmanın ortaya çıkarmak istediği unsurlardan biridir. Esinlenme hali bazen kendini örnek alma olarak da göstermektedir. Dolayısıyla özdeşim kurulan karakterler, hayat mücadelesi sürecinde insanlara ne oranda kılavuzluk etmektedir ortaya çıkarılmak istenmektedir. Tüm bu esinlenme ve örnek alma davranışı, günlük hayatla büyük oranda kesişmekte ancak bunun etkilerini ortaya çıkarmak için iyi ölçekler geliştirilmelidir. Bu yüzden araştırmacı, sadece satın alma davranışı veya zaman planlaması açısından değil refleks haline gelen günlük davranış şekillerine bu yapımların yansımaları da ortaya koymak istemiştir.

Önem

45 yılın sonunda bugün artık televizyon dizileri Türk izleyicisi için günlük hayatını bile planlamada etkili bir konuma yükselmiştir. Dolayısıyla hayatın bu kadar merkezinde yer alan yapımların günlük hayata etkisinin araştırılması gerekmektedir.

Her yıl 70'ı aşkın yapımın yayına girdiği ülkemizde (Özertem & vd., 2014), toplumun büyük oranda beslendiği şeylerin başında dizilerin geldiğini söylemek yanlış olmaz. Dolayısıyla bunların etkileri toplumun değişen ve farklılaşan dinamiklerini anlamakta kılavuzluk edecektir.

Yapılan çalışmalar genellikle eğitimci ve kuramsal iletişimci perspektifler açısından hareket etmektedir. Ancak tutumların ortaya konması aslında içeriklerin ne oranda izleyicinin önüne getirilmesinden bazen daha önemlidir. Çünkü iletişim, aslında insanların görmek istediği ve duymak istediğidir çoğu zaman. Yapımların türleri, konuları ve işleyiş şekilleriyle ilgili araştırmalar bir noktadan sonra varsayımlarla ilerlemektedir. Ancak hedef kitle üzerindeki etkileri de araştırılması gerektirir. Elbette bunun bir bayrak yarışı olduğu diğer veriye sahip olunmadan bu araştırmada hedeflenenlerin tam sonuca götürmeyeceği de unutulmamıştır. Araştırmanın geleceğin iletişimcileri olan iletişim fakültesi öğrencileri üzerinde yapılması belki yarının trend yaratıcılarının yönelimini ortaya koymak açısından da önemli bir bilgiye götüreceği düşünülmektedir. Onların bakış açılarının geleceğe dair bir projeksiyon sağlayacağı varsayılmaktadır.

Bu araştırmada elde edilen veri, Sakarya Üniversitesi İletişim Fakültesi öğrencilerinin

1. Dizi izleme alışkanlıklarının yarattığı bağlılığı ölçümleyecek
2. Bu yönelimlerin kullanımlar ve doyumlar kuramı açısından bir kaçış olarak algılanıp algılanmadığını

3. Günlük kıyafet seçimlerinde izledikleri dizilerin etkisini
4. Sözlü iletişim kültürü açısından günlük konuşma hatta jest ve mimiklere etkisini
5. Günlük sorunları anlamak, bunları çözerken dizilerden ne kadar örnek ya da ilham alındığını
6. İzlenen dizilerin özdeşim kurma açısından istek ve tutkulara etkisini
7. Daha entellektüel unsurlar açısından kişisel eşya seçimi ve kullanımına yönelik soruları yanıtlamaya çalışmaktadır.

Literatür

Kullanımlar ve doyumlar araştırmaları

İnsanoğlu ilk andan itibaren bir varoluş çabası içinde olmuş ve bu çabayı gerçekleştirmek için belirlediği veya ihtiyaç duyduğu şeyler için hep mücadele etmiştir. Bu gereksinimleri en iyi betimleyen ise Abraham Maslow olmuştur. Geliştirdiği piramit modeli ile insanların hayatlarını geliştirdikçe ihtiyaçlarının da arttığını ve karmaşıklaştığını ortaya koymuştur. Yeme içme (açlık-susuzluk) gibi fizyolojik ihtiyaçlar bu piramidin en alttaki bölümlerini yani temel ihtiyaçları karşılarken, bunlar karşılandıktan sonra ortaya yeni ihtiyaçların çıktığını tespit etmiş ve sosyal bilimlerin ufku değişmiştir (Maslow, 1943). Yeni ihtiyaçlar, güven ve emniyet, bir düzenin parçası olma, sevmeye ve sevilme, değer görme, başarı, saygı ve en önemlisi kendini gerçekleştirmedir (Cüceloğlu, 2004, s. 236). Günümüzde ise bu ihtiyaçlar değişmeye de farklılaşmış ve değişen koşullar içinde insanoğlunun yeni mücadeleleri hatta uğraşları ortaya çıkmıştır. Günümüz insanı yani modern toplumun bireyleri için en önemli ihtiyaç dünyayla bağlantı halinde kalmaktır. Çünkü artık geçen yüzyıldan daha fazla iletişim olanağı vardır. Bu bağlantı durumu veya bu süreç için yeni ihtiyaçlar ortaya çıkmıştır. Araştırmalar bu ihtiyaçların ortaya çıkış ve etkilenme şeklinin büyük oranda kitle iletişim araçlarıyla gerçekleştiğini belirlemiştir. Bu tür yönelimleri ve ihtiyaçları inceleyen Elihu Katz, yarım yüzyıl önce bugünün dimaniklerine ışık tutacak modele ulaşmıştır (Katz, 2010).

Çünkü artık modern dönemin bireyleri, ruhsal ihtiyaçlarını karşılamak istemektedir. Bunu da uzaklaşmaya veya kaçış, rahatlama ya da eğlence olarak konumlandırmakta ve zamanını planlama şeklinde hayata geçirmektedir. Elbette bu psikolojik ihtiyaçların en etkili ilacı kitle iletişim araçlarıdır. Bu bulgulardan yola çıkan Katz ve arkadaşları, geliştirdikleri kullanımlar ve doyumlar kuramı ile medyayı yani kitle iletişim araçlarını ve onların hedef kitleleri yani toplumu incelemiş ve her ikisinin birbiri ile etkileşimini ortaya koymuştur. Bu araştırmalardan yola çıkarak yeni araştırmalar ve modeller de geliştirilmiştir. McQuail ve Windahl'a göre (2010) aktif izleyici kavramının ortaya çıkmasında ve dolayısıyla, kuramın son halini almasında Blumler ile Katz'ın emekleri belirleyici olmuştur (Alioğlu, 2016). Kullanımlar ve doyumların peşine düşenler, kitle iletişim araçlarının oluşturduğu sosyal ve psikolojik kökenli gereksinimleri irdeleyerek kuramı geliştirilmiştir. Kullanımlar ve doyumlar araştırmaları 'Medya insanlara ne yapar?' sorusuna karşı 'İnsanlar medya ile ne yaparlar?' sorusu üzerinde durmaktadır. (Denis & Windahl, 2005, s. 166)

Kitle iletişim araçlarını kullananların temel olarak ne düşündükleri ve ne hissettikleri anlaşılmaya çalışılmış, Klapper tarafından 'kaçış aracı' olarak bir cazibe unsuru tanımı içine alınmış, böylece bir işlevsel yönelim olarak tanımlanmıştır. Klapper'e göre kitle iletişim araçları; rahatlama, hayal gücünü harekete geçirme, başkası adına yapılan etkileşime olanak sunma, toplumsal ilişki için ortak zemin oluşturmaya aracılık sağlamaktadır. (Denis & Windahl, 2005, s. 167)

Kullanımlar ve doyumlar araştırmaları temelde insanların esas ihtiyaçlarını medya üzerinden nasıl karşıladıklarını tanımlamaya çalışır. Çünkü insanlar kendi ihtiyaçlarına veya takip ettikleri içerikler üzerinden edindiklerine göre zevklerini ve isteklerini doyuma ulaştırma çabasıdır.

Kitle iletişim araçlarının bir kaçış aracı olarak kullanılması bazen soyutlama bazen de içinde kaybolma olarak düşünülebilir. Ancak Katz ve Foulkes, bu kaçış eyleminin asla tamamen insanları bir noktadan diğerine götürme aracı olarak görülmemesi uyarısında bulunmaktadır. Örneğin aile içi sorunlar yaşayan çocukların televizyon seyretme alışkanlıklarının daha yüksek olması gibi. Bu çocukların büyük çoğunluğu problemleri çözmek değil uzaklaşmak için bu eyleme geçmektedir (Katz & Foulkes, 1962).

Son olarak bağlılık terimi ile dizilerin arasındaki ilişkiyi incelemek gerekirse Russell ve arkadaşları geliştirdikleri ölçek ile bu kavramın kişiler ile izledikleri arasındaki etkileşimi ortaya koymak için kullanmışlardır. Buna göre insanlar izlediklerine göre edindikleri beğeni düzeyleriyle yeni davranışlar ortaya koyabilmektedirler. Bu bazen esinlenme bazen taklit bazen de duygu durumu olarak gerçekleşebilmektedir (Russell, Norman, & Heckler, 2004).

Benzer çalışmalar

Literatür taraması yapıldığında televizyon izleme alışkanlıkları üzerine birçok çalışma yapıldığı, bunların arasında ise diziler ve etkileri üzerine onlarca çalışma olduğu tespit edilmiştir. İncelenen çalışmaların **birincisi** gençlerin dizileri model alma eğilimi (Erjem & Çağlayandereli, 2006) üzerinedir. İkili araştırmalarını yerli dizilerin gençlerin hayatındaki yansımaları ve model alma davranışları üzerine konumlandırmıştır. Dizilerin gençleri ve çocukları daha çok etkilediği fikrinden hareket eden çalışma bu bağlamda, sosyal öğrenme kuramı içerisinde yer alan, model alma yoluyla öğrenme davranışları açısından televizyon içeriklerinin etkilerine yakından bakmaya çalışmıştır. Çalışmanın örneklemini İstanbul'da yer alan beş lisedir. Araştırmanın verileri ise 1020 öğrenciye anket

uygulanarak elde edilmiştir. Bu öğrencilerin demografik olarak hemen hemen ikiye bölündüğü gözlenmektedir. Gençlerin televizyon izleme alışkanlıklarının da tespit edildiği çalışmada neredeyse hiç izlemeyenlerin oranının yüzde 27 civarında kalması çoğunluğun yoğun bir şekilde televizyon izlediğini ortaya koymaktadır. Araştırma gençlerin izledikleri dizilerin günlük yaşamlarına etkilerini ortaya çıkarmıştır. Araştırmanın çarpıcı bulgularından biri kahramanları dış görünüşlerine göre beğenip-beğenmeme tutumunun aslında karakterlerin dizideki 'kişilik özellikleri'yle ilişkili olduğudur. Araştırmacılar gençlerin algılamasında kişilik sıralamasının sanıldığından daha etkili olduğunu tespit etmişlerdir. Araştırmanın ulaştığı gençlerin üçte ikisinin dizilerdeki karakterleri model aldıklarını belirlenmiştir. Bu modelleme yönelimi dizi kahramanlarının fiziki ve kişilik özellikleri üzerinde yoğunlaşmaktadır. Ancak bu yönelim onların gelir, eğitim, ailelerinin ait olduğu toplumsal tabaka gibi sosyo-demografik özelliklerine göre değişmektedir. Araştırma gelir düzeyi arttıkça modelleme davranışının azaldığını, buna bağlı olarak kent merkezinde oturan ailelerin çocuklarının kent dışında ve çevresinde oturan ailelerin çocuklarına göre daha az dizilerdeki tiplere özendiği ve modelleme eğiliminde olduğunu ortaya çıkarmıştır. Gelir ve eğitim düzeyi yükseldikçe modelleme eğiliminin azaldığı anlaşılmıştır.

İncelenen **ikinci** makale ise televizyon izleme alışkanlıklarını kullanımlar ve doyumlar (Özçetin, 2010) açısından ele almıştır. İzleyicilerin incelenildiği çalışmalara sosyolojik bir bakış açısıyla yaklaşan söz konusu araştırma, daha önce yapılan araştırma seçimlerini betimlemeye çalışmış ve eleştirel bir bakış açısıyla yeni bir hedef kitle değerlendirme yaklaşımı ile yeni bulgulara ulaşmaya çabalamıştır. Çalışma, daha önce yapılan izleyici tarama araştırmalarını kullanımlar ve doyumlar kuramı, kültürel çalışmalar (kodlama/kodaçımı modeli) ve alımlama analizini ortaya koyarak incelemiştir. Bu tür çalışmaların etkili veriye ulaşma konusundaki etkinliklerini değerlendiren araştırma, bir çeşit tarih yazımı ya da dönem tespiti yapmaya çalışmıştır. Hedef kitle söz konusu olduğunda özcü ve psikolojik indirgemeci yaklaşımların yetersizliğini tespit eden araştırmacılar, bu yaklaşımın inşacı ve sosyolojik bir perspektifle giderilebileceği varsayımından hareketle çalışmayı sürdürmüştür. Tüm çerçevenin keskin sınırlarla belirlendiği hatta toplumu resmetmek adına da aynı yaklaşımın kullanıldığı tekniklerin değil de izleyici olma halinin geniş açıyla belirlenmiş sosyo-demografik hatta kültürel yaklaşımlarla belirlenmesi gerektiği de araştırmacıların iddiaları arasındadır. Hedef kitleyi tanımlayan kültürel, pratik, tutumlar ve kimlikler açısından daha fazla sosyolojik bir yaklaşıma ihtiyaç duyduğunu öne süren araştırmacılar, televizyonun günlük hayattaki karşılığının bu sayede daha iyi belirlenebileceğini de savunmaktadır. Araştırmacının en önemli eleştirisi, yapılan çalışmaların büyük çoğunluğunun demografik özelliklere göre televizyon izleyicisini anlama eğilimidir. Bu yönelimin açıkta birçok soru bıraktığı ve bunların yanıtlarının hep gelecekteki araştırmalara bırakılmasının doğru olmadığı vurgulanmıştır. Buna neden olarak da sosyolojik bir perspektifin eksikliği görülmüş ve benzer çalışmaların çoğunlukla psikolojik indirgemeci yorumlardan beslenmesi gösterilmiştir. Örneğin bu tür araştırmalarda kitlelerin bireylerin tutumlarını tanımlayan motivasyonlar ve tatmin durumları ortaya konmuş ve etkinlikleri sayısal olarak belirlenmiştir. Fakat bu tutumları oluşturan motivasyon ve tatmin durumlarını nelerin yarattığı tespit edilmemiştir. Araştırmacı mevcut durumun arkasındaki nedenin ise kullanımlar ve doyumlar yaklaşımının kuramsal ve metodolojik kısıtlılıkları olduğunu tespit etmiştir. Aslında nicel ve nitel araştırma yöntemlerinin hangi durumlarda iletişim bilimleri çalışmalarında yerinde kullanımı olabileceği açısından önemli hatta yol gösterici bir çalışma olmuştur.

İncelenen **üçüncü** çalışma kullanımlar ve doyumlar kuramını kullanarak dizi izleme alışkanlıkları üzerinden izleyicileri tanımlamayı hedeflemiştir. (Demir & Demir, 2013). Bu çalışma için örneklem olarak Antalya ilinde 313 katılımcıya ulaşılmıştır. Elde edilen verilerden hareketle izleyicilerin dizileri belli bir takım ihtiyaçları karşılamak amacıyla takip ettiği tespit edilmiştir. Çalışmanın ulaştığı en çarpıcı sonuçlardan biri, dizilerin hedef kitlesi üzerinde daha önceden hesaplanmayan yeni durumlar daha doğrusu beklentiler yaratmasıdır. Dolayısıyla hedef kitleyi tamamen aktif rolde varsayan Katz'ın kuramının hesaplayamadığı sonuçlardan birine yani zaman zaman izlerkitlenin aktiften pasif konuma doğru pozisyon değiştirdiği sonucuna ulaşılmıştır. Bir önceki eleştirel ve betimsel çalışmada vurgulanan daha derine inme ihtiyacının söz konusu çalışmada belli oranda giderildiği söylenebilir. Bu açıdan ilerleyen çalışmalara rehberlik etmesi açısından olumlu bir yaklaşımdır. Çalışmanın bu görüşe destek verecek bulgularından biri de dizilerde gerçek ürünler kullanıldığında gerçeklik algısının arttığı ancak bu durumda da bu ürünlere karşı bir arzu eğiliminin doğduğu böylece yeni ihtiyaçlar ve yönelimlerin ortaya çıkmasıdır.

İncelenen **dördüncü** çalışma ise kamusal söylem, medyatik gerçeklik ve kültürlenme üzerinedir (Damlapınar, 2008). İzleyicilerin kitle iletişim araçları ile kamusal ve kurgusal gerçeklik arasında nasıl bir ilişki kurduğu sorusu üzerine odaklanan söz konusu çalışma, medyanın ürettiği gerçekliğin, ne zaman gerçek hayatla kesiştiği veya ne zaman buna etki ettiği sorusu üzerine kafa yormaktadır. Kültürlenme (cultivation) perspektifini kullanan araştırma algıların ne zaman bu durumun çizgiyi aştığını belirlemek istemektedir. Çalışmayı yapmaya iten motivasyon ülkemizde arka arkaya yayına giren onlarca televizyon dizisinin etkinliğinin artması ve bu durumun bir şekilde ortaya konması ihtiyacıdır. Tartışmalar genellikle bu dizilerin yapımını oluşturan senaryo, gerçeklik, oyuncular veya karakterleri üzerine yapılmakta ancak bunların hedef kitleye nasıl etkide bulunduğu dair araştırmaların azlığından hareketle karar alındığı belirtilmektedir. Bu bakış açısının araştırmanın önemini pekiştirmesi açısından iyi bir yaklaşım olduğu gözlenmiştir. Çalışma, örneklem olarak iletişim fakültelerinde eğitimini sürdüren 802 öğrenciyi belirlemiştir. Kamusal söylem açısından konuyu ele almaya çalışan

araştırmacılar, dönemin devlet-mafya-toplum üçgenini ele alan en çarpıcı dizi olan Kurtlar Vadisi'ni seçmişlerdir. Bu örnekten hareketle elde edilen veriler, televizyondaki yapımların ortaya koyduğu gerçekliğin toplumsal ya da mevcut durumda yaşanan gerçeklik olarak kabul edilme oranının yüksek olduğunu ortaya koymuştur. Araştırmacının ulaştığı sonuca göre; dizinin izleyiciler tarafından algılanma faktörleri diziyi 'kamusal gerçeklik olarak algılama', diziyi 'olumsuz bakış' ve 'kurgusal bir içerik olarak beğeni' şeklinde sıralanmaktadır. Çalışmada ulaşılan bu bulguya neden olarak "Dizinin kamusal gerçeklikle bu düzey ve görünümle örtüşürülüyor olması" eleştirel bir bakış açısı dışına çıkması olarak yorumlanabilir. Her ne kadar bu sav Sennett'in 'oyunun gerçeği simgelemediği oyunun gerçeği kendi görenekleriyle yarattığı' şeklindeki felsefi yorumuna dayandırılrsa da söz konusu dizinin kamuoyundaki algısına araştırmacının da prim verdiği şeklinde yorumlanabilir. Ancak öte yandan araştırmada sadece karakterlerin ve olayların gerçek algısı değil bu algıların günlük hayatları üzerindeki etkileri de tespit edilmeye çalışılmıştır. Bu noktadan hareketle konuşma gerçek dünyayı algılama ve model alma açısından bazı ipuçları da elde edilmiştir. Dizi izleyenlerin, gerçek dünya ile kurgu arasındaki farkları algılama düzeylerinin ortaya konması bu açıdan önemli ve değerlidir. Ancak bu tür istatistik yönü ağır basan çalışmaların sonuç bölümlerinin nedense daha genel geçer olduğu gözlemi bu çalışma için de yapılabilir çünkü verilerin işlenmesi bölümüne verilen ağırlık bunların derinlemesine yorumlanması aşamasında daha zayıf kalmaktadır. Bu da nicel araştırma eğiliminde olan araştırmacıların kendilerini sadece veriler ve sayılarla ifade edilebildiğinde güvende hissettikleri savını hatırlatmaktadır.

Literatür araştırmasında ulaşılan **beşinci** makale, uyarlama diziler ve bunların okuma alışkanlıkları üzerine etkisini ele almaktadır (Okur, 2013). Dizilerin sadece içeriklerini değil bu içeriklerin izleyicilerin günlük hayatları üzerindeki yansımalarını ele alması açısından rehberlik eden bir çalışmadır. Özellikle kitle iletişim araçlarından ikisinin birbiri arasındaki etkileşimi ve rekabetini ortaya koymaya çalışan araştırmacının, "Genellikle insanlar okumaya ayıracakları zamanı televizyonla doldurmaktadırlar" gibi önemli bir iddiası vardır. Diğer önemli bir savı ise televizyonun okumayı unutturduğu buna yol açan şeylerden birinin de aslında televizyonda yeterince okumaya yönlendirici mesajların olmamasıdır. Buna örnek olarak reklamlar ve içerikler gösterilmiş hatta izleyici tarafından örnek alınan karakterlerin çoğunlukla kitap okumadığı öne sürülmüştür. Ancak bu çalışma da bulgularını yoğunluklu olarak demografik unsurlara bağlamaya çalışmış ve televizyon izleme alışkanlığının gelir düzeyi düştükçe arttığı klişesi ile hipotezlerini savunmaya çalışmıştır. Aynı noktadan hareketle de okuma alışkanlığının gelir ve kültür düzeyi arttıkça yükseldiğini varsaymıştır. Oysa bu bir sonuç ve bu eğilimin nedenleri ya da alt kırılmaları daha önemlidir. Çalışmanın asıl odaklandığı nokta olan edebiyat uyarlaması dizilerin okumaya etkisi ise önemli ve yakından bakılması bir konudur. Ancak bu noktada bile sürekli televizyonu olumsuzlayan bir dil ve tavır, makalenin çoğunluğuna hakim olmuştur. Dolayısıyla çoğunluklu olarak bu olumsuz yaklaşım, medyanın olumlu yönleri nasıl ortaya çıkarılabilir motivasyonu araştırmada sık sık hissedilmiştir. Hatta izleyicilerin etkilenme yöneliminin, yararlanma yönelimine çevrelebilmesi için yapılan öneriler de dikkat çekicidir. Ancak uyarlama dizilerin okuma alışkanlığı üzerine olumlu etkileri olduğu tespit edilmiş bu bulgudan hareketle benzer yapımların televizyonun eğitici rolü üzerinde daha faydalı olacağı görüşü dile getirilmiştir.

İncelenen **altıncı** çalışma ise televizyon dizilerinin günlük konuşma dili üzerine etkileri üzerine yapılmış bir araştırmadır (Köse, 2012). Çalışmanın asıl hedeflediği nokta ise diziler sayesinde gündelik konuşmalara giren söz kalıpları, adlandırmalar, deyimlerin tespiti ve kullanımlarıdır. Bu bağlamda, toplumun günlük kullanımındaki iletişim kalıplarına görsel iletişim araçlarının etkisi ve bunlardan yapılan öykünmelerin yarattığı jargon veya kelime çeşitliliği, televizyonlardaki dizi yapımları irdelenerek çözümlenmiştir. Daha toparlayıcı bir anlatımla; konuşma dilini etkileyen ve seçimleri çeşitlendiren hatta zenginleştiren araçlar olarak konuşsal çözümlere yansımaları belirlenmeye uğraşmıştır. Üniversite öğrencilerinin televizyonun bu kısa ya da doğası gereği kısa olması ancak ülkemizdeki özgün uzunluğu nedeniyle ortaya çıkan ve günlük kullanıma giren ve moda olan anlatım şekillerini hangi oranda hayatlarına kattığını saptamak amacıyla "Üniversite gençlerinin gündelik dil alışkanlıklarında televizyon dizilerinde yaratılan dil ne kadar etkilidir?" sorusuna yanıtlanmaya çalışılmıştır. Çalışmanın uygulama kısmında tesadüfi örneklem tekniğiyle ulaşılmış 343 öğrenciye 16 soruluk bir anket uygulanmıştır. Araştırma bulguları üniversite öğrencilerinin diziler söz konusu olduğunda iyi izleyiciler olduğunu bu yüzden de dizilerin yarattığı konuşma pratiklerine hakim olduğunu belirlemiştir. Araştırmada gençlerin, yerli dizilerin jargonuna tamamen gönüllü bir katılım göstermedikleri, gerektiğinde buna bir sınır getirme konusunda bilinçli olduğu ortaya çıkmıştır. Ancak bu durum sadece onların beyan ettikleri baz alınarak ulaşılan bir sonuçtur. Belki karma bir araştırma yapılsa idi ve etnografik bir teknikle araştırma desteklense idi farklı sonuçlarla karşılaşılabilirdi. Araştırmacının ulaştığı sonucu anlattığı bölümdeki "Buna rağmen; sözün kendisinin vitrine dönüştüğü günümüz duygu ötesi toplumunda, bireylerin düşünce ve duygusal tepkilerini ortaya koyarken medyadan ödünç aldıkları kısa ve düz ifadelerden oluşan iletişim rutinlerini kullandıkları tespit edilmiştir" ifadesi bir önceki bulgu ile çelişmektedir. Günlük hayatta alıntı yapmak aslında mesafe koymakla ayrı şeylerdir. Belki de araştırma deseni bu ikisinin arasındaki farkı ya da kesiştiği noktaları biraz daha açacak şekilde tasarlanabilirdi. Ancak yine de televizyon dizilerinin günlük hayatın bu denli içine girdiği bir toplumda ve dönemde hedef kitlenin en dinamik ve görece en ilgili (iletişim öğrencileri) kesimiyle yapılan bu araştırma bir rehber niteliği taşımaktadır. **Yedinci** çalışma ise Türk Televizyonlarındaki dizilerin niteliğini profesyonellerinden gözünden anlama çabasıdır (Ateşalp, 2016). Araştırmacı bu tür çalışmalarda yapılan yaygın örneklem seçimlerinin tersine işin mutfağına

girmeyi tercih etmiş ve profesyonellerin perspektifinden sorunsalını çözmeye çalışmıştır. Çünkü bu aktörlerin ‘sembol yaratıcıları’ olduğunu ve endüstrinin kâr motivasyonuna hatta bunun sınırlamalarına rağmen yaratıcı süreçte ortaya çıkan işin niteliğini etkileyecek kararlar verdiğini düşünmektedir. Araştırmacının bu varsayımını destekleyecek hem literatürde hem de bulgularında yeterince done vardır. Araştırmacı en temelden başlayarak dizilerin kanallar için önemini tespit etmeye çalışmış daha sonra seçimdeki kriterleri anlamaya çalışmıştır. Bu sorulardan hareketle asıl araştırma konusuna ve nitelik ile izlenme oranları arasındaki etkileşimi ortaya koymaya çalışmıştır. Yan soru olarak da (nitelik-izlenme oranı arasında ters orantı olduğu varsayımıyla) dizilerin niteliği üzerinde olumsuz rol oynayan faktörleri tespit etmeye çalışmıştır. Bu bağlamda yapımların sürükleyicilik, merak uyandırıcı unsurları ana kriterler olarak benimsemesinin nitelik üzerinde başlangıçta yapmasa da sonrasında olumsuz etki doğurduğu ortaya konulmuştur. Literatür araştırması yapmadan da ulaşılabilecek bir sonuç olan para kazandırma ya da reyting kaygısının bir de profesyoneller tarafından vurgulanması daha sonra yapılacak çalışmalar açısından önemlidir. Ağırlıklı olarak drama tercih edilmesinin nedeni bu tür yapımlarda aşk, sır, çatışma ve yan hikayeler gibi değişkenlerin daha fazla ve elverişli olmasının nitelik açısından sorun gibi gözükmesi de ortaya çıkan ürün açısından olumsuz bir noktaya ulaştığı çalışmanın vardığı diğer bir bulgudur. Bu tür olumsuz sonuçlara götüren etkenler de çalışmada önemli oranda ortaya konmuştur. Bunun en önemli nedeni yoğun taleptir. Çalışmaya göre bir sezonda ortalama 50-70 dizi yapımların sürecine girmekte ancak bunların büyük çoğunluğu sezon sonunu göremeden sonlandırılmaktadır. Bu yönelimin yaratıcılarda bir güvensizlik ve reyting kaygısını daha kronik hale getirdiği de anlaşılmaktadır. Bu tür bir yönelimin sonucunda da özgün ve nitelikli değil, başarılı olmuş projeleri yinleme, kopya ve taklit gibi bir kısır döngünün ortaya çıktığı tespit edilmiştir.

Sekizinci çalışmada ise televizyon izleme alışkanlıkları ve bunun yansımaları bağımlılık penceresinden ele alınmıştır (İlhan & Ulusoy, 2013). Yaygın araştırmalarda olduğu gibi bu çalışmada da kitle iletişim araçları söz konusu olduğunda zaman kullanımı ve şekline yönelik eleştiriler öne çıkarılmıştır. Gündelik hayatta hastalık denilecek seviyede birçok bağımlılıktan biri olarak televizyon kullanım şekli de kabul edilmiş ve buna ölçü olarak da 2 saati geçen izleme eğilimi öngörülmüştür. Televizyon, izleme alışkanlıklarının zaman geçirme boyutundan ele alındığında hangi amaçların motivasyonu oluşturduğu açısından değerlendirilmesinin kolay bir uğraş olmayacağını varsayan araştırmacılar, benzer çalışmalarda olduğu gibi içerik değil de izleyici ve onlara yönelik etkiler üzerine bir yönelim gösterdikleri görülmüştür. Bunun için de bağımlılık ile izleyici arasındaki korelasyon tespit edilmeye uğraşmıştır. Bağımlılığı yaratan unsurların tanımlanmaya çalışıldığı araştırmada günlük pratikteki tetikleyicileri de ortaya konmaya çalışılarak kurtuluş reçeteleri bulma hedeflenmiştir. Daha önce ortaya konan reçetelerden de yararlanan çalışma, tartışmaları ileriye götürmek ve bunlara katkıda bulunma amacı taşımaktadır. “Televizyon izleme motivasyonunu sorunlardan kaçış için kendini bir süreliğine gerçek dünyadan soyutlayacak bir hale getirmek”le açıklayan ve bu açıklamasını aslında kullanımlar ve doyumlar kuramından ödünç alan araştırmacı, bunu bir aldatmaca ve kendini kandırma olarak tanımlamakta ve tespitini ampirik çalışmaları referans göstererek yapmaktadır. Bağımlılığın günde 2 saatten fazla tüketim periyoduna bağlanması her ne kadar Amerikan Psikologlar Birliği araştırmasına dayandırılrsa da belki de Türkiye koşulları hatta dijital ilerlemelerin hayatın odağına oturması da hesaba katılarak belki de yeni bir süre tanımlaması ihtiyacı doğurmuş olabilir. Ancak önceki çalışmalarda vurgulandığı gibi televizyonun kendine özgü bir gerçeklik yaratması ve bunu dayatması izlerkitle üzerinde daha fazla araştırma yapılması gerektiğini de göstermektedir.

İncelenen **dokuzuncu** çalışma okul temalı dizilerin öğrencilerin davranışları üzerine etkileriyle ilgilidir (Taş & Yalçinkaya). Araştırma, bir süredir yoğunluklu olarak izleyicilerin beğenisine sunulan okul-öğrenci-eğitimci-aile ekseninde geçen dizilerin gerçek hayattaki okullara özellikle de öğrencilerin davranışları üzerine yansımalarını eğitimcilerin bakış açısıyla ortaya koymaya çalışılmıştır. 233 eğitimciye ulaşan araştırmacılar onlara uyguladıkları kendi geliştirdikleri ölçek bağlamında sorular yöneltmiştir. Anketin dayandığı veri toplama tekniği ise “Okul İçerikli Dizilerin Öğrenci Davranışlarına Etkisi Ölçeği”dir. Ulaşılan verilere göre, okul konusunun etrafında şekillenen dizilerin, çocukların davranışlarına yansıması, eğitimcilerine ve yöneticilere karşı yaklaşımları ve benzeri başlıklar altında tespit edilmiş ve işlenmiştir. Elde edilen veriler eğitimcilerin bu diziler konusunda kendilerini rahat hissetmediğini ortaya koymuştur. Öğretmenler, dizilerdeki karakterlerin öğrencilerinin üzerinde yapıcı olmayan sonuçları olduğu görüşünü dile getirmiştir. Televizyon dizilerinin günlük davranış şekilleri üzerindeki etkilerinin tespiti açısından önemli ve özgün bir araştırmadır. Çünkü bu tür bir araştırma öğrencilere yöneltilecek sorular üzerinden ulaşılmaya çalışılsa idi, belki de gerçek sonuçlara varılamayabilirdi. Öte yandan aynı konuyu belki de öğrenciler üzerine yapılacak bir çalışma ile desteklemek iki yönlü bir sonucu ulaşma ve durumu daha iyi betimlemeye götürebilirdi.

Son olarak **onuncu** çalışma ise geleceğin iletişim profesyonelleri olacak görsel sanat öğrencilerini incelemektedir (Demir & Şeyda, 2009). Çalışma televizyon programlarının içerikleri ve kullanılan görüntülerin kalitesini bu öğrencilerin perspektifinden ele almıştır. Araştırma 110 kişilik bir öğrenci grubunu kendisine örneklem (Homojen Örneklem) olarak belirlemiş ve anket tekniği ile yönelimleri tespit edilmiştir. Araştırmanın elde ettiği verilere göre gençlerin azımsanmayacak bir bölümü günlük hayatında ortalama bir saati televizyon seyrederek geçirmektedir. Bu zamanı nasıl kullandıkları sorusunun karşılığında ise çoğunluğun yarışma programlarına yöneldiği, kültür sanat içerikli yapımların ise neredeyse izlenmediği anlaşılmıştır. Yüksek öğretimde eğitim gören bu öğrencilerin seçimlerinde etkili olan faktörlerin ise programların konusu hatta bunun çevresinde şekillenen

konuşma şekilleri ya da önlerine konulan görüntüler olduğu tespit edilmiştir. Televizyon yapımlarının sanatsal açıdan değerlendirmesini de ortaya koyan çalışma bu açıdan önemli bir işlev görmüştür. Ancak eğitimci kimliklerinden mi ya da estetik kaygılarından mı araştırmacılar televizyonu yoğunluklu olarak ‘boş zaman’ avcısı gözüyle değerlendirmiş bu da televizyonun birçok sosyal ve toplumsal işlevini çoğunlukla gözardı etmiştir. Öneriler bölümünde bu yönüne değinildiyse de yine estetik beğeni kalitesini yükseltme işlevlerine vurgu yapılması bu bölümlerde okuyan öğrencilerin içerikten uzak bir eğitim aldığı izlenimi yaratmaktadır. Oysa televizyon programlarının nüvesi içeriktir ve görsellik ile estetik onun etrafında şekillenmelidir.

İncelenen çalışmaların kullanımlar doyumlar kuramı açısından ağırlıklı olarak gençleri incelediği göz önüne alınırsa zamanın ruhunu hesaba katan bir yaklaşım gösterilmediği eleştirisi yapma ihtiyacı duyulmuştur. Bugün yapılan cep telefonu kullanımına yönelik araştırmalarda da aynı yaklaşım gözlenmektedir. Bu kuşağın (x, z veya milenyumlar) dünyayı algılama şekli hesaba katılarak geliştirilecek yeni ölçek ve projeksiyonlara ihtiyaç vardır. Bu çalışma mevcut yeterlilikte bir ölçeğe sahip olmadığı ve böyle bir amacı olmadığı için yargılama yapmayacak sadece bir durum tespiti amaçlamaktadır.

Yöntem

Problem

Üniversite öğrencilerinin dizilere bağlılığı ve bunun günlük hayatlarına etkisi nedir? Sakarya Üniversitesi İletişim Fakültesi örneği.

Alt problemler

1. Dizi seyretmenin motivasyonlarından biri olan gerçek hayattan bir kaçış ile demografik faktörler arasında anlamlı bir farklılık var mıdır?
2. Bir kaçış aracı olarak algılanabilen diziler ile yaş, günlük televizyon izleme süresi ve tercih edilen türler arasında anlamlı bir farklılık var mıdır?
3. Dizi karakterlerinin giydiklerini ve saç modellerini örnek almakta mıdır?
4. Dizilerde kullanılan söylem ve konuşma biçimlerini taklit etme davranışı ile demografik faktörler ve televizyon izleme şekilleri arasında anlamlı bir farklılık var mıdır?
5. Gerçek hayattaki sorunları çözme konusunda dizileri örnek alma ile diğer faktörler arasında anlamlı bir farklılık var mıdır?
6. Dizilerin yarattığı istek ve tutkularla demografik ve diğer değişkenler arasında anlamlı bir farklılık var mıdır?
7. Diziden etkilenerek ilgili entelektüel şeylere yönelmeyle demografik ve televizyon izleme alışkanlığı ya da tercihler arasında anlamlı bir farklılık var mıdır?

Araştırma Modeli

19’uncu yüzyılda Auguste Comte ve daha sonra takipçisi Emile Durkheim’in açtığı yoldan onyıllar boyunca binlerce araştırmacı ilerlemiştir. Sosyal bilimlerde araştırma yapmak demek artık günümüzde bilim insanlarına iki seçenek sunmaktadır: Nicel veya nitel. Ya da karma. Araştırma paradigması olarak nicel bir yönelimi tercih etmek demek deneyler, istatistikler ve anketler kullanmayı gerektirmektedir. Bu tür pozitivist bir yöntemin tercih edilmesinin nedeni de yapılan araştırmanın sonuçlarının objektif, tekrar edilebilir ve örneklem değiştiğinde bile aynı yani mutlak ve test edilebilir sonuçlara ulaşılabilmesidir (Gunter, 2000, s. 4).

Bu tekniklerden en yaygın olanı anket çalışmasıdır. Tam yapılandırılmış bir bilimsel araştırma tekniği olan anket, toplumun genel kanı ve yönelimlerini ortaya çıkarmak için onu temsil ettiği varsayılan bir paydaya uygulanmasıdır (Edmonds & Kennedy, 2017, s. 133).

Çalışma konusu belirlendikten sonra televizyon izleme davranışı içinde daha kısıtlı bir yönelim olan dizi tercihleri ve onların günlük kullanımlar üzerindeki etkileri araştırılmak istendiğinden önce literatür araştırması yapılmış ve bu altyapı oluşturulmuştur. Daha sonra araştırma deseni belirlenerek araştırma öncesi ve sonrasında test edilmek istenen hipotezlerin aynı kalması için sabit desen seçilmiştir. Böylece araştırma öncesinden belirlenen yönelimin değişmemesi hedeflenmiştir. Desen olarak ise eldeki verilerin ne anlam içerdiği tablolarla, grafiklerle ve sayısal özetler yardımı ile anlaşılabilir diye betimleyici sabit desen tercih edilmiştir (Özdemir, 2000, s. 19).

Evren

Araştırmanın evreni, dizilerin en büyük izleyen kitlesi oldukları düşünülerek yaş aralığı olarak 17 yaş ve üstü seçilmiş, bu yaş grubundaki üniversite öğrencilerinin, özellikle iletişim fakültesi öğrencilerinin daha ilgili ve derinlemesine bakış açısına sahip oldukları varsayılmıştır.

Örneklem

Bu çalışmada örneklem, Sakarya Üniversitesi İletişim Fakültesi öğrencilerinden uygun örnekleme yöntemi ile seçilen 110 kişi ile oluşturulmuştur. Uygun ya da kazara örnekleme yöntemi, anketin uygulanacağı kişilerin araştırma yapılan yere ya da araştırmacının en kolay ulaşabileceği kişilerin kullanıldığı yöntemdir. İstenilen örneklem büyüklüğüne ulaşıncaya kadar, seçme işlemine devam edilir (Robson & McCartan, 2016, s. 144).

Ayrıca örneklemin geleceğin iletişim profesyonellerinden seçilmesinin ileride ortaya çıkacak yapımların yönelimine dönük de bir gözlem sağlayacağı ortadadır.

Veri toplama aracı

Çalışmanın veri toplama aracı, Cristel Antonia Russell, Andrew T. Norman ve Susan E. Heckler'ın 2004 yılında yayınladıkları araştırmalarında kullandıkları ölçeğe değerlendirme araçları kullanılarak gerçekleştirilmiştir (Russell, Norman, & Heckler, 2004).

Televizyon programlarının tüketimi: Bağlılık ölçeğinin geliştirilmesi ve doğrulanması çalışmasında kullanılan anket çalışması likert ölçeğine uygun bir şekilde oluşturulmuş ve onaylanmış bir çalışmadır. Handbook of Marketing Scales (Beardan, 2011) kitabında yayınlanan anket çalışmasıyla ilgili sorumlu yazar Cristel A. Russell ile iletişime geçilmiş ve gerekli izin alınmıştır.

Veri analizi

Anket çalışması sonucunda elde edilen veriler, niceliksel veri analizi kullanılarak değerlendirilmiştir. Bu amacın sapmadan hayata geçirilebilmesi için ise elde edilen nicel veriler SPSS programı ile çözümlenmiştir. Yapılan analizde, önce yüzdeler hesaplanarak genel yönelimler ortaya konulmuş daha sonra ise t-testi ve tek yönlü Anova analizleri yapılarak dizi izleme davranışının gündelik hayat üzerine bağlılık açısından etkileri anlaşılmasına çalışılmıştır. Dolayısıyla yönelimlerin birbiri arasında anlamlı bir farklılık olup olmadığı ölçülmüştür.

Sınırlılıklar

Araştırma Sakarya Üniversitesi İletişim Fakültesi öğrencileri ile sınırlandırılmıştır ve evren bu şekilde oluşturulmuştur. Anket, 2017 Güz Dönemi Gazetecilik ile İletişim Tasarımı ve Medya bölümleri öğrencilerine uygulanmıştır. Bu yakınsama ihtiyacı nedeniyle de katılımcılar 110 kişi ile sınırlandırılmıştır.

Bulgular

Elde edilen veriler, demografik unsurlar (yaş ve cinsiyet) ile televizyon izleme alışkanlığı ve tercihleri açısından SPSS ile işlenmiş ve tablolara aktarılmıştır.

Daha sonra kaçış, moda, taklit, örnek alma, istek/tutku ve kişisel eşya tercihleri açısından t-Testi ve tek yönlü Anova analizleri yapılarak anlamlı farklılık olup olmadığı tespit edilmiştir.

Frekans Çizelgeleri

Toplanan veriler SPSS ile işlendikten sonra elde edilen sonuçlar doğrultusunda elde edilen yüzdeler dağılımları şöyledir:

Tablo 1. Cinsiyetiniz nedir?

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Kadın	55	50.0	50.0	50.0
Erkek	55	50.0	50.0	100.0
Toplam	110	100.0	100.0	

Tablo 1.'de görüldüğü gibi anket katılımcılarının cinsiyet dağılımları eşit düzeyde gerçekleşmiştir. Yani 55 kişi kadın, 55 kişi de erkektir.

Tablo 2. Kaç yaşındasınız?

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
17-19	17	15.5	15.5	15.5
20-22	81	73.6	73.6	89.1
23-25	9	8.2	8.2	97.3
Diğer	3	2.7	2.7	100.0
Toplam	110	100.0	100.0	

Tablo 2.'de görüldüğü gibi ankete katılanların büyük çoğunluğu (%73) 20-22 yaş aralığındadır. Onu izleyen çoğunluk ise 17-19 yaş aralığında (%15.5) olanlardır. 23 yaş üstü grupta olanların toplamı ise yaklaşık % 11 (10.8) civarındadır.

Tablo 3. Günlük televizyon izleme yönelimi

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
0-2	93	84.5	84.5	84.5
2-4	17	15.5	15.5	100.0
Toplam	110	100.0	100.0	

Tablo 3'te ise katılımcıların günlük televizyon izleme alışkanlıkları ölçümlenmeye çalışılmış ancak katılımcılar sadece iki seçenek üzerinde yoğunlaşmıştır. Büyük çoğunluk (%84.5) 2 saatten az televizyon izlediğini ortaya koymuş 2-4 saat izleyenlerin oranı ise çok düşük (%15.5) kalmıştır. 4 saatten fazla televizyon izleme seçeneği bulunmasına rağmen katılımcılardan hiçbiri bu seçeneği işaretlememiştir.

Tablo 4. En çok hangi tür dizileri izliyorsunuz?

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Komedi	39	35.5	35.5	35.5
Romantik-Dram	23	20.9	20.9	56.4
Tarihi	14	12.7	12.7	69.1
Aksiyon	34	30.9	30.9	100.0
Toplam	110	100.0	100.0	

Tablo 4'te katılımcıların en çok hangi tür dizileri tercih ettiği ölçümlenmeye çalışılmış ve sonuçta en çok tercih edilen diziler % 35.5 ile komedi türü diziler olmuştur. İkinci en çok izlenen idiziler ise aksiyon türü (%30.9) olarak gerçekleşmiş, onu ise yüzde 20.9 ile romantik komedi türü takip etmiştir. Katılımcıların en az tercih ettikleri dizi türü ise tarih kategorisi olarak ortaya çıkmıştır.

Tablo 5. Dizi izlemek benim için bir kaçış

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	22	20.0	20.0	20.0
Katılmıyorum	32	29.1	29.1	49.1
Kararsızım	23	20.9	20.9	70.0
Katılıyorum	27	24.5	24.5	94.5
Tamamen katılıyorum	6	5.5	5.5	100.0
Toplam	110	100.0	100.0	

Katılımcıların büyük çoğunluğu dizi izlemeyi bir kaçış olarak değerlendirmemektedir. Hiç katılmıyorum (% 20) ve Katılmıyorum (% 29.1) diyenlerin oranları yarıya yakındır. Kararsızlar yüzde 20.9 iken Katılıyorum (% 24.5) ve Tamamen Katılıyorum (% 5.5) diyenlerin oranı çoğunluğun altında gerçekleşmiştir.

Tablo 6. Dizi izlemek bana günlük sorunlarımı unutturuyor

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	17	15.5	15.5	15.5
Katılmıyorum	28	25.5	25.5	40.9
Kararsızım	24	21.8	21.8	62.7
Katılıyorum	33	30.0	30.0	92.7
Tamamen katılıyorum	8	7.3	7.3	100.0
Toplam	110	100.0	100.0	

Dizi izlemenin günlük sorunları unuttuğunu düşünenlerin oranı Katılıyorum % 30, Tamamen katılıyorum % 7.3 olarak ortaya çıkmış, Kararsızlar % 21.8 iken olumsuz düşünenlerin toplamı (Hiç katılmıyorum % 15.5, katılmıyorum % 25.5) ise % 40'ı geçmiştir.

Tablo 7. Eğer ruh halim kötüyse dizi izlemek moralimi düzeltiyor.

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	9	8.2	8.2	8.2
Katılmıyorum	18	16.4	16.4	24.5
Kararsızım	27	24.5	24.5	49.1
Katılıyorum	47	42.7	42.7	91.8
Tamamen katılıyorum	9	8.2	8.2	100.0
Toplam	110	100.0	100.0	

Dizi izlemenin ruh halleri üzerindeki etkisinin ölçümlenmek istendiği bu soruya verilen yanıtlarda en büyük yığılım Katılanlar (%42.7) şikkında ortaya çıkmıştır. Kararsızlar ise % 24.5'te kalırken Katılmayanlar % 16.4 olarak belirlenmiştir. Hiç katılmayanlar ile Tamamen katılanların oranı ise aynı yani % 8.2'dir.

Tablo 8. Dizideki kıyafetleri beğeniyorum

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	16	14.5	14.5	14.5
Katılmıyorum	24	21.8	21.8	36.4
Kararsızım	23	20.9	20.9	57.3
Katılıyorum	34	30.9	30.9	88.2
Tamamen katılıyorum	13	11.8	11.8	100.0
Toplam	110	100.0	100.0	

Tablo 8'de izlenen dizilerdeki kıyafetlere yönelik beğeni ölçümlenmek istenmiş en çok Katılanların oranı (% 30.9) yüksek iken en düşük oran Tamamen Katılıyorum (%11.8) olarak gerçekleşmiştir. Katılmıyorum diyenler % 21.8 iken Kararsızlar % 20.9 ve Hiç Katılmıyorum diyenler ise % 14.5'tir.

Tablo 9. Dizideki saç modellerini ve kesimlerini beğeniyorum

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	14	12.7	12.7	12.7
Katılmıyorum	19	17.3	17.3	30.0
Kararsızım	28	25.5	25.5	55.5
Katılıyorum	40	36.4	36.4	91.8
Tamamen katılıyorum	9	8.2	8.2	100.0
Toplam	110	100.0	100.0	

Tablo 9'da tercih edilen dizilerdeki saç modelleri ve kesimlerine yönelik beğeniler ortaya çıkarılmak istenmiş ve beğenilerin oranı % 36.4 (Katılıyorum) ile en yüksek bulgu olmuştur. Kararsızlar ikinci yüksek yüzde olarak % 25.5 olarak belirlenmiş ve onu % 17.3 ile Katılmıyorum düşüncesindekiler izlemiştir. Hiç katılmıyorum diyenler % 12.7 iken Tamamen Katılıyorum diyenler % 8.2 oranında kalmıştır.

Tablo 10. Dizide gördüğüm kıyafetleri satın almaya çalışıyorum

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	58	52.7	52.7	52.7
Katılmıyorum	30	27.3	27.3	80.0
Kararsızım	12	10.9	10.9	90.9
Katılıyorum	10	9.1	9.1	100.0
Toplam	110	100.0	100.0	

Dizilerde beğenilen kıyafetlerin satın alınma davranışına dönüşmesinin ölçümlenmeye çalışıldığı bu soruda hiçbir katılımcı Tamamen Katılıyorum seçeneğine yönelmemiştir. En yüksek oran ise Hiç Katılmıyorum (% 52.7) seçeneğine olmuştur. Katılmıyorum diyenlerin oranı ise % 27.3'tür. Kararsızlar % 10.9 iken olumlu görüş bildirenlerin (Katılıyorum) oranı ise % 9.1'de kalmıştır.

Tablo 11. Dizideki karakterlerin jest ve mimiklerini taklit ettiğim oluyor

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	36	32.7	32.7	32.7
Katılmıyorum	29	26.4	26.4	59.1
Kararsızım	10	9.1	9.1	68.2
Katılıyorum	30	27.3	27.3	95.5
Tamamen katılıyorum	5	4.5	4.5	100.0
Toplam	110	100.0	100.0	

Beğenilen dizilerin günlük hayattaki yansımalarının ölçümlemeye çalışıldığı sorunun sonuçlarını gösteren Tablo 11’de jest mimik öykünmesine yönelik görüşlerin en büyük oranı olumsuz yöndedir. Hiç Katılmıyorum diyenler % 32.7 iken Katılmıyorum diyenler % 26.4 olarak ortaya çıkmıştır. Katılıyorum diyenler% 27.3 iken Tamamen Katılıyorum seçeneği ise % 4.5’tir. Kararsızlar ise % 9.1 olarak ölçümlenmiştir.

Tablo 12. Günlük konuşmalarda zaman zaman ... dizisindeki diyalogları ve kalıpları kullandığımı fark ediyorum

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	21	19.1	19.1	19.1
Katılmıyorum	18	16.4	16.4	35.5
Kararsızım	19	17.3	17.3	52.7
Katılıyorum	43	39.1	39.1	91.8
Tamamen katılıyorum	9	8.2	8.2	100.0
Toplam	110	100.0	100.0	

Beğenilen dizilerin günlük yaşama yansımalarının tespit edilmeye çalışıldığı sorunun sonuçlarının ortaya konduğu Tablo 12’de ise söz konusu yapımların günlük konuşmaya etkileri Katılıyorum (%39.1) ile en yüksek yüzdeye ulaşmıştır. Hiç katılmıyorum diyenlerin yüzdesi 19.1 iken katılmıyorum diyenler % 16.4 olarak gerçekleşmiştir. Kararsızlar yüzde 17.3, Tamamen Katılıyorum diyenler % 8.2 olarak belirlenmiştir.

Tablo 13. Dizideki karakterler gibi konuşmaya çalışıyorum

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	41	37.3	37.3	37.3
Katılmıyorum	37	33.6	33.6	70.9
Kararsızım	16	14.5	14.5	85.5
Katılıyorum	15	13.6	13.6	99.1
Tamamen katılıyorum	1	.9	.9	100.0
Toplam	110	100.0	100.0	

Yine dizilerin günlük konuşmalara etkilerinin tespit edilmeye çalışıldığı Tablo 13’te ise takip edilen karakterler gibi konuşma eyleminin büyük oranda gerçekleşmediği gözlenmektedir. Hiç katılmıyorum idyenlerin oranı % 37.3 iken Katılmıyorum diyenlerin oranı % 33.6’dır. Kararsızlar % 16 ve katılıyorum diyenler ise % 15 düzeyindedir. Tamamen Katılıyorum diyen bir katılımcı vardır onun örnekleme oranı ise sadece % 0.9’dur.

Tablo 14. Seyrederken gerçek hayatta karşılaştığım sorunlarla baş etmeyi öğreniyorum

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	34	30.9	30.9	30.9
Katılmıyorum	40	36.4	36.4	67.3
Kararsızım	18	16.4	16.4	83.6
Katılıyorum	17	15.5	15.5	99.1
Tamamen katılıyorum	1	.9	.9	100.0
Toplam	110	100.0	100.0	

Tablo 14’te dizilerin bir kılavuz olarak alınması ve gerçek hayatta karşılaşılan olaylara yönelik ilham alma davranışı ölçümlemeye çalışılmıştır. Ancak büyük çoğunluk olumsuz görüş bildirmiş ve Hiç Katılmıyorum diyenlerin oranı % 30.9 iken Katılmıyorum diyenlerin oranı % 36.4 olarak ortaya çıkmıştır. Kararsızlar % 16.4

iken katılıyorum diyenler %15.5 olarak ölçümlenmiştir. Tamamen katılan katılımcı sayısı ise yine 1 olarak bütüne oranı sadece % 0.9'dur.

Tablo 15. Dizi seyrederken hayatımdaki insanlara nasıl davranacağımı öğreniyorum

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	36	32.7	32.7	32.7
Katılmıyorum	35	31.8	31.8	64.5
Kararsızım	17	15.5	15.5	80.0
Katılıyorum	19	17.3	17.3	97.3
Tamamen katılıyorum	3	2.7	2.7	100.0
Toplam	110	100.0	100.0	

Tablo 16'da yine dizilerden öykünme durumu ölçümlenmeye çalışılmış bu doğrultuda benzer sorun ve olaylar karşısındaki davranış şekilleri anlaşılacak istenmiştir. Bu doğrultuda katılımcılar yine ağırlıklı olarak olumsuz görüş bildirmiş ve Tamamen Katılmayanların oranı % 32.7 ve Katılmıyorum diyenlerin oranı % 31.8 olarak ölçümlenmiştir. Katılıyorum diyenler % 17.3 iken 'Tamamen katılıyorum'u destekleyen görüş bildirenlerin sayısı 3 ve oranı yüzde 2.7 olarak belirlenmiştir. Kararsızlar ise % 15.5'tir.

Tablo 16. Dizideki olaylarla kendi hayatımdaki olaylar arasında ilişki kuruyorum

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	22	20.0	20.0	20.0
Katılmıyorum	28	25.5	25.5	45.5
Kararsızım	24	21.8	21.8	67.3
Katılıyorum	31	28.2	28.2	95.5
Tamamen katılıyorum	5	4.5	4.5	100.0
Toplam	110	100.0	100.0	

Dizilerde işlenen konular doğrultusunda ele alınan olaylara bakış ve bunlarla gerçek hayatlar arasında bağlantı kurulması davranışının belirlenmek istendiği Tablo 16'da ise toplamda çoğunluk olumsuz görüş bildirmiş olsa da en çok tercih edilen seçenek Katılıyorum (%28.2) olarak tespit edilmiştir. Bu doğrultuda tamamen katılanlar % 4.5 iken Hiç Katılmıyorum diyenler % 20 düzeyindedir. Ancak Katılmıyorum diyenler 25.5 olarak ikinci en yüksek eğilim olarak ortaya çıkmıştır. Kararsızlar ise 21.8 ile yine yüksek bir oran ortaya koymaktadır.

Tablo 17. ... dizisinde oyuncu olmak isterim

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	23	20.9	20.9	20.9
Katılmıyorum	23	20.9	20.9	41.8
Kararsızım	14	12.7	12.7	54.5
Katılıyorum	29	26.4	26.4	80.9
Tamamen katılıyorum	21	19.1	19.1	100.0
Toplam	110	100.0	100.0	

İzlenen veya sevilen bir dizide oyuncu olmak yani rol model alma açısından yöneltilen soruya verilen yanıtlar arasında en yüksek yönelim Katılıyorum (% 26.4) seçeneğine olmuştur. Onu eşit oranda Hiç katılmıyorum (%20.9) ve Katılmıyorum (%20.9) takip etmektedir. Kararsızlar ise % 12.7 olarak ortaya çıkmıştır. Tamamen Katılanlar ise %19.1'dir.

Tablo 18. Dizideki karakterlerle tanışmak isterim

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	13	11.8	11.8	11.8
Katılmıyorum	7	6.4	6.4	18.2
Kararsızım	16	14.5	14.5	32.7
Katılıyorum	51	46.4	46.4	79.1
Tamamen katılıyorum	23	20.9	20.9	100.0
Toplam	110	100.0	100.0	

İzlenen veya sevilen bir dizideki karakterlere yönelik öykünme davranışının göz önüne alındığı Tablo 18’de katılımcıların büyük çoğunluğunun bu karakterlerle tanışmak istediğini ortaya koymuştur. Katılıyorum diyenlerin oranı % 46.4 iken Tamamen Katılıyorum diyenlerin oranı % 20.9 olarak ortaya çıkmıştır. Kararsızlar ise % 14.5 oranındadır. Olumsuz görüş bildirenler ise % 11.8 ile Hiç Katılmıyorum ve % 6.4 ile Katılmıyorum’dur.

Tablo 19. ... dizisiyle ilgili aksesuar, kitap, poster, vb. satın aldım

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	58	52.7	52.7	52.7
Katılmıyorum	36	32.7	32.7	85.5
Kararsızım	6	5.5	5.5	90.9
Katılıyorum	9	8.2	8.2	99.1
Tamamen katılıyorum	1	.9	.9	100.0
Toplam	110	100.0	100.0	

Tablo 19’da izlenen dizilerden etkilenecek söz konusu yapımlarla ilgili satın alma davranışının kitap, poster veya aksesuar gibi araçlar açısından yansıması ortaya konmaya çalışılmıştır. Bu soruya verilen yanıtların büyük çoğunluğu olumsuz yöndedir. Hiç katılmıyorum diyenler % 52.7 ile en yüksek oranı ortaya koyarken Katılmıyorum diyenler % 32.7 ile onu izlemiştir. Katılıyorum diyenler sadece % 8.2 iken Kararsızlar % 5.5’tir. Tamamen katılıyorum seçeneğini işaretleyen 1 kişi çıkmış onun da bütüne oranı 0.9 olarak gerçekleşmiştir.

Tablo 20. ... dizisiyle ilgili kitap (lar) okudum, okuyorum

	Frekans	Yüzde	Geçerli Yüzde	Yığılmalı Yüzde
Hiç katılmıyorum	48	43.6	43.6	43.6
Katılmıyorum	36	32.7	32.7	76.4
Kararsızım	12	10.9	10.9	87.3
Katılıyorum	11	10.0	10.0	97.3
Tamamen katılıyorum	3	2.7	2.7	100.0
Toplam	110	100.0	100.0	

Dizilerden etkilenecek alınan kitaplar ve okuma davranışının ölçülmesi istendiğini Tablo 20’de ise büyük çoğunluk olumsuz görüş bildirmiştir. Hiç Katılmıyorum diyenler % 43.6 iken Katılmıyorum diyenler % 32.7’dir. Kararsızlar ve Katılıyorum diyenler % 10 olarak ölçülmüş, Tamamen Katılanlar ise 3 kişi ve bütüne oranı % 2.7’dir.

Bağımsız T-Testi Uygulaması

Yöneltilen sorular açısından demografik faktörler açısından anlamlı bir farklılığın ($p \leq 0.05$) olup olmadığını ölçmek için Bağımsız t-Testi uygulaması yapılmıştır. Yapılan testler sonucunda sadece bir soruda anlamlı bir farklılık bulunamamıştır. Bulunan anlamlı farklılık ile ilgili veriler aşağıdaki gibidir:

Tablo 21. Cinsiyet dağılımına göre Bağımsız t-Testi ($\alpha < 0,05$)

		F	Sig.	t	df	Sig. (2-tailed)
... dizisindeki karakterler gibi konuşmaya çalışıyorum	Equal variances assumed	3.253	.074	-1.982	108	.050
	Equal variances not assumed			-1.982	104.901	.050

Tablo 21’de cinsiyetlere göre yapılan Bağımsız t-Testi uygulamasıyla sadece “dizideki karakterler gibi konuşmaya çalışıyorum” sorusu arasında anlamlı bir farklılık ($p \leq 0.05$) bulunmuştur. Cinsiyet dağılımdaki ortalamalar incelendiğinde ise erkeklerin ($=2.27$) kadınlara göre ($=1.87$) günlük hayatlarında, dizilerdeki karakterler gibi daha fazla konuşma eğilimi gösterdikleri görülmektedir.

Ölçekte başka iki seçeneekli demografik faktör bulunmadığı için Bağımsız t-Testi uygulaması yapılmamıştır.

Varyans (Tek Yönlü Anova) Analizi

Katılımcıların yaş grupları (17-19, 20-22, 23-25 ve diğer) ile sorular arasında anlamlı bir farklılık ($p \leq 0.05$) bulunamamıştır. Yine günlük TV izleme alışkanlıkları açısından yapılan tek yönlü Anova analizinde anlamlı bir

farklılık tespit edilememiştir. Ancak tercih edilen dizilere göre yapılan tek yönlü Anova analizinde iki tane anlamlı fark bulunmuştur. Bunlar Tablo 22, 23, 24 ve 25'te gösterilmiş ve yorumlanmıştır.

Tablo 22. “... dizisindeki olaylarla kendi hayatımdaki olaylar arasında ilişki kuruyorum” sorusuna yönelik tek yönlü Anova analizi

	Kareler Toplamı	Kareler Ortalaması	F	P
Gruplar arası	13.101	4.367	3.189	.027
Grup içi	145.163	1.369		
Toplam	158.264			

Dizilerdeki olaylarla kendi hayatlarındaki olaylar arasında ilişki kurma açısından en çok izlenen dizi türleri arasında anlamlı bir fark ($p:0,027 < \alpha:0,05$) bulunmuştur. Tablo 23'e bakılarak ayrıntılar yorumlanabilir

Tablo 23. “... dizisindeki olaylarla kendi hayatımdaki olaylar arasında ilişki kuruyorum” sorusuna yönelik tek yönlü Anova analizinin tanımlayıcı istatistikleri

		n	Ortalama	Standart Sapma
... dizisindeki olaylarla kendi hayatımdaki olaylar arasında ilişki kuruyorum	Komedi	39	2.7436	1.29204
	Romantik-Dram	23	3.3043	1.14554
	Tarihi	14	2.2143	.69929
	Aksiyon	34	2.5000	1.18705
	Toplam	110	2.7182	1.20497

Tablo 22'de bulunan anlamlı farklılığın nedenini tespit etmek için tanımlayıcı istatistiklere (Tablo 23) baktığımızda Romantik-Dram izleyicilerinin (Ortalama: 3.3) fütürlük hayatlarındaki olaylarla dizilerdeki olaylar arasında ilişki kurma konusunda diğer dizi izleyicilerinden ayrıldığı gözlemlenmektedir. Bu anlamlı farklılık özellikle tarih konulu dizi izleyicileri ile daha fazladır.

Tablo 24. ... dizisindeki karakterlerle tanışmak isterim

	Kareler Toplamı	Kareler Ortalaması	F	P
Gruplar arası	11.934	3.978	2.759	.046
Grup içi	152.830	1.442		
Toplam	164.764			

Dizilerdeki karakterlerle tanışmak isteyen izleyiciler ile izlenen dizi türleri arasında anlamlı bir farklılık ($p:0,046 < \alpha:0,05$) tespit edilmiştir. Tablo 25'e bakıldığında bu anlamlı farklılığın Aksiyon türü dizi tercih edenlerle diğerleri arasında gerçekleştiği gözlemlenmektedir. Aksiyon türü dizi izleyenlerin dizideki karakterlerle tanışma isteği ortalamasının 4.02 ile tarihi (3.1) ve komedi türü izleyenlere göre yüksek olduğu gözlemlenmektedir. Anlamlı farklılığı da bu unsur ortaya çıkarmaktadır.

Tablo 25. “... dizisindeki karakterlerle tanışmak isterim” sorusuna yönelik tek yönlü Anova analizinin tanımlayıcı istatistikleri

		n	Ortalama	Standart Sapma
... dizisindeki karakterlerle tanışmak isterim	Komedi	39	3.3333	1.42040
	Romantik-Dram	23	3.6087	1.23359
	Tarihi	14	3.1429	1.09945
	Aksiyon	34	4.0294	.90404
	Toplam	110	3.5818	1.22947

Sonuç

Araştırmanın örneklemini oluşturan öğrenciler rastlantısal olarak seçilmiş ancak cinsiyet frekansı yine rastlantısal bir şekilde eşit düzeyde gerçekleşmiştir. Ancak diğer demografik faktör olan yaş aralıklarında ise araştırmanın üniversite ortamında yapılmasından kaynaklı katılımcıların büyük bölümü (% 73.6) 17-19 yaş aralığındadır.

Televizyon izleme alışkanlıkları ölçümlendiğinde ise hiçbir katılımcının 4 saatten fazla ekran başında zaman geçirmemesi ulaşılan şaşırtıcı bir sonuçtur. Bu veri belki de artık gençlerin dizi ya da sevdiği programları yayınlandığı saatte değil de çoğunlukla dijital platformlar üzerinden izledikleri için ortaya çıkmış olabilir. Bu veri, gençlerin televizyonu izleme aracı olarak hayatlarında geri itmiş olmalarından kaynaklandığı şeklinde yorumlanabilir. En çok seyredilen dizi türü ise yüzde 35.5 ile komedi çıkmış onu aksiyon türü izlemiştir. Şu an yayınlanan tarihi dizilerin çokluğuna ve reyting sonuçlarına karşıt olarak iletişim fakültesi öğrencilerinin bu tür yapımları en az tercih eden kitle olduğu anlaşılmıştır.

Dizi izlemeyi bir kaçış olarak görenlerin sayısı (toplam %30) görmeyenlere (%49.1) göre az olsa da diğer sorulara geçildiğinde "...dizisini izlemek bana günlük sorunlarımı unutturuyor"da oran yükselmekte (%37.3) ancak ruh hali düzeltmek için dizi tercihleri sorgulandığında bu oranın gözle görülür bir oranda (%50.9) çarpıcı boyuta ulaştığı görülmektedir.

Moda tercihleri açısından dizilerdeki saç ve kıyafet sunumlarının beğenileri incelendiğinde ise kıyafetlerin (%30.9) ve saç modellerinin (%36.4) olumlu karşılandığı ancak bunların satın alınma davranışı söz konusu olduğunda yüzde 80'lik bir karşı çıkış sergilendiği belirlenmiştir. Hatta anketteki "Tamamen katılıyorum" seçeneğinin işaretlenmediği tek soru olması dikkat çekicidir. Gençler ya moda konusunda televizyondan etkilendiklerini dile getirmekte gönüllü değiller ya da bunun için başka mecraları kullanmaktadırlar. Yapılan ve yapılacak sosyal medya araştırmaları bu savı destekleyici bulgular ortaya koyabilir.

Sözsüz iletişim açısından yaklaşıldığında taklit yöneliminin olmadığı (%59) ortaya çıkmaktadır ancak bu dizilerdeki konuşma şekilleri ve tarzlarının çoğunlukla (% 48.1) model alındığı anlaşılmaktadır. Gençler bunu ya bilinçli olarak yapmakta ya da taklit ettikleri jest ve mimiklerin çok farkında değillerdir. Bir diğer ilginç sonuç ise dizi karakterleri gibi konuşma eğilimine dair sorudur. % 70.9'luk bir oranla gençler karakterleri örnek almadıklarını dile getirmişlerdir. Konuşmalarda kalıplar kullanılırken, öte yandan karakterlerin nasıl taklit edilmediği başka bir araştırma konusu olabilir.

Gerçek hayatla bağlantı kurarak örnek alma konusunda ise yine farklı sonuçlar ortaya çıkmıştır. Bu dizilerden ilham alarak gerçek hayattaki sorunlarla baş etmeyi (%67.3) ve insanlara nasıl davranacaklarını öğrenmediklerini (%64.5) dile getiren katılımcılar; dizilerdeki olaylarla kendi hayatlarındaki olaylar arasında ilişki kurma konusunda eşit dağılım göstermektedir. Bu yaklaşım "hayatı dizilerden öğrenecek değilim" yaklaşımının bir ifadesi de olabilir.

Dizilerde oyuncu olma konusunda ağırlıklı olarak olumsuz yaklaşım gösteren üniversite öğrencileri, bu dizilerdeki karakterlere karşı aynı fikirde değildir. Onlarla tanışmak istemelerinin altındaki motivasyon, örnek alma ya da istek/tutku faktörleriyle açıklanabilir.

Gençlerin izledikleri dizilerle ilgili kişisel eşya seçiminde özellikle kitap ve poster konularında genellikle olumsuz bir tavır ortaya koymaları belki de promosyon çalışmalarına verilen önemin Türkiye'de yapım sürecinin bir parçası olarak görülmemesinden kaynaklanabiliyor olabilir. Oysa dünya devleri (Game of Thrones, Breaking Bad vb.) bu süreci bir bütün olarak görmekte bazen buradan alınan gelirler hatırı sayılır miktarlara ulaşmaktadır.

Dizilerdeki karakterler gibi konuşma konusunda erkeklerin kadınlara göre daha eğilimli olması ise bir genelleme yapmaya ihtiyaç duyar mı sorusu başka bir araştırma konusudur. Çünkü bu dönemde belki de daha çok erkeklere hitap eden dizilerin diyalogları ve karakterleri yayında olabilir. Bir dönem Avrupa Yakası gibi popüler dizilerdeki kadın karakterler gibi konuşan birçok kadın izleyicinin bulunduğu unutulmamalıdır.

Romantik-dram türü dizileri izleyenlerin gerçek hayatlarındaki olaylarla bu dizilerdeki kurgular arasında daha fazla bağlantı kurma hali ise duygusal ihtiyaçların bu yapımlar tarafından daha iyi karşılandığı şeklinde yorumlanabilir. Ancak yine dönem dizilerinin niteliğinin de belirleyici olduğu gerçeği unutulmamalıdır. Ayrıca dönem dizilerinde dil ve toplumsal davranış kalıpları olarak çağdaş örnekler değil dönemin yönelimlerinin sergilenmeye çalışıldığı da göz önünde bulundurulmalıdır.

Dizilerdeki karakterler, gerçeklik duygusu ya da gerçeklik ihtiyacı açısından ele alındığında aksiyon türü yapımların izleyicilerinin bu yapımlardaki karakterleri tanıma konusunda daha istekli olması; acıcılık ve heyecan faktörü ile açıklanabilir. Ayrıca böyle bir gözlem yapmadan önce, yakın dönemde ülkenin içinden geçtiği travmalar nedeniyle televizyonlarda ağırlığın aksiyon türü dizilere verildiği not düşülmelidir. Yine söz konusu dizilerin en iyi saatlerde en iyi senaristler tarafından yazıldığı ve en iyi oyuncuların rol aldığı da hesaba katılmalıdır. Dolayısıyla bu yapımlardaki karakterlerin beğeni alması anlaşılır bir bulgudur.

Ill Posed Problems And Some Methods How To Solve Them

Richard HORSKÝ

Department of Mathematics University of Economics Prague Czech Republic
rhorsky@vse.cz

Abstract

The term *ill-posed problem* has been gaining popularity in modern science since the middle of the 20th century. Several decades of research in this area have shown that a great number of problems in different branches of classical mathematics (differential and integral equations, partial differential equations, functional analysis, computational algebra) can be classified as ill-posed and they belong to the most complicated ones (thanks to their unstability and usual nonlinearity). At the same time these problems began to be studied in astronomy, geophysics, medicine and other applied sciences. In this paper some examples are introduced as well as the two most remarkable methods of solving such problems are described.

Introduction

The definition of the well-posed problem was introduced by J. Hadamard in 1923 in order to figure out what types of boundary conditions are to be used for various types of differential equations. Hadamard's concept reflected the idea that any mathematical model of physical phenomena should have all the following properties:

- There exists a solution to the problem (existence).
- There is at most one solution to the problem (uniqueness).
- The solution depends continuously on the data (stability).

A problem which does not satisfy at least one of these conditions was called *ill-posed* (improperly posed) problem. Hadamard also gave the now classical example of ill-posed problem, the Cauchy problem for the Laplace equation. It became clear later that many branches of natural sciences in general involve ill-posed problem, e.g. computer tomography (see [3], p.183) and others. In 1950's a great attention was drawn to ill-posed problems. It must be mentioned the names of outstanding Russian mathematicians: A. N. Tikhonov, M. M. Lavrentiev, V. K. Ivanov and also their disciples, e.g. V. A. Morozov. They contributed much to the development of the theory and techniques which became a new and fruitful area in numerical analysis (e.g. [5]). The foundations of approximate methods for solving ill-posed problems were laid by A. N. Tikhonov. He generalized the classical Hadamard's concept of well-posedness of the problem.

Many problems of mathematical physics and analysis can be formulated as the problem of solving the equation

$$Ax = b, \quad (1)$$

where $A: X \rightarrow Y$ is an operator defined on a normed space X with values in a normed space Y , b in Y is given. Tikhonov was the first to invoke a topological theorem providing sufficient conditions for the problem (1) to be well-posed in his new sense: *Let A be a continuous operator on a non-empty compact set M in X , and suppose A is injective. Then its inverse A^{-1} considered on $A(M)=N$ is continuous.* In Tikhonov's viewpoint a certain compact set plays a basic role. Generalizations of this theorem to metric and topological spaces were obtained by Ivanov. As to the ill-posed problems Tikhonov suggested a new method which he called *regularization*. This method is based on the idea that the minimum deviation of the values Ax from the specified right hand side b is stabilized by means of some non-negative convex functional (see section 5 below).

The article is divided into the following sections:

- Examples of ill posed problems
- General concept of regularization
- Singular value decomposition
- Tikhonov regularization

Examples Of Ill Posed Problems

Example 1) If the spaces X and Y are both equal to the euclidean n -dimensional space then the operator A in (1) is represented by a matrix \mathbf{A} . It is well-known that in this case A is always continuous (w.r.t. any norm in X and Y resp.). The well-posedness of (1) can be violated if \mathbf{A} is singular. Then A is neither injective nor surjective. However, even if \mathbf{A} is nonsingular the system (1) can be problematic in the numeric viewpoint. In this context the notion of the condition number is introduced: $\text{cond}\mathbf{A} = \|\mathbf{A}\| \|\mathbf{A}^{-1}\|$. Let b_δ be a perturbation of b in (1), $Ax^* = b$, $Ax_\delta =$

b_δ . Then $x^* - x_\delta = A^{-1}(b - b_\delta)$. For the relative error of the solution it holds $\frac{\|x^* - x_\delta\|}{\|x^*\|} \leq \text{cond}\mathbf{A} \frac{\|b - b_\delta\|}{\|b\|}$. One can see

from this estimate that a large condition number can result in a considerable change in the solution even if the relative change in the right hand side is small.

Example 2) Next we go to equation (1), where X and Y are Hilbert spaces and A is a compact operator. Let us recall that A is the *compact operator* if it transforms any bounded set in X to a relatively compact set (its closure is compact) in Y . The compact operator is a natural generalization of the operator in finite dimensional spaces. If X or Y are finite dimensional spaces then any linear operator $A: X \rightarrow Y$ is compact. If $Y = X$ then the compact operators form a closed ideal $\mathcal{L}_c(X)$ in the space of all continuous linear operators $\mathcal{L}(X)$ the domain of which is the Hilbert space X and their range is a subspace of X . If the Hilbert space X is of infinite dimension then a compact operator A may not have continuous inverse operator. The argument is as follows: if A^{-1} were continuous then $I = A^{-1}A$ should be compact since $\mathcal{L}_c(X)$ is an ideal. However the identity I on X is compact if and only if the space X is of finite dimension. The typical example of a compact operator is the Fredholm integral operator of the first kind:

$$y(t) = Ax(t) = \int_a^b k(t,s)x(s)ds. \quad (2)$$

In the formula (2) $k(t,s)$ is the given function lying in the space $L_2((c,d) \times (a,b))$ (this function is called *kernel of the integral operator* (2)), $x \in X = L_2(a,b)$, $y \in Y = L_2(c,d)$.

Example 3) Differentiation and integration are two problems which are inverse to each other. Even if the symbolic differentiation is much simpler than symbolic integration surprisingly the differentiation is ill-posed in the settings considered below. The differentiation turns out to be the more delicate problem from the numerical point of view. We define the operator

$$Ax(t) = \int_0^t x(s)ds, \quad (3)$$

where $t \in [0,1]$, $x \in C[0,1]$. The spaces $X = C[0,1]$, $Y = C^1[0,1]$ are regarded here as normed linear spaces, both with the supremum norm $\|\cdot\|_\infty$, Y is a subspace of X . The inverse operator to the operator (3) is defined on the space $\mathcal{R}(A)$ of those functions in Y satisfying the condition $y(0) = 0$ and it is the derivative. Let us assume that we are given certain function b in $\mathcal{R}(A)$ and noisy data b_δ for which $\|b - b_\delta\|_\infty \leq \delta$. If we have a sequence of functions $b_{\delta,n}(t) = b(t) + \delta \cos \frac{nt}{\delta}$, $\delta \in (0,1)$, $n = 1, 2, 3, \dots$ then it is obviously $\|b - b_{\delta,n}\|_\infty \leq \delta$. On the other hand for the solutions of (1) with operator (3) we obtain $\|A^{-1}b - A^{-1}b_{\delta,n}\|_\infty = n$ since

$$A^{-1}b - A^{-1}b_{\delta,n} = \frac{db}{dt} - \frac{db_{\delta,n}}{dt} = n \sin \frac{nt}{\delta}. \text{ Hence, the error in the solution increases without bound as } n \rightarrow \infty$$

although the error in the data is bounded by δ . This shows that the equation (1) with the operator (3) is ill-posed. Let us look at the approximation of the derivation by the *central difference quotients*

$$R_h b(t) = \frac{b(t+h) - b(t-h)}{2h}, \quad h > 0. \text{ To avoid some difficulties near the boundaries 0 and 1 we suppose that } b \text{ is}$$

periodic with period 1. A Taylor expansion of the function b yields $\|A^{-1}b - R_h b\|_\infty \leq \frac{h}{2} \|A^{-2}b\|_\infty$ suppose that b is continuously differentiable of the second order (the operator of the second derivative is denoted A^2). For noisy data the total error can be estimated as follows:

$$\|A^{-1}b - R_h b_\delta\|_\infty \leq \|A^{-1}b - R_h b\|_\infty + \|R_h b - R_h b_\delta\|_\infty \leq \frac{h}{2} \|A^{-2}b\|_\infty + \frac{\delta}{h} \quad (4)$$

In this estimate we have split the total error into an *approximation error*, which tends to 0 as $h \rightarrow 0$ and a *data noise error*, which explodes to infinity as $h \rightarrow 0$. If we want to obtain a good approximation it is necessary to balance these two error terms by a suitable choice of the discretization parameter h . The minimum of the right

hand side in (4) is attained at $h = \left(2\|A^{-2}b\|_\infty^{-1}\right)^{1/2} \delta^{1/2}$. With this step h the total error is of the order

$$\|A^{-1}b - R_h b_\delta\|_\infty = O\left(\delta^{1/2}\right) \quad (5)$$

It can be shown that for higher order difference schemes the convergence rate is always smaller than $O(\delta)$. It is well-known that the operator of derivative A^{-1} is closed but not continuous operator. The convergence rate (5) reflects the fact that stability is restored due to a-priori information

$$\|A^{-2}b\|_{\infty} \leq C. \quad (6)$$

The inequality (6) guarantees the continuity of the operator of derivative A^{-1} on the set of functions b satisfying (6). It follows from inequalities

$$\|A^{-1}b\|_{\infty} \leq \|A^{-1}b - R_h b\|_{\infty} + \|R_h b\|_{\infty} \leq \frac{h}{2} \|A^{-2}b\|_{\infty} + \frac{\|b\|_{\infty}}{h} \leq 2\sqrt{C\|b\|_{\infty}} \text{ if we set } h = \sqrt{\frac{\|b\|_{\infty}}{C}}.$$

This last example exposes the typical properties of ill-posed problems:

- Amplification of high frequency errors.
- Restoration of stability by a-priori information
- Trade-off between accuracy and stability in the choice of the discretization parameter

General Concept Of Regularization

Suppose again the general problem (1) with $A: X \rightarrow Y$, X, Y are normed linear spaces, A is continuous and injective with range $\mathcal{R}(A)$, which is a proper subspace of Y , dense in Y , i.e. (1) is ill-posed problem. We first introduce approximations of the inverse operator A^{-1} (which is not continuous). A *regularizing strategy* is a family of continuous linear operators $R_{\alpha}: Y \rightarrow X$, $\alpha > 0$, for which $\lim_{\alpha \rightarrow 0^+} \|R_{\alpha}Ax - x\| = 0$ for all $x \in X$.

A regularizing strategy may not be uniformly bounded. In fact, there is a sequence of positive numbers $\alpha_n \rightarrow 0$ such that $\|R_{\alpha_n}\| \rightarrow \infty$. Assume the converse: there is c such that for all $\alpha > 0$, $\|R_{\alpha}\| \leq c$. Then for any y in $\mathcal{R}(A)$ the following inequalities hold:

$$\|A^{-1}y\| \leq \|A^{-1}y - R_{\alpha}y\| + \|R_{\alpha}y\| \leq \|x - R_{\alpha}Ax\| + \|R_{\alpha}\| \|y\| \leq \|x - R_{\alpha}x\| + c\|y\|. \quad (7)$$

The first term on the right hand side in (7) tends to zero as $\alpha \rightarrow 0$. However, it means that $\|A^{-1}y\| \leq c\|y\|$ which is a contradiction with A^{-1} is not continuous. In other words, the product $R_{\alpha}A$ converges to identity I pointwise, not uniformly.

The second matter is to deal with the noise involved in the right hand side of the equation (1). We worked with this noise in Examples 2.1 and 2.3 in section 2. Suppose again that b_{δ} is a perturbation of b in (1), $\|b - b_{\delta}\|_{\infty} \leq \delta$. We then define

$$x_{\alpha,\delta} = R_{\alpha}b_{\delta}. \quad (8)$$

Now we derive the fundamental estimate for regularizing strategy. Let x^* is the solution of (1). It holds

$$\|x^* - x_{\alpha,\delta}\| \leq \delta \|R_{\alpha}\| + \|R_{\alpha}Ax^* - x^*\|. \quad (9)$$

As α tends to zero the second term in the right hand side in (9) converges to zero (regularization effect) while the first term grows to infinity (ill-posedness effect). Thus two competing effects enter (9). These effects forces us to make a trade off between accuracy and stability. It is obvious that the choice of parameter α is of the crucial importance. In Example 3 there is $\alpha = h$. The parameter is in general dependent on the noise parameter δ as can be seen in Example 3 and again in section 5. In what follows we introduce two remarkable regularization techniques, the singular value decomposition (SVD), for compact operators, and Tikhonov regularization (TR) which can be used in more general situations.

Singular Value Decomposition

We will suppose that A is a compact injective operator on an infinite dimensional Hilbert space X . Let A^* be the adjoint operator to A and $\lambda_j > 0$, $j \in \mathbb{N}$, the eigenvalues of the self-adjoint and positive operator A^*A . Then the numbers $\sigma_j = \sqrt{\lambda_j} > 0$ are called the *singular values* of A . Since $\sigma_j \leq \|A\|$, we order the singular values so that

$$\sigma_1 \geq \sigma_2 \geq \dots \geq \sigma_n \geq \dots > 0.$$

Multiple singular values are repeated as many times as their multiplicity (the multiplicity of eigenvalues λ_j is the finite dimension of associated eigenspaces for compact self-adjoint operator A^*A). Then there exist two

orthonormal systems (u_j) and (v_j) in X such that $Au_j = \sigma_j v_j$ and $A^* v_j = \sigma_j u_j$, see [1], p. 31. The following claim is a very useful characterization of the range of the compact and injective operator:

Theorem (Picard) *The equation (1) has a solution in X if and only if*

$$\sum_{j=1}^{\infty} \frac{1}{\sigma_j^2} |(b, v_j)|^2 < \infty. \quad (10)$$

The solution is then given by

$$x^* = A^{-1}b = \sum_{j=1}^{\infty} \frac{1}{\sigma_j} (b, v_j) u_j. \quad (11)$$

Proof: Assume that $b = \sum_{j=1}^{\infty} (b, v_j) v_j$. If (10) holds true then the series $\sum_{j=1}^{\infty} \frac{1}{\sigma_j} (b, v_j) u_j$ is convergent. We denote its sum by x^* . Applying A we obtain

$$Ax^* = \sum_{j=1}^{\infty} \frac{1}{\sigma_j} (b, v_j) Au_j = \sum_{j=1}^{\infty} (b, v_j) v_j = b.$$

Vice versa, assume $Ax^* = b$. It holds $(b, v_j) = (Ax^*, v_j) = (x^*, A^* v_j) = \sigma_j (x^*, u_j)$. It follows that

$$\sum_{j=1}^{\infty} \frac{1}{\sigma_j^2} |(b, v_j)|^2 = \sum_{j=1}^{\infty} |(x^*, u_j)|^2 = \|x^*\|^2 < \infty. \text{ For details see [4], p. 13.}$$

The formula (11) clearly illustrates the ill-posedness of the equation (1) with a compact operator A . As $\frac{1}{\sigma_j} \rightarrow \infty$, the higher terms of the Fourier series (11) are amplified without bounds. The analogous effect can be observed in Example 2.3 even if it is not the case of a compact operator in this example. The faster the decay of the singular values, the more severe is the ill-posedness of the problem. An ill-posed problem with a compact operator can be classified as *mildly ill-posed* if the singular values decay to 0 at a polynomial rate, i.e. there exist positive constants C, p (p integer) such that $\sigma_j \geq Cj^{-p}$ for all $j \in \mathbb{N}$. In the other cases it is classified as *severely ill-posed* problem.

One way how to restore stability for (1) is to truncate the series (11). We define

$$R_\alpha b = \sum_{\sigma_j \geq \alpha} \frac{1}{\sigma_j} (b, v_j) u_j \quad (12)$$

The regularizing strategy (12) is known as *truncated singular value decomposition*.

One of the main drawbacks of SVD is that it is quite expensive to compute numerically once generally continuous problem has been discretized.

Tikhonov Regularization

One of the most famous regularization techniques is the Tikhonov regularization (TR), see e.g. [2], p. 99. It consists in the idea of the transformation of the problem (1) to the variational problem of minimizing certain functional. We will assume in this section that the operator A in the equation (1) is from the space $\mathcal{L}(X)$, where X is a Hilbert space, A is injective, not necessarily compact and (1) is ill-posed. We can find the solution of (1) in the sense of the least squares, i.e. we will regard the operator equation

$$A^* Ax = A^* b. \quad (13)$$

However neither this transformation is sufficient to remove the ill-posedness. Typically, if A is compact, then A^*A so is. We showed in section 2 that in the case of infinite dimensional Hilbert space we come to the ill-posed problem. Let us recall that the solution of (13) is usually denoted as the *generalized solution* of (1). Solving (1) corresponds to minimizing the functional $\|Ax - b\|$. Instead one may minimize the *Tikhonov functional* $J_0(x) = \|Ax - b\|^2$. It can be shown that if there exists the solution of (13), say \hat{x} , then it is the minimizer for this functional and vice versa. The existence of such solution can be ensured on the base of Lax-Milgram theorem but it is necessary to create a gap between zero and the low bound of the spectrum of the self-adjoint and positive operator A^*A . It may be surprising that it can be done only by adding some positive multiple of the identity. Thus we obtain operator equation

$$A^*Ax + \alpha Ix = A^*b, \quad (14)$$

where $\alpha > 0$. The idea of the Tikhonov regularization consists in this access. The adding of the term αI means that the operator $\alpha I + A^*A$ is the continuous operator with range equal to the whole space X . Its inverse is therefore continuous and

$$R_\alpha = (\alpha I + A^*A)^{-1} A^* \quad (15)$$

so is. We obtain in this way regularization strategy for computing the approximative solution \hat{x}_α to the unique solution \hat{x} of (13) (if it exists). The approximative solution $\hat{x}_\alpha = R_\alpha b = (\alpha I + A^*A)^{-1} A^*b$ is at the same time the unique minimizer for the *regularized Tikhonov functional* $J_\alpha(x) = \|Ax - b\|^2 + \alpha \|x\|^2$. For the regularizing strategy (15) it holds $\|R_\alpha\| \leq \frac{1}{2\sqrt{\alpha}}$. It can be shown by the help of polar decomposition of a continuous operator

(see [4], p. 234) and the Riesz functional calculus (see [4], p. 87). More particularly, denote $T = A^*A$. The operator T is self-adjoint and positive. By polar decomposition $T = U|T|$, where U is unitary, i.e.

$U^*U = UU^* = I$, and $|T| = T^{1/2}$. Therefore, $R_\alpha = (T + \alpha I)^{-1}|T|U$ and we denote $f(T) = (T + \alpha I)^{-1}|T|$.

Obviously $\|R_\alpha\| \leq \|f(T)\|$ and $\|f(T)\| = \sup_{\lambda \in [0, \|T\|]} |f(\lambda)| = \sup_{\lambda \in [0, \|T\|]} \frac{\sqrt{\lambda}}{\lambda + \alpha} = \frac{1}{2\sqrt{\alpha}}$. Suppose now a noise is involved

in the right side b as above. Then we obtain a noisy approximative solution to (13), say $\hat{x}_{\alpha,\delta} = R_\alpha b_\delta$. Then we gain the estimate which is in accord with the general estimate (9), i.e.

$$\|\hat{x} - \hat{x}_{\alpha,\delta}\| \leq \delta \|R_\alpha\| + \|R_\alpha A\hat{x} - \hat{x}\| \leq \frac{\delta}{2\sqrt{\alpha}} + \frac{\|(A^*)^{-1}\hat{x}\|\sqrt{\alpha}}{2}, \quad (16)$$

where the second term on the right side proves, that (15) is really the regularizing strategy. The second inequality in (16) can be derived using the current properties of the norm. At the same time we assume, that the solution \hat{x} satisfied a certain condition of smoothness: $\hat{x} \in R(A^*)$. We can notice the relationship between SVD and TR. If $A \in \mathcal{L}_C(X)$ we can verify that SVD of (15) has the form (see (12))

$$R_\alpha b = \sum_{j=1}^{\infty} \frac{\sigma_j}{\alpha + \sigma_j^2} (b, v_j) \mu_j.$$

As was mentioned in section 3 the essential problem for numerical computations is the choice of the regularization parameter α . There exist a lot of strategies for it. The most well-known is Morozov's discrepancy principle. It consists in taking $\alpha = \alpha(\delta)$ such that $\|A\hat{x}_{\alpha,\delta} - b_\delta\| = \delta$. This choice guarantees the balanced approximation and data noise errors. The numerical computation of α can be carried out by Newton's method.

The biggest drawback of TR is the repeated matrix manipulation, computation of the inverses (15).

Conclusion

The regularization methods are efficient tool for solving of the ill-posed problems. Although we introduce only two, SVD and TR, there are others as Landweber iterations for example. The choice of regularization parameters is of the main importance. It generally depends not only on the noise level but also on the data. It can be shown, that the convergence of any regularization method can be arbitrarily slow. However, as Example 3 shows the convergence rate can be determined if smoothness properties are known a-priori.

Immersive technologies can be used as enhancements to traditional education tools. Many types of applications are available but are underutilized in education and training. This paper will define the different types of immersive learning, provide current examples of each type an explore the pros and cons of augmented learning, virtual reality and mixed reality use in education and training. This paper will additionally examine the state of the science of actionable gamification strategies using altered reality to enhance education, improve healthcare and generate profit.

Impact And Importance Of Support For Higher Education In Science And Technology In Mexico

Abstract

The document studies the importance of the support granted by the National Council of Science and Technology (CONACYT) for higher education in Mexico by analyzing the resources, supports and distinctions granted in three aspects such as the number of professors who are members of the National System of Higher Education, Researchers (SNI), graduate programs that have been integrated into the National Postgraduate Program in Quality (PNPC) and the scholarships granted to study a high quality postgraduate program. The methodology is descriptive quantitative by analyzing the statistics of the support of the CONACYT. The results show the growth in the budget of the CONACYT in 43% from 2012 to 2017. Even though the investment is higher, it is low because it represented 0.126% of GDP in 2012 and in 2016 it represented 0.187% of GDP, which is below 1% of the GDP that should be invested according to Article 9 Bis of the Science and Technology Law in Mexico. The results show that it is insufficient the support for science and technology and it is necessary the support to higher education derived from the fulfillment of the commitments of the Science and Technology Law in Mexico oriented to the production of high level human resources.

Keywords: *Science and Technology, Conacyt, SNI, Posgraduate.*

Introduction

In recent years, several Latin American countries have made significant efforts to improve their performance in science, technology and innovation by increasing the resources dedicated to that end (RICYT, 2008 cited by Luchilo, 2009). This represents an eloquent indicator of the distance between the countries of the region and the developed countries. Therefore, reducing this gap becomes a clear policy objective established in several national strategic plans (PECIT, 2008, PENCTI, 2007).

By analyzing the impact and importance of support for higher education in science and technology in Mexico, it is possible to show the increasing production of knowledge in our country. Such production is created in different ways by the National Council of Science and Technology (Conacyt) which is responsible along with the public policy of the Mexican Federal Government. The objective of this article is to reflect the impact and importance of the support granted by Conacyt in higher education as well as to establish the resources, financial supports and distinctions provided in three fundamental aspects which are the number of members of professors of the National System of Researchers (SNI), the Postgraduate Programs integrated in the National Postgraduate Program in Quality (PNPC), and scholarships granted to study a high quality postgraduate program.

In order to fulfill its goal, Conacyt has ten fundamental programs with several subprograms that are really important in its operation such as the National Postgraduate Program of Quality (PNPC) and the evaluation of scientists and technologists in order to provide the distinctions which are divided into candidate for National Researcher, National Researcher with three levels and National Researcher Emeritus.

For the development of these programs, Conacyt has an amount of resources granted by the federal government. In 2017 there was a budget reduction of -14.8%, due to a cut approved by the Federal Executive derived from the decrease in the oil price, but if we compare the year 2017 with year 2012 we can highlight an increase of 42.95% in the resources given to Conacyt.

The first section of the document highlights the importance of the National Council of Science and Technology since its creation by the Federal Government as well as the design of its fundamental programs which attempt to solve the problem of the use of natural resources, implement actions to solve deficiencies in health, food, agricultural production, industrialization, education and rural development as well as to achieve the decentralization of research through the creation of foreign research centers. A key program of Conacyt is the National System of Researchers since its creation by official decree in 1984 and up to the present with the distinction of the researchers assigned to any dependency, entity, institution of higher education or center where researches are carried out all states of the country. In 2016, the SNI had 25072 members which is 7.5% more than it had in 2015 at a national level and, compared to 2004, it had an increase of 146.1% regarding 2016 (CONACYT 2017).

The next relevant point in this paper is the National Postgraduate Program of Quality (PNPC) which is a program that was created in 1991. It was initially called "Padrón de Excelencia" (Excellence Register), then it changed its name to "National Program for the Strengthening of Postgraduate Programs"(PNFP) from 2001 to 2006, and it finally became as the National Postgraduate Program in Quality (PNPC) from 2007 to the present. Its aim is to recognize the specialty, masters and doctorate programs that have the necessary elements to guarantee the relevance of its implementation and the attainment of optimal results. It is adequate to highlight that in Mexico there is an offer of 8,504 active postgraduate degrees registered between 2014-2015 with a total of 287,324 students, 14% of the programs correspond to doctorate level (1,186), 67% of the programs correspond to a masters level (5,668) and 19% correspond to specialty degrees (1,650). From these, 2155 programs have PNPC recognition for their quality. Regarding the number of students, we can also highlight that there was an enrollment of 287,324 students, 55% of them are in the private sector with 158,359 students and 45% in the government sector (128,965 students). It is important to establish that the PNPC recognizes four levels depending on the level of development of the postgraduate degree which can be newly created, in development, consolidated and international competition.

Regarding scholarships, it can be highlighted that in 2016 there were 63474 scholarship recipients, 107% more than the 30634 scholarships granted in 2009, and the amount for national graduate programs was 56.497 scholarships (89%) and 6977 recipients abroad (11%) in 2016. The cost of the scholarship program was M\$ 9,505 million pesos in 2017, 7.2% more than the M\$ 8866 million pesos that were given in scholarships in 2016.

Objective

This article attempts to make a reflection on the impact and importance of the support granted by the National Council of Science and Technology (Conacyt) in higher education as well as to establish the resources, supports and distinctions awarded in three fundamental aspects such as:

- The number of members of professors of the National System of Researchers (SNI).
- Postgraduate programs that have been integrated into the National Program of Quality Postgraduate (PNPC), and
- The scholarships granted to study a high quality postgraduate program.

Importance the National Council of Science and Technology (Conacyt)

The Conacyt is the organization that is responsible for carrying out the public policy of the Mexican federal government for the support of science and technology. Its organizational structure is the one of a decentralized public organization from the Mexican federal government dedicated to promote and stimulate the development of science and technology in the country (Márquez 1982).

On December 29, 1970, the law that created Conacyt was published in the Official Gazette of the Federation, and the organization began its work formally in 1971. At the beginning, it was proposed to design specific programs to face the problem regarding the use of natural resources, the implementation of actions to solve deficiencies in health, food, agricultural production, industrialization, education and rural development as well as to achieve the decentralization of research through the creation of external research centers (Márquez 1982).

In order to fulfill its goal, Conacyt has ten fundamental programs which are:

- National and international postgraduate scholarships.
- National System of Researchers (SNI).
- Science and Technology networks.
- Scientific investigation.
- Applied research.
- Professorship for young researchers.
- International projects.
- Infrastructure in science and technology.
- Projects with the industry.
- Regional development.

For the implementation of these programs, Conacyt has several subprograms that are very important in its operation. Some of them which we can highlight are:

- National Postgraduate Program in Quality (PNPC): postgraduate evaluation for the purpose of granting national resources and scholarships.

- SNI: Evaluation of scientists and technologists in order to grant the distinctions which are divided into candidate for National Researcher, National Researcher with three levels and National Researcher Emeritus.
- Applied research: Evaluation of the country's scientific research programs and projects.

For the development of these programs Conacyt has a budget from the federal government, which is distributed in the following way:

Table 1: Net expenses for the Conacyt from 2012 to 2017

Source: Own elaboration based in SHCP (2018).

Expressed in current Mexican Pesos.

From the previous Table we can highlight that there was a budget of \$ 31,831.7 million pesos and then there was a budget reduction in 2017 to reach \$ 27,113.5 million pesos with a decrease of -14.8%, due to an approved budget cut by the federal government derived from the drop in the price of oil, but if we compare 2017 with the first year of our 2012 analysis, we can highlight an increase of 42.95% in the resources allocated to Conacyt. In nominal terms, this is an unprecedented support to the area of science and technology in the history of Mexico. However, if we compare this data with the Gross Domestic Product (GDP), which was \$ 17,028,177 million pesos in 2016, this represents only 0.187% and in 2015 it was 0.186% of the GDP, although if we consider that in 2012 it barely represented 0.126% of the GDP, it is very far from the 1% of the GDP indicated in Article 9 Bis of the Law of Science and Technology, which should be allocated to support this area. It should be noted that this constitutional article was published on September 1, 2004 and it had to be implemented no later than 2006, which evidently has not happened.

National System of Researchers (SNI)

The SNI is the most emblematic program of Conacyt and it was created by presidential decree which was published in the Official Gazette of the Federation on July 26, 1984. The SNI is the most important distinction in research in México; its objective is to recognize the work of people dedicated to produce scientific knowledge and technology. The recognition is obtained through the evaluation by pairs and consists on awarding the category of national researcher. This distinction symbolizes the quality and prestige of scientific contributions (Flores 2012).

The economic grant is delivered in accordance to Article 59 of the Regulation of the National System of Researchers (RSNI), the amounts of the incentives and the location on the table for each category and level are:

- I. Candidate for National Research: Three times the monthly value of the UMA (\$7,350.72 Mexican pesos);
- II. National Research level I: Six times the monthly value of the UMA (\$14,701.44 Mexican pesos);
- III. National Research level II: Eight times the monthly value of the UMA (\$19,601.92 Mexican pesos);
- IV. National Research level III: Fourteen times the monthly value of the UMA (\$34,303.36 Mexican pesos);
- V. National Researcher Emeritus: Fourteen times the monthly value of the UMA (\$34,303.36 Mexican pesos).

The value of the monthly UMA as of February 1, 2018 is \$2,450.24 as a reference value which increases each year on February 1 on terms of inflation in the country.

Researchers who have obtained any of the distinctions and are assigned to a dependency, entity, institution of higher education or center where research is conducted in any of the states of the Republic will receive an additional third of the incentive that corresponds to the Candidate for National Researcher, subject to budget availability.

Table 2 shows the budget used by the SNI from SNI 2004 to 2017:

Table 2: Net expenses of the SNI from 2004 to 2017

Source: CONACYT (2017).

Expressed in millions of Mexican pesos

As it can be seen in the analysis period, the budget for the SNI has increased by 166% from 2004 to 2016 and only during a six-year term there was an increase of 56.7% from 2012 to 2016. However, it has grown only 11.4 % the last year which highlights the support for this important stronghold of scientific research.

Table 3: Number of researchers in SNI 2004 to 2016

Source: CONACYT (2017).

As it can be seen, the SNI had 25072 members in 2016, 7.5% more than the 23316 members at the national level in 2015 and in 2004 there were 10189 members, which is an increase of 146.1% in comparison to 2016; and only in this six-year term there has there been an increase of 35.1% from 2012 to 2016 (CONACYT 2017).

However, one of the most important aspects for a recognized researcher is undoubtedly the publishing of their articles in indexed journals which is considered a measurement that reflects the success of the SNI supports. Consequently, it is possible to emphasize the increasing number of published articles of Mexicans which is analyzed in the following table.

Table 4: Publications of Mexicans and annual growth (2007-2016)

Source: CONACYT (2017), by query made in the databases: Database Incites Global Comparisons, Essential Science Indicators, Research Areas, Thomson Reuters, 2016, Date of access: 03/29/2017.

■ Number of articles.

■ Percentage variation.

As it can be seen from the previous table, the published works of Mexican increased from 8009 in 2007 to 12815 in 2016 with a growth of 60%. Just from 2012 to 2016 the published articles increased by 17.5 %, although there is a -1.3% drop in comparison to the last year of the analysis. Nevertheless it is considered that there are good figures of publications at national and international levels as well as highlighting the databases that were obtained (Database Incites Global Comparisons, Essential Science Indicators, Research Areas, Thomson Reuters), which shows that they are among the best publications.

National Program of Quality Postgraduate Studies (PNPC)

Firstly, it is necessary to establish the postgraduate distribution in Mexico where we find the following information:

Table 5: postgraduate distribution active in Mexico according to the regime, grade, and enrollment in 2014-2015.

Regime	Ph.D.	Masters	Specialty	Total of programs	% Total of Programs	Enrollment	% of the total
Private	431	3,603	833	4,867	57%	158,359	55%
Autonomous	491	1,208	580	2,279	27%	85,077	30%
Federal	203	397	180	780	9%	21,786	8%
State	48	318	36	402	5%	13,660	5%
Federal transferred	13	142	21	176	2%	8,442	3%
Total	1,186	5,668	1,650	8,504	100%	287,324	100%
% of the Total	14%	67%	19%	100%			

Source: PNPC 2017.

As it can be seen in the previous table, we can highlight that in Mexico there is an offer of 8,504 active postgraduate registered programs between 2014 and 2015 with a total of 287,324 students. 14% corresponds to doctorate level with 1,186 postgraduate students, 67% corresponds to a master's level with 5,668 students and 19% corresponds to a specialty level with 1,650 students. In this trend of ideas, we can highlight that in the private sector there are 4,867 postgraduate students (57%) and 3,637 that belong to the public sector (43%). Regarding the number of students, we can also highlight that there was an enrollment of 287,324 students, 55% of them are in the private sector with 158,359 students, whereas 45% (128,965 students) are part of the government sector.

Regarding the PNPC, it is a program that was created in 1991, which was initially called "Padron de Excelencia" (Excellence Register), then it changed its name to "National Program for the Strengthening of Postgraduate Programs" (PNFP) from 2001 to 2006, emerging as the National Postgraduate Program in Quality (PNPC) in 2007, with the objective of recognizing the specialty, master's and Ph.D. programs that have the necessary elements to guarantee the relevance of their operation and obtain optimal results. To be part of the PNPC is a public acknowledgement of the quality of the program by the Ministry of Public Education and Conacyt, which derives from a rigorous evaluation process by academic peers. Additionally to the attainment of academic quality, the programs belonging to the PNPC have scholarships for full-time students, mixed scholarships for national and international research stays and provides postdoctoral scholarships to graduates of doctorate programs registered in the PNPC (CIDE 2018 and PNPC 2018).

The PNPC acknowledges four modalities for the integration of postgraduate programs which are described below (PNPC 2017):

1. "School or face-to-face. This modality recognizes the postgraduate programs in its two orientations:
The Graduate Programs with Research Orientation offered at the doctorate, master's and specialty levels in the different areas of knowledge.
The Graduate Programs with Professional Orientation offered at the doctorate, masters and specialty levels in order to promote the link with the sectors of society.
2. Medical specialties. Due to their academic-professional nature, and orientation to clinical and healthcare research, an appropriate methodology was designed for this type of postgraduate degree.
3. Postgraduate studies with the industry aim to strengthen the competitiveness and productivity of companies through the training of high-level human resources able to apply knowledge, develop technological solutions and with the ability to innovate.
4. Postgraduate courses in the out-of-school modality include a vision of context and definitions of aspects that are particularly relevant to this modality, specifying how educational quality is ensured in this type of programs taking into account: the management, evaluation of the learning, curricular and content design, organization, design of the academic core, results and cooperation with the sectors of society".

Based on the four modalities mentioned, we can highlight the postgraduate courses that are part of the PNPC.

Table 6: Postgraduate courses recognized by the PNPC from 1991 to 2017

Source: PNPC (2017).

- Specialty
- Master's
- Ph.D.

From the previous table we can highlight that in 1991 (the year of its creation), the PNPC had only 414 registered postgraduate courses, 296 in Master's and 118 in Ph.D. There was a growth of 421% in 2017 with 2155 courses. Another noteworthy fact is the current distribution of postgraduate degrees with 309 programs of specialties which represents 14.3%, 1202 in Master's (55.8%) and Ph.D. with 644 (29.9%). Only from 2012 to 2017 there has been a global growth of 51.5% of postgraduate courses in the PNPC, but only the specialty courses grew in the same period by 91.9%. In terms of geographical distribution, we can highlight that 20% of PNPC postgraduate courses are offered in Mexico City and the remaining 80% in the states of the country.

As a fact of paramount importance, we could highlight the distribution of the different postgraduate courses in 2017, according to the institution's regime that offers it:

Table 7. Postgraduate distribution in PNPC in 2017

Regime	Ph.D.	Master's	Specialty	Total of programs	% Total of Programs
Private	33	75	26	134	6%
Center Conacyt	53	90	5	148	7%
Federal	120	183	62	365	17%
State	346	696	207	1,249	58%
Center of Research Federal	58	65		123	6%
Technological institutes	32	85	1	118	5%
Others	2	8	8	18	1%
Total	644	1,202	309	2,155	100%
% of the Total	30%	56%	14%	100%	

Source: PNPC (2017).

From the previous table we can point out that despite the postgraduate distribution in which the private sector concentrates 57% of the postgraduate students in Mexico, it only has 6% of postgraduate courses in the PNPC, which is the highest concentration in the PNPC. State institutions have 58% and, in the last place, federal institutions that represent only 17% of the PNPC.

It is important to establish that the PNPC establishes four levels that depend on the level of development that the graduate program has according to the following PNPC classification (2018):

- Recently created. Programs that meet the basic criteria and standards of the PNPC reference framework.
- Developing. Programs with a positive academic prospection based on their improvement plan and on the feasible goals to achieve in the medium term.
- Consolidated. Programs that have national recognition for their relevance and impact in the formation of high-level human resources, in academic productivity and in collaboration with other sectors of society.
- International competition. Programs that have collaborations in the international arena through agreements that include the mobility of students and professors, co-management of theses and joint research projects.

Derived from the previous levels we can highlight that in 2017 there were 540 postgraduate programs of recent creation in the PNPC which represents 24% of the 2,155 programs that are part of the PNPC, 811 in Development which represent 38%, 597 Consolidated (28%) and 207 in International competition with just 10%. This highlights that the postgraduate programs are in constant development, as Recently created and Consolidated reach 62%, while International competition reaches only 10%, which requires a higher level of agreements with student and teacher mobility, joint international direction and more support with foreign universities in order to access this area.

Similarly, one of the most important factors for the entrance of institutions to the PNPC is represented by the scholarships that are awarded to students, a fact that we can verify in the following table.

Table 8: Number of scholarship from 2009 to 2016.

Source: CONACYT (2017)

■ Current scholarships
■ New scholarships

As it can be seen, the growth in the number of scholarships for postgraduate degrees is very important, as a total of 63,474 of them were awarded, 7.9% more scholarships than the 58,835 ones that were awarded in 2015. If we compare this with the 30,634 scholarships in 2009, it is possible to observe a growth of 107.2% in relation to 2016. It is worth noting that from the 63,474 scholarships granted in 2016, 56,797 were assigned to national postgraduate programs (89%) and 6,977 were assigned to abroad programs (11%).

It is worth noticing the amount received by the grantees, both national and international, as it is shown in the following two tables.

Table 9. Amount in national scholarships for 2018

Intended Level	UMA: Unit of Measurement and Update	Value in Mexican Pesos
Ph.D.	6.0	\$ 14,701.44
Master	4.5	\$ 11,026.08
Especiality	4.0	\$ 9,800.96

Source: Conacyt (2017)

It is important to mention the maintenance fee that students are entitled to have when studying a graduate degree in Mexico. The Ph.D. level has the highest value (\$14,701.44 Mexican Pesos), while a master's degree is \$ 11,026.08 Mexican Pesos and an specialty \$ 9,800.96 Mexican Pesos, in addition to having medical services from the Institute of Security and Social Services for State Workers (ISSSTE). As long as students are grantees they cannot provide services in any company for more than 8 hours a week, but the benefit is to support students who do not have a paid employment. Moreover, there is no difference between single and married grantees, which is a recognized aspect in international scholarships.

Table 10. Amount in international scholarships for 2018

Region	Foreign currency	Single	Married
European Union	Euro	\$ 1,090.00	\$1,362.00
United Kingdom	Pound	\$ 770.00	\$963.00
London	Pound	\$ 880.00	\$ 1,073.00
Rest of the world	US Dollar	\$1,100.00	\$1,375.00

Source: Conacyt (2017)

When we talk about interns abroad there are four classifications in general that separate clearly the amount of money between single and married students who receive on average 25% more than single grantees. The fundamental difference is in the European Union and the United Kingdom, and the rest of the world, because although in the United Kingdom there are two classifications among interns in London and in the rest of the United Kingdom, there is an important difference in the cost of living in London regarding the rest of the country. Thus, for single students in the countries of the European Union the support is 1,090 Euros, 880 pounds in London and 770 pounds in the rest of the United Kingdom, and for the rest of the world the support reaches \$1,100 US dollars or its equivalent in the country where they reside.

Finally, there is the total cost of the scholarship program. The information is presented as it was mandatory to mention the cost of the various programs indicated in the Income Tax Law in its Article 90 but this information was not available for previous years, so there is only information from 2015 to 2018, the latter only for the first half of the year.

Table 11: Total expenses in national and international scholarships from 2015 to 2018

Source: Conacyt (2018).

2018: Only from January to June

We can highlight from the previous table that in 2017, \$7,270 million pesos were used in national scholarships, 4.9% more than in 2016, which were \$ 6,927 million pesos and only \$ 3,786 million pesos were applied from January to June 2018.

Regarding foreign scholarships in 2017, \$ 2,354 million pesos were spent, 15.3% more than the amount used in 2016, which was \$ 1,939 million pesos and \$ 726 million pesos were applied only from January to June 2018. The total cost of the scholarship program was \$ 9506 million in 2017, 7.22% more than the year 2016 with its \$ 8,866 million pesos.

Therefore, if we consider the \$ 8866 million pesos used in scholarships in 2016 in the 63474 granted scholarships, compared to the \$ 4448 million pesos in the SNI in its 25072 members, we can establish that the postgraduate scholarships represent 99% more of what was spent in the SNI, benefiting a total of 88,546 people. If we consider

that in 2015 there was a population of 119.5 million Mexicans (INEGI, 2018), this implies that only 0.074% of the national population obtained this benefit from these two programs. It may seem very little but it must be remembered that the financial supports in these two programs range from \$ 9,800.96 Mexican Pesos for national specialty grantees up to \$ 34,303.36, for SNI level III, which represent important economic and social supports.

Conclusions:

The importance of Conacyt is its commitment to promote and boost the development of science and technology in Mexico. It has faced the problem of the use of natural resources by implementing actions to address deficiencies in health, food, agricultural production, industrialization, education and rural development through the decentralization of research. However, their essential programs pose different challenges in their actions nowadays.

Accordingly, a challenge it faced was the budget cut approved by the federal government derived from the fall in the price of oil in 2017, which manifested itself in a reduction of -14.8%. By comparing this information with the gross domestic product. (GDP) of 2016 and Conacyt it represents only 0.187% and in 2015 it was 0.186% of the GDP. In 2012 it only represented 0.126% of the GDP and it is very far from the 1% of the GDP that the constitutional article 9 Bis states in the Law on Science and Technology which should be used to support the national cost in this area. It is important to emphasize that this constitutional article was published on September 1, 2004 and it had to be obligatory no later than 2006, which obviously has not been implemented.

The information discussed above refers to the financial data on the National Council of Science and Technology in general, but by analyzing their programs in a specific way, it can be observed that the budget for the SNI has increased 166% from 2004 to 2016 and just in a six-year period there was an increase of 56.7% from 2012 to 2016, but in the last year there was a growth of only 11.4%. This highlights the support for this important institution of scientific research. Similarly, the SNI had increased the number of members in 2016 as it had 25072 members, an increase of 7.5% more than the 23316 members who were registered nationally in 2015 and in 2004 they were 10189 members, which shows an increase of 146.1% in relation to 2016 (CONACYT, 2017). This has led to an increase in the number of publications made by Mexicans with SNI support from 8009 in 2007 to 12815 in 2016, an increase of 60% growth, reflecting the overall success of the SNI and its impact on Mexican publications.

Regarding the PNPC, it can be seen that in Mexico there is an offer of 8,504 active postgraduate courses registered between 2014 and 2015 with a total of 287,324 students. From these, 14% corresponds to the doctorate level with 1,186 postgraduate degrees, 67% of master's degree with 5,668 postgraduate courses and 19% of specialty degree with 1,650 postgraduate courses. Regarding postgraduate courses with recognition for their quality by the PNPC, the distribution in the four modalities for the integration of postgraduate programs in 2017, there were 540 postgraduate programs of recent creation, representing 24%, 811 in Development, which represents 38%, 97 Consolidated with 28% and 207 in International Competition with just 10%. This highlights that postgraduate courses are in constant development, since in Recent creation and Consolidated engulf 62%, while international competition reaches only 10%.

Regarding foreign scholarships, \$ 2,354 million pesos were disbursed in 2017, 15.3% more than the amount spent in 2016, which was \$ 1,939 million pesos, and \$ 729 million pesos were applied only from January to June 2018. It is important to increase the financial support for postgraduate internationalization, since M \$ 7,270 million pesos were used in Mexico in 2017 with a 5% increase in relation to the M \$ 6,927 million pesos spent in 2016.

It is very important to point out that the scholarships granted in 2016 were 63474, and that in the SNI there were 25072 members. We can conclude that these two programs have benefited a total of 88,546 people, if we consider that in 2015 there was a population of 119.5 million Mexicans (INEGI, 2018), this implies that only 0.074% of the national population benefited from these two programs, which are supports of great economic and social importance for an important professional development.

Under this general view we can conclude that although the support that has been given to CONACYT in the present federal administration is important, this is insufficient to achieve a harmonious development of the different programs managed by this important institution in Mexico and that it is essential that it achieves what is established in the Science and Technology Law that mentions that at least 1% of GDP must be spent in this area.

Abstract

Rare are the teachers who have never used information and communication technologies (ICT) in an educational context. We intend to know the impact of the inclusion of ICT in the learning process by listening to primary teachers in service and students in an internship situation, the latter in the scope of initial teacher training. With regard to in-service teachers, a case study of a quantitative and qualitative nature was chosen in the Porto region in 2012. The analysis of a question of a questionnaire survey of about 1300 teachers, teaching in public and private institutions in the Porto region, is presented. Of these, 188 referred to perform good practices with digital technologies being eleven selected for interview, for which the analysis of the good practices referred to is presented. With regard to trainee students, in the scope of initial teacher training, 15 reflective narratives selected from two professional masters were analyzed. The analysis of the questionnaire question allowed to verify the impact of ICT in educational practices and the triangulation of data allowed on the one hand to clarify the conception of good practices and to find the principles of the same ones, on the other hand to verify the evolution of educational practices in terms of the selected resources and methodologies. We intend to contribute to a reflection on the impact of ICT in primary education and on the responses that training institutions can give on this issue.

Key Words: *Good practices with ICT, Impact of ICT in primary education, Methodological renewal.*

Introduction

Pink (2006) highlights the emergence of an era of accessible opportunities for those who develop digital skills and a new intelligence paradigm capable of adapting to the new challenges of the digital era. Castells (2000) also highlights the social movements of the network society, fostered by emerging technologies, which facilitate interactions and highlights the value of education to take advantage of these opportunities for access and development. In fact, the increasing digitalization in the world, in the most varied areas, imposes, in the field of education, the need to rethink teacher education for the implementation of practices that form the exercise of the current citizen, namely to enable students with skills to help them challenges of contemporary society, as reinforced by the OECD framework (2018). Thus, the context of education requires renewal not only at the organizational and political levels, but above all in the context of educational practices, at didactic and pedagogical level, which means methodological renewal, inclusion of new didactic resources, namely the digital ones that stimulate and reinforce the field of digital literacy important for the full exercise of citizenship

According to Portugal INCoDe.2030 (2017) and OECD (2018), the preparation of students to be responsible and conscientious in the present and in the future requires the ability to coexist with digital technologies and comprehension by the early acquisition of knowledge at the user level often intervening, which means developing logical reasoning skills, collaborative work and design, and code development skills such as programming language knowledge. It requires the ability to think critically and creatively by transforming reality through reflection, anticipation and action. It requires empathy, curiosity, resilience, adaptability, responsibility, ability to act, mobilizing knowledge with rigor and coherence, solving problems with effectiveness, trust, respect for self and others.

In this scenario, renewal presupposes the design of educational practices adjusted to the new social and technological reality. It should be noted that the lack of preparation of the teachers makes them inflexible and reproductive of more traditional practices, not being able to create a good learning environment, so it is important to know the contours of their own knowledge and their mobilization in the course of their practices, as Gomes (2018) states. The author reinforces that teacher education should not only focus on knowledge of curricular content, but also focus on didactic knowledge to guide students to learn to learn. In fact, in the past, students were

influenced by the teacher's status and knowledge, but today they devalue the school as a source of access to knowledge by questioning the teacher's competence or decisions and valuing affective and relational aspects (Jesus, 2008). This change of focus may be due to the easy access of the information, on the one hand, and to the type of methodology adopted by the teacher, on the other hand, that may not correspond to the interests of the students. Teacher training and motivation for success and professional achievement is important in the pedagogical relationship. According to the same author (idem), it is important that the teacher has a global perspective on the most appropriate working hypotheses for a given educational moment, thus reinforcing the importance of a teacher's view on the trends of education in the present and in the social future, which presupposes the need for teachers to develop their skills in the context of initial teacher training and lifelong learning, not only in the scientific dimension, but also in adaptability to the new era, so that they can respond with quality to the need and expectations of their students. The active and participatory methodologies that promote the student and his / her proximity to the teacher and the surrounding reality may motivate the students and develop fundamental basic skills in the answers to the current challenges.

A study *Future Vision +15*, developed by the Telefônica Vivo Foundation, shows the relevance of the consolidation of social and emotional competences in school curricula and in the educational processes that are increasingly close to the communities. It also highlights the inclusion of technology with special emphasis on the programming language in the learning process, from early childhood, and as a value in the personalization of education. This vision is part of a process of innovation that sees the concrete person, who values the humanist profile by placing learning as a center of educational process and inclusion as essential in the attention to differences. These same aspects are mentioned in the student profile for the 20th century XXI (Oliveira-Martins, 2017) and contribute to achieve a new model of development that, besides the utilitarian and economist view, includes the integration of multiple dimensions of human existence to build a sustainable future and a dignified life (UNESCO, 2016). This opportunity to reconsider the articulation between education and social development re-contextualizes education to ensure sustainable development in an interdependent world.

In fact, bringing schools closer to the community increases the challenges in preparing students for the multiple demands of contemporary society, so there is a need to combine knowledge, skills, attitudes and values that enable people to act in diverse contexts by making free and informed decisions, in order to participate actively and responsibly in society (Oliveira-Martins, 2017). In response to this complexity, we live a change from a curricular point of view, since enumerative encyclopedic accumulation is replaced by the deepening of the complexity of the essential knowledge, promoting qualitative gains in solidity and deep use of knowledge, emphasizing the need to implement and organize the teaching and learning within the framework of curricular, interdisciplinary and transdisciplinary articulation (OCDE, 2018; Roldão, Peralta & Martins, 2017).

Rethinking education in a changing, plural and interconnected world and for the common good imposes social inclusion and transformation of learning processes, namely the process of acquisition, validation and use of knowledge, as well as fundamental issues of knowledge creation and control (UNESCO, 2018). It also requires the inclusion of resources in supports other than conventional ones and educational practices that respond to potentialities, expectations and needs within a common and plural educational project (Decree-Law No. 54/2018, of 6 July). This requires a conscious reflection of the teacher about what children learn, how they learn, where and how they mobilize what they learn, which implies creativity and ability to select resources, ways of teaching to learn to learn, evaluation processes and dissemination of knowledge. It changes the role of the actors in education and teachers assume great challenges and responsibilities in the process of promoting learning opportunity as a collective individual and social effort.

In this article, we intend to know the impact of the inclusion of ICT in the educational practices with ICT by primary teachers in service and in the stage of training. Considering different temporal moments, we can understand the evolution of educational practices in recent times and realize the way in which higher education responds to current challenges.

Methodology

The opinion of primary school teachers, teaching in public and private schools in 2010 was recorded, as well as the opinion of trainee students in initial teacher education, who were carrying out the supervised educational practice in primary education, in the 2016/2017 and 2017/2018.

Thus, in the case of in-service teachers, a quantitative and qualitative study was carried out by questionnaire, having collected about 1300 valid answers, corresponding to 41% of the 1st Cycle teachers in the region.

Of these teachers, 188 reported having performed good practices, and 11 teachers were selected because they presented practices that were more significant in terms of methodologies, articulation of knowledge and ICT resources used.

- In our sample, 89% are female and 11% male; 14% are younger (22-28 years of age) and 25% are older (48 to 65 years of age); with ages ranging from 29 to 47 years are 61%. Regarding education, 78% are graduates, 10% are bachelors and 12% have postgraduate, master's or doctoral degrees. In addition, 87% teach in a public institutions and 14% in private institutions. The teachers interviewed fit into a teaching profile with ages between 29 and 47 years of age, 5 and 33 years of professional service.

With respect to the trainee teachers of two professional master's degrees, 15 reflective narratives carried out by them during these years, were analyzed. The sample involves young female students who practice in public schools.

For the quantitative analysis the SPSS program was used and for the interviews a content analysis was done.

Findings

(a) Impact of information and communication technologies, according to in-service teachers

We wanted to understand the opinions of teachers in service regarding the impact of information and communication technologies on some educational practices, namely: information research by students; discussion of ideas in forums; sharing of digital files; preparation of text works; preparation of a self-learning diary; presentation with multimedia; conducting research projects and problem solving; interactive exercises.

It should be noted, however, that it has been found that the evaluation of some variables related to the effect of ICT depends on the age of teachers, so that older people are more likely to consider that ICTs deconcentrate pupils and that it occupies them quite a lot of time, and that while motivating students do not notice enough differences in learning. Perhaps this result mirrors the difficulty that these teachers have in the correct integration of digital resources, since in themselves they do not guarantee success in education, especially if a traditional methodology is used. There is thus a need for ICT training, but also time to deconstruct internalized models and renew methodological strategies. On the other hand, young people are likely to recognize that ICT enables students to engage in learning and improve school outcomes. This result shows that initial teacher training has responded to the demand for ICT inclusion by providing future teachers with ICT training. It was also found that the probability of asserting that all students are involved in learning is higher in teachers who teach in private institutions and that the probability of claiming that ICT takes up a lot of time is higher in teachers who teach in public institutions. It should be noted that teachers in private institutions are younger and in public are older.

The analysis of the evaluation of the effect of ICT on the activities carried out by the students reveals that there are independent variables and others that establish a significant relation of dependence. These last variables are presented in the following tables (1, 2, 3 4, 5, 6.7 and 8), that evaluate the effect of ICT in different activities (Results according to the Chi-Square Test with 95% confidence):

Table 1 - Evaluation of the effect of ICT in information research

<i>Search Information</i>		Yes %	No %	Total %	p_value
Allows all students to be involved in learning	Anything	11,5	6,5	7,3	0,044

Looking at the tables (1, 2, 3, 4, 5, 6, 7, and 8) above it is concluded that regardless of whether or not ICT activities are carried out, teachers generally have positive opinions, but those who carry out that activities that have a higher probability of recognizing better results of activities. Effectively, the correlation between the activities developed and the effects verified, shows that ICT has the potential to improve the quality of education, improving the effects of activities, which depend on the type of activity:

- (1) the probability of involving all students in learning is higher in teachers who integrate ICT in the following activities: information research; discussion of ideas in forums; preparation of text works; conducting presentations with multimedia; develop research and problem solving projects, and engage in interactive exercises.
- (2) the probability of greatly improving school outcomes is more significant for teachers integrating ICT to share files, conduct interactive exercises, develop a self-learning diary (portfolios), present content, develop research projects and solve problems. However, the probability of those who do not integrate ICT affirm that they improve a lot is high, revealing the potentiality of the activity by itself.
- (3) the probability of saying that it takes up a lot of time is higher in teachers who use ICT to share digital files.
- (4) the probability of allowing a more focused learning in comprehension and participation is quite high in the students who write text work with ICT, but very much in those who develop research projects and solve problems with ICT and perform interactive exercises.
- (5) the probability of fostering collaborative work is quite a lot in those who work on ICT (although the differences are not significant), develop research projects and problem solving, and engage in interactive exercises.
- (6) the probability of deconcentrating students is quite a lot in those who do not use multimedia in the presentations they perform and in those who do not perform interactive exercises.
- (7) the probability of feeling motivated students, but with no impact on learning, is higher in those who do not perform multimedia learning nor perform interactive exercises.

In addition, there is a higher probability of the teachers who are trained, the ones who carry out the activities most, namely to plan the work with ICT resources and to use a new working methodology, designing innovative strategies. Although most recognize that they do not use or use few times a new work methodology and self-regulating learning strategies so that the student learns to research and carry out collaborative projects. This result shows that there are factors that inhibit the inclusion of ICTs in education, as shown by Quadros-Flores, Flores and Ramos (2018).

(b) Impact of information and communication technologies on educational practices, according to in-service teachers interviewed

Of the 188 in-service teachers who reported good ICT practice, we interviewed 11 teachers. These teachers have more than five years of service and less than 33 years, which shows that it is not enough to have ICT knowledge (higher in those who complete the initial training), but also some professional experience is required. The analysis of the interviews allowed the categorization of a simple model in order to clearly translate the objectives of the lesson, the curriculum integration, the selected methodology and resources, and also the observed impact. About 90 examples of lessons that teachers believed were good practice were built. Their analysis shows that there are three categories in the design of good practices: the *context*, the *problem* and the *solution* (Figure 1), revealing that the methodology of design and problem-based learning are fundamental today and that ICTs favor the realization.

Figure 1 Categories of good

In addition, the analysis of is no evidence of a practices, they do not reinforce

of methodological changes in order to recreate practices in order to form citizens who are ready for the 21st century, so that they are student-centered practices and that develop research, information selection and interpretation skills, with open knowledge and skills for continuous and autonomous learning, as highlighted by Area (2007) and Manereo and Sources (2005). Moreover, having been asked to describe good practices with ICT, it was found that the models referred to drew up practices transformed with some creativity, originality, efficiency and utility. They were practices that developed other competences, besides the curricular ones, that demanded a different role from the part of the student and the teacher. These practices also showed impacts on the educational process and on the learning outcomes, so they satisfied the actors of education.

Figure 2 Impact of good practice

The content analysis of teachers' words allowed us to construct Figure 3, which shows that good practices in the learning process are current, inclusive practices that interest, motivate, respond and prepare students and which also ensure, satisfy, save, and democratize.

Based on the seven basic principles of good practice referred to by Epper (2004) and Cabero and Román (2006), we wanted to understand the frequency of these principles in the good practices mentioned by teachers in service. It was found that we could not limit ourselves to the seven principles of good practice insofar as others, also significant ones, were mentioned. Thus, we present the sixteen principles of good practice more frequent in educational practices (Figure 3). Good ICT practices encourage problem-solving, communicate high expectations, develop soft skills, respect the diversity of talents and ways of learning, promote satisfaction, increase classroom performance, improve school performance, facilitate the relationship between the school and the family, stimulate active learning, moments of cooperation / collaboration, among others.

Figure 3 Frequency of good practice principles

(c) Comparing educational practices in different spaces and dimensions

According to our sample, regarding the teachers in service, the youngest ones have the most training in ICT, and we are curious to perceive what kind of practices students carry out during the supervised educational practice in order to understand the evolution of ICT integration.

- Briefly, good practices referred to by in-service teachers (the eleven teachers selected by the best practices) already revealed some methodologies, resources and practices that tried to escape from the traditional teaching. Here are some examples:
- *Methodologies* - WebQuest, curricular articulation, project learning and problem solving, ubiquitous.
- *Resources* - Word, CD Software, Internet: web sites, Moodle, Blogue, Interactive whiteboards, Virtual School, video projector.
- *Educational Practices* - "Students watch a movie, reflect critically on the subject and work collaboratively on the WebQuest in solving the problem"; "Students turn on the computer to consult, or write the summary"; "Teacher puts the ranking tests on the computer and these are discussed in the class"; "The teacher starts the lesson with a video ...", "student accesses the evaluation sheet ... solve doubts on the internet"; Interactive whiteboard (QIM) - "the teacher keeps the notes of the class and sends them by email to the student / parents"; "The teacher writes, explains in the QIM and the students perform interactive exercises"; "Students carry out projects to solve problems, research outside school"; "The teacher publishes curricular contents in the Moodle and the students access outside the school", "the teacher creates resources to stimulate the reading; guided the students in the discovery "; "The students took home the links, accessed and presented to their colleagues what they learned." In the classroom students go to the site to develop reasoning for mental calculation, take the links home, with their codes, to train, "students post to the class blog"; "the teacher teaches hypertext"; "The teacher puts stories online,

hotpotatoes in Moodle"; "The student uses CD educational software"; "Students make online dictionary"; "Read the stories and the teacher records them to correct reading"; "The teacher uses CD"; "In a group, students create stories with images from the Internet"; "Rewrite in word processor and autocorrect errors"; "Use virtual school"; "Students use Movie Maker to make video."

In a first exploratory analysis to the narratives of the trainee students they reveal common themes, although they present new dimensions. We give the example of *WebQuest* which is a web-oriented research, supported by collaborative principles. Usually used in a classroom, *WebQuest* is limited to the interaction of children with information that will make sense to them throughout the stages (Dodge, 2006), insofar as the child establishes a relationship with information to give him meaning: introduction, task, process, conclusion and evaluation. The registration of the interviews of the teachers in service, shows simple *WebQuests*, direct that involve a curricular content, that interact with other curricular areas. Ends with a group presentation to colleagues. The resources used are just the computer and the *WEB*. The registration of the narratives of the trainee teachers tells us about *WebQuest* in the same line, but they are more demanding in terms of processes and tasks, since they require the integration of several technological resources (*smartphone, iPad, QRCode, ...*), (*video, PowerPoint, Comic, eBook, Avatar ...*), hosted in *Google Drive* allowing the construction of knowledge in the form of *Wiki*. It stimulates, therefore, the triangulation of competences (creativity, literacy, research, decision, presentation, argumentation and foundation) in the execution of tasks, the possibility of interacting with the reality of the world (for example, according to a budget, to simulate the purchase of an airplane ticket, to travel in the country collecting information and images of possible memories as evidences of the culture of the country, to argue with the discussion of the theme of the lesson and resolution of the problem). Trainee teachers build *WebQuests*, more up-to-date due to technological evolution. In addition, its resolution requires the revisiting of different curricular areas in a multidisciplinary and transdisciplinary way, ending not only with the presentation by the groups and collective discussion, but also with a conclusion of the work in an online book format. This evolution also reveals another trend currently discussed and implemented in Portugal: the project of autonomy and curricular flexibility (Dispatch-Law no. 5908/2017, of July 5, 2017) articulated with the profile of the student at the end of compulsory schooling (Oliveira-Martins, 2017) that includes transversal, transdisciplinary competences in a network that mobilizes knowledge, skills, attitudes and values.

It should also be pointed out that in the narratives of trainee teachers we find more active methodologies, absent from the good practices of in-service teachers, as well as other resources that stimulated new strategies and developed other skills closer to the current reality. Due to their relevance and extension, the mentioned narratives will be object of analysis in later publications.

Conclusions

Being aware of social and technological changes means considering a problem in education that requires measures that constitute an effective intervention in order to respond to the demands of a new social, educational and economic paradigm. It was found that these measures are beginning to take shape in order to find a teaching and student profile capable of responding to the demands of contemporary society. In this scenario, emerging technologies are facilitators of opportunities and possibilities, so they are an added value in the learning processes, but require increased training for teachers for their good use in an educational context. But they require more training for teachers to be used in an educational context. What do teachers think about digital resources? What impact on the learning process? What educational practices are designed in this new educational scenario? Who prepares them?

It was found that teachers have a positive opinion about the impact of ICT on education, but it is those who include them in their educational practices who are most likely to confirm this impact. Knowing that teachers who have done good ICT practices have between 5 and 33 years of service and that the probability of the young people possess more knowledge in ICT is higher, this result reinforces the importance of professional experience in the methodological design. However, given the technological evolution and the support of the institutional supervisor in the context of the initial teacher training (character with pedagogical experience), the practices of the students in a stage of education show to be more up-to-date, robust and creative in relation to the student profile expected in this new century. It should be noted that it was also observed that the methodologies adopted are important in the results, so that ICT can facilitate the learning process and add value in education since well selected according to a set of variables and objectives of the class, as reported by Cabero (2003).

It should also be noted, too, that it was found that the contexts are potential influencers of educational practices, as these tend to solve problems by finding solutions from the reflection, anticipation and action and mobilization of knowledge and contextual and disciplinary skills, so we understand the current curriculum based in the essential learning and student profile, as well as the autonomy and curricular flexibility in the promotion of effective and meaningful learning, contextualized according to the interests and needs of all students (Order no. 5908/2017, of July 5).

It was found that the educational practices with ITC meet the needs and interests of the students, are inclusive and that the principles of good practices reveal frequencies of practices in line with current legal and guiding normatives, so we conclude that there are educational niches that preceded the guidelines. This study thus shows the importance of a perspective on practices that respond to the educational moment and to the educational, social and economic paradigm and on the guidelines of education in the new era by teachers. However, ICT practices that could promote interaction with contexts and multiple stakeholders, between schools and other formal and informal institutions, and which could stimulate the proximity of networks of learning spaces and mobilization of knowledge are still not frequent. Other dimensions were found in educational practices that reveal that these are not limited, and that they evolve according to the social and technological advances, with the available resources, education and teaching profile, needs and interests of students and societies.

Implementation Of 2i Camp Program In Titas As Multi-Cultural Teaching And Learning Module In Higher Learning Institute: A Case Study In Sunway University

Yazilmiwati Yaacob (PhD)

Senior Lecturer MOHE-General Studies Department Sunway University Malaysia
yazilmiwati@sunway.edu.my

Malissa Maria Mahmud (PhD)

Senior Lecturer American Degree Transfer Program Sunway University Malaysia
maliassam@sunway.edu.my

Abstract

The Islamic and Asian Civilizations or TITAS subject at the Higher Learning Institute level in Malaysia still focuses totally on the delivery of the content, rather than the practicality and the appreciation towards the knowledge in daily life. Since TITAS is a compulsory subject for all students in order to complete their courses, it is taken for granted. There is no awareness or appreciation towards the subject which is actually a multi-cultural educational module that should be understood by students in order to strengthen Malaysia Civilization which consists of people from multiple races and religions. Thus, the 2i Camp (Interaction and Integrity) program was organized by Sunway University's lecturers in order to give an opportunity to the students who are taking the subject to practice the multi-cultural education in Higher Learning Institute. Hence, the objective of this paper is to assess and observe the level of interaction between students of different races and ethnics through the 2i Camp program. This research utilizes the qualitative method, by interviewing the students who had already participated in the 2i Camp on January 2018. This is to obtain the theme of the learning outcomes throughout the program. According to the research findings, there are four main themes in this research. Firstly, there were communications and harmony interactions between students of different races through the Ice-Breaking activity. Besides that, the students were also able to identify the cultures and lifestyles of the different races through the traditional games carried out. In addition to that, the intellectual and critical thinking skills of the students were developed through a simple game of designing and building their own replica of buildings that represented the three main races in Malaysia.

Introduction

'Islamic and Asian Civilizations' (Tamadun Islam dan Tamadun Asia or TITAS) is one of the compulsory subjects for students in both private and public higher learning institutes for their first degree. This course encompasses the introduction to civilization, the evolution and the interaction between Islamic, Malay, Chinese and Indian civilizations, and the contemporary civilization issue in Islamic and Asian civilizations. The focus of this subject is to provide the students with the educational modules of multiple cultures in their efforts to produce students, who are knowledgeable in the nation's heritage and history, to cultivate positive moral values, possess the identity of nationality and to appreciate diversity (Ministry of Higher Education, 2016).

According to Abd Rashid bin Abdul Halim (2015), most of the students consider TITAS as a subject based on Islamic studies and history. It is also perceived as a review for certain subjects that were taught in schools. These assumptions caused the students to be uninterested, lacking focus or taking the course for granted. Hence, negative perceptions and ill-advised views of the course must be corrected in order to make this subject more interesting and appealing towards students. The teaching method used for this course must be very compelling in order to achieve the learning objectives. In their efforts to successfully achieve the learning outcomes, the lecturers in Sunway University have structured a program called Interaction and Integrity Camp (2i Camp) to give equal opportunities to the students who are taking TITAS to practice multi-cultural education in higher learning institutes.

The Program's Approach

Generally, approach is usually defined as to come close or near. However, the term 'approach' used in academical context is to refer to how a subject is taught based on the objective of the subject (Yazilmiwati, 2014). According to Ahmad (1997), approach is to bridge a gap in an education field and each approach should reflect the objective of the learning process. Thus, lecturers or educators must plan, organize and carry out meaningful activities for their students in order to achieve the learning outcomes. The implementation of suitable and effective approach in learning modules will help the students to understand the subject much better and be able to achieve the learning outcomes, as explained by Omar al-Syaibani (1991). He said, the teaching methods in education is created to ease the process of teaching and learning for the students and to allow them to achieve as many learning objectives as possible.

Therefore, the 2i Camp program that relies on the multi-cultural education module focuses more on experience-based learning by making the activities included in this program compulsory to the students who took the subject. According to Carl Rogers (1969), experience-based learning focuses more on the students' necessities and wants. Rogers listed down some of the characteristics of experience-based learning, which are personal involvement, self-initiated, learner evaluation, and giving persuasive effect on learners.

In addition to that, this program was filled with lots of physical activities and active exchange of mind outside of learning session and university compound. The purpose of this program is to instill positive values among students by focusing on two main components which are integrity and interaction. The content of this program leans more towards patriotism where it will test the students' mind and knowledge of the history and the diversity of Malaysia's culture. The aspirational values that were highlighted in this activity will trigger unity and increase understanding among races. Hence, the 2i Camp program has listed down four objectives to be achieved, as follow:

- a. To apply communication and harmonious interaction between races in the effort to instill unity in order to protect the peace among Malaysians.
- b. To create the spirit of love to your country by appreciating the contributions by past national heroes.
- c. To test the physical and mental capabilities of students about the multi-ethnic cultures in Malaysia
- d. To strengthen teamwork and tolerance among students of different backgrounds, cultures and religions.

In order to achieve the objective of the program, multiple modules were constructed by combining various academic, mind test and physical activities together. These activities were carried out outside of the classroom. The activities are listed as follow:

a) Ice-Breaking Session

The ice-breaking session is of the must-do activities handled by the facilitators. The purpose of this activity is to bridge a gap between the newly formed group members among the participants and also to build relationship between the participants and the facilitators. This activity is able to create a sense of friendship and warmth between the participants and the facilitators so there will not be any kind of communication barriers or awkwardness throughout the program. One of the games usually played during the ice-breaking session is called 'This, This, That, That', where the participants are required to mimic the facilitators' actions and words quickly and correctly. The game started with a slower pace to give the participants some chance to familiarise themselves with the game. After few rounds, the facilitators will begin to pick up some pace and play the game much faster. This game can be played individually, with a partner, and even played in a group. This game enables the participants to be more active to communicate among themselves.

b) Completing the Puzzles

In this activity, participants are given a set of puzzle pieces of various national figures who have contributed mightily to the country. The participants are required to solve the puzzle and to identify the figures. Then, they are required to name the figure and what are their accomplishments to the facilitators. The purpose of this game is to introduce the nation's greatest figures to the younger generations and to appreciate their contributions and sacrifices to the country.

c) 'Magunatip' Dance

The 'Magunatip' dance is a traditional dance of the various sub-ethnic of the Murut in island Sabah. The word 'Magunatip' was taken from the word 'atip' which means to press on two surfaces (Kamus Dewan, 2000). 'Magunatip' dancers require good skills and agility to dance while stepping over bamboos that are used to create sound and rhythm for the dance. The dance does not usually require any musical accompaniment. This is because the sound made by the hitting of the bamboos produces a loud and interesting beat and melody. This dance is usually performed by the Muruts during certain ceremonies including to show respect for their guests. During the 2i Camp, all participants are required to perform and experience the dance themselves. This allows the participants to learn about one of the many cultures of the Murut ethnic in Malaysia

d) Building Game

In this activity, participants are required to design and create a building which symbolizes the three main races in Malaysia which are the Malays, the Chinese, and the Indians. Used items such as drinking boxes, straws, newspapers and masking tapes are the only materials allowed and provided for this activity. During the designing/building and also the presentation part of the activity, the participants are expected to share and exchange ideas and information regarding their build. This is to help the participants to think more creatively and innovatively while improving their intellectual capabilities.

Research Methodology

In this research, researchers utilized semi-structured interview method because this is a flexible method which allows for respondents to describe what the researchers are thinking. In addition, this method can also be used to identify the respondents' experience and background. The findings of the indirect interview will shape the theme of the research which will then be compiled in a single complete report. The report is the result of the research in qualitative format (Patton, 1990). Hence, in order to achieve the objective of the research, researchers have interviewed 15 students who have joined the recent 2i Camp. These students were chosen based on their different cultural background to help researchers to obtain as much necessary information as possible in order to deeply understand the respondents' experience joining the program.

Research Findings

In general, there were 400 students participated in the program. The researchers have chosen 15 respondents representing the three main races in Malaysia which are Malay, Chinese and Indian to be interviewed. Each race was represented by at least 5 respondents. All of the respondents participated very actively throughout the program. There were 8 male participants and 7 female participants selected as respondents. All of them are students of Sunway University, taking different bachelor degree courses. The analysis has found that there are four main themes in this research, and are listed as follows:

a) The Theme of Communication and Interaction between Different Races through Ice-Breaking Activity

The result of the interview analysis found that 100% of the respondents agreed the Ice-Breaking activity helps them to build and create a good communication and interaction bridge between the participants of different backgrounds and races. This theme is illustrated from the interview as follows:

Respondent 1:

In the Ice-Breaking activity, we were able to interact openly and politely with one another without looking at the background of their races or culture.

Respondent 2:

The Ice-Breaking activity helps us to communicate and interact with people of other races. We were able to get to know more people from different culture.

Respondent 6:

The Ice-Breaking activity encourages us to talk and interact with new friends of different races and culture.

Respondent 7:

We have to speak in Bahasa Malaysia to play the game. It helps us to sharpen and improve our Bahasa Malaysia that we rarely used in our daily life.

Respondent 11:

We rarely talked to each other in class before, but this activity helps us to build the friendship between classmates.

b) The Theme of Love to your Country by Appreciating the Contributions of the National Figures

The result of the analysis found that 100% of the respondents agreed that the appreciating the contribution of the Nations's heroes activity helps to nurture the love for their country among the participants.

Respondent 1:

We had to complete a task by making references on the contributions made by Malaysian heroes. By doing this, we are able to appreciate their contributions and strengthen our love for Malaysia.

Respondent 4:

We were able to learn more about the national figures who had contributed greatly to our country. This activity helps us to appreciate their contributions more and increase our love to the country.

Respondent 7:

We were able to learn more about the national figures and their contributions to the country. By showing appreciation to their contributions, it helps us to be more loving to our own country and homeland.

Respondent 9:

Through this activity, we were able to identify the various challenges faced by the national figures in order to protect our country. Thus, this activity helped us to appreciate our country even more.

Respondent 13:

Challenges faced by the national figures in their effort to build our country were very difficult. Hence, as a citizen, it is our responsibilities to protect our country as a symbol of appreciation towards their effort.

c) The Theme of Learning New Culture and Lifestyle of other Races through the ‘Mangunatip’ Dance

The result of the analysis showed that 80% of the respondents agreed that through the ‘Mangunatip’ dance activity; they were able to learn more about other races’ culture.

Respondent 2:

This activity gave us the opportunity to experience the culture of other races.

Respondent 5:

Through this traditional dance, we were able to learn about the culture and lifestyle of other races.

Respondent 8:

We were fortunate to be able to experience the culture of other races and this is a very fun activity.

Respondent 10:

This activity showed us a very interesting traditional dance. It helps us to experience some culture of other races in Malaysia.

Respondent 11:

By performing the traditional dance, our group which comprises of people from different races was able to work together in order to learn about a new culture and it was very fun.

Respondent 15:

This is our first time trying this dance, and it was very memorable.

d) The Theme of Creating the Intellectual Competency and Critical Thinking of Students through Building Game.

The result of the analysis found that 80% of the respondents agreed that through the building game, they were able to improve their intellectual competency and critical thinking skills.

Respondent 1:

The building activity allowed us to think critically and creatively. It also taught us to appreciate other people’s perspectives and helped us improve our friendship. For example, we built three bridges which connect three different structures to represent the unity of our group that consists of the three different main races in Malaysia.

Respondent 5:

In order to build a structure that represents the three main races in Malaysia, we need to think creatively and innovatively. The activity was very tiring and challenging, but it was also very fun and enjoyable.

Respondent 6:

The intellectual competency and critical thinking skills were shown when we were required to create a building that symbolizes the three main races in Malaysia. Each group members contributed excellent ideas in designing and creating this structure.

Respondent 9:

Critical thinking and innovation skills can be improved among students during this activity. This is because each component or parts of the structure has to bring a meaning. Most importantly, the building created has to somehow symbolize the three main races in Malaysia.

Respondent 12:

This activity gave us the opportunity to share our ideas in a creative and innovative way. This building design shows that we are united and worked together to complete the task.

Conclusion

Based on the research findings, the majority of the participants agreed that the 2i Camp program had affected them positively. The program has exposed the students to the multi-cultural education system within the higher learning institutes. Through this program, participants of different backgrounds or races were encouraged to communicate

and interact with on another. On top of that, the sense of belonging to the nation can also be instilled among the students. Moreover, students or participants are able learn to appreciate other races' cultures and lifestyles while sharpening their intellectual and critical thinking skills.

Thus, the step took by the lecturers of Sunway University in organizing the 2i Camp for the students was a very proactive move in their effort to instill interest towards TITAS among the students. This is due to the exposure through the cultural and historical modules in the program which allow the students to self-experience the cultures and lifestyles of other races and ethnics. Besides that, experience-based learning focuses more on the needs and demands of the students as compared to theoretical learning.

Implementing System-Wide Assessments At A Multi-Campus Institution: An Impact Study

Fatima ALHAMMADI

Higher Colleges of Technology United Arab Emirates

falhammadi@hct.ac.ae

Abstract

The paper researches the impact of a common assessment across multiple campuses of HCT for the same course, which is geographically separated across the United Arab Emirates (UAE). Final exams are conducted as the same exam across all the campuses at the same time and day. The data was collected where the final exam was done at the campus level. Also, data were collected about the same course, once system-wide exams were introduced. System-wide assessment seems to be a necessity for the modern education system as there is seen to be an improvement of teaching and learning as well as the accountability of the learning process.

Introduction

The recent decades have witnessed changes in the educational practice and culture that consist in the shift from testing and its results towards overall assessment of the higher education structures and mechanisms (Boud, 1995; Elander et al., 2006). In addition, as reported by Kimmel, Marquette, and Olsen (1998), the current higher education focuses neither on quantity nor quality, but the evidence of educational results. Learning currently occupies the centre of attention (Rust, 2002), and its assessment is “probably the most important thing [researchers] can do to help students learn” (Brown, 2004). Dinur and Sherman (2009) also stress that system-wide assessment is an efficient means for educational institutions to demonstrate their ability to produce and spread knowledge. Boud and Falchikov (2006) argue that short-term focus in higher education should “be balanced against a longer-term emphasis for learning-oriented assessment to foster future learning after graduation.”

Systematic and regular measures of learning outcomes are the primary purpose of the system-wide assessment in a multi-campus system. They are capable of demonstrating the health condition of the education system and providing the data that may be taken for further analysis in an attempt to improve the learning process, including assessment for learning, assessment as learning, and assessment of learning (MCEETYA, 2008). A number of scholars have researched the issue of system-wide assessment but still needs professional evaluation and advice. Therefore, the primary objective of the research is to consider the impact of system-wide assessments at Higher Colleges of Technology (HCT), a multi-campus system, on the learning process.

This aim is going to be reached through a number of tasks fulfilled within the paper. Thus, the literature basis considering the system-wide assessment will be discussed from different perspectives; the data available will be analysed as based on the appropriate methods and approaches; the findings of the analysis will be used to provide recommendations for the improvement of the system-wide assessment process.

To demonstrate the use of system-wide assessment in the context of HCT, the most important contributions in research are reviewed to promote understanding of the development and use of system-wide assessment through its historical and current perspectives. The main features, assumptions, and difficulties are discussed as well as the effectiveness of system-wide assessment as expressed with the factors and lessons taught. Reaching those goals demands the overview of the primary purposes of the program as well as the discussion of some examples of the system implementation. The information on the process of collection and report on the data is also of value and will be taken into consideration. Since the final step that all of those factors should lead to is the improvement of the learning process, the literature on the actual use of the collected data and concerns that have been raised is reviewed. Moreover, the research provides an insight into the use of system-wide assessment, demonstrates its perception, impact, and value. It also offers the ideas that should be taken into account while improving the process of effective assessment and higher education system in general.

Literature Review

The assessment process has long been taken for granted, but with the shift of stress to the adequacy of the education system a number of new assessment methods were developed (Boud and Falchikov, 2006). At the same time, there was research conducted by Sadler (1998), Hounsell (2003), and York (2003) that highlighted the adverse effect and inadequacy of summative assessment in the learning process. In addition, Ecclestone (1999); Knight (2002); Knight and Yorke (2003) criticise the role of the summative assessment and its influence on the students and their knowledge. Since the inappropriateness of the summative assessment was indisputable, the assessment techniques were refreshed with new notions among which there was the constructive alignment, a teaching system that is closely connected to the learning process assumed in the learning outcomes (Biggs, 2003). Simultaneously, Black and Williams (1998) debate the validity of the formative assessment, discussing the need for putting learning in the centre of assessment, differentiation between grading and feedback as well as applying to self and peer

judgments. “In managing tests, policymakers have created the illusion that test performance is synonymous with the quality of education” (Madaus, 1985). There is also a concern about the threat to turn assessment into the narrow discussion based on marks without taking into account the reality of the classroom (Dorn, 1998).

Boud (2000) tries to identify the needs of a learning society for assessment and introduces the requirements for a new way of assessment perception. He argues that the functioning mechanism of assessment cannot satisfy the needs of the students in their future professional activities, which should be the main index of the education efficiency. Boud (2000) offers the notion of sustainable assessment that manages to combine the present demands of the educational system with the future challenges that the students will face. In other words, assessment should reflect not only the current knowledge of the students but also project their ability to process and gain new insight into further learning.

Therefore, the primary emphasis in the learning process is put on the knowledge that may be used in practice and the amount of information that is valid for the future career activities. Educational outcomes, the new notion introduced in the assessment system, have become of the utmost importance in the system of assessment. The necessity of educational outcomes considering is proved by the fact that recent research has shown an increased focus on the educational outcomes that can be explained by a number of reasons. Among the most critical points, according to Meyer and Bushley (2008), there is a historical failure in proper assessment of programs and systems in higher education. Other reasons that get enough attention from the researchers are the lowered standards and expectations (Lukas and Weber, 1998) as well as the need for the national exams that will demonstrate the meaningful progress for students and teachers (Kimmel and Marquette, 1998). “High attrition rates and differential educational outcomes based on socio-economic status and factors of race/ethnicity,” according to Kimmel and Marquette (1998), have also contributed to the increased focus on the system-wide assessment. Because of the decline in the institutional effectiveness and challenges within communities that have under-prepared and uneducated populations.

Basing their assumptions on all the problems stated above, the educators have managed to offer the list of points that demonstrate the purpose of the system-wide assessment (British Columbia’s Foundation, 1999). It includes the ability to provide the data to the authorities in order for them to plan future steps in the area, deliver the information to the public in relation to expectations and trends over time; demonstrate the achievement of the students, indicate the presence of any trends in the learning process, and indicate the presence of students who fail the standards of the current educational demands. Forster (2001) stresses that system-wide assessment programs provide both policymakers and educational institutions with information that they can use while allocating resources and supporting the learning process. The same information informs parents on the performance of their children as well as students on their progress. System-wide assessment is seen as an unavoidable part of the educational reform as illustrated in Figure 1 (British Columbia’s Foundation, 1999).

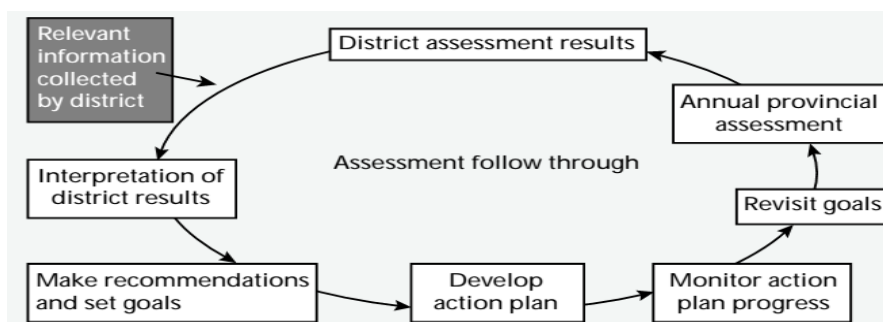

Figure 1- Educational reform (Source: British Columbia Ministry of Education)

The importance and necessity of the information reflected in system-wide assessment remain indisputable, but the means of its collection and report are currently unstable and in the process of coming with the most optimal variant. There is a debate on the most appropriate approach, choosing between full-cohort and sample assessment programs. Either of them has its pros and cons and may be reported in a number of ways (Forster, 2001). The full-cohort assessment enables interested bodies to receive the data on the individual level progress of all the students of a chosen diapason. On the contrary, sample assessment does not report on individual students, only the system-wide situation but is used to evaluate a rich set of learning goals and is less expensive than full-cohort assessment. Forster (2001) also offers a number of reporting tools, which are divided into two broad categories of system-wide and school results, both of which may be assessed in terms of averages and distributions, national norms, standard framework, performance expectations, international benchmarks, subgroups of students, background variables, curriculum areas, and item-by-item criteria.

The reports obtained in the process of system-wide assessment are used to monitor the trends in the averages, the percentage of students below and above norms, at levels of the standard framework, below or above expectations,

and changes in achievements within the student subgroups. At the same time, it is highlighted that system-wide assessment may hide a range of drawbacks that may influence the final management of the learning process. Findings received from numerous research state that system-wide assessment may involve such notions as over-interpreting improvement in test scores (Cannel, 1987; Linn, 1995) and trend data (Broadfoot, 1999), underestimating the negative impact of programs on a teacher (Masters and Forster, 2000) and influence of accountability measures (Linn, 1998; US Department of Education, 1998), assuming that summative data will inform teaching (Harlen and James, 1997; Stobart, 1999), and ignore the role of a teacher in reform (Black and Williams, 1998; Scottish Office Education, 1998).

Considering all the findings of the scholars discussed, the research is intended to observe the system-wide assessment system from the optimally objective perspective. The similar approach was taken by Forster (2001), an Australian scholar who discusses the system-wide assessment from the all possible angles, offers the table of the current practices in Australia, Canada, and the US. Also, she provides the recommendations for the system-wide assessment optimisation and meeting the needs of all parties involved. The ideas offered by Drummond and Robby (2012) who estimated system-wide assessment would also be taken into account. Their research was conducted within the HCT, as based on the survey of 80 Deans and Chairs who comment on the perception, process, and impact of system-wide assessment.

An essential source of information for the research was a collection of articles edited by Brown and Glasner (2003) that offer a wide range of material on assessment matters in higher education. First, the value of the collection can be proved by the fact that it provides a vast data on the system approaches to the assessment from the viewpoint of different scholars. Secondly, it gives a brief, but a precise review of the effectiveness of innovative assessment provides tools for practice assessment and considers the notion of autonomous assessment. As a result, the research gets an opportunity to place the phenomenon of system-wide assessment within other notions that, apparently, are connected with it to a bigger or smaller extent.

Glasner provides a closer look at the assessment from the system-wide perspective in her article "Innovations in Student Assessment: A system-wide perspective," where the scholar provides a broad overview of the system-wide assessment process in the UK since 1993. It is rather exciting research since it considers system-wide assessment not as a sum of data from different institutions scattered around the specific area but within the frame of a system of means that an educational institution can use to provide an objective and clear assessment of the students as possible.

A more traditional approach to system-wide assessment is provided by Erwin discussing some of the public policy issues addressing higher education assessment and confronting how educators can react to the result produced by the assessment. From the outset he explains the reasons for an increasing need for accountability, citing the ideas offered by Terenzini (1997) and Candy (1997) on the institutional pressures for the system-wide assessment demands. As an alternative to traditional instructions, the scholar offers a system of modern years means that may simultaneously be used in the assessment process. He also evaluates different factors that may alter the results and influence the measures taken to optimise the learning process. Among those categories, he considers methods, format, time, and the relation of the testing results with the actual learning outcomes of students. The role of the main assessors, according to Erwin, is taken by assessment centres that have a rather profound history of existence but are facing many challenges since there is a recent tendency towards computer-based assessment, including measurement, cognitive psychology, and artificial intelligence in the assessment process. He concludes that modern educational system is in an urgent need for a collective and systematic approach to the assessment. Moreover, he states that the assessment process has to be up-to-date and reflect the demand of a constantly changing education. If the curriculum and the approaches in the learning process continuously change, the assessment has to reflect all the newly introduced points. Even though the article speaks little about the phenomenon of system-wide assessment, it explains in detail the recent call for adequate assessment in general.

In fact, the system-wide assessment is perceived as an efficient means of improvement on different levels (Forster, 2001). The education system receives the data that will help decide on the resources allocation, research motivation, and updating the standards of curriculum and performance. Individual schools may benefit in terms of indicating the space for the professional development, setting goals, and allocating resources. Data provided by system-wide assessment will also provide curriculum feedback on the level of a classroom as well as inform and motivate learning of an individual student. The assessment improves the course focus informing within pre-service training and provides the community with information on educational standards. On a broader scale, system-wide assessment contributes to the research of various educational tendencies and approaches.

Currently, scholars research system-wide assessment from various perspectives and approaches, which allows somewhat a high level of objectivity and evidence. Some researchers highlight the positive influence of the system-wide assessment and are ready to sacrifice some minor point to the general beneficial outcome. Simultaneously, some disputable effects of system-wide assessment raise concerns among another part of both educators and officials, since the price of the system-wide assessment implementation may become too high and lead to unpredictable consequences. The research believes both of the approaches are worth considering while analysing the data offered by them with common sense and looking for proof of the theories.

Since all the mentioned factors concerning system-wide assessment may be shortened to its two primary purposes of accountability and improvement, the importance of the assessment cannot be questioned. Regarding the research, it is considered as a useful tool for communication between different levels of the education system and the elements that occupy the position beyond its frames. System-wide assessment is viewed as means of getting feedback and managing the practices and activities of educators. Consequently, the phenomenon will be researched as profoundly as possible, considering all potential advantages and disadvantages. The research is not limited to any assumptions or conclusions made, and its primary purpose is to interpret the concerns of system-wide assessment through the prism of both theory and actual data. This approach should allow evaluation of the gaps in the system-wide assessment scheme and offer possible solutions to the problems.

Methodology

The paper researches the impact of common assessments across multiple campuses of HCT, which are geographically separated across the United Arab Emirates (UAE). HCT was established in 1988 as one of the largest institutions of higher learning in the UAE. During the 2015–2016 academic year, there were 14,829 female and 8,644 male students enrolled at 17 campuses throughout the country. The student breakdown per campus is highlighted in table 1.

	Campus	Student Numbers (Academic Year 2015-2016)
1	Abu Dhabi Men's College	3467
2	Abu Dhabi Women's College	1736
3	Al Ain Men's College	764
4	Al Ain Women's College	1377
5	Dubai Men's College	2576
6	Dubai Women's College	2763
7	Fujairah Men's College	438
8	Fujairah Women's College	1793
9	Khalifa City Women's College	1130
10	Madinat Zayed Colleges	281
11	Ras Al Khaimah Men's College	655
12	Ras Al Khaimah Women's College	1952
13	Ruwais Colleges	458
14	Sharjah Men's College	1165
15	Sharjah Women's College	2977

Table 1- Different campuses with student numbers for HCT

Final exams are conducted as the same exam across all the campuses at the same time and day. Data was initially collected for one course, CIS 1003 - IS in Organizations and Society. This course is a semester one course taken by all students who are admitted to the Computer and Information Science (CIS) program at HCT. The data was collected where the final exam was done at the campus level. Also, data were collected about the same course, once system-wide exams were introduced.

The research analyses the data collected from 2242 first and second-semester students who studied at different campuses during the 2012-2014 period. The sample of students consisted of 964 male and 1279 female respondents who were selected randomly. There were 797 students in 2012, 992 in 2013, and 454 in 2014. The distribution according to the college is illustrated in table 2.

Colleges	Tested student numbers
Al Ain College	322
Abu Dhabi Colleges	261
Dubai Colleges	577
Fujairah Colleges	111
Khalifa City College	301
Ras Al Khaimah Colleges	236
Ruwais Colleges	23
Sharjah Colleges	412

Table 2- Data used for analysis

The results of their final assessment test are compared with their coursework mark and used for making conclusions as based on the experience of other countries that have already implemented the practices of system-wide assessment.

The system of different campuses was chosen due to the need for the data that will reflect the situation from as many angles as possible and will not be limited to territorial indexes. The sample was trying to reflect the actual distribution of number, semester, sex, and marks among the colleges and timespan that is covered. There were also some reasons that had led to giving the preference to sample assessment rather than full-cohort assessment.

The experience of the USA and the UK has shown that full-cohort assessment may produce unintended and unpredictable effects on the system of education from the perspective of both teachers and students. Griffin and Heidorn (1996) as well as Harlen and Deakin Crick (2002) state that full-cohort assessment leads to the reduction of self-esteem of students with lower achievements, and it may even trigger the lack of confidence (Stiggins, 2009). In addition, it promotes the methods of teaching that encourage students to obtain shallow and superficial knowledge (Shepard, 2008).

Another threat of full-cohort assessment is the possibility of misinterpretation of test results (Stiggins, 2007). Especially this issue becomes topical while trying to apply data from full-cohort assessment to school accountability processes since there are many cases of misclassification (Linn, 1998). Moreover, the phenomenon of the test scores attribution to the quality of teaching in schools cannot be considered as trustworthy (Popham, 2003; Stake, 2007).

Therefore, sample tests seem more precise and valid for the activities of policymakers and trends researchers. As a result, this mechanism is believed to allow more precise and accurate data for analysis. Due to this reason, the information provided by testing is believed to create the necessary basis for adequately supported findings and become a basis for further development of the educational policy.

Findings

To evaluate the impact of system-wide assessment, it is necessary to compare the coursework scores with final test scores as provided by the sample. Therefore, it was required to develop a table that reflects the analysis of the points received by the students. Table 3 shows the number and percentage of students according to a particular grade.

Grade	Coursework		Final assessment	
	Number of students	Percentage, %	Number of students	Percentage, %
A	484	21.57	514	22.91
B	470	20.95	788	33.13
C	478	21.2	545	24.29
D	254	11.3	135	6.01
F	555	24.75	257	11.45

Table 3- Number and percentage of students according to their grade.

The information provided by the table has allowed presenting a number of following findings. First, the number of students who have excellent marks has remained approximately the same, and it has even slightly grown from 21.57% to 22.91%. Nearly the same situation is observed with grade C students. At the same time, there is a vivid rise in the percentage of students who got B and, on the contrary, an obvious decline in students who failed the test. The number of those who either failed or got mark D for their coursework fell almost by half, according to the points of final assessment.

The situation seems rather positive and pledges for absolutely definite conclusions. There is no need for finding drawbacks of the experiment, but the research has to take into account the findings and concerns expressed by other scholars. Apparently, there are some points that such an improvement in the reporting and evaluation of system-wide data may indicate.

First, it is entirely possible that the results may increase without an actual improvement in the level of students' knowledge. This phenomenon is known as the Lake Wobegon Effect and is usually caused by the combination of the factors, among which there are "the use of old norms, the repeated use of the same test year after year, the exclusion of students from participation in accountability testing programs at a higher rate than they are excluded from norming studies, and the narrow focusing of instruction on the skills and question types used on the test" (Linn, 1995). Simultaneously, researchers offer the solution to the problem, stating that systematically constructed tests will limit this adverse effect (Resnick, 1999).

Moreover, the positive marks may become a consequence of sampling and/or measurement errors. This may also be caused by the change of any of the elements of the testing process, being it time allowed, test format, or exclusion policies (Forster, 2011). As a result, it is of the utmost importance to indicate measurement errors and compare the indexes that are possible and valid to compare.

When system-wide assessment results are used to monitor the trends in the education system, there is a high probability that mistaken data will misguide to wrong conclusions about the rise in the knowledge of the students. While drawing inferences, researchers need to take special care not to overlook any factors that are of value in a specific situation.

It is found that if tests are found to have gaps in design, the assessment may distort and reshape the studying program, promote superficial knowledge due to possible sanction that the test results may cause (Broadfoot, 1999; Masters and Forster, 2000). In other words, positive tendencies presented in Table 1 can be a result of teachers not including some minor topics in the curriculum and pay particular attention to spheres that will be undoubtedly important during the testing. Students gain high points in testing using a smaller amount of information. It has been demonstrated that increases in assessment rates are due to a combination of "teaching to test" and students get accustomed to the tests (Assessment Reform Group, 2006; Koretz, 1988; Shepard, 2000). In real life, the knowledge of students is significantly different from the level offered by the assessment (Harlen and Deakin Crick, 2002; Koretz et al., 1991). To avoid this, Forster (2001) claims that it seems necessary for teachers to focus not only on the formal indexes of the knowledge but try to maximally align the course curriculum with the one required by the assessment standards. Also, efficient communication between and among teachers, students, and parents may format the direction and approach of teachers in their educational activity.

Another point is that schools may manipulate the results on purpose. There was a situation in Chile when schools indicated much higher rates of poverty to boost their position (Linn, 1998). Therefore, all the factors that are taken into account while doing calculations have to be considered in detail. The tests should also differ according to the final goal that they address.

Even though the results of the calculations seem rather positive, they may have both positive and negative consequences since the final result depends to a great extent on the context of the assessment. The circumstances that influence the outcome are leadership, collective responsibility, a break with the past, and professional development (US Department of Education, 1998). This shows an urgent need for close monitoring of the assessment effects on the educational system and the learning process in general.

The issue that concerns many scholars is that test results cannot reflect all the factors that have influenced the getting of this mark. On the one hand, schools are the elements that get prized for good results, even though there is no clear evidence of their primary importance. On the other side, the factors that are significant in that situation are in danger of being overlooked (Harlen, 1999; Dorn, 1998). Therefore, the limitations of the data have considerable value here and should always be mentioned.

Folkner (2001) does not forget about the fact that if the information for the analysis is gathered for a more extended period of time, its value and applicability cannot be the same as of the data presenting the most recent figures. The issue has been assessed by Gibbs and Rowntree (1999) and Thorpe (2000) who claim that “assessment becomes valid when the assessors use evidence of achievement, clearly matched against the criteria.” The point is that this data is valuable, but it should be treated cautiously while taken as a basis for current improvements. In other words, the situation may have changed since the moment when the assessment was conducted, and this fact has to be managed appropriately.

It is necessary to understand that one assessment cannot serve the functions of teaching and learning evaluation (Harlen and James, 1997), though the professional judgment of teachers is integral to assessment (Student Assessment Regimes, 2009). Summative assessment can be used as a survey of the overall result but is rarely perceived as a material for analysis and improvement by teachers. As a result, there is a necessity to show teachers how they may use the data for improving their practices.

In addition, the mere collection of system-wide assessment data is not capable of improving education standards. Indeed, the most necessary and topical issue here is that teachers can interpret this data in the beneficial for the learning process way (Wolff, 1998). The role of specific professional development in the following context comes to the foreground.

Conclusions, Suggestions And Recommendations

According to data that Table 1 contains, the improvement in the learning process is obvious, but Barton (1999) believes that “there is much that is wrong with this system, that there are signs here and there of improvement, and that there are ways to make assessment much better in serving teaching and learning.” Therefore, the research will offer a number of recommendations that may become useful while trying to implement reforms and innovations. The recommendations provided hereafter are based on the analysis of data gathered at HCT, as well as the application of the experience of other countries that were represented in the works used in the research as references.

1. System-wide assessment format should be decided due to the final purpose of the assessment. This fact may considerably influence the choice of the participants, the format of testing, and time needed, hence providing a realistic data of student comprehension.
2. The validity of the information has to be taken into account since the demands may differ because of the different final purposes of the assessment. Providing the assessment has to equip teachers with possible direction for improvement, tests have to deal with the spheres that call for improvement. In the opposite case, data will not be useful for implementing changes to the existing system.
3. Special focus has to be put on the reliability of the data that is the source for the future decisions. The choice of the students in the representative sample is to represent the smallest error possible, and the tasks offered by the assessment must discuss the target scope of learning outcomes.
4. The assessment producers have to do everything possible to ensure that they will not repeat the known mistakes, such as incorrect level of assessments, of their predecessors and eliminate the impact of potential adverse outcomes.
5. The reports of the results have to be comprehensive and with clear arguments. If there is any uncertainty about the outcomes, it should be indicated.
6. The reported results have to be easily accessible by the all the target users. In addition, there may appear a need for additional training if the assessment is a new practice or needs an updated approach.
7. In case the assessment results are openly published and can be accessed by everybody, all the limitations and possible measurement errors must be indicated and made clear.
8. There is a need for a full-fledged developmental program for teachers since the single system-wide assessment results cannot ensure the necessary improvement in specific fields.
9. The results of the system-wide assessment must be continuously monitored and taken into account.

Offering a number of recommendations for further improvement, the research is not able to reflect all the possible aspects of the problem, which, therefore, is the limitation of the paper. The data provided and used in the study demonstrates only the quantitative side of the issue while lacking the human factor. Thus, the feedback of both students and teachers would be of value and would occupy an essential place while judging the outcomes.

This limitation, at the same time, may become an additional stimulus for future research since researchers will know the gaps and have the basis for their filling. In addition, the research will equip the future research in the sphere of system-wide assessment with data on statistical results and recommendations that seem applicable to the current stage of development.

System-wide assessment seems to be a necessity for the modern education system since it fulfils a number of life-important functions that cannot be gained with other means. Among those functions, there is the improvement of teaching and learning as well as the accountability of the learning process. To reach those goals, the assessment system has to meet demands of being flexible and up-to-date.

In addition, people who are responsible for the implementation of system-wide assessment cannot allow themselves to overlook the experience of others countries. If they are willing to get higher levels of preciseness, meaningfulness, and accuracy, researchers and policymakers have to address the issue of system-wide assessment implementation starting with the evaluation of the possible drawbacks and risks. It does not imply the pessimistic approach but presupposes the notions of awareness and readiness.

At the same time, the experience of others can be too limited in order to satisfy the needs of different environment and culture. Therefore, there is a need for gathering and assessment of the information reflecting the gains and faults of the current system-wide assessment implementation. Only this data may indicate the gaps in the system and enable the necessary for improvement steps.

The research witnesses the high impact of system-wide assessment on policymakers and educators regarding regulation and adjustment of policies implemented. Thus, the accuracy and validity of the assessment tests become highly needed. Since there is a vivid connection between the quality of system-wide assessment and the following steps taken, its importance gradually occupies the central position in the assessment of students.

In Search Of A Methodology? Conceptual Maps For Learning And Teaching Spanish As A Foreign Language (Sfl)

Marta SARACHO ARNÁIZ
 Politécnico do Porto – Escola Superior de Educação
 Portugal
 martasaracho@ese.ipp.pt

Abstract

There are areas in languages that have only recently been taken into account in the teaching and learning of Foreign Languages (FL), as in the case of phraseological units (UFS) (González Rey, 2004). Similarly, we can say that theoretical research concerning the importance of Phraseology in the learning of Foreign Languages, particularly with respect to Spanish as a Foreign Language (SFL), has still not reached enough teaching professionals, especially when it comes to practical applications in the classroom. With respect to UFS, we refer to language units such as *tomar el pelo* [a alguien], [hacer algo] *a trancas y barrancas*, [ser un] *arma de doble filo*, as locutions, but there are also other types of units, like routine formulas, *las paredes oyen*, *tiene narices*, *arriba los corazones*, or more extensive units, like *Más vale pájaro en mano que ciento volando*, *A Dios rogando y con el mazo dando* (Corpas Pastor, 1996). On the other hand, the difficulties in teaching these UFS in the classroom are well known, especially those of an idiomatic nature, that is, those that come from the figurative meaning of these expressions (Navarro, 2004, Saracho Arnáiz, 2016). These factors demand that we investigate the linguistic characteristics, of form and meaning, of these units, as well as, specifically, the way we present them as an object of teaching and learning. In this work we want to demonstrate that Mind Maps are a methodological instrument (Buzan, 1993) to teach and learn UFS, since they serve to organize them by concepts or notions, that is, starting from a more general meaning (Schwartz & Raphael, 1985). We take the perspective that learning must be meaningful for students (Ausubel, 1963; Novak, 1998) and we also take into account that language acquisition is done through the human brain, which stores the words and expressions in nodes of more general meaning, creating links of different types between these, the words and other language units. For this reason, we support an onomasiological teaching of the UFS in other words, starting from the concept or notion and establishing a network of words and expressions to direct students towards the complex meaning of UFS in order to reach the difficult goal of memorizing them. In this research we will also present an example of how to apply the methodology of Mind Maps in the teaching and learning of UFS, in particular, of SFL, and we will also demonstrate its performance in the classroom.

Introduction

The objective of this paper is to explain how conceptual maps for the teaching-learning of Spanish as a foreign language (SFL) can be beneficial and profitable. For this, I first intend to explain the educational theory that is at the basis of conceptual maps (Ausubel, 1960). Then I'll briefly explain what a conceptual map entails, its most important elements and the advantages these maps have for students (Novak, 1998), as well as the reason for becoming a methodology of teaching and learning. Third, I will also make a brief reference to the teaching of vocabulary and phraseology in class of SFL and the various ways to get to the meaning of a word or expression (González Rey, 2004). In this way, by adopting an onomasiological orientation of the presentation of the phraseological units, that is, starting not from a word or unit, but from a broad concept to reach several forms that are related by meaning, creating a network of connections, we find the affinity with the structure of the conceptual maps, which gives credibility to the method. Finally, we will see an example, of a phraseodidactic activity, using a digital tool for the SFL class.

The Theoretical Basis Of Conceptual Maps

They have been called "mind maps" or "conceptual maps", or also in French "heuristic maps", but actually all make use of the same technique. We prefer to talk about conceptual maps, following Novak (1998), because we believe that the term "concept" is the one that best defines the maximum hierarchy proper of the map that will serve us for teaching-learning of phraseology.

What is a conceptual map? It is a graphic structure, as we can see here:

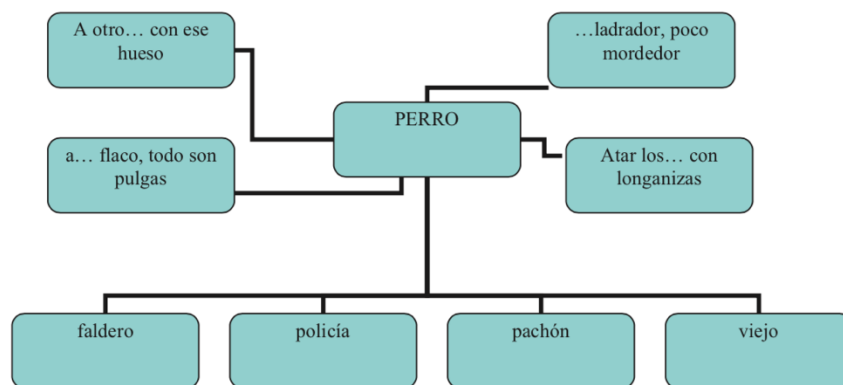

Figure 1. Example of a lexical map by Rodríguez Paniagua, (2011, p. 122)

To exemplify and explain the different versions, this map is not properly conceptual, but phraseological (Figure 1), because from the word PERRO/DOG, in a central box, the collocations are derived (1): *perro faldero*, *perro policía*, *perro pachón*, *perro viejo*, in the boxes of the base, and sayings (ps. paremias): *A otro perro con ese hueso*, *A perro flaco, todo son pulgas*, *A perro ladrador, poco mordedor*, *Atar los perros con longanizas*, placed in boxes around PERRO/DOG. However, this map, as we have advanced, does not start from the concepts, but from the PERRO form, that is, it is a classification that attends to the formal aspect of the expressions, being the connection between these the word "perro", and not its meaning. Consequently, this is not a conceptual map in a rigorous sense.

The educational theory that is at the basis of the methodology of the conceptual map is that of the meaningful learning advocated by Ausubel (1963). This theory explains the way humans create meanings through mental processes and the production of language. Thus, learning has to do with the acquisition of new words, concepts and propositions. In this way, the child begins to discover regular patterns in the world around him and associates them with lexical labels or linguistic elements that identify them. Over time, the human being creates a wide network between existing concepts, new concepts and words. I will relate this perspective in my communication with the lexical approach (Lewis, 1990; Baralo, 1997) for teaching words and expressions that I will mention later.

From a cognitive perspective, the human being is the only one of all animals with the capacity to learn the regularities of objects and events (the two elements of the universe) and to code them symbolically (human language, mathematical or physical symbols). There are events that we consider to be *facts* because they are valid records of them (for example, that water boils at 100°C), but there are events and objects that are interpretable, and the interpretations can be divergent. For Novak (1998) the concept is a regularity perceived in events, objects or records of events, designated with a label. This is how meaning and knowledge are constructed through concepts. This brings us closer to the question: What kind of learning should we promote for teachers?

The human being learns through a sequence of thought, feeling and action, and significant learning must include these three elements:

"I pretend that the central objective of education is to train students to be responsible for their own construction of meanings. The construction of meanings includes thought, feeling and action, and these three aspects must be integrated in the new meaningful learning and, particularly, in the creation of new meanings" (Novak, 1998: 2000, p. 9).

When brain structures are well organized, the higher-level, more inclusive and general concepts subordinate others that are more specific and less general.

On the other hand, our brain memorizes, that is, stores information. This occurs in three different ways: through sensory or perceptual memory, from memory to short-term and long-term memory. All of them are related and the way one organizes is going to influence the other. This is going to be decisive in the level of teaching-learning, the student will have to be exposed to new materials long enough for the sensory memory to capture new information, move to short-term and long-term memory. In this way, and more related to lexical learning, three phases have been identified: *input*, or new lexicon entry, storage and recovery (Gairns and Redman, 1995).

How To Build A Conceptual Map

Several authors point out that conceptual maps are a true cognitive technique to organize our thinking, pose a problem, memorize a structure, etc., because they are able to set in motion the two hemispheres of the brain, the left one that promotes reflective and intellectual thinking, and the right, more creative. They are called heuristic maps because they make us discover, they make the information emerge (Deladrière et alii, 2007).

In addition, they stimulate positive feelings in the affective-relational sphere of the individual, such as self-confidence and self-esteem (Ontoria Peña, 2011). Other benefits have also been pointed out, such as autonomy, easy memorization, the desire to learn, serenity in complex situations, the pleasure of using new resources, the satisfaction of having spent our time well, the ease of argumentation and the feeling of mastery of knowledge. In addition, it has the advantage of being polyvalent. They serve to organize a work meeting, to analyse a problem, and also to teach and learn lexicon and phraseology. As we have mentioned, its effectiveness is due to a psychological base that derives in a creative and pleasant work and, in addition, it is a technique that keeps the student active.

As we have already indicated, the conceptual map establishes a hierarchy between the concepts. But when working with our students in a Phraseology or Lexicon class, selecting concepts may not be an easy task. Normally, we are not used to looking for the most general idea of words or expressions. It is more common to resort to a dictionary of meanings in which we find the concrete meaning of the word or expression. We are going to use the methodology of conceptual maps that, as already mentioned, has different uses, to apply it to the specific field of teaching-learning of Phraseology in SFL. For this, we will also use other types of resources in the area of linguistics, as we will see later. What we describe next are the general steps to apply the methodology of the conceptual map, and then it will have to be adapted to each use, in our case, to the learning of Phraseology. Steps to build a conceptual map in general:

1. The first thing will be to identify a particular question or domain of knowledge and select 10 or 20 concepts (of one word or two) that are relevant to that question.
2. Next, the concepts are arranged, placing the most comprehensive and inclusive idea above, at the top of the map.
3. More concepts are added, if necessary.
4. We will start to build the map, placing the most general ones (above). They are usually one, two or three.
5. We will select two, three or four sub concepts and put this under each general concept.
6. Two concepts are joined with branches that represent the relationship between both. Each branch defines a relationship that must be expressed briefly.
7. The structure of the map is reworked. You can add or remove superordinate concepts. Work with cards or post- it is very useful.
8. Then, cross connections between concepts are sought. Many times, cross-connections can help to see new creative connections in the domain of knowledge.
9. You can add concrete examples of concepts.
10. Conceptual maps can be made in many different ways for the same set of concepts. There is no predefined way to design a concept map. As the understanding of the connections between the concepts changes, the maps also change.

As can be seen, this technique that has just been described is very general. We will explain how to put it at the service of our students so that they acquire phraseological competence.

The Importance Of Phraseological Competence In The Learning In A Foreign Language

The phraseological competence is part of the communicative competence and, therefore, its role in the SFL class must be granted. In general, teachers are aware of the role of the lexicon in learning a FL, but not so much about Phraseology. The shortage of materials for the teaching-learning of phraseological units is notorious and the reference documents for teaching and learning in general are not illuminating, in the case of Spanish, the Common European Framework of Reference for Languages (2001) and the Curriculum Plan of the Cervantes Institute (2007).

However, the dominance of the language is determined by the student's ability to engage in idiosyncratic ways and forms as a native speaker would, using the expressions and word combinations that use has perpetuated through the centuries (Castillo Carballo, 2000). In this sense, any contribution of methodologies, techniques, resources and materials for the teaching-learning of Phraseology can contribute to disseminate among the teachers the awareness of their importance in the class for the students, and the conceptual maps can fulfil their role.

As we said before, we start with the lexical approach that affects the importance of the lexicon in the learning of an FL. This new conception of the lexicon integrates parameters and criteria of psycholinguistics or lexicography, incorporating principles of neurology and psychology. The acquisition of new words implies a dynamic process of creating multiple connections with other words already acquired, reorganizing the structures to accommodate the new term (Aitchison, 1987; Higuera, 2007).

It is important to say that the delimiting line between the lexicon and the phraseological elements is not rigid, and, when working with conceptual maps, it is evident. Therefore, although our main objective is the learning of phraseological units (PUS), relationships with other units can be created, especially with the lexical units.

If the memorization of words or expressions has been pointed out as one of the fundamental difficulties of teaching FL, the conceptual map is a technique that consists in leading the student to become aware of the relationship of words to each other, helping him “to recuperate” expressions and words he knows or has heard (passive lexicon), and to build new relationships between words and groups of words that could be new (Rodríguez Paniagua, 2011)

Proposal Of Phraseodidactic Activity With Onomasiological Basis

Our proposal to use conceptual maps for the teaching-learning of Phraseology is based on an onomasiological classification of the language. We will say very briefly that Onomasiology is the science that starts from the notions or concepts and looks for the different designations for that notion. Therefore, it is the investigation of the forms from the concepts (Baldinger, 1964). It is not the usual way we use, for example, dictionaries. Normally, we look for a word or expression to know its meaning, but in any case, we must know the word or expression in advance. Despite this, the onomasiological perspective can be useful for students who are studying a foreign language, since they know the concept, but not the term. To find the term from the concept, we have to resort to thematic or ideological dictionaries. However, these are not so abundant, and, in addition, they do not present homogenous classifications. That is, there isn't a reference classification of the concepts.

To exemplify the phraseodidactic activity with a conceptual map, we have started from the concept of HABLAR/SPEAKING and its opposite CALLARSE/BE QUIET, considering that these are sufficiently broad concepts and because they are found in most of the works we have consulted (Rodríguez Vida, 2011; Bárdosi and González Rey, 2012). On the other hand, HABLAR/SPEAK (2) is a fundamental action of the human being on which there are a potentially large number of words and phraseological units.

The main activity is for students to build a concept map, which aims to activate already known units and acquire new units. The construction of the map will be proposed as an end task, since before they will have to carry out a series of previous steps. We consider that the level of the students should be from B1 onwards.

First, the teacher will expose students to the concepts of HABLAR/SPEAKING and CALLARSE/BE QUIET and will ask them to think of words or expressions that refer to these actions (nouns, adjectives, verbs, phrases, expressions). To motivate them, you can read a text or tell a short story. Then, they will brainstorm new concepts, words and expressions that will have to be reorganized again.

For example, to SPEAK/HABLAR: *hablador/-a (talkative), charlatán, hacer una ponencia (to make a presentation), ser un cotilla, decir tacos, meter la pata, mala boca, cantar las cuarenta, hablar por los codos, poner verde a alguien, abrir la boca, hablar como una cotorra, hablar largo y tendido, darle a la lengua, etc.* CALLARSE/BE QUIET: *tímido/a, reservado/a, guardar un secreto, no decir ni pío, en boca cerrada no entran moscas, callarse la boca, etc.*

If we see that our students do not produce an adequate number of units, we can propose that they consult dictionaries, which will constitute another phase of the activity. This phase can be very interesting, since we can introduce them to the search in the ideological or thematic dictionaries, that is, to search for expressions based on a concept. Another way to carry out the activity, more directed, would be to present the lexical and phraseological units that seem appropriate and ask them to find their meaning in the usual dictionaries, in this case.

When the students already have the words and the units, that is to say, their form, and they know their meanings, we ask them to make a conceptual map, explaining to them that they should focus all their attention in ordering each expression related to a certain concept. As we mentioned earlier, they will start with two concepts: HABLAR/SPEAK and CALLARSE/BE QUIET, which will be placed at the top of the map. The difficulty will be in finding the sub concepts that are underlying the words and expressions and hierarchizing them. Branches, as proposed by Novak (1998), must represent a logical link that makes sense through words. The task should be done in groups of four students, for example.

The maps can be made on paper or using a digital tool, if we have tablets, computers and internet. We can also request the collaboration of the teacher of TIC, in the case that students have any subject of this nature. We chose the *Bubbl.us* tool because it seems easy to use for teachers and students, but other digital resources can be used.

Figure 2. Example of a conceptual map created from the concept HABLAR/SPEAKING

As observed, there are two levels of generalization from the SPEAK concept, represented in a yellow box. The second level, more specific, represented in green and, finally, in pink, the expressions of the language are presented. It is very important that the arrows that join the boxes represent relationships and that they are expressed (boxes in grey) so that a meaningful reading can be made. It must be added that the tool allows us to include images and make links to pages.

Conclusions

Conceptual maps can be an effective technique for the teaching-learning of lexical and phraseological units in SFL, because:

- They present a structure and a dynamic similar to that of our brain;
- They activate the two hemispheres of the brain, making learning more motivating and satisfying;
- They help to recover the lexical units and the known expressions;
- They lead to the learning of new units, reorganizing the previous mental structure;
- They classify the lexical and phraseological units that have a hierarchy concepts, creating groups not closed language units;
- They present a coherent methodology so that teachers can apply it in the SFL class with their students.

Finally, I would like to express my belief that more theoretical and empirical research should be done on conceptual maps in order to obtain data on their validity as a teaching-learning technique in the field of FL.

Notes

(1) Taxonomy of the phraseological units of Corpas Pastor (1996).

(2) Rodríguez Vidal (2011) includes the concept of HABLAR/SPEAKING in social relationships, a broader concept, and subdivides it into: speaking clearly, talking about consideration, speaking about extension, talking about frankness, talking Regarding reflection, talking about good sense, talking about vanity, talking about knowledge and talking about the interlocutors.

Abstract

Increasing the quality and effectiveness of education and training, contributing to the social, political and economic structure of the countries is something that educators and educational policy makers are always working on. Increasing the quality of education and training nowadays can be achieved with the development of 21st century skills in the students, the integration of education with technology. The role of technological developments, which provide many conveniences for our everyday life, in education environments is getting more and more effective. In computer training, the use of coding and robotics is becoming a prevailing practice. Coding and robotics based informatics education; has the potential to unravel and shape the real world and to reveal the skills of creating innovative ideas and products through the application of the knowledge they learn to real life problems. The aim of this study is to reveal the opinions of Informatics teachers about the coding and robotics based IT teaching practices. The survey model was used and the study group consisted of 120 information technology teachers working in secondary schools in Sakarya province. These teachers were asked questions about quantitative research on whether they had received any training in robotic applications and coding in their previous lives and whether they would contribute to themselves and their students. The results were interpreted by quantitative evaluation tools.

Key words: *Information, coding, software, original product, robotics, trainer training, robotic coding, self-efficacy perception*

Introduction

We are talking about coding and robotic coding now and we are in a period where we have to talk. It is necessary to speak the same language with computerized systems in order to be able to tell them what to do and to guide them. The coding of this new foreign language of our era is among 21st century skills that are so important that it is no longer a stranger and that our children must win. Our children should meet this dill at the earliest possible age. My children should be given the opportunity to explore themselves in this area. Because at a later age our children are now starting to become more interested. A child who does not have the opportunity to meet with this skill will naturally not be able to develop such an interest. We see how games, social media, videos, and animations are all about our children. Prensky (2001) calls the new generation of individuals "digital natives" because of their clear view of their predisposition to digital technologies. This tendency is convinced that if my children are not educated in place and on time, only a society that consumes technology will remain as a shallow skill that can not go forward. Akpınar and Altun (2014) point out that the educational community can not look at this perspective from the viewpoint that the culture and the skills of the basic media literacy and basic media literacy and the skills of individuals have been developed to become typical consumers of information technology, which can only be a demand from the big commercial sector. We need to transition to a training program where we can raise individuals who produce their own technology from training programs that create a consuming society. In our country, coding education was included in the curriculum of the Secondary School and Imam Hatip Secondary School Information Technologies and Software Course (5th and 6th Grades) curriculum adopted and renewed by the Decision dated 17/07/2017 and numbered 78 of the Ministry of National Education Ministry Talim Terbiye Kurulu. This is an important step on our behalf.

Nowadays, with many block coding programs, children can take part in a more colorful, more entertaining adventure of coding out of complicated code structures that are heavy to them (Resnick et al., 2009). In addition to improving children's problem-solving and logical thinking skills, coding also supports learning in many classes such as mathematics, science and technology. Children learn to design projects and establish connections between ideas and collaborative work. These skills are not only for computer specialists but also for all ages, working people and everyone in the profession (Wing, 2006; Resnick, 2013). Must be found in 21st century individuals;

Basic skills such as problem solving, creativity, algorithmic thinking and computer thinking can be gained by teaching programming and computer science (Karabak and Güneş, 2013, Monroy-Hernández and Resnick, 2008). Thanks to robotic coding practices, they can catch up early on at the chance to observe how the codes they write come together with a piece of hardware. It has been stated that the self-efficacy perceptions of the students' performance on robotic coding activities after coding robotic coding activities significantly changed in the positive direction in the student activities (Kasalak, 2017) regarding the effects and activities of the secondary school students on the coding self-efficacy perceptions. This can be attributed to the fact that in robotic coding activities, children have the chance to see the designs they code. In addition, children's 3D design programs enable children to acquire 3D thinking and design skills at an early age.

A study on the effect of coding education and coding on educational policies as a new 21st century skill (Sayın ve Seferoğlu, 2016) investigated the effects of coding education in the world on the world location, education policies and development plans of the countries and obtained striking results. Even in the development plans that the whole world has emphasized, the encyclopedia that is included in our plans is a problem that we have to pay attention to as a country.

This important skill can be achieved with our teachers in the first place. The adequacy of our teachers to use these programs and tools to cry for children and the method-techniques of presenting them to students are extremely important. Scratch, code.org, mblock The primary purpose of coding in a similar environment is to improve learning outcomes and motivate learners by using coding as a tool to develop other skills, rather than teaching themselves (Resnick, 2013). For this reason, it is extremely important for the teacher to teach the coding, which is seen as the language to come to the competence in these subjects, to love the children and to enter the interests of the children. In this research, it has been tried to determine the self-efficacy of the knowledge teachers in coding, robotics coding and 3D design subjects. In their lectures, how much they are inclined to these topics was evaluated and their opinions about whether these topics were helpful or not were taken.

Purpose of the research

Within the scope of the study; It is to determine the self-sufficiency status of the knowledge teachers working in secondary schools in Sakarya province in terms of coding and robotic coding.

Method

In this section, information about research model, universe and sampling, data collection tool, data collection and analysis will be given.

Model of your research

Survey screening model was applied. The main purpose of screening research is to describe the situation as it exists. Everything that is subject to research is tried to be defined as if it is within its own conditions (Karasar, 2005). The data from the teachers constitute the screening part.

Working group

The universe of the research consists of 120 IT teachers working in Sakarya during the academic term of 2017/2018.

Data Collection and Analysis

In order to collect data in the survey, a questionnaire developed by the researchers was used. The questionnaire consists of two parts. Second part it consists of 30 attitude questions under 3 headings. The data obtained with the means of quantitative data collection in the study were analyzed using the SPSS 24.0 statistical program and descriptive statistics were used in the examination of the quantitative data.

Findings And Comment

Table 1. Gender Main Distributions of Respondents

Gender	Frequency	Percent
Woman	51	%43
Male	69	%57
Total	120	%100

When table 1 was examined, it was observed that the number of males was higher when the teachers participated in the survey were examined in terms of gender. It can be said that men prefer to teach IT.

Table 2. Distribution of Respondents In the Survey

The institution you work for	Frequency	Percent
Public	103	%86
Special	17	%14

Total	120	%100
-------	-----	------

When table 2 is examined, most of the teachers who participated in the survey were working from the state schools. As the number of specials is low, participation has been realized there.

Table 3. Occupational Seniority Distributions of Respondents

Your professional senior	Frequency	Percent
0-5	52	%42
6-10	41	%34
11-15	25	%22
16-20	1	%1
Above 21	1	%1
Total	120	%100

When table 3 is examined, it is seen that most of the teachers who participated in the survey are working among 0-10 years. From here, we can say that the informatics teacher branch is a new field.

Table 4. Participants In the Survey were Divided by the Faculties They Graduated From

Your graduate faculty	Frequency	Percent
Faculty of Education	92	%77
Technical Training	25	%21
Other	3	%2
Total	120	%100

When Table 4 is examined, it is understood that the majority of the teachers who participated in the survey graduated from the Faculty of Education. We can say that the information technology teachers in secondary schools are usually graduated from education faculty.

Table 5. Distribution of Participants In The Survey On The Code.org Application

Are you trained?	Frequency	Percent
Yes	46	%38
No	74	%62
Total	120	%100

When table 5 was examined, it was observed that the majority of the teachers who participated in the survey did not receive any training from Code.org application. It can be said that teachers do not take such kind of courses in the sections they read.

Table 6. Distribution of Educational Situations In The Field of Scratch Application by Respondents

Are you trained?	Frequency	Percent
Yes	46	%38
No	74	%62
Total	120	%100

When table 6 was examined, it was observed that the majority of the teachers who participated in the survey did not receive training from any institution related to scratch application. It can be said that they do not take such kind of courses or courses in the teachers' readings and their later occupations.

Table 7. Distribution of Educational Attitudes In The Field of Appinventor Application by Respondents

Are you trained?	Frequency	Percent
Yes	30	%25
No	90	%75
Total	120	%100

When table 7 was examined, it was observed that the majority of the teachers who participated in the survey did not receive training from any institution related to appinventor application. It can be said that they do not take such kind of courses or courses in the teachers' readings and their later occupations.

Table 8. Distribution of Educational Attitudes In The Field of Arduino Practice by Respondents

Are you trained?	Frequency	Percent
Yes	35	%30
No	85	%70
Total	120	%100

When table 8 was examined, it was observed that the majority of the teachers who participated in the survey did not receive training from any institution related to arduino application. It can be said that they do not take such kind of courses or courses in the teachers' readings and their later occupations.

Table 9. Distribution of Educational Status In The Field of Mblock-Arduino Application by the Respondents

Are you trained?	Frequency	Percent
Yes	34	%28
No	86	%72
Total	120	%100

When table 9 was examined, it was observed that the majority of the teachers who participated in the survey did not receive training from any institution related to mblock-arduino application. It can be said that they do not take such kind of courses or courses in the teachers' readings and their later occupations.

Table 10. Distribution of Educational Attitudes In the Field of MBot Application of Respondents

Are you trained?	Frequency	Percent
Yes	32	%27
No	88	%73
Total	120	%100

When Table 10 was examined, it was observed that the majority of the teachers who participated in the survey did not receive training from any institutions related to MBot application. It can be said that they do not take such kind of courses or courses in the teachers' readings and their later occupations.

Table 11. Distribution of Educational Attitudes In The Field of Makeymakey Application of the Respondents

Are you trained?	Frequency	Percent
Yes	34	%28
No	86	%72
Total	120	%100

When table 11 was examined, it was observed that the majority of the teachers who participated in the survey did not receive training from any institution related to makeymakey application. It can be said that they do not take such kind of courses or courses in the teachers' readings and their later occupations.

Table 12. Distribution of educational situations in the field of game coding applications of survey participants

Are you trained?	Frequency	Percent
Yes	36	%30
No	84	%70
Total	120	%100

When table 12 is examined, it is observed that the majority of the teachers who participated in the survey did not receive training from any institutions regarding game coding practices. It can be said that they do not take such kind of courses or courses in the teachers' readings and their later occupations.

Table 13. Distribution of Educational Attitudes In The Field of TinkerCad Application by Respondents

Are you trained?	Frequency	Percent
Yes	30	%25
No	90	%75
Total	120	%100

When Table 13 is examined, it is observed that the majority of the teachers who participated in the survey did not receive training from any institutions related to TinkerCad application. It can be said that they do not take such kind of courses or courses in the teachers' readings and their later occupations.

Table 14. Distribution of survey participants' 3d design and education in 3D printer area

Are you trained?	Frequency	Percent
Yes	38	%32
No	82	%68
Total	120	%100

When table 14 was examined, it was observed that the majority of the teachers who participated in the survey did not receive training from any institution in the area of 3d design and 3d printer. It can be said that they do not take such kind of courses or courses in the teachers' readings and their later occupations.

Table 15. Distributions of Use of Code.org Application In Participant's Lessons

Do you use it in your lessons?	Frequency	Percent
Yes	52	%43
No	68	%57
Total	120	%100

When table 15 was examined, it was observed that most of the teachers who participated in the survey did not use code.org application in their lessons. The fact that teachers do not receive training on how to integrate the Code.org application into classes has caused them not to use this practice in lessons. Teachers who received training in the subject (46% of the teachers who received the relevant training) or teachers who had knowledge in their own interest achieved the course gains by using the code org application in information technology and software lessons.

Table 16. Distribution of Usage of Scratch Application In The Courses of Participants In The Survey

Do you use it in your lessons?	Frequency	Percent
Yes	63	%52
No	57	%48
Total	120	%100

When table 16 was examined, it was observed that the majority of the teachers who participated in the survey used scratching in their lessons. It can be said that the fact that the teachers were educated about the subject caused the increase in the usage rate.

Table 17: Distribution of Usage of Appinventor Application In The Subjects of The Survey Participants

Do you use it in your lessons?	Frequency	Percent
Yes	4	%3
No	116	%97
Total	120	%100

When table 17 was examined, it was observed that the majority of the teachers who participated in the survey did not use appinventor practice in their lessons. Teachers should not be trained on how to integrate appinventor practice into lessons, which can be said to have caused them not to use this practice in lessons.

Table 18. Distribution of use of arduino practice in the subjects of the survey participants

Do you use it in your lessons?	Frequency	Percent
Yes	7	%6
No	113	%94
Total	120	%100

When table 18 is examined, it is observed that most of the teachers who participated in the survey did not use arduino practice in their lessons. It can be said that the majority of the teachers do not take an education about arduino practice, so they do not use this subject in the lessons.

Table 19. Distribution of Mblock-Arduino Usage In The Subjects of the Survey Participants

Do you use it in your lessons?	Frequency	Percent
Yes	10	%8
No	110	%92
Total	120	%100

When Table 19 is examined, it is observed that most of the teachers who participated in the survey did not use mblock-arduino practice in their lessons. It can be said that the majority of the teachers do not use MBLOCK-arduino training in their lessons.

Table 20. Distributions of Using MBot Application In The Courses of Participants In The Survey

Do you use it in your lessons?	Frequency	Percent
Yes	6	%5
No	114	%95
Total	120	%100

When table 20 is examined, it is observed that the majority of teachers who participated in the survey did not use MBot application in their lessons. It can be said that the majority of teachers do not take an MBTot training and do not use this topic in their lessons.

Table 21. Usage Distributions of Makeymakey Application In The Courses of Participants of The Survey

Do you use it in your lessons?	Frequency	Percent
Yes	8	%7
No	112	%93
Total	120	%100

When table 21 was examined, it was observed that the majority of the teachers who participated in the survey did not use makmakmaki in their lessons. It can be said that the majority of teachers do not take an education on makeymakey practice, which causes them not to use this subject in the lessons.

Table 22. Usage Distributions of Game Coding Applications In The Courses of Participants In The Survey

Do you use it in your lessons?	Frequency	Percent
Yes	32	%27
No	88	%73
Total	120	%100

When table 22 is examined, it is observed that the majority of the teachers who participated in the survey did not use the game coding practices in their lessons. It can be said that the majority of the teachers do not take an education about game coding practices, so they do not use this subject in the lessons.

Table 23. Use Distributions of TinkerCad Application In The Subjects of The Survey Participants

Do you use it in your lessons?	Frequency	Percent
Yes	14	%12
No	106	%88
Total	120	%100

When table 23 was examined, it was observed that the majority of the teachers who participated in the survey did not use the TinkerCad application in their classes. It can be said that the majority of teachers do not take an education on the application of TinkerCad, which causes them not to use this subject in the lessons.

Table 24. Distributions of Using 3d Design and 3d Printer In The Subjects of The Survey Participants

Do you use it in your lessons?	Frequency	Percent
Yes	12	%10
No	108	%90
Total	120	%100

When Table 24 is examined, it is observed that the majority of the teachers who participated in the survey did not use 3d design and 3d printer lessons. It can be said that the majority of the teachers do not use these subjects in their lessons if they do not receive an education on these subjects.

Table 25. Opinion Distributions of Respondents Regarding Code.org Implementation

Do you think it will be useful to students?	Frequency	Percent
Yes	116	%96
No	4	%4
Total	120	%100

When table 25 was examined it was observed that the majority of the teachers who participated in the survey thought that the implementation of code.org was beneficial to the students. If practical training is given to teachers related to the subject, it can be said that the potential of teachers to use code.org in their lessons is very high.

Table 26. Opinion Distributions of Respondents Regarding the scratch Application

Do you think it will be useful to students?	Frequency	Percent
Yes	118	%98
No	2	%2
Total	120	%100

When table 26 is examined, most of the teachers who participated in the survey indicated that they think that scratch application is beneficial to the students. If a hands-on training is given to the teachers concerned, it can be said that teachers' scratching practice will have a very high use potential.

Table 27. Opinion Distributions of Respondents Regarding Appinventor Application

Do you think it will be useful to students?	Frequency	Percent
Yes	97	%81
No	23	%19
Total	120	%100

When table 27 is examined, the majority of teachers who participated in the survey indicated that they think that appinventor application is beneficial to the students. If practical training is given to the teachers related to the subject, it can be said that the usage potential of teachers' appinventor in their lessons is quite high.

Table 28. Participants' Opinions About Arduino Practice

Do you think it will be useful to students?	Frequency	Percent
Yes	102	%85
No	18	%15
Total	120	%100

When table 28 is examined, the majority of the teachers who participated in the survey indicated that arduino practice is beneficial to the students. If practical training is given to the teachers related to the subject, it can be said that the usage potential of the teachers in the courses of arduino training will be quite high.

Table 29. Opinion Distributions of Respondents Regarding Mblock-Arduino Application

Do you think it will be useful to students?	Frequency	Percent
Yes	112	%93
No	8	%7
Total	120	%100

When table 29 is examined, the majority of the teachers who participated in the survey indicated that they think MBlock-arduino application is beneficial to the students. If practical training is given to the teachers related to the subject, it can be said that the usage potential of mblock-arduino teachers in their lessons is very high.

Table 30. Opinion Distributions of Respondents Regarding MBot Application

Do you think it will be useful to students?	Frequency	Percent
Yes	107	%89

When table 30 is examined, the majority of the teachers who participated in the survey indicated that they think MBot application is beneficial to the students. If practical training is given to teachers related to the subject, it can be said that the usage potential of the MBot application is very high.

Table 31. Opinion Distributions of The Respondents Regarding Makeymakey Application

Do you think it will be useful to students?	Frequency	Percent
Yes	107	%89
No	13	%11
Total	120	%100

When Table 31 is examined, the majority of the teachers who participated in the survey stated that they think that makeymakey application is beneficial to the students. If practical training is given to the teachers related to the subject, it can be said that the use of makeymakey in their lessons will be quite high.

Table 32. Opinion Distributions Related to Game Coding Practices of Respondents

Do you think it will be useful to students?	Frequency	Percent
Yes	115	%95
No	5	%5
Total	120	%100

Table 32 shows that the majority of the teachers who participated in the survey think that the game coding practices are useful to the students. If practical training is given to the teachers related to the subject, it can be said that the use of the game coding practices by the teachers is very high.

Table 33. Opinion Distributions of Respondents Regarding TinkerCad Implementation

Do you think it will be useful to students?	Frequency	Percent
Yes	102	%85
No	18	%15
Total	120	%100

When Table 33 is examined, the majority of the teachers who participated in the survey indicated that they think TinkerCad application is beneficial to the students. If practical training is given to the teachers related to the subject, it can be said that the use of TinkerCAD by teachers is very high.

Table 34. Participants' Opinions About 3d Design and 3d Software

Do you think it will be useful to students?	Frequency	Percent
Yes	102	%85
No	18	%15
Total	120	%100

When Table 34 is examined, the majority of teachers participating in the survey indicate that 3d design and 3d printer applications are useful to the students. If practical training is given to the teachers related to the subject, it can be said that the teachers use 3d design and 3d printer applications in their lessons.

Conclusion And Discussion

120 information technology teachers working in secondary school participated in the research. 77% of our teachers are graduates of the Faculty of Education. Approximately 70% of our teachers on programs that make children's coding learning experience more enjoyable such as Code.org, scratch, appinventor, arduino, mblock-arduino, mbot, makeymakey, oyuncodlama, tinkercad, 3d design, robotics applications and 3D designs He has been receiving. Therefore, our teachers who do not have sufficient knowledge about these subjects use about 20% in their practice. It can be said that there are hardware deficiencies in the reason why these subjects are not used in the lessons. When our teachers were asked if these practices were beneficial to their students, they said that 90% would be useful. This shows to us that if our teachers take trainings on these subjects, their potential to practice in their courses will be quite high.

Suggestions

Most of our teachers do not have any training related to coding, robotics coding and 3D design for middle school students in university years and later occupations. For this reason, it can be rearranged according to the needs of today by observing the curriculums of the universities. In addition, in-service trainings can be revised again in the light of these topics. It can be planned that the trainings related to these topics will be made at a frequency that can reach wider masses because there will be an intense demand.

An average of 30% of teachers have knowledge about these topics and there are various reasons why 20% of them use them in their lessons. The absence of information classes and the inadequacy of hardware in information classes can be seen among these reasons. In addition, when these trainings are given, it can be thought that it is inadequate for the teachers to give only the contents of the topics to the teachers about how these topics can be given to children and with which activities. For this reason, such trainings need to be well organized and well designed.

We see that our teachers have very positive views on coding, robotic coding, and 3D design. According to other countries, our greatest advantage in coding is that we do not have trained teachers in this area. For this reason, the necessary infrastructure for the use of this potential in the positive direction, the design and realization of the trainings as soon as possible will be beneficial for our country and our future.

Abstract

The world population has changed spectacularly in the last decades. The growth in life expectancy is forcing a restructure in our policies and, obviously, education. For 2050, there will be 2.000 sixty plus year olds. That is mor that 20% of the world population. Besides, discrimination for ageing and, sometimes, abandonment and abuse of elderly people is a frequent and harmful attitude. The main objective of this article is to make a theoretical approach to the work that is carried out from educative cities to that effect. Local governments have an outstanding role when giving response to the challenge of a more and more aged society. One of the obligations of the cities that have joined this international movement is the fulfillment of the charter of EC. In it, it is said that cities should be aware of the mechanisms of inclusion and exclusion that affect them, and the varieties that are coated and will be developed by the needed policies of affirmative action, such as activities directed to the inclusion of that given collective.

In a second part of the article, we will make a selection of the main activities with elderly people carried out in the Spanish territory, as a reference of the work towards the inclusion of vital importance for this collective around the world.

Key words: *Inclusion, elderly people, educating city, social exclusion.*

Introduction

Fernández (2015) explains that there is a continuous ageing of the Spanish population. Since the beginning of 20th century, there has been a great change in the Spanish population pyramid, with a progressive increase in 65 year old people with respect to the total. The 2014 report on statistics of elderly people in Spain shows that the future evolution of ageing points to a great growth of elderly population.

Figure 1: Spanish population pyramid

Source: Instituto Nacional de Estadística (2014)

Ageing is a progressive, slow and irreversible evolution, which affects all living beings. This process starts with birth and ends with death, at fourth age. Despite being a road that every living being must fulfill, it is not a concrete or framed phase in the life of people. It is not something either homogenous or static. Every individual lives it in a unique way.

According to Martín García (2000):

the perspective of the theory of the vital cycle considers the process of ageing as a dual one of change and continuity along life, in which internal factors (biological and psychological) combine with external (social and cultural). These factors depend on our way of living and our own nature, making such process something we can change, both speeding it up and slowing it down. (p.168)

According to a research published by IMSERSO (2006), ageing successfully (actively) comes determined by four groups of factors: low probability of falling ill and with associated disability, high cognitive functioning, high physical functioning and compromise with life. Therefore, this role model of ageing is based on elements that are mainly individual. This is a clear case of multidimensional concept, where several conditions coincide: bio-medical, psychological and social. Due to this reason, the statement cannot be reduced only to some of its components (i.e. it cannot be reduced only to health or satisfaction). In the same way, this study explains that most of the conditions that define this type of ageing are:

- Psychological conditions (cognitive capacities)
- Behavioral conditions (physical competence, functional skills) and
- Psycho-social conditions (control and self efficiency, social participation, social realtions).

One of the essential aspects included in the research by IMSERSO (2008) is the Independence, where they recognize the right that elderly people have to have access to income, food, housing, medicines, as well as a suitable education and formation. And Self-realization, that highlights the need to favour free access to social resources that facilitate opportunities to develop its potential. Both aspects are key for the support of the aforementioned research. The approach to Active Ageing leans on the recognition of human rights of elderly people and the previously mentioned principles. It accepts their rights to have equal opportunities and treatment in all aspects of life as they grow older. Moreover, it backs their responsibility to participate of the political process, and any other aspects of everyday life, according to their needs, wishes and capabilities, as they give them protection, security and adequate care when the assistance is needed. It is a must for all public policies to be used as an axis of transformation in order to enable a change of paradigm on the image and value that society gives elderly people. By means of the active ageing, we pretend to enlarge both hope and quality of healthy life for everybody as they evolve into the development of their lives, and, consequently, getting older. Carrying on with the idea that is given from either national and autonomic documents, Active Ageing is understood as ageing safely, counting on all social, legal and sanitary supports that may be needed.

European Year for Active Ageing and Solidarity between Generations (2012) establishes the need for a life-long education, as a right, after all social, political, financial, sanitary and educative institutions adapt their objectives and approach to the society where they are included. According to Bedmar y Montero (2017) long-life education is an expression related to Permanent Education, and derives from the progressive need that people have to chose their own life project and personal development.

The manifestation of the right to formation and education throughout life is a need (the right to read and write, to have access to given resources, to develop and practise both individual and collective capabilities and competences, etc.). Present mankind gives a especial value to the concept of continuous education, which states that the educative process should not be limited to childhood and youth.

As García Mínguez (2009) points out:

the Universal Declaration of Human Rights proclaimed by the UN General Assembly establishes in article 26 that everybody has the right to education, noting some of its own characteristics: it supposes the integral personal development, value judgements and improvement as ideal components. (p.134)

Human beings must and can acquire formation, culture, knowledge and skills throughout our lives, as studying has no age. It is in the 90's that we first find, in the Delors report, the successful and expressive expression *life-long education* as an indication for the deviations of Permanent Education. According to Serdio (2008), what we aim with life-long education is to provide elderly people with the opportunity to develop their level of competence by assimilating new knowledge and skills, both intellectual and social.

- Improving and stimulating physical and mental welfare of elderly people, helping them defeat and eliminate solitude.
- Eliminating negative stereotypes on both old age and people, by stimulating intergenerational contact, solidarity and social support.
- Developing and/or generating skills for a better adaptation to community and social life, by stimulating social networks and social support systems.
- Developing and/or generating skills for the rise of self-confidence and self-dependence.

Educational Challenges. Educating Cities Movement

The concept of educating city was born as an ideal, a reality dreamt by Edgar Faure and a group of contributors, around 1970. The idea, in those times, was a utopia on which they based the precedents for a distant city, but with strong foundations. The idea of a city that educates, both always and well, is, by itself, contradictory. Therefore, it should be appropriately built, satisfactorily and coordinately channeling its own educative aspects (Amaro y Delgado 2003). Active citizenship implies a new culture of public education, and gives citizens a true autonomy and responsibility. Without such conscience of citizenship, it is difficult that anybody may be tempted for social participation. The term Active Citizenship is a desirable referent for coexistence as it promotes mutual respect and non-violence ensures human rights and strengthens democratic values (Moro, 2007; Trilla y Cámara, 2011; Escudero, 2014).

The beginning and germ of such active citizenship, which implies a continuous learning process, is the Educating City: “the educating city is that which, aware of the essential role of cities in the education of people, states the willingness to influence them positively” Amaro (2002, p.56). The city is, at the same time, environment, instrument and object of learning. The city is the context, the device for selfless formation. It is, at the same time, a support used by educators to create learning settings, and a consolidator of the specific content for the everyday learning of life itself. The possibilities that the EC movement offers is a referent for this present essay. Both life-long education and offering educating activities is, by all means, one of the essential pillars of the movement.

This concept offers us a new environment, with new possibilities of interaction, conveyed through projects that allow the fulfillment of the Charter of Educating Cities. Such charter arranges the 20 essential principles and aspects that should be met by the cities that take part in the EC movement.

Biece And Activities With Elderly People In Spain

The IBDEC is the International Bank of Documents of Educating Cities. IBDEC “created a computerized documentary data base, developed by the bibliographic retrieval system BRS, which contains information on initiatives or concrete achievements that are carried out in cities with an express educating will” Viladot (1994, p.18).

Currently, the experiences kept in the Bank are classified into 15 categories. The belonging cities conduct the set of actions needed for the development and formation of their citizens throughout their lives, being adjusted to their real requirements and the fulfillment of the charter of educating cities. IBDEC serves as a platform for the publication of the same, helping share them with other cities belonging to the movement. We will now detail them in the following chart:

Table 1: Categories

CATEGORIES	
Art and humanities Social welfare Citizenship and coexistence Personal development Urban development Information and documentation Policies and administration	Educating system Associations and participation Science and technology Culture and leisure Socioeconomic development Permanent formation Environment Health and sports

Source: own development from the web-page <http://www.edcities.org/banco-de-experiencias/>

Method

The general aim of the current research is to gather and analyze the main activities that are being carried out within the Spanish educating cities on elderly people and active ageing, referent for the development of the situation of our elders.

There is a selection in base to the data from IBDEC, within the category of “permanent formation and elderly people”. Starting from that, a random sample has been done for the analysis of the content in the year 2016-2017 on the main activities referred to elders and active ageing, which is the target in our research, and using for that the official webpage of Educating Cities.

The analysis of content of the activities consists in specifying and systematizing the content of the messages and the expression of that content with the help of either quantifiable or unquantifiable signs. All that with the aim of making logical and justifiable deductions to do with the resource. It is obvious that the interest of the analysis of

content is not only the description of such contents but also what these could teach us, once treated, relative to other things (Taylor and Bogdan, 1994; Buendia and Colas, 1997; Perez, Galan y Quintanal, 2012). Out of all the cataloged ones, we have focused on 4, gathering the essential aspects referred to the following aspects:

Volunteers for Madrid

Social rating, a local initiative for equal opportunities

Boost of learning-service as a tool for coexistence, social cohesion and participation

RADARS, project of community action for elderly people

Experience classrooms

Relating life

Community promotion and intervention in Los Ambitos neighborhood

Table 2: Volunteers for Madrid

Title of the experience: Volunteers for Madrid	
Topic: Citizen participation	
City: Madrid	
Description:	Volunteers for Madrid is a program from Madrid City Council, intended for the neighbors of the city interested in taking part in projects of citizen participation, designed and promoted from the local initiative in all areas (social, cultural, sportive, environmental, health. Etc.). In occasions, these projects are carried out together with different governmental areas, institutions, social entities and companies that promote solidarity, coexistence and common wealth.
Objectives:	<ul style="list-style-type: none"> - Promoting volunteering action and active participation of citizenship in actions of common interest in everyday life. - Giving civil society a main and co-responsible role in the search for solutions and alternatives to the problems in the environment. - Generating volunteering projects in all areas: social, sportive, cultural, environmental, etc. - Boosting the role of Madrid City Council as the promoter of the caring organization of the city. - Promoting work guidelines in entities and companies that support social responsibility and corporative volunteering. - Offering support for the dissemination and formation of volunteers.
Methodolgy:	<p>The axes that articulate the Program are:</p> <ul style="list-style-type: none"> - The formation aimed for volunteers. - More than 100 own projects, which are classified in permanent and occasional. Permanent projects are developed all year round. Volunteers collaborate in programs of attention towards young and elder, reinforcement of learning, and socio-educational activities, promotion and awareness towards volunteering among youngsters, accompaniment and re-habilitation of memory in order to promote health among elderly people, preventing labors, orientation and family support, promotion of healthy food habits in schools, cultural visits around the city, district projects, etc. Some of these projects are carried out in collaboration with groups of work from other entities or organizations, as, for example, the sharing of foods in social soup kitchens together with Rotary Foundation, accompaniment of homeless people together with Samur Social teams; social-sportive volunteers in the school for shanty children "El

	<p>Gallinero”, together with Fundación Real Madrid, cognitive stimulation in homes together with the. Centro de Prevención del Deterioro Cognitivo (Madrid Salud), or volunteers with animals, together with the Centro de Protección Animal (CPA). Punctual projects are carried out occasionally, and they allow the participation of people that don’t usually have the opportunity to make permanent solidarity actions. They are a channel for active citizen participation in the events in Madrid in areas such as cultural, sportive, environmental, etc. They develop the feeling of active citizenship and enable the access to more innovative forms of volunteering. Among others, these are highlighted: sports events (Carrera Popular de San Isidro, Perroton, etc.); international days (Semana Europea de la Movilidad “La Celeste”, International Day of Infant Cancer, etc.); festivals, fairs and days (Festival de Artes Escenicas de Madrid Fringe, Salon para la Adopción de Animales de Compania, etc.) local campaigns (caravan “Madrid sin filtros”, to stop throwing out cigarette ends on the floor, participative processes “Decide Madrid”, etc. and other events such as the Three Wise Men Parade, Special Olympics adapted sports activities, etc.</p> <ul style="list-style-type: none"> - Collaborations with non-profitable social entities. The Department of Volunteering provide them with volunteers for their projects. - Subsidies for non-profitable social entities and institutions that develop projects of volunteering in the city of Madrid. In order to promote transparency, such entities are regularly called to analyze the presentation, development and justification of projects. - The Foro de la Solidaridad, public participation body with a consultive character where they discuss and suggest different initiatives for the neighborhoods. It provides the local authorities with useful information for the development of policies to do with volunteering. - All projects and petitions of volunteers from the different areas of the city council or other entities are planned at length in order to determine the role of volunteers and to organize the details of the actions.
Results:	<p>The monthly average growth of volunteers is of 70 to 80 people, mainly by “word of mouth”, as there haven’t been huge broadcasting campaigns. This datum shows that both motivation and the sense of belonging of the people who form a team of caring ones, who get related, operate actively and feel useful for their city. Along 2017, Volunteers for Madrid will start two new projects: the creation of a body of junior volunteers, designed with the purpose of preventing and fighting school bullying, run in collaboration with the local police, and the setting up of a digital platform of volunteers, through which citizens will be informed about all caring projects, as well as consulting an agenda for events that count with the collaboration of the volunteers. In 2016, the City Council of Madrid granted Volunteers for Madrid with its highest distinction, the Gold Medal, for the humane, local and social transcendence of its labor</p>
Summary:	<p>This program, based on the design of active citizenship, began its evolution and development with the creation, in 2006, of its own body of volunteers. The Department of Volunteers, dependent on the Area de Gobierno de Participación Ciudadana, Transparencia y Gobierno Abierto, is in charge of making citizens aware of the importance of volunteering, and provides people interested in becoming volunteers with welcoming, information, formation and</p>

	<p>assessment. Besides, it plans and coordinates volunteers in its own projects, as well as serving social entities, providing them with volunteers who help in their projects.</p> <p>Finally, the Department cooperates with other areas and organisms in the running of solidarity projects.</p> <p>Currently, the body of volunteers of the City Council is made up of 11,500 people, who may take part in activities such as: accompanying in hospitals, sharing out foods, school support to children, supporting in sports, cultural and environmental activities, local campaigns, etc. Being part of Volunteers for Madrid means to take part in a team of citizens ready to promote positive and caring values, and enjoy collaborating with their City Council so as to turn their city into a role model for coexistence and welfare.</p>
--	---

Table 3: Boost of service-learning as a tool for coexistence, social cohesion and participation

Title of the experience: Boost of service-learning as a tool for coexistence, social cohesion and participation	
Topic: Service Learning	
City: L'Hospitalet de Llobregat	
Description:	Service-Learning (ApS) is a pedagogical methodology that joins, in an only action, the learning of a given part of the school syllabus with the realization of a job on behalf of the community. The student learns contents and values and acquires competences and skills, developing a social compromise with the most vulnerable groups in their environment, exercising, since they were little, their right to an active citizenship committed towards the transformation of society.
Objectives:	<ul style="list-style-type: none"> - Promoting values of solidarity, social compromise and the exercise of an active and transforming citizenship among students. - Increasing students success and the interest in studying, and reducing school absenteeism. - Promoting the knowledge and appreciation of the environment among the students, getting them to feel proud of the work that they do for their neighborhood. - Improving the esteem of both the centers and students among neighbors. - Opening schools to their nearest surroundings and building alliances with social and educational entities in the neighborhood. - Strengthening the associative tissue as of the community work of youngsters, turning it into a future, into a stable either voluntary of professional compromise.
Methodology:	<p>In order to boost Service-Learning initiatives in the city, there is a permanent work group that meets every three months to coordinate, revitalize and evaluate proposals, integrated by ten people representing teachers, participating social entities, the Promotional center for Service-Learning in Catalonia, the autonomic government and the City Council.</p> <p>Alliances are set up with other local departments (culture, social services, sport...) so that they get involved in the project and push Service-Learning (currently, 40% of such initiatives are prompted by other local services different to the Education Council).</p>

	<p>At the same time, a local technical team is composed to be in charge of monitoring projects and offering both formation and assessment to teachers, educators and social activists who are willing to promote Service-Learning in their educating centers of associations. They also create meeting spaces among the educating centers and the entities that would like to receive students in their social and educating activities.</p> <p>An archive has been created, with all the projects carried out in the city, as an inventory.</p> <p>The settings that surround such activities could range from offering a service in elderly homes (motor exercises, memory games, musical performances, etc.) to supporting the learning of literacy and digital literacy among our elders, to receive the new students that join the center, to tale-tellers in libraries for the younger, to the care and embellishment of the school surroundings and of the city, to organizing bicycle routes for disable people, and even contributing in solidarity campaigns, etc.</p> <p>As a joint activity, an annual seminar is held for interchanging of Service-Learning experiences and for the reflection on methodology. Besides, at the end of the academic year, there is an act of institutional recognition from the City Council towards the youngsters who participate in the program.</p>
Results:	<p>The impact of coordination and extension of methodology of Service-Learning on the city of L'Hospitalet has been very important in the last eight years.</p> <p>During the year 2007/8, experiences of community work or of social compromise of students were under ten, and almost none of them were related to the school Syllabus. At least, not consciously. Only five educating centers practiced that activity with a hundred students on behalf of few social entities.</p> <p>Every year, new educating centers and social entities have been added to the proposals of Service-Learning in the city. Nowadays, over 100 projects have been inventoried. Stable Service-Learning projects, led by more than 2000 students from 44 primary and secondary schools that attend the needs of the different groups from some 70 social and educating entities.</p> <p>The activities gather people of different ages and cultures, these being a clear example of promotion of intergenerational and intercultural relations, of social cohesion, of bonding with the neighborhood and of education in values.</p> <p>Three books have been published, which show the main Service-Learning experiences: "Youngsters for the neighborhood", "Service-Learning in L'Hospitalet" and "The Council of Youth". Local and national newspapers and televisions have taken on board such projects in the city. And scientific researches on the impact of such programs in the city have also been promoted.</p> <p>This experience was granted in 2016 with the Premio Ciudades Educadoras a Buenas Practicas de Convivencia en a Ciudad (Educating Cities to Good Practices of Coexistence in a City).</p> <p>Key points:</p> <ul style="list-style-type: none"> - This innovative way of learning renovates the classrooms pedagogically speaking. It has got to reduce school absenteeism and also improve coexistence in schools. Proof of this is that after 52 mediations in schools during the academic year 2009/10, there were just 5 last year. - This tool is getting to increase the value of the image of both educating centers and youngsters, as well as promoting collaborative networks and reinforcing the associative tissue of the city.

	<ul style="list-style-type: none"> - Lots of social entities and entities of education in free time have also experienced an increase of young people who work either professionally or voluntarily in their centers, after having carried out their first Service-Learning experience.
Summary:	<p>In 2007, L'Hospitalet considers the improvement of education as a milestone for the city. Therefore, the City Council decides the objectives should be to rise school success, to avoid early school drop-out and absenteeism, to reduce conflicts in schools, to promote the inclusion of immigrant students in both the school and the city, to open the educating centres to the neighbourhood by supporting wide educative networks, and to get the students nearer to their closest environment for them to feel proud of it and get involved in its transformation.</p> <p>In such way, the City Council decided to include Service-Learning, boosting and extending it to the schools and centres of educational leisure, as a global strategy of a city that counts with the political support from the municipality and the implication of several areas of the local government.</p>

Table 4: RADARS, project of community action for elderly people

Title of the experience: RADARS, project of community action for elderly people	
Topic: Community action	
City: Barcelona	
Description:	<p>The growing ageing of the population shows challenges in many cities. Barcelona, like most of occidental cities, is getting older and older: life expectancy is 82.2 years of age, and, currently, 20.80% of the population (335,586 people, according to data from the City Council in 2015) is 65 or older. Note that a fourth of this population live alone, in many cases because they prefer to stay in their homes due to a feeling of belonging to the neighborhood and its environment. Social changes frequently modify the traditional system of attention and care to elderly people. For that reason, they create the Project Radars, in order to rise the degree of welfare and the feeling of security, and also to reduce the risk of isolation, loneliness and social exclusion of this population.</p>
Objectives:	<p>Promoting an active and healthy ageing of people older than 75 years of age who live either alone or accompanied by people older than 65, boosting solidarity among generations and attention to dependent people.</p> <p>Specific objectives:</p> <ul style="list-style-type: none"> * Extending and improving attention to elders, either dependent or at risk of social exclusion. * Rising awareness among citizens of the importance of the collaborative process, promoting the participation of the beneficiaries and their relatives in the design and enhancement of services, as well as the implication in the Network of volunteers. * Boosting an action and awareness plan that will guarantee the network between civil society and public administration to prevent, detect and act efficient and coordinately in front of situations of risk for elderly people, paying especial attention to the most vulnerable ones. * Enhancing social services of proximity, oriented towards providing support to elderly people in everyday life.

	<p>* Optimising the available public and private resources, according to the gradual implementation of the project.</p> <p>* Revitalising the neighborhood's net to share knowledge and define joint actions.</p>
Methodology:	<p>Project Radars has a standard methodology that gets adapted and implemented in every neighborhood in a different way, paying attention to the characteristics of the same.</p> <p>The five spaces that work on the Net as of co-responsibility are:</p> <p>The Team of Social Services of Primary Care in the neighborhood. It is responsible for inviting local agents to take part in the main organism of the project, the Committee of Entities, evaluating the level of risk or social exclusion of users and defining the type of required action.</p> <p>The Committee of Entities, integrated by neighbors, shops, organizations and services in the neighborhood. It is the meeting point where they decide how to develop the project, designing the strategies and actions to be carried out in an annual planning (detection of the target population, activities and the linking to the territory, etc.). The Committee is also in charge of the spreading of the project in the neighborhood.</p> <p>The Door to Door: volunteers formed and coordinated by entities of the third sector as Red Cross. They identify and interview elderly people that may need help and invite them to become users of the service. They also propose neighbors that are sensitive to the necessities of the environment to participate with "neighborhood radars".</p> <p>The Platform for telephone monitoring, integrated by volunteers from the neighborhood or collaborating entities such as the Red Cross or Avismon. It keeps regular contact with elderly people so as to keep a control of their situation, to invite the participate in the activities proposed in the neighborhood and, in the case that they are unable to leave their homes, to activate some volunteer who could give them company.</p> <p>The Neighborhood and Commercial Radars, integrated by people, associations and businesses in the neighborhood that are willing to collaborate. They do a daily follow up sensitively and respectfully. If they detect a change in the daily routine of any of the elders in the risk of isolation, and they are not able to reach that person, they will contact the Net to define the actions to be developed.</p> <p>In addition, Project Radars has both designed and implemented the "Resources and Services Portal for elderly people", a catalogue of the services for the elders that are in the city.</p>
Results:	<p>The evaluation of Project Radars is carried out in a continuous and participative way. The Committee of Entities is the main organ of the Net, in charge of evaluating actions and results every three months.</p> <p>At present, 247 entities and services, 1023 neighborhood radars, 587 commercial radars and 456 chemists' take part in the project. All these assist 764 elders who are users of the project. Social services have intervened on 184 people at risk.</p> <p>The City Council added SROI methodology (Social return on the inversion) for the evaluation of the pilot phase of Radars in the district of Gracia (2008-2011), which lets us calculate monetarily the value of the results, either they have economic value or not. Such analysis allows us to explain society the social value that gets generated for every invested euro, where monetization plays an important value, although not exclusive. In total, and for the considered period, Radars generated a positive Social Return on the inversion (SROI): for every euro that the Public Administration invested in this project, Radars returned 3.80 euros to society.</p> <p>Key points:</p>

	<p>The project is a reference of good practice to optimize human resources, both material and economic, motivating work on the net as the best organizing response: it works from prevention, boosts social cohesion and intergenerational relations, and improves the relation between Administration and Social Services with citizenship.</p> <p>The first three years of application of Radars showed that the project reduces the feeling of solitude in elderly people, and rises their feeling of security due to being accompanied by the different services (platform for telephone monitoring, radars or committees of entities). Besides, volunteers have been reinforced for their social contribution, implementing their sensitivity towards social exclusion.</p> <p>Weak points: The job, both detailed and slow, needs the participation of different agents to draft a social network. Elderly people show distrust with regard to some actions in their private lives.</p> <p>Proposals for the future: The future prospect is to continue implementing experience in the neighborhoods that still have not included it. Currently, it has also been spread to other cities in the surroundings, which receive technical and methodological support from the City Council.</p>
Summary:	<p>Radars is born in a district in Barcelona in the year 2008 thanks to the participation of both neighbors, shops, pharmacies, associations, libraries, etc. that, together with the City Council, form a Net for community prevention and action that helps elders living by themselves in the neighborhood.</p> <p>“Radars” are these voluntary people, shops and entities that are aware of the dynamic of the elderly people that they know. If they detect some change in their daily routines, their behavior or looks, they would contact the Net, this being integrated by professionals from social services.</p> <p>The elders who accept to be users of the Project benefit daily from the respectful treatment from their nearest surroundings, and the supervision that they receive from the Platform for Telephone Monitoring, where also volunteers work. Professionals from Social Services in the neighborhood are the ones that decide to intervene, in case of being necessary, and co-responsibly with entities and other services.</p> <p>Taking into account the good results, in 2012, the City Council decided to implement the Project in the whole city, spreading it to all districts.</p>

Table 5: Experience classrooms

Title of the experience: Experience classrooms	
Topic: Education	
City: Mislata	
Description:	<p>For the past few years, there has been an important increase of aged population in Mislata, which means 20.3% of people older than 60. Besides, the profile of these people is changing; most of them are active and self-sufficient, whose experienced lives enrich society. Due to this, it is necessary to insist on social policies that promote both humane and caring contribution to elderly people in the community, in order to demystify stereotypes, increase their self-esteem and sensitize and develop proposals for integration in the community.</p>

Objectives:	<p>General objective: improving the quality of life of elderly people by means of non-formal education, promoting community integration, participation and the associative tissue.</p> <p>Specific objectives:</p> <ul style="list-style-type: none"> - Facilitating active ageing of the elders, by stimulating both initiatives and participation in the process of development of their own community. - Promoting healthy lifestyles by means of formative proposals. - Presenting proposals that facilitate adaptation to retirement. - Fostering self-autonomy and self-esteem of elders. - Coordinating all existing resources, both from public administrations and social initiatives, in order to support caring proposals. - Creating an atmosphere of interchange of experiences, helping both group and associative work. - Facilitating access to new technologies. - Arousing concerns in elderly people.
Methodology:	<p>For the year 2013-2014, the formative offer aimed for the elders is wide and varied: more than 100 workshops to do with health, craft, generational interchange, expression, reading encouragement, information technology, communication, traditional games, etc. and also to be able to attend or participate in other sociocultural activities like: exhibitions, contests, seminars, talks, etc. In total, there have been more than 2000 registrations to workshops.</p> <p>Voluntary monitors belong to different associations in the city, and they are all coordinated and assessed by two technicians from the City Council, with both pedagogical and gerontological formation, and two professionals employed by the Council, with artistic formation and health education who also teach in workshops.</p> <p>The main requirements to become a monitor are, on the one hand, to either show experience in the subject or hold an academic title. However, what is more important is to have the capacity to get adapted to the essential target of the program: community integration.</p> <p>From the Oficina del Mayor (Office of the elder) they coordinate together the volunteers, the local technicians and the professionals employed by the Council, in order to develop the proposals of formation and specify the tasks to be done by technicians and volunteers:</p> <ul style="list-style-type: none"> - Coordination of functions and tasks of technicians: <ol style="list-style-type: none"> 1. Development of programs, projects and activities (definition of objectives and activities). 2. Promotion of volunteering: recruitment and motivation; formation of volunteers; monitoring of their labor through tutorial meetings; monitoring of collaboration agreements established with elderly associations in order to boost the volunteers compromise and also cover the expenses of the activities. 3. Program management. 4. Information and enrollment. 5. Monitoring and evaluation (assistance, degree of satisfaction...). 6. Elderly Homes management. - Coordination of functions and tasks of volunteers: <ol style="list-style-type: none"> 1. Fulfillment of arranged agreements. 2. Coordination of information with Oficina del Mayor (Office of the elder) (planning, schedules, groups and levels, etc.).

	<p>3. Development of workshops.</p> <p>4. Participation in meetings.</p>
Results:	<p>The program enjoys great acceptance according to the data obtained from a satisfaction questionnaire filled in by both pupils and monitors, which is justified by the rise of enrollments year after year.</p> <p>With time, the team of volunteers developed by elderly people has been consolidated, and, currently, it plays an essential role in local social policies for the elder. Such team is based upon the governing principles of citizenship and participation, cooperation, transversality, social innovation and compromise of the different agents. Together, professionals and volunteers, they make it possible to enrich experiences in non-formal education, and widen the offer of activities for the elder.</p> <p>Key points:</p> <ul style="list-style-type: none"> - Mutual understanding among participants, and between participants and monitors. - High level of satisfaction shown by participants referring to monitors and the employed methodologies. - Motivation among volunteers to carry on conducting activities of the Program. <p>Weak points: Management of material, depending exclusively on the associations, and the premises, local centers of coexistence where the activities are carried out.</p> <p>Proposals for future: Increasing the contents and carrying out transversal activities.</p>
Summary:	<p>Experience classrooms (“Aulas de la Experiencia”) is a proposal coordinated by the Department of Elderly People (Concejalía de Personas Mayores) that consists in offering formative workshops aimed for the elder population, conducted mainly by elder volunteers, who work altruistically giving their knowledge out, at the same time that they learn what their partners teach them. 90% of voluntary monitors that conduct workshops are people older than 65. The program Experience Classrooms is started in 1995. In 2002, the Department activates the Office of the elder, a reference for the elders, for offering a service of information, assessment and coordination of both the Program and other sociocultural activities. Currently, more than 200 people carry out tasks of accompaniment, teaching, coordination, information and support to the Program.</p>

Conclusions

After retirement, people enjoy longer free time. Therefore, they can occupy that time with socially productive tasks, and continue with their personal formation, for the pleasure of getting integrated by means of acquiring a pluridimensional education that breaks down barriers, both spatial and temporary, embracing person and knowledge. Education without time and space limits becomes a dimension of life itself.

An active ageing brings the development of a number of conditions to age safely, by means of social, legal, sanitary and educational support. Currently, we may find a number of educating activities intended for elderly people, like, for example, university programs, cultural programs in day centers, or cultural associationism. Educating cities are an unbeatable support in this process of formation. Besides, the richness and variety of activities, like the ones gathered within this research, are a support and a reference for the present reality of a growing part of the population: our elders. The compromise of the cities belonging to the movement, acquired through the chart of EC implies a process of formation of all citizens, guarantee for rights for the most vulnerable collectives.

Indicators Of Integrating Technology In Music Education: A General Framework

Dr. Eduard MASDEU

University of Vic – Central University of Catalonia (UVic – UCC)

Av. Universit ria, 4-6 08242 Manresa (Barcelona)

Spain

emasdeu@umanresa.cat

Abstract

Schools are experiencing a new way of understanding and using technology in teaching and learning. Teachers now have at their disposal a pedagogic resource that can be used as much for learning about technology as learning with technology. Educational technology, while generating a great deal of interest among music teachers for the huge potential that technologies offer as teaching tools, they remain an under-utilised resource in many music classrooms. In this article, a brief description of a general framework proposal for integrating technology in music education will be provided. A survey was produced to identify the elements which influence the implementation of technologies in music education. 16 interviews were conducted with experts in technologies applied to music education. These elements serve as a base for formulating a proposal for a framework for the integration of technology in music education. The results of this study highlight 4 factors and 13 elements which facilitate the use of technology in primary school music education, with the aim that music teachers use technologies in teaching in a conscious way.

Keywords: *Music education, elementary schools, educational technology, curricular integration, music classroom.*

Introduction

Schools have been incorporating many different technological innovations in the classroom, albeit in a fairly informal way, since the beginning of the last century (Novelino, 2008), although it was not until the 1980s, with the arrival of the personal computer and computer-assisted teaching, that most local, regional and/or national education authorities around the world began to include technology integration initiatives in their education policies (OECD, 2009). Spain exemplifies this with the initiation in 1985 of the process of introducing computing into non-university education. Through the Ministry of Education and Science's Atenea plan, the autonomous communities with their devolved educational competencies began to implement their specific programmes. In the case of Catalonia, the Department of Education initiated the Education Information Technology Plan (Programa d'Inform tica Educativa) in 1986 to promote and co-ordinate the integration of technologies in non-university teaching ( rea, 2006; PIC, 2007). However, it is only since the implementation of the Education Act known as LOE (an acronym which stands for Ley Org nica de Educaci n) which came into force in Catalonia with the Decree 142/2007 of 26th June -containing explicit references to the development and implementation of technology in all stages mandatory education- that the majority of schools have really started to integrate it into the teaching and learning processes and different governments have instigated classroom digitalisation programmes with the goal of aiding digital literacy among pupils and improving the quality and efficiency of learning in schools. Examples of the latter include the Escuela 2.0 programme, the EduCat 2.0 project and the Cultura Digital en la Escuela plan.

As for the field of music education, the explosion in the use of technology in the classroom has opened up a whole new horizon of opportunities. Music teachers now have at their disposal technological equipment with the aim of promoting digital literacy of students and improving the quality and effectiveness of school learning (Reid, 2002; Goble, 2008). However, *"it would be a mistake to assume that simply introducing technology into the classroom will lead to innovation and changes in methodology"* (Generalitat de Catalunya, 2010, p.5). The use of technologies in the classroom is a complex process. If they are to produce a step change in the quality and effectiveness of learning at school, one needs to understand the integration process and the factors that can complicate implementation of technologies in the music classroom (Pablos, Col s & Gonz lez, 2010; Lugo & Kelly, 2008). Otherwise, theoretical approaches will remain but good intentions (Canales & Marqu s, 2007). It is against this background that the framework we provide could be useful to music teachers who wish to implement technology in their teaching and who are unaware of the factors which should be taken into account.

The Challenge Of Effectively Integrating Technologies In The Music Classroom

FITME -an acronym which stands for a general Framework proposal for Integrating Technology in Music Education- is one of the results of the research study *"The Digitalisation Of Music Classrooms In Schools In Catalonia: Study Of And Proposal For A General Framework For Integrating Technology In Music Education"*

(Masdeu, 2015). One of its objectives is to identify the elements and factors which influence the implementation of technologies in music education.

Process for drawing up the FITME framework.

Regarding the process of planning and creation of the proposed FITME framework, three stages are established:

- Ideation and design. An initial proposal of FITME is created based on the information obtained from: (a) a literature review of previous research on the digitalisation of music classrooms, (b) interviews conducted with 10 experts in music education and (c) one's own professional experience in the field of music education and educational technology.
- Validation of the initial proposal. This phase involves carrying out 6 interviews with experts in the use of technologies in the field of music education in order to share information and contrast opinions on the initial proposal of FITME.
- Review and refinement of the proposal. This phase consists of reviewing and refining the proposal based on the conclusions obtained from the two previous phases.

Presenting the framework.

The final design is the result of taking into account the education laws governing the primary education system in Catalonia, the strategies employed by education authorities for the integration of technologies in schools (Generalitat de Catalunya, 2013, Benavides & Pedró, 2007, Pelgrum & Law, 2004), the technological models for the implementation of technologies in schools proposed by Newhouse, Trinidad and Clarkson (2002), Marquès (2000a) and Radencich, McKay and Paratore (1995), previous studies related to: (a) the process of integration and convergence of technologies in schools (Lugo & Kelly, 2011, Generalitat de Catalunya, 2010, Pablos, Colás & González, 2010, ISTE, 2008, Morrissey 2008, Brunner, 2008, Hew & Brush, 2007, Tejedor & García-Valcárcel, 2006, Area, 2005, UNESCO, 2004, BECTA, 2004, Aviram, 2003, UNESCO, 2002), (b) the process of integrating technologies into teaching practices (Koehler & Mishra, 2009, UNESCO, 2008, ISTE, 2008, Jones, 2007, Perrenoud, 2007, Marquès, 2000b) and (c) the process of integrating technologies in music education (Pérez, 2011, Figueras, 2009, PRELUDE, 2007).

The FITME proposal identifies 4 essential factors to consider in the implementation of technologies in primary school music education (Figure 1): Digital-musical competences, Strategic planning, Learning environment and Teaching competence.

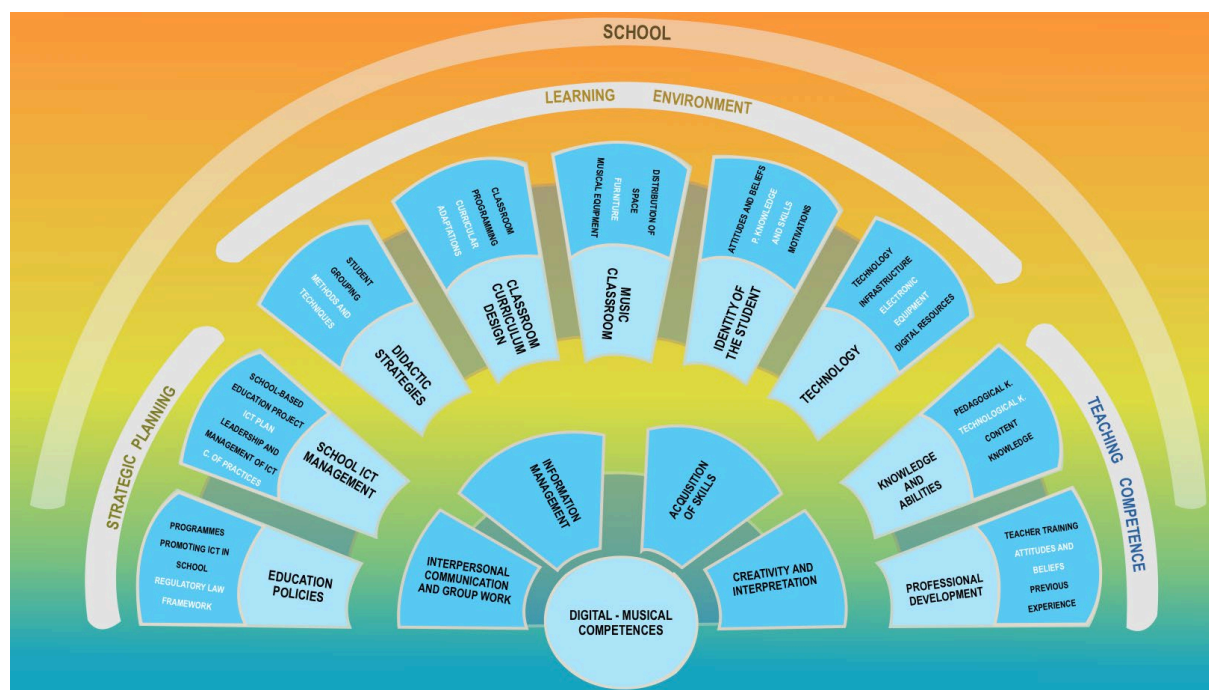

Figure 1: Framework proposal for Integrating Technology in Music Education.

As regards to the position of the factors on the design of the framework, the digital-musical competences factor is at the core of the FITME. This factor has a direct impact on three secondary hubs: (a) Strategic planning, (b) Learning environment and (c) Teaching competence. Furthermore, all the four factors come under the umbrella

of school. We opt to situate the Digital-musical competences factor at the core of the FITME because the purpose of integrating technology in education and learning is to be “*at the service of learning and knowledge*” (Generalitat de Catalunya, 2010, p.5) and to help pupils acquire the knowledge, abilities and attitudes necessary for digital competence.

Digital-musical competences.

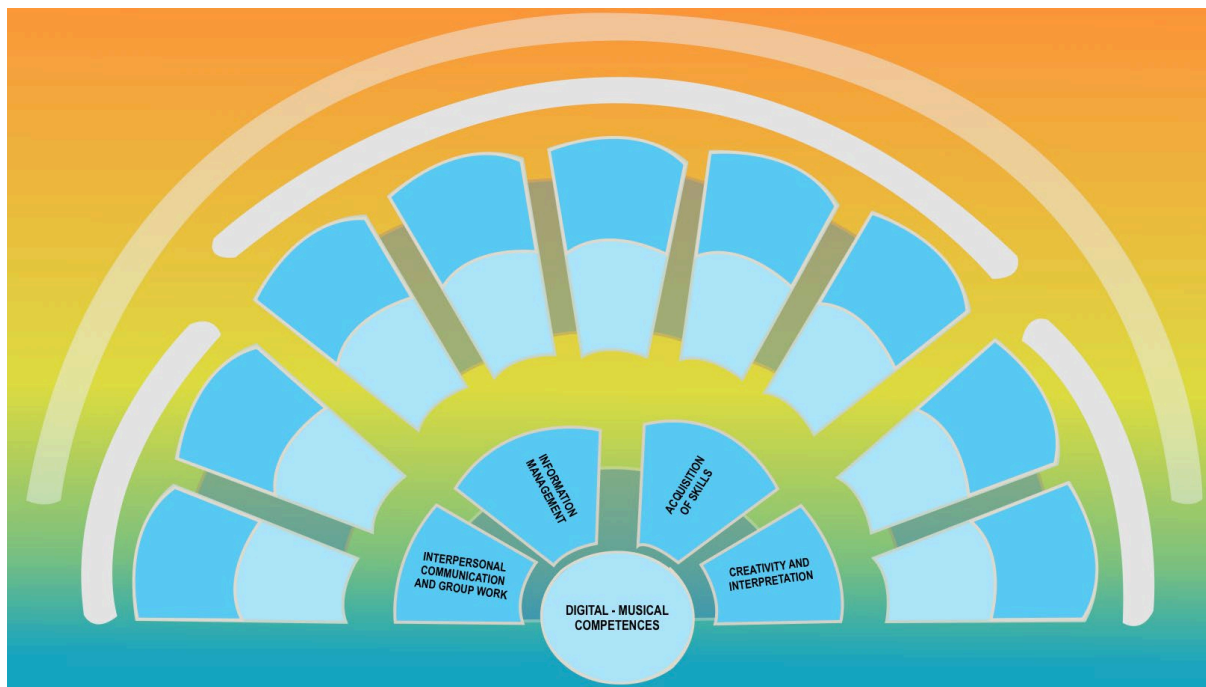

Figure 2: Digital-musical competences factor.

This factor (Figure 2) comprises four elements relating to music, which not only help in the acquisition of musical competence, but also of the knowledge, abilities, and attitudes necessary for digital competence: (a) Interpersonal communication and group work, (b) Information management, (c) Acquisition of skills and (d) Creativity and interpretation. It is important to note that the competencies included are the result of bringing together music education objectives with those associated with using technology.

- Interpersonal communication and group work. This comprises work processes based on the exchange of experiences, feelings and emotions among people or work groups: *comment, share, participate, transmit* and *use*.
- Information management. This includes tasks related to the search, manipulation, and treatment of language: *access, analyse, search, classify, store, link, investigate, summarize* and *use*.
- Acquisition of skills. This includes tasks related to perception, knowledge, and understanding of the elements of musical language: *analyse, evaluate, classify, compare, discriminate, listen, read, memorize, perceive, recognize, remember* and *use*.
- Creativity and interpretation. This includes tasks related to the expression and experimentation of the creative possibilities of the sound fact: *apply, understand, create, execute, experiment, improvise, investigate* and *use*.

Strategic planning

Figure 3: Strategic planning factor.

This factor (Figure 3) includes two elements connected with the regulatory framework and school management: (a) Education policies and (b) School ICT management.

The first element, Education policies, identifies aspects that refer to strategies of education administrations related to the incorporation of technologies in schools: Programmes promoting ICT in schools and Regulatory law framework.

- Programs promoting ICT in schools. Since the arrival of personal computers and computer-assisted teaching in the field of education, most local, regional and/or national education authorities around the world began to include technology integration initiatives in their education policies (OECD, 2009). The most significant education programmes currently promoting ICT in Catalan schools are the Erasmus+ programme, the Avanza II plan, Red.es, the Cultura Digital en la Escuela plan and XTEC.
- Regulatory law framework. According to the competencies provided to the Government of Catalonia for the establishment of the compulsory school education, it corresponds to the Department of Education to regulate the Primary Education considering the minimum teachings established by the Spanish Government. Thus, the Decree 142/2007 of 26th June provides the methodological guidance, the core competencies, the learning objectives, the key contents and the assessment criteria at the Primary Education and to each one of the areas that comprise it.

The second element, School ICT management, comprises those aspects that should be considered in relation to the governance of technologies in the school: School-based Education Project, ICT Plan, Leadership and management of technologies, and Communities of practices.

- The school-based Education Project. According to the Decree 142/2007 of 26th June, each school must prepare a document -called school-based Education Project- to develop and specify the Primary Education curriculum in accordance with the characteristics of their students.
- ICT Plan. Lugo and Kelly (2011) and Generalitat de Catalunya (2010) point out the importance of ensuring that the integration of technologies in schools happens following a process of reflection, discussion and planning involving the entire teaching staff.
- Leadership and management of technologies. We must promote a school climate that encourages teachers to experiment with technologies (Bitner & Bitner, 2002). It is essential that the leadership team -together with an ICT support team- promote strategic actions that advise and motivate the rest of the staff to integrate technologies into teaching and learning processes.
- Communities of practices. They are groups of teachers who meet to share problems and advice on a specific topic as well as to expand their knowledge through continuous interaction among all participants. The

participation of teachers in these spaces will motivate teachers to gain confidence and confidence in the use of technologies.

Learning environment

Figure 4: Learning environment factor.

This factor (Figure 4) includes five elements relating to how teaching is planned within the classroom: (a) Didactic strategies, (b) Classroom curriculum design, (c) Music classroom, (d) Identity of the student and (e) Technology.

The first element, Didactic strategies, includes aspects linked to systematic and systemic action guidelines that teacher can incorporate into the teaching processes with the purpose of being able to configure learning that involves the use of the technologies: Grouping of the students, and Methods and techniques.

- Student grouping. According to Somekh and Davis (1997), teaching competence in the use of technologies is a necessary but not sufficient condition for integrating technologies into teaching and learning processes. In this regard, Newhouse (1999) suggests considering different types of group class that can be configured in teaching and learning processes and that favour the use of technologies.
- Methods and techniques. According to Newhouse, Trinidad and Clarkson (2002), we can distinguish three basic models for using technology in education: (a) Individual, (b) Flexible groupings and (c) Whole class group.

The second element, Classroom curriculum design, includes aspects that affect the curricular concretion process carried out by the teacher from the information included in the School-based Education Project: classroom programming and curricular adaptations.

- Classroom programming. According to Ander-Egg (1993), it is the instrument that allows the teacher to organize and articulate their educational practice according to the purposes expressed in the school-based Education Project. Among the various elements that should be included in the program, we highlight the learning objectives, the key contents, the methodology, the timing, the different learning activities, the materials and resources, and the assessment criteria.
- Curricular adaptations. It consists of adapting the curriculum to the specific educational needs of the student so that he can achieve the established objectives. The adaptations may be non-significant, if the established modifications do not require adapting the capacities set in the objectives of the curricular subject; or significant, if the modifications established in the adaptation require adjusting the evaluation criteria and the degree of achievement of the area's capabilities.

The third element, Music classroom, brings together aspects that have a direct link with the organization and configuration of the specific classroom of music education: Distribution of space, Furniture and Musical equipment.

- Distribution of space and furniture. Radcliffe, Wilson, Powell and Tibbetts (2008) conclude that the design and equipment of the classroom condition the teaching and learning patterns that can be promoted within it. Thus, in order to teachers to develop different teaching styles, it is important that the classroom has a flexible distribution of space and furniture that makes possible different configurations of the space.
- Musical equipment. Apart from the physical specifications of the space and the existing furniture within the classroom, we must also pay attention to the musical equipment available in the classroom and specify the instruments that can be used in teaching and learning processes.

The fourth element, Identity of the student, includes aspects that allow identifying the distinctive features that particularize the students: Attitudes and beliefs, Previous knowledge and skills, and Motivations.

- The knowledge of aspects that singularize the students in relation to the use of technologies -such as, attitude, beliefs, previous knowledge and skills or motivation- allow the teacher to plan and adapt the use of technology according to the characteristics of the student.

Finally, the fifth element, Technology, identifies aspects related to the technological equipment available in the classroom: Technological infrastructure, Electronic equipment and Digital resources.

- It is important to keep in mind what technological infrastructure has the classroom (e.g., connectivity to the network) and what electronic equipment -both general and specific for the practice of music- and digital resources can be used by the teacher in the designed learning activities (e.g., tablet, MIDI keyboard, computer, music software).

Teaching competence

Figure 5: Teaching competence factor.

This factor (Figure 5) includes two elements directly related to the professional profile of the specialist music teacher: (a) Knowledge and abilities and (b) Professional development.

The first element, Knowledge and abilities, includes those aspects that refer to competences and skills that the teacher must have to make effective use of technologies in teaching music education: Pedagogical knowledge, Technological knowledge and Content knowledge.

- The irruption of technologies in schools has prompted the music teacher to update their knowledge and skills in the use of technologies to take advantage of the wide pedagogical possibilities offered by

technologies as learning tools. Following this line, Mishra and Koehler (2006) suggest a conceptual knowledge framework -known as TPACK (Pedagogical Content Knowledge Technology)- that identifies the types of knowledge and synergies that exist between them and that teachers must possess to be able to make effective use of technologies in teaching processes.

The second element, Professional development, includes the sections that determine the way in which the music teacher integrates the use of technologies in their professional activity: Teacher training, Attitudes and beliefs, and Previous experience.

- Although it has been identified that one of the most common reasons for which teachers decide not to use technologies in educational processes is the lack of knowledge and specific skills in the use of technologies (Hew & Brush, 2007); attitudes, beliefs and previous experiences also play a decisive role in the process of integrating technologies in the classroom. Thus, for example, Ramírez, Cañedo and Clemente (2012) emphasize that a positive attitude of the teacher towards technological resources will make the latter more willing to integrate them into their teaching work.
- Teacher training is an instrument that fosters confidence in the pedagogical use of technologies (Paraskeva, Bouta and Papagianni, 2008).

Conclusions

Pedagogic innovation through the use of technology is a complex process in which a series of factors are at play which directly impacts the implementation and use of technology in schools. So it *“would be a mistake to assume that simply introducing technology into the classroom will lead to innovation and changes in methodology”* (Generalitat de Catalunya, 2010, p.5). Successful integration, therefore, may be dependent on knowledge of the factors that can help implementation of technologies in the classroom. On the basis of these arguments, and to avoid technology becoming a mere supplementary resource for occasional use, the FITME proposal identifies 4 factors and 13 elements which facilitate the implementation and use of technology in music education:

- Digital-musical competences. This comprises four elements relating to music, which not only help in the acquisition of musical competence, but also of the knowledge, abilities and attitudes necessary for digital competence: (a) interpersonal communication and group work, (b) information management, (c) acquisition of skills and (d) creativity and interpretation.
- Strategic planning. This includes two elements connected with the regulatory framework and school management: (a) education policies and (b) school ICT management.
- Learning environment. This includes five elements relating to how teaching is planned within the classroom: (a) didactic strategies, (b) classroom curriculum design, (c) the music classroom, (d) identity of the student and (e) technology.
- Teaching competence. This includes two elements directly related to the professional profile of the specialist music teacher: (a) knowledge and abilities and (b) professional development.

From the factors and elements identified several conclusions can be drawn, of which we would highlight the following:

- Technology is not an end in itself but a means to aiding and promoting digital literacy among pupils and improving the overall quality and effectiveness of learning. When implementing it in music education, technology should be taken into account alongside the other elements in the planning of teaching activities in music classrooms in primary education.
- A shared vision among teaching staff of the use of technology in the classroom facilitates the integration of ICT in the school. According to the International Society for Technology in Education (ISTE, 2008), one factor which facilitates the integration of technology in classrooms is that this happens following a process of reflection, discussion and planning involving the entire teaching staff.
- When integrating technology in learning, teachers' proficiency in its use is not sufficient. It is clear that even if adequate training is provided, this does not guarantee that technology implementations lead to improvements in the quality and effectiveness of teaching. To achieve this, and avoid technology becoming a mere supplementary resource for occasional use, its incorporation into education processes must involve a series of methodological and organisational changes to the classroom.
- Classroom design and equipment dictate teaching practices. According to Radcliffe, Wilson, Powell and Tibbets (2008), layout, furniture, infrastructure and technology equipment all effect how children learn and are taught, and so these elements must be considered when planning teaching involving the use of technology.

İnfoğrafik ve Görsel Okuryazarlık İlişkisi

Banu İnanç UYAN DUR
FMV Işık Üniversitesi, Güzel Sanatlar Fakültesi
Görsel İletişim Tasarımı Bölümü
inanc.uyan@isikun.edu.tr

Özet

İletişim teknolojilerindeki gelişmeler hayatın görünen tarafını etkilemekle kalmayıp düşünce, algı ve yorumlama biçimlerini de dönüştürmüştür. Görseller üzerinden sağlanan iletişim biçimi günümüzün gerçeği olarak kabul edilmektedir. Diğer yandan teknolojinin ilerlemesiyle yaşanan dijital evrimin getirisi giderek artan veri ve bilgi akışı olmuştur. Bu nedenle, yoğun, düzensiz ve karmaşık verilerin işlenerek anlamlı ve kullanışlı bilgi setlerine dönüştürülmesi daha fazla önem kazanan bir alan haline gelmiştir. Bilginin geniş kitleler için daha anlaşılır hale getirilmesi bilginin sistemli bir biçimde görselleştirilerek sunulmasını gerektirmektedir. Bununla bağlantılı olarak artık infografikler her mecrada daha sık kullanılan bir unsur olmuştur. İnfografikler, görsel iletişimin merkezde olduğu, teknolojik gelişmelerin sonucu olarak artan bilgi ve verileri, işlevsellik ve estetik odaklı bir anlayışla görsel hikayeler şeklinde sunarak bu çağda önemli bir gereksinimi karşılamaktadır. İnfografiklerin bilgiyi aktarmak için etkili iletişim kurabilmesi sadece infografiğin iyi tasarlanmış olmasına bağlı değildir. İnfografiğin anlaşılmasında kullanıcının görsel okuryazarlık düzeyi en az tasarımın niteliği kadar önemli bir etkidir. Bu makalede, görsel okuryazarlığın infografikleri okuma, algılama ve yorumlama süreciyle olan ilişkisi kullanıcılar açısından ele alınarak araştırılmıştır.

Anahtar Kelimeler: *İnfoğrafik, Görsel Okuryazarlık, Veri Görselleştirme*

Giriş

Görselliğin ve görsel iletişimin baskın gücünün yanında çağın bir diğer getirisi de giderek artan veri ve bilgi akışı olmuştur. Bilgi çağında yoğun, karmaşık, düzensiz bilgi ve verilerin belirli bir sistematiğe düzenlenerek sunumunda görsel tasarımın önemi giderek artmaktadır. Bu nedenle son yıllarda çeşitli iletişim ortamlarında bilgiyi görselleştirerek sunan infografiklerin kullanımında artış görülmektedir. İnfografiklerin ele aldığı konular sistemli sunulması gereken çok katmanlı, yoğun ve karmaşık bilgi içerikleridir. İnfografikler, ele aldığı bilgileri hikayeleştirerek sunan, içeriğine göre kimi zaman eğitici, kimi zaman ikna edici ve yönlendirici olma gibi nitelikler taşıyan güçlü araçlardır. Durağan, hareketli, etkileşimli olarak basılıdan dijital her türlü ortamda infografik uygulamaları kullanılabilir. İnfografik tasarımında içeriğe göre veri görselleştirme, harita, illüstrasyon, fotoğraf, tipografi, renk gibi çeşitli unsurlar kullanılmaktadır. Estetik niteliği yüksek ve işlevsel bir infografik, tüm bu unsurların birbirleriyle olan ilişkisinden, bütünlük, denge, hiyerarşik düzen gibi tasarım ilkelerine kadar sonucu etkileyen değişkenler içerir. Bu açıdan bakıldığında, infografiklerin amacını yerine getirme başarısı sadece tasarım ekibinin performansına bağlı görülür. Öte yandan infografiklerin amacını gerçekleştirebilmesi kullanıcıların görsel okuryazarlık düzeyi ile de bağlantılıdır. Bu makale, infografikler, okuma pratiği gerektiren yapılar olarak ele alınarak görsel okuryazarlık ile ilişkisini araştırılmaktadır.

Okuryazarlık Kavramı

Okuryazarlık kavramı sıklıkla okuma ve yazma becerileriyle aynı anlamda kullanılmaktadır. Basılı medyanın hakim olduğu dönemlerden kalan bu geleneksel algıda, okuryazarlık okuma ve yazma yeteneği olarak anlaşılmakta, fizyolojik ve bilişsel beceri edinme süreci olarak görülmektedir. Fakat okuryazarlık, yazı sembolleri ile gerçekleştirilen bir eylem olan okuma ve yazma becerisinden daha geniş bir kavramsal içeriğe sahiptir. “Okuryazarlığı okuma-yazmadan ayıran temel özelliklerin başında durumsallık özelliği gelmektedir. Çünkü okuma-yazma, okuyucu tarafından yazılı materyal ile okuma durumunun kapsamı arasında iletişim kurmayı gerektiren bir süreçken, okuryazarlık bağlamlar arasında değişiklik yapabilmeyi ve becerilerin farklı bağlamlara aktarılması ya da aktarılmamasını ifade etmektedir” (Gül, 2007, s.19). Okuryazarlık sadece okuma-yazma becerisini değil aynı zamanda kavramsal düzeyde bilgiyi işleme, yorumlama ve anlamlandırmayı gerektiren zihinsel süreçleri içerir.

Teknolojik, sosyal ve kültürel gelişmeler süreç içinde okuryazarlık kavramının içeriğinin genişlemesine ve yeni okuryazarlık türlerinin çıkmasına neden olmuştur. Bilgi okuryazarlığı, medya okuryazarlığı, kültürel okuryazarlık, duygusal okuryazarlık, eleştirel okuryazarlık, ağ okuryazarlığı, evrensel okuryazarlık, finansal okuryazarlık gibi daha çoğaltılabilecek pek çok okuryazarlık türü bulunmaktadır. Okuryazarlık kavramını her disiplinin kendi teorik bakış açısıyla ele alması terim çeşitlemelerinin artmasına ve tanımlarda bazı farklılıklara yol açmıştır. Her koşulda, okuryazarlık, ilgili disiplinde belli bir yetkinlik göstergesi olarak ele alınır. Bilgiyi anlamlandırabilme, işlevsel olarak kullanabilme, farklı bilgilerle ilişkilendirerek yeni anlamlar üretebilme tüm okuryazarlık terimlerinin tanımlarındaki ortak niteliklerdir.

Görsel Okuryazarlık

Mirzoeff (1998, s.4), insan deneyiminin artık her zamankinden daha görsel olduğunu ve görselleştirildiğini belirtmektedir. Yapılan pek çok araştırma da toplumsal süreçleri, iletişim, algılama ve anlamlandırma biçimlerini yeniden şekillendiren görsel bir çağda yaşadığımızı göstermektedir (Barnard, 2002; Lester, 2000; Parsa, 2004; Sartori, 2004). İnsana ve hayata dair her şeyi temelden değiştiren internet, vazgeçilmez bir araç olarak akıllı telefonlar, sosyal medya, mobil uygulamalar, video oyunları, sanal gerçeklik, artırılmış gerçeklik gibi uygulamaların hepsi görsel odaklıdır. İletişim teknolojilerindeki gelişmeyle sayfadan ekrana, kelimedenden resme geçiş, okuryazarlık kavramında da değişimlere neden olmuştur. Çağımızda insanoğlunun daha önce hiç olmadığı kadar çok görsel imgeyle karşılaşması görsel okuryazarlığa duyulan gereksinimi artırmıştır.

Görsel okuryazarlık, görselleri tanımlayabilme, taşıdıkları mesajları çözebilme, görsel dili kullanabilme ve yeni anlamlar oluşturabilme olarak tanımlanabilir. Felten'e (2008) göre, görsel okuryazarlık kültürel temelli imajları, nesneleri ve görsel kaynakları yorumlama, tasarlama, üretme ve kullanma becerisini içerir. Yenawine (2015), görsel okuryazarlığı bir çeşit imgelerdeki anlamı bulma yeteneği olarak tanımlarken Sinatra (1986) görsel okuryazarlığı, anlam oluşturmak için görsel mesajları geçmiş görsel deneyimlerle etkin şekilde yeniden yapılandırma olarak görmektedir.

Görsel okuryazarlık aynı dil gibi öğrenilebilen ve geliştirilebilen bir yetenektir. İnsanın gelişim sürecinde görme konuşmadan ve kelimelerden önce gelir. Görsel okuryazarlıkta, görseller, geçmiş birikimler, ait olunan kültür, eğitim seviyesi, sosyal ve ekonomik durum gibi çevresel koşullara bağlı olarak yorumlanır. "Görsel okuryazarlık, küresel olarak anlaşılan evrensel semboller veya görsel imgeler olsa da dil okuryazarlığı gibi kültürel olarak kendine özgüdür" (Stokes, 2002, s.12).

Irvin Rock (1995), görme olayında beynin, dünyanın tıpatıp aynısının basit bir kaydını yapmayıp, onun kendine has bir resmini yarattığını belirtir. Görme merkezine iletilen sinyaller beyin tarafından 'görülen şeyin' ne olduğuna dair bir anlamlandırma sürecinden geçmektedir. Bu nedenle insan dünyayı algımlarken pasif bir izleyici konumunda değildir. Bilişsel veriler, bellek ve deneyimler birleştirilerek, ne görüldüğüne ilişkin bir anlam yaratılmakta ve dünya adeta zihninde tekrar yapılandırılmaktadır. Bu anlamlandırma sürecinde önceki deneyim ve bilgilerin baskın bir rolü vardır. John Berger (1990, s.8) de "şeyleri görme şeklimiz, bizim ne bildiğimize ve neye inandığımıza bağlıdır" diyerek bu fikri desteklemektedir.

Görsel Okuryazarlık ve İnfografik İlişkisi

Görsel okuryazarlıkla ilgili eski tanımlar imgeyi analiz etme, değerlendirme ve iletişim kurma becerisine odaklanmıştır. Fakat görsel okuryazarlıkla ilgili çağdaş tanımların çoğu görsel imgeleri anlamlandırma ve yorumlama ile tasarım ve yaratım bileşenlerinin tamamını içermektedir. Görsel okuryazarlığı, Avgerinou (2009), görsel imgelerin ve mesajların üretilmesi, tasarlanması ve yorumlanması için bir dizi edinilmiş yetkinlik olarak tanımlarken; Seels (1994), görsel iletişim, görsel düşünme ve görsel öğrenme için kazanılan bir yetenek olarak görmektedir. Bu bakımdan görsel okuryazarlık, görsellerin yaratımından kişi tarafından yorumlanmasına kadar olan tüm sürecin içinde olması gereken bir yetkinliktir.

Tasarımcı açısından bakıldığında görsel okuryazarlık yetkinliğinin üst düzey olması gerekir. Yukarıda da belirtildiği gibi görsel okuryazarlık tasarım ve yaratım süreçlerini de kapsamaktadır. Bu nedenle, infografikler, görsel okuryazarlık bağlamında değerlendirilirken, konu, hem tasarımcı hem de okur/kullanıcı açısından ele alınmalıdır. İnfografikler ele aldıkları konunun kapsamına ve içeriğinin özelliklerine göre çoğu zaman bir ekip çalışmasıyla ortaya çıkar. Örneğin, ele alınan konu belli bir alanda özel uzmanlık gerektiriyorsa ekipte içeriği yöneten bir uzman yer alırken, etkileşimli uygulamalarda bir yazılımcı yer alabilir. Her koşulda infografiğin kullanıcıya görünen yüzü tasarımcının sorumluluğundadır. Veri görselleştirmeler, illüstrasyonlar, renk, tipografi, harita gibi infografiği oluşturan unsurlardaki görsel kararlar tasarımcı tarafından verilir. Bu noktada, görsellerin kültür taşıyıcısı konumunda oldukları gerçeğine değinmek gerekir. Kültür, görsellerin üretim sürecine etki eden önemli bir unsurdur. Yapılan pek çok araştırmaya göre (Kress & Leeuwen, 2006; Jun & Lee, 2007; An & Kim, 2007; Clahan, 2007; Wu, 2008) görsel iletişimde bazı kültürel farklar bulunmaktadır. Dünyada farklı alfabelerin ve sözel dillerin var olması gibi farklı görseller diller vardır. Görsel diller, aynı sözel dilde olduğu gibi kültürler arasında farklılık göstermektedir. Gunther Kress ve Theo van Leeuwen, görsellerin de sözel dilde olduğu gibi gramer yapısı olduğunu öne sürer. Kress ve Leeuwen'in (2006), "Reading Images: The Grammar of Visual Design" adlı kitapta ortaya koydukları 'görsel gramer' kavramı görselleri okumak ile ilgili yeni bir yaklaşımdır. Kress ve Leeuwen, görsel imgelerin de metinler gibi okunabileceğini, gramerin ise görseller üzerine çalışırken kullanılan bir yöntem olabileceğini öne sürmektedir. 'Gramer' görsel dilin doğru kullanımına ilişkin bir kurallar dizgesinden çok anlamın yapılandırılması için bir araya getirilen kaynaklar dizgesidir. Kress ve Leeuwen, her sözel dilin gramerinin kendine göre farklılıklar içermesi gibi her kültürün kendine özgü olan görsel dilinin yine kendine özgü bir görsel grameri olduğunu belirtir. Görsel dil ve görsel gramer kültüre has bir

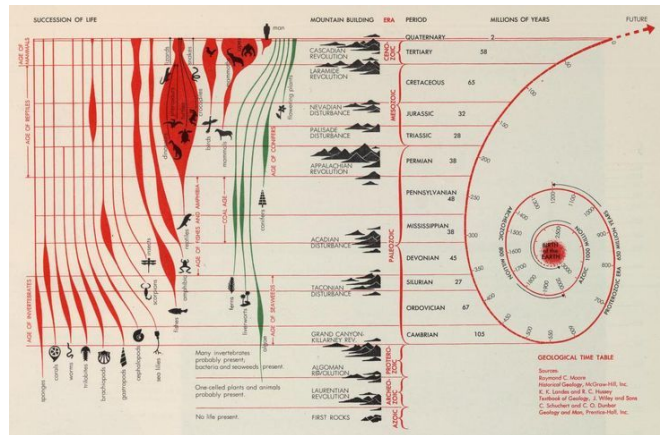

unsur olması infografik tasarım süreci açısından oldukça önemli bir kılavuz noktasıdır. İnfografiğin görsel dilinin kullanıcınla uyumu etkin bir görsel iletişim için önkoşuldur. Yine de tüm bu önkoşullara rağmen infografiğin etkin iletişim kurabilmesinde kullanıcının/okuyucunun görsel okuryazarlık düzeyi çok önemlidir.

Görsel dili okuyabilmek ve imgelerdeki kodları çözebilmek genel bir yetkinlik gerektirir. Fakat infografikleri anlayabilmek için bundan daha fazlası gerekir. Bu noktada, bu makalede, illüstrasyon, harita, veri görselleştirme, tipografi gibi unsurların tümünü veya büyük çoğunluğunu içerecek kadar kapsamlı konuların görselleştirildiği infografiklerin ele alındığını belirtmek gerekir. Örneğin, bilginin görselleştirilmesi adına bir kilometre taşı olarak görülen Herbert Bayer'ın 1953'de tasarladığı 'World Geographic Atlas: A Composite of Man's Environment' adlı 363 sayfalık çalışma, içeriğinde pek çok kapsamlı infografik bulundurmaktadır (Görsel 1).

Görsel 1: World Geographic Atlas: A Composite of Man's Environment, Herbert Bayer, 1953.

Atlasta klasik coğrafik haritalarla beraber pek çok bilgi seti içeren kapsamlı infografikler bulunmaktadır. Bu nedenle, makalede, görsel okuryazarlık bağlamında ele alınmak istenen ölçüde katmanlı bilgi setlerine ve örüntü yapısına sahip infografiklere örnek olarak verilebilir. Ülkelerin ekonomik, jeolojik, demografik ve iklimi hakkında kapsamlı bir bakış sunan atlastaki infografikler görsel okuryazarlık yeteneği gerektirir. Örneğin kitabın 17. sayfasında yer alan coğrafik zaman çizelgesini anlamak için okuryazarlığın tanımında yer alan 'kişinin geçmiş bilgisini kullanabilmesi ve bilgileri ilişkilendirebilmesi' yeteneğine sahip olması gereklidir. (Görsel 2). Her ne kadar kullanılan illüstrasyonların ve şekillerin ne oldukları bir bakışta anlaşılabilir de zaman çizelgesinin özgün tasarımının işlevsel yapısı algılanmadan infografik çözülemez. İnsanlar düz çizgi halinde zaman çizelgesine (timeline) alışkındır fakat Bayer, Görsel 2'deki çalışmada daha fazla bilgi taşıyabilecek gelişmişlikte özgün ve yepyeni bir zaman çizelgesi yaratmıştır. Kullanıcı, alışkın olduğu düz zaman çizelgesinin işleyiş mantığını, ilk defa karşılaştığı bu çizelgeyi anlamak için kılavuz olarak kullanabilme yeteneğine sahip olmalıdır. Bu örnek üzerinden görsel okuryazarlığın tanımına gönderme yapılacak olursa; görsel okuryazarlık sadece bir şeyi bilmek değil sahip olunan bilgiyi kullanarak yeni çıkarımlar yapabilmek anlamına gelmektedir.

Görsel 2: World Geographic Atlas: A Composite of Man's Environment, Herbert Bayer, 1953, s.17.

İnfografikler, doğası bakımından, bir bakışta mesajı aktarması beklenen afiş gibi grafik tasarım çalışmalarından farklıdır. Bilgilerin rahat ve hızlı algılanabilmesi infografiğin başarı kriterleri içinde olsa da bilgilerin

anlaşılabilmesi, örüntülerin çözümlenebilmesi ve bütün olarak işlevselliğini yerine getirebilmesi için infografiklerin belli bir okuma süreci gerektirdiği açıktır. Bu durum ‘görsellerin aynı metinler gibi okunabileceği’ önermesiyle örtüşür. Diğer yandan, infografiklerde de ‘ilk bakışın’ önemli olduğunu belirtmek gerekir. Estetik bakımdan nitelikli çalışmalar ve sistemli bilgi yapılarının tasarımın geneline yansması ilk bakışta ilgiyi uyandırarak kullanıcıyı infografiğin içine çeker.

Daha önce bahsedildiği gibi, okuryazarlık kavramında kişinin var olan bilgilerini kullanabilmesi, yeni karşılaştığı bilgilerle ilişkilendirebilmesi yeteneği, infografiklerde büyük öneme sahiptir. Burada ‘bilgi’ ile kastedilen infografiğin içeriği/konusu değil görsel okuryazarlık gerektiren tüm yapısal kurgusu ve tasarım bütünüdür. Infografiklerde kullanılan illüstrasyon, grafik, tipografi, veri görselleştirme, harita gibi unsurlar kendi başlarına anlamlar taşıyan ve görsel dil okuması gerektiren geniş uygulama alanlarıdır. Infografiklerde bu unsurların beraber kullanılmasıyla ortaya çıkan örüntü, kişinin, bilgileri birleştirebilme ve birbirleriyle ilişkilendirebilme yeteneğiyle çözümlenebilir.

Infografiklerde kullanılan çeşitli çizelge, tablo, diyagram ve haritaların anlaşılabilmesi genellikle daha önce onlarla karşılaşmış olma ve belli bir okuma pratiği edinmiş olmayla ilişkilidir. Kökenleri çok daha eskiye dayansa da günümüzde halen kullanılmakta olan pek çok grafik formlar 18. yüzyılda bulunmuştur. Basılı yayınların çoğalmasıyla insanlarda belli bir harita ve grafik okuma düzeyi oluşmuştur. Yine de infografiklerde algılama güçlükleri çoğunlukla en yoğun bilgiyi taşıyan grafiklerde yaşanır. Yoğun bilgi ve sayısal değerlerin görselleştirilmesine yarayan öğelere genel olarak “grafik” denilmektedir. Genel bir başlık olarak ‘grafikler’, çizelge, tablo, diyagram, kartogram gibi çeşitli görselleştirme şekillerini ifade eder. Grafik çeşitleri bu makalenin kapsamında girmese de Anna Vital’in basitten karmaşığa doğru sınıflandırdığı görsel analogilerden oluşan infografiği genel bir bakış sunabilir (Görsel 3).

Görsel 3: How to Think Visually, Anna Vital.

<http://anna.vc/>

Grafikler bağlamında, bilgiyi görselleştirmenin çok çeşitli yöntemleri bulunmaktadır. Severino Rebecca farklı bilgi görselleştirme türlerini araştırarak derlediği görsel kütüphanede, yöntemlerin çeşitliliği görülebilir (Görsel 4). Rebecca, her bir grafiğin bilgiyi sunma yöntemini (çalışma prensibini) ve hangi veri içeriğini sunmada daha etkin olduğunu açıklamıştır.

Görsel 4: The Data Visualisation Catalogue, Severino Rebecca.
<https://datavizcatalogue.com/>

Görüldüğü gibi bilgiyi görselleştirmek için pek çok grafik araç bulunmaktadır. Bu araçların etkin bir şekilde iletişim sağlayabilmesi ve bilgiyi aktarabilmesi için belli bir görsel okuryazarlık yeterliliğine gereksinim vardır. Ağ diyagramı (network diagram) gibi olguların birbirleri ile bağlantısını gösteren, ağaç diyagram (tree diagram) gibi hiyerarşik sınıflandırmaları gösteren, zaman çizelgesi (timeline) gibi süreç gösteren bilgi görselleştirme çeşitleri sayısal veri içermediği için nispeten daha kolay algılanabilir (Bkz. Görsel 2). Sayısal değer içeren veri görselleştirmeler ise sıkça karşılaşılan grafiklerden değilse anlamak için daha gelişmiş bir görsel okuryazarlık seviyesi gerektirir. Bu noktada, nelerin veri görselleştirme (data visualization) olarak adlandırılabilceği konusuna değinmek gerekmektedir. Sıklıkla yapılan hata sayısal veri içermeyen grafiklere de veri görselleştirme denilmesidir. Veri görselleştirme, sayısal değerlerin tablolar ve grafiklerle görselleştirilmesi ve ham verilerin görsel bilgiye dönüştürülmesi olarak tanımlanabilir. En önemli özelliği, ölçülebilir istatistiksel verilere dayanan net bilgiler içermesidir. Friendly'e göre, “veri görselleştirme, bilgi birimleri/setleri için nitelikler veya değişkenler de dahil olmak üzere, şematik formlarla soyutlanmış olan verilerin görsel temsil bilimidir” (2008, s. 2).

Veri görselleştirmeleri çok fazla sayısal değerleri taşıdığı için infografiklerde kullanılan en güçlü araçlardan biridir. Bu güçlü araçların içerdiği veri katmanları arttıkça daha gelişmiş bir okuryazarlık düzeyi gerekir. Örneğin, bir eksen, karşılaştırılan kategorileri, diğer eksen ise bir değer ölçeğini gösteren klasik çubuk grafikleri (bar chart) sadece iki katmanlı bilgi seti içerdiği için kolay okunur (Bkz. Görsel 2). Ayrıca çubuk grafikler ve pasta grafikler çok sık kullanıldıkları için insanların alışkın oldukları veri görselleştirmelerdir. Radar grafik veya örümcek grafik (radar chart) çoklu nicel değişkenleri karşılaştıran ve değişkenler arasındaki sapmaları gösteren çok katmanlı veriler içerdiği için daha gelişmiş okuryazarlık seviyesi gerektirir (Bkz. Görsel 2). Gelişmiş okuryazarlık seviyesi ifadesiyle, daha önce ele alınan (görsel) bilgiyle karşılaşmış olmak kastedilmemektedir. Çağın gerektirdiği görsel okuryazarlık, yeni bilgileri kişinin var olan donanımlarıyla anlama veya anlamamanın yollarını araştırma motivasyonuna sahip olmasıdır. Bilgiyi araştırma, bulma, işleme ve yorumlama şeklinde daha aktif süreçlerin işlediği bir okuryazarlık yeteneği gerekmektedir. Buna ek olarak yeni okuryazarlık becerileri değişkendir. İnternette, sosyal medyadan, televizyondan durmaksızın yayılan görsel içerikler, değişikliklere daha hızlı adapte olabilen bir görsel okuryazarlık yeteneği gerektirmektedir.

“Araştırmacılar yapılan deneysel çalışmaları ve farklı yaklaşımları kullanarak yeni okuryazarlıklarla ilgili temel teorik ilkeleri ortaya koymuşlardır” (Destebaşı, 2016, s. 903). Bu ilkeler şu şekilde sıralanabilir: “yeni

okuryazarlık becerileri değişkendir çünkü teknoloji veya bağlam değiştikçe bu beceriler de farklılık gösterebilir; yeni okuryazarlıklar çeşitli, çok katmanlı ve çok yönlüdür; yeni okuryazarlıklar içinde, eleştirel okuryazarlık becerileri önemli bir konuma sahiptir” (Destebaşı, 2016, s. 903).

Güncel araştırmalar, görsel okuryazarlığı, dijital dünyaya ve sanal ortamlara uyum sağlayabilme, bu ortamların ürettiği görsel içerikleri anlama ve içerik oluşturabilme yetenekleriyle ilişkilendirmektedir. Bu bağlamda, hareketli ve etkileşimli infografiklerin görsel okuryazarlıkla ilişkisi daha farklı yetkinlikler gerektirir. Dijital dünyanın araçlarını etkin bir şekilde kullanabilme yeteneği etkileşimli infografikleri anlamayı kolaylaştırır. Etkileşimli infografik uygulamaları web tabanlı olabileceği gibi çevrimdışı olarak bir yazılım ürününün arayüzünde veya mobil bir uygulamada yer alabilir. Etkileşimli infografiklerde kullanıcı aktif bir roledir. Kullanıcı etkileşimi, bilgiyi seçme, arama yapma, gösterilecek içeriği aktif olarak şekillendirme gibi kontroller içerir. Böylece kullanıcı, bilginin ne zaman ve ne kadar detaylı görüntüleneceğini kendisi kontrol eder. Kullanıcının, bilginin üzerindeki bu kadar kontrolünün olması etkileşimli infografiklerin durağan (basılı, etkileşimsiz) hallerinden çok daha fazla miktarda bilgiyi taşıyabilmesini sağlar. Bu anlamda, görsel okuryazarlık bakımından, dijital dünyanın olanaklarını iyi kullanabilme, etkileşimli infografiklerdeki anlam yapılarını çözümleme aşamasına önemli ölçüde etki eder.

Görsel okuryazarlık, medya okuryazarlığından ayrı düşünülemez. Medya okuryazarlığı, büyük çeşitlilik gösteren formatlardaki (basılı, görsel, işitsel, hareketli, etkileşimli, çokluortam vs) mesajlara ulaşma, bunları çözümleme, değerlendirme ve iletme yeteneği olarak tanımlanmaktadır (<https://www.medyakuryazarligi.gov.tr/>). Bu bakımdan, görsellerle beraber ‘etkileşim, ses, hareket’ gibi unsurlar da içeren ‘etkileşimli infografikleri’ anlamak için aynı zamanda yeni iletişim formları sağlayan dijital medya teknolojilerini kullanabilme becerisi de gereklidir.

Sonuç

İnfografikler, bulunduğu ortama göre sadece görsel değil aynı zamanda ses, hareket, zaman gibi unsurları da içeren çok katmanlı yoğun bilgileri ve süreçleri işlevsel ve estetik olarak sunan çalışmalardır. İnfografikler, yapısında yer alan ‘tipografi, görüntü, illüstrasyon, harita, veri görselleştirme, ses, hareket, zaman’ gibi unsurların birleşiminden oluşur. Fakat bahsi geçen tüm bu unsurların hiçbirisi tek başına infografik olamaz. Çünkü, infografikler, tüm bu unsurları kullanarak kapsamlı bir hikaye anlatır. Dolayısıyla, infografikleri anlamak ve bilgilerden azami faydayı sağlamak için bahsi geçen unsurların her birinin tekil olarak anlaşılması yeterli değildir. Hikayenin tamamını anlamak tüm bu unsurların birbirleriyle ilişkisinden oluşan yapıyı anlamakla gerçekleşir. Bu bakımdan, infografikler, gelişmiş görsel okuryazarlık yeteneği gerektirir.

İnfografiklerin görsel okuryazarlıkla olan ilişkisi sadece bilginin görsel yoldan sunan bir yapı olmasından ileri gelmez. İnfografikte yer alan tüm unsurların birbirleriyle olan örüntüsünü ve bu örüntünün anlattığı hikayeyi anlama, görsel yapıların çözümlenerek yeniden birleştirildiği analitik bir yaklaşım gerektirir. Messaris de (1994) görsel okuryazarlık becerilerinin bir kişinin genel bilişsel becerilerinin bir türevi olduğunu belirtmektedir.

İnfografikler izleyicide bir değişiklik yaratma amacındadır. Bu temel amaç kimi zaman sadece kullanıcının bilgi düzeyini artırmak, kimi zaman bir fikre ikna etmek, algısını yönlendirmek, kimi zaman da doğrudan harekete geçirmek üzerinedir. İmgelerin doğruluğunu, geçerliliğini ve güvenilirliğini sorgulama becerisi görsel okuryazarlığın önemli bileşenleri arasındadır. İnfografikler, sayısal veriler içermesi ve en etkili iletişim biçimi olan görsel iletişim kanalını kullanması nedeniyle büyük bir ikna etme ve yönlendirme gücüne sahiptir. Bu bakımdan, infografiklerdeki bilgilerin doğruluğunu sorgulayabilmek ve olası manipülasyonları fark edebilmek ancak infografiği analitik bir yaklaşımla okuma, anlama ve değerlendirmeye sağlanabilir. Yeterli bilgi edinilemeden eleştirel yaklaşım gerçekçi sonuçlar veremez. Sonuç olarak infografiklerin etkili iletişim kurabilmesi, bilgiyi aktarabilmesi tek başına (ideal olarak) iyi tasarlanmış olmasına bağlı değildir. İnfografiklerin iletişim başarısı çift taraflı çabayla gerçekleşir. İnfografiğin anlaşılmasında kullanıcının görsel okuryazarlık düzeyi en az tasarımın niteliği kadar önemli bir etkidir.

Abstract

Internet-based technologies have changed the way patients search for information and social support systems, allowing health services to be maintained even at remote access points. Providing communication when the patient is experiencing intense stress and need for information strengthens decision support systems, increases the effectiveness of the treatment and the quality of life of the patient. In cancer patients, who these processes are most intense, the right information about the disease and the realization of healthcare communications (health professionals, family, etc.) become even more important. The National Cancer Institute has stated that clinician communication is crucial and contributes to health care in at least seven ways. These ways: access to care, increased understanding of patient information sharing, development of therapeutic communication (doctor, patients etc.), empowerment of emotional self-management, activation of social support and advocacy resources, increased quality of medical decisions and increased patient self-sufficiency. In the literature, the right information about the diseases of cancer patients, transportation and health professionals - web based systems provided by peer communication: CONNECT™, Comprehensive Model of Information Seeking (CMIS), Interactive Health Communication System (IHCS), Interactive Cancer Communication System (ICCS), Comprehensive Health Enhancement Support System (CHESS). All of these systems have strengthened the coping methods in chronic diseases and cancer patients, improved the quality of life, strengthened the communication between the patient and the health professional and improved the effectiveness of the treatment. Cancer patients are in a difficult decision making process. Because they are often confronted with mortality, with character treatment options with uncertain outcomes and toxicity potential. In general, doctors are the primary source of medical information, and communication between the doctors and the patient is critical to both parties, but making the right decision is critical. With these web based systems it is very important to strengthen the decision support systems between doctors and patient in cancer patients.

Introduction

Internet-based technologies have changed the way patients search for information and social support systems, allowing health services to be maintained even at remote access points. Providing communication when the patient is experiencing intense stress and need for information strengthens decision support systems, increases the effectiveness of the treatment and the quality of life of the patient (Coons et al., 2000). In cancer patients, who these processes are most intense, the right information about the disease and the realization of healthcare communications (health professionals, family, etc.) become even more important. The National Cancer Institute has stated that clinician communication is crucial and contributes to health care in at least seven ways. These ways are strengthening emotional self-management, enabling social support and advocacy resources, increasing the quality of medical decisions, and increasing patient self-efficacy, as well as improving patient information sharing, developing therapeutic communication (clinician, patient, etc.) (Thorne et al., 2005).

In chronic illnesses especially of cancer patients, communication and accurate information access, allows the psychosocial health of patients to indirectly improve their general health and the effectiveness of treatment. The correct information and therapeutic communication have the effect of direct and indirect on health are shown in Figure-1 (Hack et al., 2005).

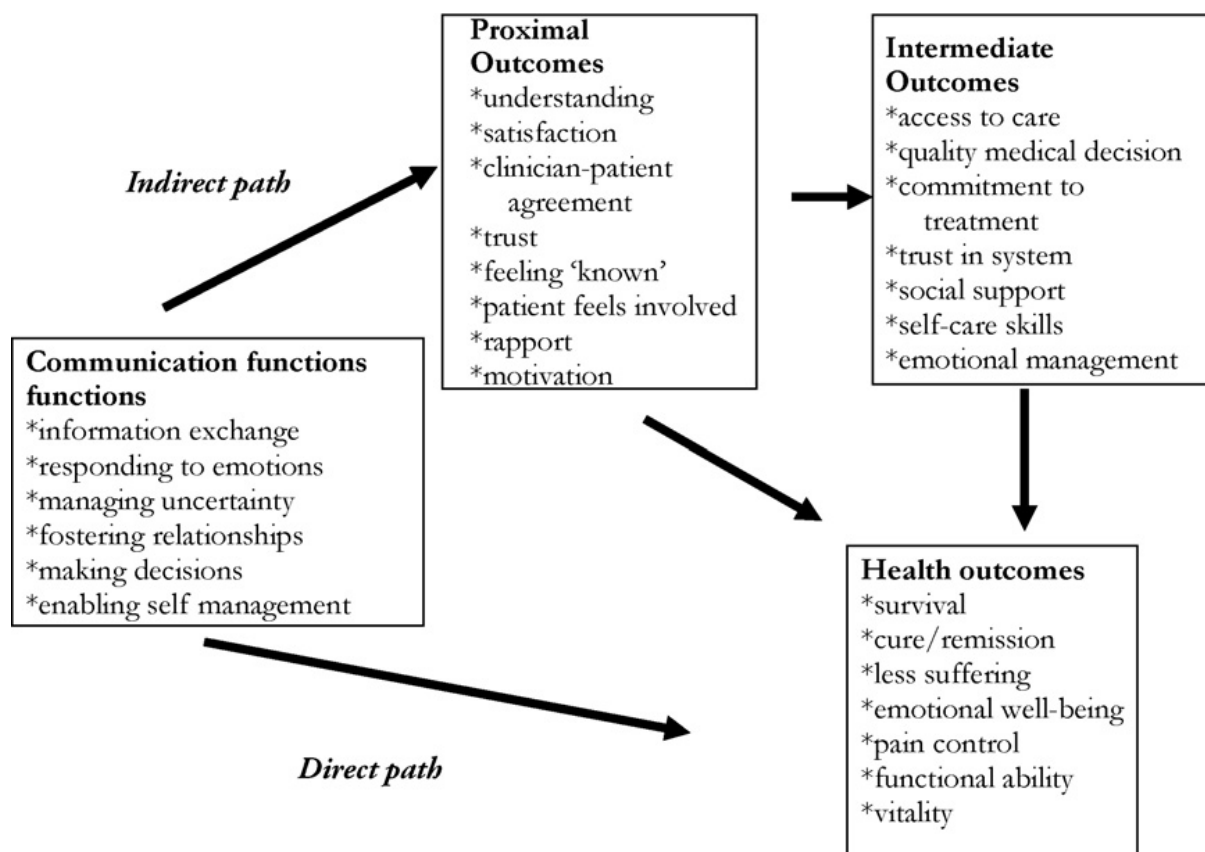

Figure 1. Direct and indirect pathways from communication to health outcomes.

Street Jr, R. L., Makoul, G., Arora, N. K., & Epstein, R. M. (2009). How does communication heal? Pathways linking clinician–patient communication to health outcomes. *Patient education and counseling*, 74(3), 295-301.

As can be seen in the figure, the ways in which clinician-patient / family communication can affect health outcomes can be direct. For example, it is stated in the studies that patients who are the psychological state of the patient of a physician who gives information about the health condition of the patient and communicates empathically is better (understanding, satisfaction, livelihood etc.) (Ong et al., 2000; Schofield et al., 2003). Communication can also affect physical symptoms. In one study, for example, empathic communication was found to reduce physiological arousal and pain in patients with irritable bowel symptoms (Kwekkeboom, 1997). In non-verbal behaviors such as touch or tone, health can be directly increased by reducing anxiety or providing comfort. In addition, communication affects health through a more indirect or mediated way with proximal consequences of interaction (eg: satisfaction with care, motivation of commitment, confidence in clinician and system, self-efficacy in personal care, shared understanding between clinician and patient). For example, a clinician's clear explanations and support statements provide more patient confidence and understanding of treatment options (proximal outcomes) (Henricson et al., 2008). Patients should be informed about the diseases, risks and benefits of various treatment options in order to make informed decisions about medical care. Treatment options given to the patient improve a specific health outcome (disease control, emotional well-being). Participation of the patient in the consultation helps the physician better understand the needs and preferences of the patient. Informing the patient about the risk factors of the patient, a high quality decision is made with the patient's decision and the mutual decision (Braddock et al., 1999).

Clinicians also need to understand a patient's health-related values, preferences and beliefs. Besides, it may be difficult to achieve a shared understanding because clinicians and patients evaluate health and disease from different perspectives (Makoul et al., 2009). Clinical evidence is typically applied to populations, not to individuals. Integrating the patient's individual characteristics, value judgments, cultural and religious beliefs and clinical evidence levels positively affects the success of the treatment, patient satisfaction and psychological well-being. (Fuentes et al., 2007). Clinician providing clear and comprehensive information to patient about clarification of health and treatment options can help patients gain a greater sense of control, be more hopeful and manage uncertainty (Makoul et al., 2009). Detecting, investigating and approving patients' feelings can reduce patient anxiety and depression (Iwamitsu et al., 2005).

It is very difficult to help cancer patients manage their negative feelings. Clinicians can strengthen their ability to manage the patient's emotions by listening attentively to the patient's life and expressing the patient's feelings and providing clear and honest information about diagnosis and treatment (Fujimori et al., 2007). Discussed issues

between clinician and patient; self-efficacy, teaches special skills in managing one's health, informs where to apply for access to self-care resources (eg, websites, groups), solves health problems, copes with complications, increases control empathy and facilitates follow. For example, it has been reported that cancer patients strengthen control over disease, emotional well-being during recovery, and coping strategies (Glasgow et al., 2005).

Method

The literature review was conducted in the Pubmed, Cochrane, Scopus, YÖK-TEZ and Google Academic databases using the keywords "online communication in cancer", "information search in cancer", "cancer and communication", "health communication" and "web based communication". The screening was done in Turkish and English and no year limit was applied.

Results

In the literature, the right information about transportation and health professionals related to the diseases of cancer patients - web based systems provided by peer communication: CONNECT™, Comprehensive Model of Information Seeking (CMIS), Interactive Health Communication System (IHCS), Interactive Cancer Communication System (ICCS), Comprehensive Health Enhancement Support System (CHESS). All of these systems are provide the ways of coping with chronic illnesses and cancer patients, improve quality of life, strengthen communication between patient and health professional, and improve treatment efficacy (DuBenske et al., 2010).

Connect™ Study

CONNECT™ is an interactive web-based communication for cancer patients and oncologists that can be used in a variety of settings, allowing for increased communication between caregiver and patient and the opportunity to use web-based technologies (Robinson et al., 1998). The integration of health communication and principles with behavioral theory and information design has been achieved through a multidisciplinary approach that shares different perspectives and approaches. CONNECT™ communication has three main components: (1) a web-based patient survey to assess values, goals and communication preferences (2) a web-based communication skills training module for patients and (3) a physician report describing the condition of the patient as a result of the general examination of the patient trying to maximize the communication of the issues compatible with patient values, and an automated question and answer button responding to the patient's problems. It is actively used on the Internet. It provides a theoretical framework for strengthening the decision-making process in cancer patients. Identify variables such as cancer knowledge, perceived vulnerability, self-efficacy beliefs, distress, values and targets, and predict individual self-management strategies so that behavioral change can be realized and provide training for individual coping mechanisms afterwards (Miller et al., 1997). Psycho-oncological trainings enhance the knowledge and well-being of individuals. In patients with prostate cancer, CONNECT™ has been shown to increase clinical decision making and effective on behavioral outcomes (Diefenbach and Butz, 2004). Health communication is among the best practices with CONNECT™ user test and feedback system (Fleisher et al., 2008).

Cmis

It is a comprehensive information search model. In the past search process of the individual, three components of the individual are defined. These three components are; (1) socio-demographic information, disease experience, needs and values, (2) information access methods, and (3) information seeking behavior. According to CMIS, the direct experience of individuals with disease predicts information needs and information seeking behaviors (Johnson, 1997). For example, the cancer stage is the key factor in treatment. Whether the cancer patient is in the early stage or advanced stage, the drug used has a great effect on side effects and prognosis (Johnson, 1997). At the same time, each stage of the cancer journey (eg treatment decision, chemotherapy, radiation) comes with its own anxieties and can influence the scope and the trend of the information (Han et al., 2010). For example, when the patient is preparing for surgery or treatment, they may choose information about the nature of their disease or treatment options; management of side effects during treatment; and then search for information about decision-making processes (Johnson, 1997). CMIS is an individual-centered information search system, and the right information appropriate to the patients' process provides easy and accessible information (Han et al., 2010).

Ihcs

Cancer patients and caregivers face many challenges, including diagnosis, treatment, remission, and the end of life in cancer orbits. Shortly after diagnosis, patients may need to make important treatment decisions. It is very important for the clinician to support patient selection, to provide information to maintain personal well-being and quality of life (Cayton, 2006). Knowledge management can be an important factor in understanding cancer diagnosis, making treatment decisions and predicting prognosis. In life-threatening diseases, clinical decisions must result from a fully informed decision-making process based on co-operation resulting from effective

communication between patient, family and clinic. Patients and family members often have differences in treatment decisions and care (Chen et al., 2003). This can create tension in their relationships, impairing the planning of decision-making and care. In clinical decisions; to create a full-fledged team, people need support for the right information at the right time and for effective use of this information (Cayton, 2006). Useful information must be an integral part of health care. Patients and caregivers should share confidence in making decisions with the clinician and communication should be central to patient care. Accordingly, the patient has a critical prescription to facilitate the exchange of information and intervention between the caregiver and the clinician - not just to direct intervention to the patient - to produce positive health outcomes (Donnelly et al., 2010).

The role of IHCS provides a channel for information and communication in this process. And IHCS provide information, support and skills training, to deal with the physical and psychosocial sequelae of the disease, to make collaborative decisions, and to communicate with the healthcare team (Donnelly et al., 2010). IHCS provides three main services to the illness (1) provides ready and regular access to information, (2) provides care between the patient and the family, (3) IHCSs act as an interactive coach, where the system retrieves the information from the user, providing feedback on the patient's status with algorithms. Patients can secretly check the recommendations of their doctors from their systems.

IHCSs are a social network that provides social support between people with the same disease and families, as well as a social network that provides information communication between the patient and the physician. Many other individuals have experienced similar conditions; wants to communicate to share information, personal experiences and support systems (Ziebland et al., 2004). IHCS is a highly developed social network in this respect. The IHCS can provide direct communication with the clinic, providing up-to-date information about the patient's condition and sharing information with the patient and family. The most important feature is that only confidential information about the patient can be presented to the patient (DuBenske et al., 2010).

Chess

CHESS is a social network as well as an information resource developed for lung cancer patients first. CHESS is a broader form of IHCS. CHESS communication services enable patients to communicate with each other and with the healthcare team. In the case of the patient and the expert, the patient gets a response within 48 hours to questions about the health status of the patient. The CHESS specialist takes into account the individuality of the patient, who is extremely sensitive to the user's private life and allows the patient to feel expert knowledge in the context of specific health and psychosocial concerns (Siegel, 2005).

Provides a forum for information sharing and support among patients in the same process as the discussion groups (Han et al., 2008). Groups are monitored by an educated facilitator to ensure that discussions are supportive and contain incorrect or harmful information. However, the facilitator does not take an active role in guiding patients and their families about what to communicate (McTavish et al., 2003). Patients do not only exchange information about their own experiences with breast cancer but also give and receive psychosocial support. Due to the severity of advanced disease, the caregiver is focused on supporting the patient as a primary goal. Thanks to the Clinician's Report, it is give information to clinic team about the needs of patient and patient caregivers and patient symptom conditions via the Website. The relationship between the patient, caregiver, clinical team, peer and social at CHESS is shown in figure 2 (DuBenske et al., 2010).

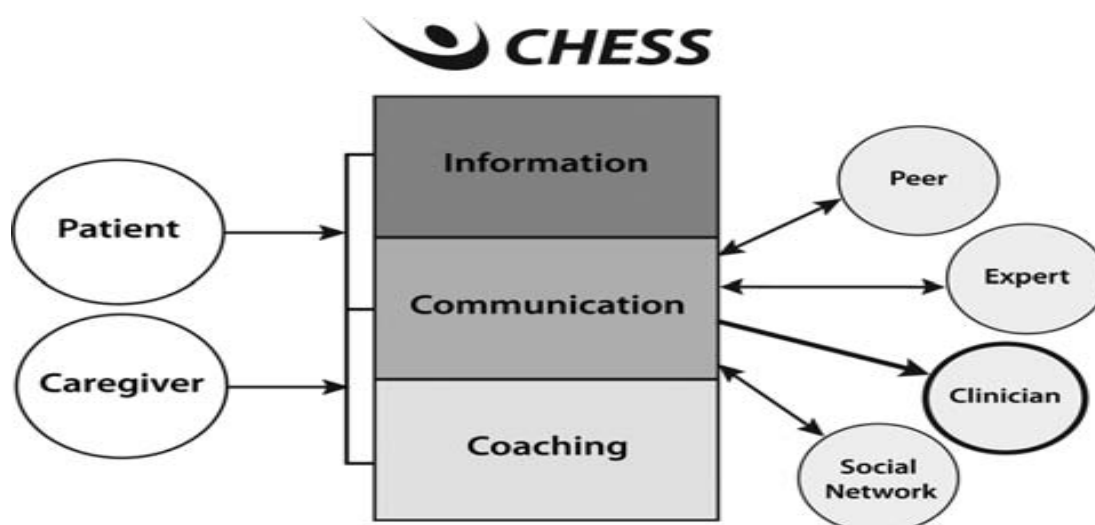

Figure 1. Model of how CHESS connects patients/caregivers to key others in cancer experience.

The "Discussion Group" and "Personal Stories" help users to explore the decision-making experiences of other patients, and to help users evaluate their own options and potential outcomes. Information services also deal with

communication with the health team and improve communication skills, such as questions to ask before deciding on treatment. In addition, CHESS can facilitate decision-making by promoting communication between the patient and his social support network. Coaching services such as "Healthy Relationships" provide training on communication techniques for difficult debates like life-long decision-making. Provides the same information and support to family members (DuBenske et al., 2010).

Table 1. CHESS Services Listed According to Service Category

Once a decision has been made about the patient's situation, users can get support for action to implement their choices, either by developing a plan for change through the "Action Plan" or by receiving support from others

Information Services	
Frequently asked questions (FAQs)	Short answers to hundreds of common lung cancer questions; e.g., "How does chemotherapy work?" or "How do I know if I have depression?"
Instant library	Full-text articles on lung cancer from scientific journals and the popular press; e.g., "Do I Have to Die in Pain?" (PBS)
Web links	Links to high-quality content in health-related and non-health-related sites
Cancer news	Summaries of lung cancer news and research; e.g., "Erlotinib Improves Survival in Stage III NSCLC," August 2009
Personal stories	Real-life text accounts of how patients and caregivers cope with cancer
Communication Services	
Discussion groups	Limited-access, facilitated online support groups for—separately—patients, caregivers, and bereaved caregivers
Ask an expert	Confidential expert responses to patient and caregiver questions
Personal Web page	Guidance for setting up a patient's own bulletin board and interactive calendar with family and friends to share updates and request help
Clinician report	Three types: <i>On Demand</i> gives a summary report on a patient to a clinician who logs into CHESS. <i>Threshold Alert</i> sends an e-mail notice to the clinician when the patient exceeds a threshold on a symptom. <i>Clinic Visit Report</i> sends an e-mail notice to the clinician 2 days before a patient's scheduled clinic visit, suggesting that the clinician look at the report
Coaching and Training Services	
Health status	Prompts users to enter data and provides graphs showing how patient health status is changing,
Decision aids	Helps patients and caregivers think through difficult decisions by learning about options, clarifying values, and understanding consequences, e.g., Treatment Decision Aid or Respite Decision Aid
Easing distress	Uses principles of cognitive-behavioral therapy to help patients and caregivers identify emotional distress and cope with it
Healthy relating	Teaches techniques to increase closeness and decrease conflict
Action plan	Guides patients and caregivers in building a plan for change, including identifying and overcoming obstacles

through the "Discussion Group" and "Personal Web Site". The dynamic nature of cancer gives many decisions in the disease orbit. CHESS provides continuity of communication and information as multiple sources allowing the user to be fully involved and to make decisions throughout a complete cancer spectrum, including diagnosis, treatment, survival or end of life and caregivers (DuBenske et al., 2010).

DuBenske, L. L., Gustafson, D. H., Shaw, B. R., & Cleary, J. F. (2010). Web-based cancer communication and decision making systems: connecting patients, caregivers, and clinicians for improved health outcomes. *Medical Decision Making*, 30(6), 732-744

Conclusion

Cancer patients are in a difficult decision making process with character treatment options with uncertain outcomes and toxicity potential. Because they are often confronted with mortality. In general, physicians are the primary source of medical information, and communication between the physician and the patient is critical to both parties, but making the right decision is critical. With these web based systems it is very important to strengthen the decision support systems between physician and patient in cancer patients.

Information Literacy Promotion And Its Impacts In Academic Library: Case Study In Rangsit University Library

Malivan Praditteera

Library Director, Rangsit University Pathumthani, Thailand

malivan@rsu.ac.th

Abstract

The purpose of this study is to investigate 1) how the library conducts the information literacy promoting programs to its users; and 2) what are the impacts of the information literacy promotions and practices. To answer those research questions, the following indicators have been monitored and analyzed: 1) number and frequency of the IL training courses; 2) number of students attending the IL training courses; 3) number of library accesses (either physical visits or online access); 4) reference service usage statistics; 5) online database usage statistics; and 6) information resource borrowing statistics. The research methodology is to do the data analysis. The Library has created the information literacy programs such as library orientation, online searching strategy and research literacy. Additionally, some literacy promoting campaigns have been running such as liaison librarians, RSU Loves to Read campaign; I love RSU Library clip competition and reading and borrowing competition. The statistics collected from 2015-2017 identify the positive trends of library usages, especially the library accesses and reference services. The information literacy courses have been customized to serve the appropriate target groups and indicate the increased number of attendees. The number of training courses is increased, whereas the number of library uses either physical visits or online accesses are increased.

Keywords: *Information Literacy, Information Literacy Promotion, library usage statistics, Rangsit University Library*

Introduction

Literacy has been defined as the ability to identify, understand, interpret, create, communicate and compute, using printed and written materials associated with varying contexts. Literacy involves a continuum of learning in enabling an individual to achieve his or her goals, develop his or her knowledge and potential and participate fully in community and wider society (UNESCO, 2005). New forms of literacy needed in modern life are also increasingly taken into account in the curriculum, in particular those related to new technologies such as digital literacy, information literacy, mass media literacy and social media literacy.

Information literacy is defined as a mean to empower people in all walks of life to seek, evaluate, use and create information effectively to achieve their personal, social, occupational and educational goals (UNESCO, 2018), whereas ACRL (2017) defines information literacy as a set of abilities requiring individuals to recognize when information is needed and have the ability to locate, evaluate, and use effectively the needed information.

Recently, information literacy becomes more important when UNESCO (2007) has named it as one of the 21st Century Survival Literacies. The set of survival literacies include: basic or core functional literacy fluencies of reading, writing, orally and numeracy; computer literacy; media literacy; distance education and E-learning; cultural literacy; and information literacy.

Rangsit University is a private institution of higher education, located in Pathumthani, Thailand, with the primary aim of creating graduates in the area of study meeting the requirements of national development by focusing mainly on science, technology, design and management including independent professions which are requisites in development of one's own career.

Currently the University offers 138 programs which are 92 undergraduate programs for, 36 master programs, 1 post graduate diploma and 9 doctoral programs (Rangsit University, 2018)

Rangsit University Library serves as a knowledge center for teaching and learning process for faculty members, students and researchers. Besides the information resource acquisition for each academic programs, the information literacy skill enhancement and development is one of the Library responsibilities. Currently the Library has totally 26,116,363 titles of information resources. Those are 152,039 books, 976 journals, 1,604 archival documents, 20,138 audio-visual materials, 18 newspapers, and 11 online databases (Rangsit University Library Website, 2018).

Rangsit University Library has taken an important role on information literacy development of the University's learners. In 2013, the Library had surveyed the information behavior of the University students (Praditteera, 2013). The result found the most response are from the 1st year student (32.46 percent), female students (65.90 percent) and 25.06 percent are from the group of faculties of Economics and business students. Most of the students conduct their information seeking and searching when they need to do reports, classroom presentations and class discussion. The information sources they use most often (56 percent) are search engine websites such as Google, Bing, Yahoo, Ask.com. Most of the students assess the information from websites and library by the update. Two-third of students uses their friends and family members in order to assess and select the information. Self-collection

information resources (i.e. lecture notes, self-collection, own books) are the most often used in doing academic or class works. The 50 percent of students choose to ask their lecturers, classmates, close friends and their family members regarding to gain the information for decision making whereas only 11 percent ask librarians. Knowledge blogs, online databases, and reference librarians have been named unknown from the students. Some suggestions on creating an information literacy skill and online database training courses are mentioned.

According to the findings from the 2013 survey, Rangsit University library has taken actions in order to promoting the information literacy skill to the students and gaining more efficiency and effectiveness on information resources management and services. The library has improved and implemented the literacy skill promotions and marketing outreach campaigns.

The findings and recommendations from 2013 survey have been taken to emphasize the importance of the role of the library in developing an information literacy skill.

The Objectives of the Study

The purpose of this study is to investigate:

- 1) How the Library conducts the information literacy promoting programs to its users;
- 2) The impacts of the information literacy promotions and practices to the Library.

Research Instruction

To answer those two questions, the related library data during the Year 2015-2017 have been collected and analyzed. The two sets of data indicated the results of research questions have been categorized as following:

The first set of data included 1) number and frequency of the IL training courses; and 2) number of users attending the IL training courses.

The second set of data included 1) number of library accesses (either physical visits or online access); 2) reference service usage statistics; 3) online database usage statistics; and 4) information resource borrowing statistics.

Research Findings

1. The information literacy promoting programs which the Library provided to its users.

1.1 Number and frequency of the IL training courses

As showed in Table 1, there were 3 types of information literacy courses offering to users. There were 1) library orientation 2) Online searching strategy and 3) Research support courses. Each course varied with its content coverage and target group. For example, the first year students would take the library orientation course, whereas the graduate students took an online searching strategy course.

Table 1 Information Literacy Courses Provided by the Library

Courses	Coverage	Target group	Frequency
1. Library orientation (1hrs)	How to access library collection and use library services	1.Freshmen 2. New faculty members	-All year round -On request -Walk-in
2. Online searching strategy (2hrs)	How to search and access online databases	1.Undergrad students 2.Grad students 3.Faculty members	-All year round -On request -Walk-in
3. Research support (3hrs)	-How to access specific online databases -How to use research tools -How to find journals for research publishing	1.Grad students 2.Faculty members	-Twice per semester -On request -Walk-in

Additionally, the Library organized other services/informal activities related with information literacy development. As shown in Table 2 were some activities well-known among its library users such as liaison librarians; RSU Loves to Read Campaign; Reading & borrowing competition. Each activity was appropriate with its target group. Mostly they were organized once a year.

Table 2 Other Information Literacy Activities/services

Activities/Services	Coverage	Target group
1. Liaison librarians	Information and research literacy services	Students and faculty members
2. RSU Loves to Read Campaign	Reading community promotion	Students and faculty members
3. I Love RSU Library Clip Competition	Video clip promoting the library services and activities	Students
4. Reading & Borrowing Competition	Promoting the book & knowledge material borrowing	Students
5. RSU Library Week	Meeting with authors/reading idols, book fair, etc.	Students and all member

1.2 Frequency and Number of Students Attending the IL Courses

As shown in Table 3, the number of information literacy courses/events and number of attending students from 2015 to 2017 have been increased respectively. The data indicated the positive trends in information literacy courses and numbers of students attend.

Table 3 Frequency and Number of Students Attending the IL Courses

IL Courses	2015 Frequency and Number of Students Attending the IL Courses	2016 Frequency and Number of Students Attending the IL Courses	2017 Frequency and Number of Students Attending the IL Courses
Library & literacy orientation	134 (2,985)	138 (2,915)	140 (3,419)
Online searching course	10 (524)	12 (747)	14 (927)
Research literacy course	16 (71)	18 (189)	21 (290)
Other activities	15 (6,832)	16 (7,367)	18 (8,004)

2. The impacts of the information literacy promotions and practices to the Library.

As shown in Table 4, the statistics collected from 2015-2017 identifying the positive trends of library usages, especially the library website visits, online database accesses and reference services.

Table 4 Library Service Statistic 2015-2017

Indicators	2015	2016	2017
Physical visits	240,942	230,186	221,847
Website/Virtual visits	70,899	73,497	85,439
Information resource borrowing	28,134	26,177	22,378
Online database access	3,340,996	3,712,310	8,447,674
Reference services	4,151	4,943	5,836

Conclusion

1. The information literacy promoting activities which being implemented by the library for its users had impact to the frequencies of usage, especially online database access.
2. The IL promoting activities which fitted for the variety of user groups should be emphasized.
3. The frequency of IL promoting activities and number of participants were relatively impacted to the number of service usages.
4. While the information literacy courses have been customized to serve the appropriate target groups, the statistics indicate the increasing number of attendees

Lesson-learned

The most important benefit gained is that the librarians have developed their searching and research support skills in order to train or consult its library users.

Online or digital access becomes more challenge for the library to continue its role as a learning-teaching support center.

Suggestions for future research

1. The information literacy behavior study shall be redone in order to verify whether the information literacy promoting activities are suitable.
2. The information and research literacy courses themselves shall be evaluated whether they are fit for the objectives.

Abstract

While plagiarism is wryly said to be common among undergraduates due mainly to ignorance, the occurrence of the academic dishonour among postgraduate students is perhaps not that unheard of either, though for reasons other than lack of awareness. Considering that plagiarism is a serious academic offence, it would logically be shunned by a mature, responsible postgraduate student in preparing written work for submission. As such, it is noteworthy that plagiarism cases among postgraduate students may be attributed to a combination of reasons at both personal and institutional levels. This paper describes an in-house study of postgraduate students' perception on plagiarism at the University, with emphasis on 2 clusters of factors, i.e. institutional demand and historical baggage. Responses from 315 postgraduate students at both master's and PhD level were analysed and discussed. From the institutional demand perspective of workload and grading exercise, it was found that excessive workload and time-consuming field trips with little impact on the assessment were considered silent factors pushing students towards the dishonest act, while seemingly unfair assessment by the lecturers was also thought to be a trigger to plagiarism. On the other hand, students do come with historical baggage of prior experiences, and largely regarded reporting the published work of others (without citation) as a form of respect and recognition, and that creating a patchwork of others' efforts to be claimed as one's own is considered acceptable. All in all, the survey results shed light on the potentially negative pull towards plagiarism caused by intrinsic values of the students as well as the University's academic system in general, highlighting the need to realign the factors examined.

Keywords: *Plagiarism, integrity, citation, awareness, postgraduate writing*

Introduction

Plagiarism is often claimed to be the most severe of academic misconduct in the realm of higher education. Students could have included others' work in his or her own writing without recording the necessary credits to the rightful owner or originator of the ideas. Whether it takes place in a conscious or unconscious manner, intentionally or unintentionally, the act would still be considered a serious offence and breach of academic propriety. Plagiarism does not only undermine one's integrity, it also affects the student's learning process as well as that of their peers (McCabe et al., 2002), while putting the validity of higher degrees in certain bad light (Ehrich et al., 2014). Hence it should be monitored where preventive or corrective measures were to be taken as when the need arises.

Debnath (2016) expostulated plagiarism of text to be most commonly encountered, and further categorized the academic theft in ascending order of severity as text-recycling or self-plagiarism, paraphrasing, literal copying and substantial copy-paste. This hints at the ease with which postgraduate students who write extensively for reports, assignments and thesis to falter on the slippery slope of plagiarism. The advent of the internet and proliferation of mobile devices have accelerated, if not complicated the matter (Boisvert & Irwin, 2006). A vast reservoir of information is not only available but readily accessible by a mere click of the mouse or tap of the finger (Wang, 2008). The ease of storage and subsequent retrieval from internet resources has also adversely encouraged the culture of copy-paste among students (Schiller, 2005). Such selective hoarding of information could encourage

students to ‘create’ reviewed papers for publications in proceedings and journals (Long et al., 2009), despite the use of plagiarism detection tools and softwares as preventive measures (Sattler et al., 2015). Also, considering that bad habits, or worse, misconception of what is acceptable and what is not acquired at the university are routinely brought to the workplace of the graduates (Martin, 2009), reflecting a flawed character building process corrigible with appropriate measures by the University.

The present study was conducted to gauge the postgraduate students’ perception on plagiarism from their own reckoning of institutional and personal aspects. The findings would lay the foundation for review and improvement of the University’s learning environment as well as provision of assistance to the students against plagiarism, to nurture scholars of good ethics, morals and professionalism.

Contents Of Survey

The survey circulated among the postgraduate students consisted of 2 clusters of 10 questions and 2 components each. The first category explores the students’ views of the University’s academic environment pertaining to plagiarism, and the second category derives from the students’ inherent values in response to the matter termed as ‘historical baggage’. The cluster of questions were designed to capture an opposing yet comprehensive review of the students’ perception on the issue of plagiarism from within themselves and with relation to the learning environment they were immersed in, i.e. the University. Further details on development of the survey can be found in Chan et al. (2014). Students were simply asked to answer ‘YES’ or ‘NO’ to the questions. Breakdown of the survey clusters and components are as follows:

INSTITUTIONAL DEMAND	
Workload	
W1	There is so much to do that I have to “copy” others’ work to pass of as my own.
W2	There are too many assignments to do for each course.
W3	The due dates for the assignments are always overlapping.
W4	Field work and site visit should be counted as part of the coursework assessment as they take up much time.
W5	The scope of each course is too wide and demanding for me to cope.
Grading System	
G1	I have to copy-and-paste to make good reports / assignments.
G2	My lecturer gives good marks for poor work too.
G3	There is not much difference between the marks given to good and poor work.
G4	As long as the report is long and wordy, I will get good marks for it.
G5	My lecturer does not have time to read through all the reports anyway.
HISTORICAL BAGGAGE	
Cultural Influence	
C1	I see reporting others’ work as a form of respect and recognition.
C2	It is disrespectful to question / criticize the work of others.
C3	I have never heard of ‘plagiarism’ before my graduate study at UTHM.
C4	Referencing and citations are new ideas to me.
C5	I do not understand why I need to cite others’ work.
Educational Background	
E1	I am used to memorizing facts to pass examinations.
E2	I search and transfer information from various sources (e.g. internet, books, journals, etc.) to my own work for good grades, with minimum alterations.
E3	I am not taught to read and think carefully before transferring others’ work into mine.
E4	It is acceptable to combine information from several sources to form my own data.
E5	My previous institution of learning is less strict about plagiarism.

THE SURVEY: RESULTS AND DISCUSSIONS

Following are the analysis and discourse on the survey results per component. The responses were categorized as ‘YES’ or ‘NO’ as decided by the 315 respondents, and presented in pie charts for ease of comparison.

Cluster #1: Institutional Demands

Workload

Note that analysis for this sub-component is more attuned to the by coursework students who were required to

attend regular classes with formative and summative assessments per semester. From Figure 1, it seems apparent that the students found the workload at postgraduate level to be rather overwhelming, with approximately a quarter of the respondents considered field trips to be burdensome with excessive semester-long assignments from the course taken, followed by almost 20% felt overloaded with the number of activities and tasks assigned. These were supported by affirmation in terms of the overlapping due dates of submission as well as the wide scope of research necessary to complete the assignments. In addition, looking at the very low 'NO's for W4, programmes with numerous field trips as part of the course contents should better incorporate appropriate assessment to make the time-consuming excursions rewarding not just in terms of exposure, but marks and grades as well. Note too that students may have the tendency to plagiarize less for tasks with higher marks assigned, and vice versa (Gómez et al., 2013), a tell-tale sign of their awareness of the consequences of the academic misconduct. Responses in the 'workload' component can be summed up as an indicator of work overload driving students towards the inadvertent copy-paste practices. While not condoning the academic misconduct, no matter how small scale it may seem, it surely raises the concern of "too much teaching but too little learning" going on in the University in postgraduate taught courses programme. Taking into account the fact that these master's by coursework programmes were meant to advance the students' knowledge and cognitive skills in the respective areas of studies, turning to plagiarism to make the grades clearly is counter-productive, if not destructive for the students' learning.

Figure 1: Summary of responses on the factor of 'workload'.

Grading System

This sub-component is also more relevant to the students enrolled in coursework programmes, where the responses are summarized in Figure 2. Clearly the 'YES' and 'NO' responses were fairly balanced for this part of the survey. The charts show approximately 20% of the respondents considered the pressure of achieving good grades made them plagiarize intentionally, and that more worryingly, their perception of how the assessment is made cause them to be reckless in this matter. 22% did not think that a well written work would necessarily be given better marks, and that this could be associated with lecturers rushing through the marking resulting in unfair assessment. Besides, 20% of the students reckoned assignments were assessed by the amount of information included in the writing, i.e. the more words there were and the more pages were bound together, the better chances of them being given high marks. Moreover students may be disheartened by peers who got away with plagiarism because of the lack of monitoring by lecturers (Sisti, 2007).

Figure 2: Summary of responses on the factor of ‘grading system’.

These notions, albeit wrong and misled, do raise the concern of the rather negative regard students seemed to hold for some lecturers. It is suggestive of a learning environment driven primarily by marks and grades but not the thirst for knowledge. The responses are also indicative of a certain lack of professionalism among the academic staff in performing their duties, causing the students to make such assumptions of counter-productive nature. Nonetheless it is perhaps a little heartening to learn that only 15% respondents made the serious presumption that poorly written work were judged the same as the deserving ones. This could be taken as a sign that in general the academic staff were dedicated in the delivery of lessons and assessment instead of passing off bad work as good.

Cluster #2: Historical Baggage

Cultural Influence

This part of the survey focused on the students’ pre-possessed views and values, with cultural influence being related with the respective student’s cultural background and beliefs. In corroboration with reports of cross-cultural studies by Egan (2008), Asian students came across as being more receptive and accommodative of plagiarism, though it may be due to genuine lack of understanding of the matter. In Figure 3, it can be observed that about a third of the students consider reference to others’ work as a form of recognition and honour, though not necessarily to be appropriately cited and recognized in their writing. About 20% each found it a little disconcerting to criticize others’ work, which could lead to mild or shallow reviews in their writing; and claimed to be ignorant of the necessity to include proper citations in their own writing when referring to the work of others. Perhaps related to the ignorance of making proper citations in academic writing (C4), 16% respondents were unsure on the importance of making such recognitions in their writing. Also of interest is the 12% who found plagiarism as an academic misconduct to be alien to them until now.

Based on the responses discussed above, it would seem that a number of students were either unaware of the need to make proper citations, where plagiarism was something novel to them until their enrolment in the postgraduate programmes, or that they simply could not grasp the need to make such references in a legit manner (C3, C4 and C5). However, whether or not ignorance should be considered a valid excuse for committing the academic theft is debatable, especially in this era of information overloading and hyper connectivity within the academia. On the other hand, the students’ reluctance to make critical remarks on the work cited could be attributed to their upbringing and cultural background of excessive courtesy, or more worryingly due to the under-developed critical thinking and analytical skills to make incisive reviews of others work with relevance to their own.

**Figure 3:** Summary of responses on the factor of ‘cultural influence’.

Educational Background

Educational background refers mainly to the undergraduate level education undergone by the students prior to enrolment in the postgraduate programmes at the University. Almost one third of the respondents (28%) considered the assembly of information from several sources an acceptable creative exercise, while almost a quarter of them (24%) admitted to the adoption of rote learning for passing examinations (Figure 4). Interestingly, the latter reflects the traditional teaching and learning approach commonly found in Asian institutions of learning, even at tertiary level. Corresponding to the former, 19% of the students owned up to the habit of copy-paste from different references in their written work (E2), suggesting a naïve or lackadaisical attitude towards academic propriety where written intellectual ownership is concerned. In addition, a small number of the respondents attributed their

nonchalant outlook on plagiarism to the lack of exposure (E3, 16%), as well as the less stringent monitoring of such academic misconduct in their previous respective places of learning (E5, 13%).

The responses presented above hint at the significant prior understanding and notion of plagiarism have on the students' preconceived idea of what constitute plagiarism. Nonetheless, inadequate command of the language (usually English) and other related skills for learning effectively, such as conducting a literature review, could cause students to plagiarize too (Devlin & Gray, 2007). It may not seem wrong or even mildly unethical to reconstruct randomly acquired bits of information derived from others' hard work into a coherent composition of their own, without assigning proper attributions and citations. In other words the irresponsible practice was silently condoned to the extent that it was never considered an inappropriate thing to do among these students. Arguably a certain amount of effort is required to search, review and reorganize the information gathered. Nevertheless that does not justify claiming the origin of the idea to be one's own.

Figure 4: Summary of responses on the factor of 'educational background'.

Comparison between Factors

Distribution of the students' responses are summarized in Figure 5. Note that for every factor examined, the further apart the filled and blank circles are, the more balanced the percentage of responses were for the particular component. Taking 10% as the threshold to identify limits of the extreme ends of the spectrum, the lower limit is $\leq 5\%$ and the upper limit is $\geq 20\%$ in terms of direct difference between the numbers of 'YES' and 'NO'. Factors W2, G1, G4, G5, C4 and E2 were found to be in the range of the lower limit, i.e. these were the factors which elicited almost equal numbers of affirmation and responses on the contrary. A review of the factors revealed the claim that heavy postgraduate workload (W2) inadvertently pushes students towards sloppy copy-paste practices in preparing written reports (G1, G4 and G5) to be unsubstantiated, as the ratio of students who agreed and disagreed were about 50:50. On the other hand, justifying the practice of copy-paste with ignorance (C4 and E2) was also not necessarily the case when plagiarism is committed, as evidenced by the similarly distributed responses.

Figure 5: Distribution of 'YES' and 'NO' for all factors.

Figure 6: Correlation between 'YES' and 'NO' in terms of frequency of responses.

Also referring to Figure 5, factors W4, C1 and E4 are captured in the upper limit range, all with affirmation leading in numbers. Wanting fieldwork to be incorporated in the assessment (W4) is most probably an expected reaction from students in an attempt to gather more marks in the formative assessment of their studies. Nonetheless there appears to be a rather alarming confusion between reporting others' work as a form of respect (C1) and creating a mix-and-match piece of writing from several sources to be claimed as one's own (E4). It would seem as if the respondents considered recognition to have been rendered when the work is being referred to, without necessarily making clear ownership of the information reported.

In Figure 6, the frequency of positive and negative responses are plotted against each other with a linear trend line plotted for the data. Despite the slight scatter, the 'NO'-'YES' plot shows a consistent 75% probability of a positive response for every negative answer given in the survey. The ratio of 'YES'/'NO' = 0.75 indicates a scenario where the postgraduate students were aware of the fact it is unethical and wrong to engage in such activities, though they may not be fully conscious of the implications and impact on their learning development.

Conclusions

The study gave an interesting overview of the postgraduate students' perception on the issue of plagiarism from both the perspectives of the learning environment of the University as well as personal values based on past experiences. In the 'institutional demand' cluster, students largely considered the workload drove them to inadvertently copy-paste to make the grades, while the grading exercise was perceived to be inadequately fair in some instances. From the 'historical baggage' aspect, cultural background seemed to steer some students away from criticizing the work of others, and perhaps of more concern is the students' uncertainty of what is considered plagiarism. The students' past education experiences also had a strong influence on their perception of what constitute plagiarism, to the extent of blurring the line between copy-paste and copy-reorganized-paste, both of which make no reference to the origin of the source. A distribution analysis of the responses gave insights to the correlation between the factors examined, such as the students' apparent misconstrued idea of recognition in referencing compared to actual citations. Also, derivation of the ratio of positive : negative responses = 75:35 suggests the students' awareness of the risk for them to slip into the unethical act of plagiarism. All in all the study shed light on the postgraduate students' perception of plagiarism with respect to institutional conditioning and their personal preconceptions: the 2 clusters which do not always complement each other to prevent the occurrence of the academic dishonour.

Abstract

The main purpose of this research is to propose an instructional supervision model to prepare early childhood children's language development in Thailand. Researchers utilized qualitative method including in-depth interview, documentary analysis, and observation approaches to collect data. After reviewing the related literatures as documentary analysis, researchers identified six key factors and 21 sub-factors. The initial findings showed that there are six key factors namely planning for action, invitation for building trust, encourage, action, reflection, and evaluation. After the in-depth interviews to the seven experts to validate the key factors, sub-factors, and indicators, findings revealed that there were six key factors, 19 sub-factors, and 109 indicators as the foundation, researchers developed an instructional supervision model particularly for early childhood children's language development. Finally, researchers proposed an instructional supervision model for language development of early childhood children.

Keywords: *Early childhood children; instructional supervision model; language development; supervisor*

Introduction

The acquisition of language is one of the most remarkable achievements of early childhood children. According to Hoff (2009), five years old children are essentially master the sound system and grammar of their language and acquire a vocabulary of thousands of words. It is extremely crucial to have descriptions of normative development that allow identification of children with language impairment and to have an understanding of the mechanisms of language acquisition that can provide a basis for optimizing all children's development (Morrison, Bachman, & Connor, 2005). This is because early childhood children's language skills are important to their interpersonal and academic success. Language development is a process starting early in our lives. Typically, children develop receptive language abilities before their verbal or expressive language develops. Receptive language is the internal processing and understanding of language. As receptive language continues to increase, expressive language begins to slowly develop (Graven, Browne, Joy, 2008).

Supervision has existed in all countries worldwide for many decades and occupies a essential position in educational management, which can be understood as an expert technical service most importantly concerned with scientific study and improvement of the conditions that surrounds learning and children growth. Supervision is leadership and development of leadership within groups, which cooperatively assess educational product in light of accepted educational objectives, studying the teaching-learning situation to determine the antecedents of satisfactory and unsatisfactory children growth and achievement, and improving the teaching learning process (Essays, 2013). Most of the problems that related to instructional supervision are due to the fact that educational supervisors were inadequate and there were no cooperation between school administrators and teachers (Poonbua, 2013). In addition, the supervision in early childhood setting is expected to be more problems if we did not study the current states and needs for development. Therefore, Ninpan (2010) stated that supervisors need to have plans, alternatives, and teamwork if there were the conditions of evaluation, improvement, and development.

Research Objectives

The main purpose of this research is to propose an instructional supervision model to prepare early childhood children's language development in Thailand. To achieve this purpose the following specific objectives were formulated to guide the research:

- i. To identify the factors and sub-factors of instructional supervision model to prepare early childhood children's language development.
- ii. To propose the instructional supervision model to prepare early childhood children's language development.

Method

A qualitative method was chosen due to it is a systematic subjective approach used to describe life experiences and give them meaning. Researchers begin the study using document analysis to investigate the key factors and sub-factors by analyzing the related documents both printed and electronic materials. This document analysis requires that data be examined and interpreted in order to elicit meaning, gain understanding, and develop empirical knowledge (Bowen, 2009). This is followed by in-depth interviews to the seven experts to validate the identified key factors and sub-factors from the first phase. In-depth interviews was found suitable to employ because researchers would like to capture rich, descriptive data about the suitability of identified key factors and sub-factors as a foundation to develop the instructional supervision model to prepare early childhood children's language development. The final phase of the study was observation. A total of nine early childhood and experienced teachers were observed.

Purposeful sampling technique was employed to select the seven experts and nine early childhood teachers in this study to ensure the identification and selection of information-rich cases for the most effective use of limited resources (Patton, 2002). This involves identifying and selecting individuals that are especially knowledgeable or experienced with this phenomenon of interest (Cresswell & Plano Clark, 2011). In addition to knowledge and experience, Bernard (2002) noted the importance of availability and willingness to participate, and the ability to communicate experiences and opinions in an articulate, expressive, and reflective manner.

The research instruments used were two types of checklists namely document analysis checklist and observation checklist as well as in-depth interview guide. The three instruments were administered in Thai language to ensure that the respondents were clear about the statements. The in-depth interview guide included a series of probes and clarification questions to maintain the consistency in questioning across participants.

Results

The initial result is the descriptive qualitative findings from literatures and related documents to identify the key factors and their sub-factors of the instructional supervision model to prepare early childhood children's language development. Results were derived from the checklist. This is followed by qualitative results from in-depth interviews about the verification of key factors, sub-factors, and indicators. Finally, the modified instructional supervision model to prepare early childhood children's language development was tried out by nine experienced teachers. Adjustments were made before the proposed instructional supervision was presented.

Qualitative results from documentary analysis

Initial results derived from document analysis checklists concluded that there are six key factors and 21 sub-factors as follow:

- Planning for action (P) consists of four sub-factors
- Invitation (I) for building trust consists of three sub-factors
- Encourage (E) consists of four sub-factors
- Action (A) consists of three sub-factors
- Reflection (R) consists of four sub-factors
- Evaluation (E) consists of three sub-factors

These six key factors would form an acronym as PIEARE.

Qualitative results from in-depth interviews and classroom observation

Researchers continued the study by interviewing seven experts to validate the six key factors and 21 sub-factors from the first phase. Results from the in-depth interviews concluded that the seven experts maintain the six key factors but reduce the 21 sub-factors to 19 sub-factor, giving a total of 109 indicators. Results from the in-depth interviews and also trial out in the classroom observation are presented in Table 1 as below:

Table 1: Six key factor, 19 sub-factors and 109 indicators of instructional supervision model

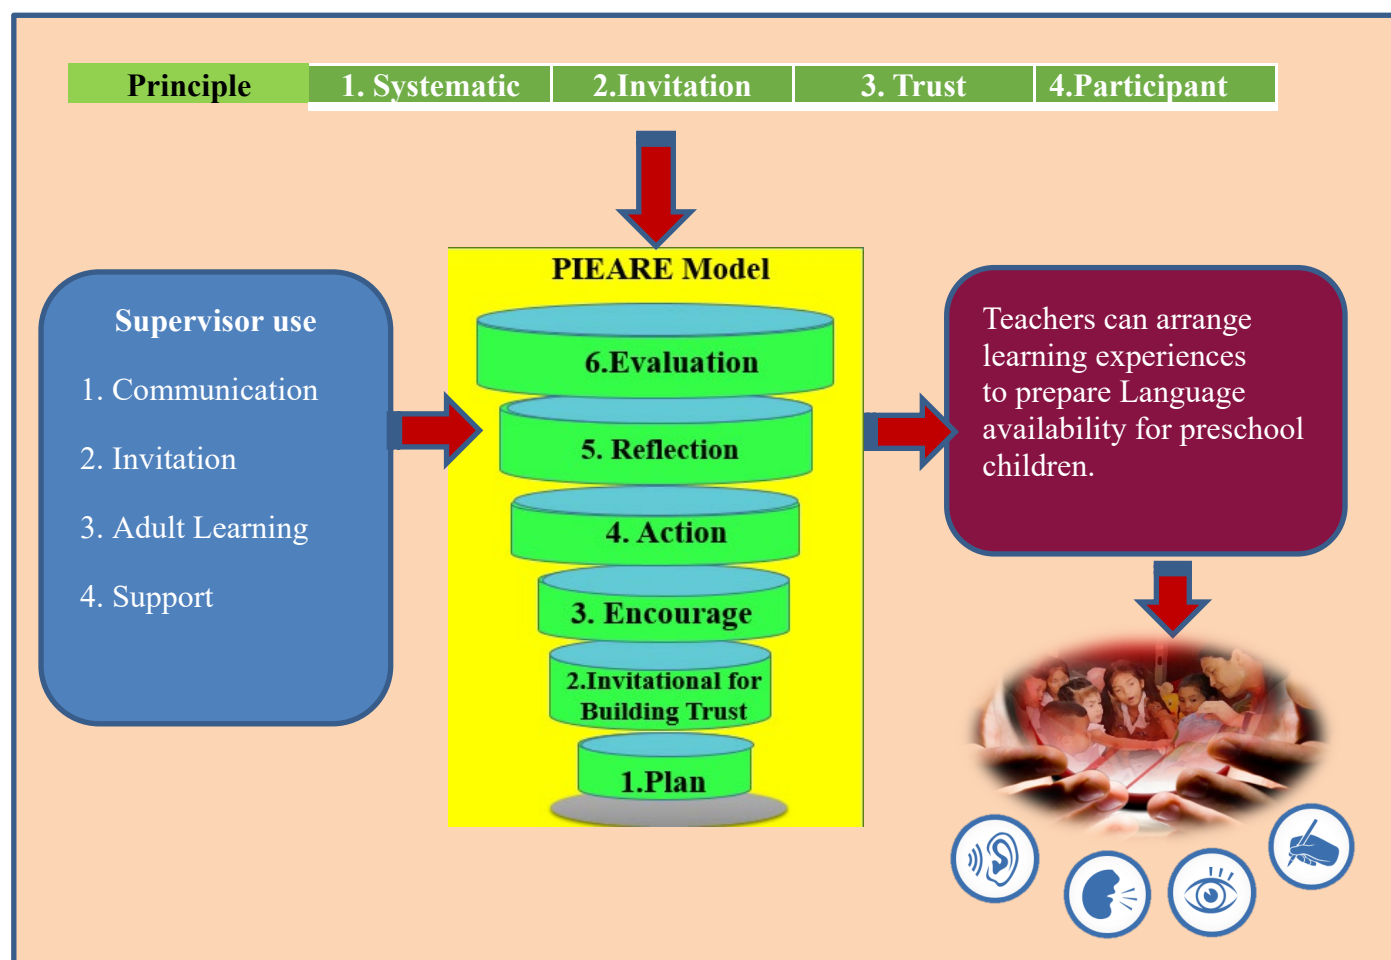

Key factor	Sub-factor	Indicator
P	1.1 Target	1.1.1 Compliance with expectations and needs.
		1.1.2 Be clear and concise.
		1.1.3 Lead to concise action planning.
		1.1.4 Lead to action.
		1.1.5 Can be measured and evaluated.
	1.2 Method and process	1.2.1 Make choices for practices.
		1.2.2 Appointment of a working group covering workload
		1.2.3 An appropriate supervision calendar based on institutional context.

Key factor	Sub-factor	Indicator
		1.2.4 Related personnel have knowledge and understand how to supervise.
		1.2.5 Related personnel understand the methodology and planning.
		1.2.6 Develop a supervision tool that consistent with the goals.
		1.2.7 The supervision plan is continuous clarity.
	1.3 Resources	1.3.1 The staff has morals.
		1.3.2 Personnel appropriate to the job and abilities.
		1.3.3 Provide facilities for operation
		1.3.4 Support material and equipment to operate.
		1.3.5 Allocate additional budget.
		1.3.6 Empower the management by appointment order.
	1.4 Participation	1.4.1 Related personnel participate to achieve supervision goals and objectives.
		1.4.2 Related personnel participated in planning, implementation, supervision operations.
		1.4.3 Related personnel understand the supervision plan in the same direction.
		1.4.4 Related personnel decided on guidelines and methods.
		1.4.5 Related personnel participate in systematic and continuous operation.
		1.4.6 Related personnel perform duties thoroughly.
I	2.1 Characteristics of supervisor	2.1.1 Trust that everyone is competent.
		2.1.2 Be responsible for the commitment.
		2.1.3 Optimistic, positive vision.
		2.1.4 Have a caring concern, help the recipients and solve the problem with sincerity.
		2.1.5 Honor and accept the opinions of others.
		2.1.6 Advice, guidance rather than command.
		2.1.7 Provide professional support.
	2.2 Communication	2.2.1 Open communication with sincerity.
		2.2.2 Use verbal, sweet, and melodious.
		2.2.3 Face-to-face and indirect communication (ICT).
		2.2.4 The use of ICT in communication makes it easier and more convenient,
		2.2.5 Communication makes the supervisor feels self-reliant (directed, valuable, and acceptance in society.
E	3.1 Emotional support	3.1.1 Confidence building with recipients in self-development.
		3.1.2 Encouraging exchanges of ideas and opinions.
		3.1.3 Listen to the information from the recipients as much as possible without contradicting or commenting further.
		3.1.4 Find a solution or common developmental approach for improvement.
		3.1.5 Acceptance, expression of kindness and concern.
	3.2 Materials, equipment, and technology	3.2.1 Provide materials and equipment to arrange adequate and appropriate experience.
		3.2.2 Provide knowledge on the use of technology for communication in schools.
		3.2.3 Provide high speed internet access to schools to connect and link in modern communication.
		3.2.4 Provide up-to-date teaching aids ready to use.
		3.2.5 Provide a Line group, Facebook or network for academic communication.
	3.3 Knowledge support	3.3.1 Consultation when the recipients' requests or have problems.
		3.3.2 Coaching to develop and provide quality learning experiences.
		3.3.3 Provide a variety of useful information.
		3.3.4 Encourage supervisors and recipients continuing self-study and ascertain.

Key factor	Sub-factor	Indicator
		3.3.5 Provide training on knowledge required.
		3.3.6 Provide a study visit to the schools and school networks.
		3.3.7 Provide academic discussion for schools and school networks.
A	4.1 Preparation before observation of teaching together.	4.1.1 Organize meetings before observing provided experiences to review operational procedures, roles, and duties.
		4.1.2 Clarification of supervisory objective and operational plans for recipient to plan ahead.
		4.1.3 Training supervisors in the field of knowledge, understanding the supervision system and technique.
		4.1.4 The recipient provide full components of the experience plan.
		4.1.5 Supervise the experience plan provided by recipients before observing the class.
		4.1.6 Schedule 2-3 days prior to observe teaching.
		4.1.7 Have varieties of supervisory tools consistent to aims, make class observation more accurate.
		4.1.8 Have supervision manuals or teaching observation tools to facilitate the recording, analysis, and interpretation.
	4.2 Classroom observation	4.2.1 Arrival classroom prior to learning experience
		4.2.2 Select seat according to the provided position.
		4.2.3 Do not interfere or disturb with the teaching of teachers and students.
		4.2.4 Observe full-time classes for one hour.
		4.2.5 Take notes of observing the behavior of teachers and students according to the tools without the sense of judgment.
		4.2.6 Record teaching and learning behavior of children every 10 minutes.
	4.3 Exchange of learning	4.3.1 Compile notes from new classroom observations.
		4.3.2 Gathering information related to the situation in the classroom.
		4.3.3 Analyze data to communicate and understand between teacher and the relevancy.
		4.3.4 Teachers analyze the results, problems, obstacles, and teaching practices.
		4.3.5 Supervisor provides information reflecting the practice to inform teacher.
		4.3.6 Supervisor and teachers interpreted valuation on teaching hours observed in previous class.
		4.3.7 Find a joint agreement from the valuation information to improve the development to the next planning.
R	5.1 View of reflection	5.1.1 Reflect on prepared experience in the previous week.
		5.1.2 Reflect on students' learning outcomes and learning behaviours.
		5.1.3 Reflect the obstacles of prepare experience and development process in the new week.
		5.1.4 Use teacher's view to share learning and learning management.
		5.1.5 Apply theoretical concepts as a framework.
	5.2 Reflecting period	5.2.1 Reflection after completion observation.
		5.2.2 Duration of reflection conversation 5 to 10 minutes.
		5.2.3 Timetable for reflection less than 5 minutes each.
		5.2.4 Reflection first during and after prepare experience.
		5.2.5 Summarize trend development to lead further planning.
	5.3 Writing reflection communication	5.3.1 Use reflection writing to review learning management.
		5.3.2 Use reflection principles based on questions.
		5.3.3 Reflects writing independent learning management.
	5.4 Spoken communication reflects idea	5.4.1 Reflection of arrange experience sharing concepts between teachers.
		5.4.2 Describe the atmosphere of teacher and children learning.

Key factor	Sub-factor	Indicator
		5.4.3 Exchange lessons to confirm arrange experiences.
		5.4.4 Discussion on the success and failure.
		5.4.5 Find new experiences arrangement for problem solving.
E	6.1 Measurement and evaluation tools	6.1.1 Measurement tools are correct and accurate.
		6.1.2 Measurement tools are of several types.
		6.1.3 Measurement tools are set the criteria and aim clear and consistent.
		6.1.4 Method and evaluation understand the same.
		6.1.5 Selection of measurement tools and quality inspection tools
	6.2 Realistic assessment	6.2.1 Evaluation done jointly
		6.2.2 Evaluation assignment for self-assessment.
		6.2.3 Measure children's work and behavior.
		6.2.4 Evaluate teaching behavior.
		6.2.5 Evaluate supervisory behavior.
		6.2.6 Evaluate continuously.
		6.2.7 Correctly interpretation.
	6.3 Applying the evaluation results	6.3.1 Assessment results informed to related personnel.
		6.3.2 Provide feedback with real information.
		6.3.3 Evaluation result for development plan.
		6.3.4 Apply evaluation results for improvement.

Proposed instructional supervision model for language development of early childhood children

Discussion And Conclusion

Researchers would like to suggest to Early Childhood Education department, Ministry of Education and all kindergartens in Thailand to implement a systematic development for children to develop their language abilities with the condition that teachers are utilizing this instructional supervision model. Finally, implication of this research is encouraging the policy level agencies to focus on supervision through managing a motivation system for supervisors, school administrators, and early childhood school teachers who can conduct effective supervision.

Integration Of Model Predictive Control And Two-Box Systems In The Inventory Management Of Hospitals

Ednan AYVAZ
Kocaeli University
ednanayvaz@hotmail.com

Abstract

In many hospitals, increases in supply and service costs have surpassed increases in revenues. Drug and consumables, which are the highest cost elements, take an important place in public hospital budgets. For that reason, hospitals focused on these increases have sought to find effective ways to manage their medical supplies in a comprehensive manner. In hospitals stocks are kept in clinical warehouse and main warehouse. For this purpose, different models were used for clinical warehouse and main warehouse in this study. In many clinics in many countries, kanban (2Bin system), which is used as an efficient and effective inventory system, has been used in many hospitals called 2bin. Model predictive control (MPC) inventory method, which is an important advanced control technique, was used for control problems with variable values in main store. In the case of a public hospital, periodic and continuous inspections in clinical repositories were followed up daily with the use of the 2Bin inventory system in order to / so as to avoid excess stocks in the clinical tanks and the clinical waste was abolished. With the implementation of model predictive control (MPC) inventory management in the main warehouse, inventory costs have been decreased considerably by average stock level and the reduction of workload.

Interactive Activities “Technology-Based”: An Approach To Reach Self Learning Independence Of Moroccan University Students

Karima SLAMTI

Faculty of Humanities, Moulay Ismail University, Meknes Morocco

karimaslamti8@gmail.com

Abstract

The educational system in Morocco has been extensively reformed to be in line with the global movement, of adopting technology to the learning of the English language, which holds, today, a vital importance in the academic success of university students. This study aims at exploring the positive effect of adopting an effective use of technology in teaching the language to create a dynamic synergy among students. The study states a hypothesis that confirms the need of inserting the interactive “technology-based” activities into the teaching methodology to boost students’ self independence. This exploratory research uses a qualitative method, with a semi-structured interview instrument, which inductively examines the perceptions of 6 English university teachers on the positive impact of technology within interactive learning environments on the learners’ performances. The study results show that technology plays the role of a mediator in the success of interactive activities and in the trigger of students’ autonomy, motivation and connections. It also shows that the integration of technology in classrooms’ interactive activities leads to the acquisition of cognitive, communicative and collaborative skills. Hence, this study contributes in making teachers aware of the importance of integrating technology to their teaching methodology to improve the teaching quality of foreign languages acquisition in Moroccan higher education. It also shows to students the urgent need of learning digital literacy to become independent and successful in their professional life.

Keywords : *Academic success, Interactive learning, Technology-based Activities, Self-independence, Digital literacy.*

Introduction

Interactive learning prepares students to be more engaged in the learning process. They become able to understand classmates’ thinking approaches to use in real-world situations. Those students gain more knowledge through positive reinforcement and interactions with their peers, teachers and the faculty staff management. Creating learner-centered environments is the most important thing educators can do, to improve student’s learning independence, and delegate new learning roles (Doyle, 2008). Besides, cooperative activities help students becoming engaged towards the learning process that increases their critical thinking skill (Millis, 2010).

Digital interactivity, based on the interaction with smart devices, has many similarities with electronic and mobile learning. Students have the possibility to assess their work and independently learn about things they need to develop. The learning theory of e-learning often involves both out-of-classroom and in-classroom experience via technology tools, thanks to the computer and network which favour the transfer of skills and knowledge.

Junghun & Leem (2011) presented the key features of mobile learning including the mobility of learning space, flexible access to resources, simplicity of study details and interactivity. Also, this M-learning has increased students’ sense of research, Demouy & Kukulska-Hulme (2010, as cited in Boyinbode & Fasunon, 2015) expressed that:

“ the advantage of mobile learning in terms of formal and informal way of interaction among students and lecturers through their mobile devices; this supports social communication such as reviewing of contents, sending comments and comparing responses, which has proved to be a source of learning empowerment to the students and has enabled them to participate actively in collaborative learning environments.”(p.321)

The ability to learn independently has become a prior condition for living in a dynamic world of rapid change (Levett-Jones, 2005). Independent learning is related to general skills such as evaluation, reflection, and analysis, which are important for long-life-learning and living in diverse society (Warring, 2010). In such independent learning, students improve their autonomy and come up with problem-solving, decision-making and organizing learning activities (Fallows & Steven, 2000). Researchers associate the independent learning with learning skills and experiences (Wilkinson et al., 2004), group work and peer-tutoring (Houstona & Lazenbatta, 1996).

In this study, the learning theory of “connectivism” suits the interactive learning process. It may be melted with the interactive and communicative methodologies to enhance students’ knowledge and the perceptions gained through their personal network and personal life experience, “the capacity to know is more critical than what is actually known” (Siemens, 2006, para.6). In this learning theory knowledge takes the form of various digital formats, which is shared through information network and classroom interactions. Moreover, collaborative learning is favourable in such interactive environment, to exchange knowledge and enhance observation and

analysis skills. Siemens (2006, para.10) stated that “the ability to see connections between fields, ideas, and concepts is a core skill”.

The present study will seek to answer some research questions, to demonstrate the role of technology in interactive learning environments, the study will address:

- 1) How far does the use of technology devices improve the interactive learning process?
- 2) To what extent do “technology-based” activities develop students’ self independence?

This study provides a rationale for the claim that effective use of technology devices is critical to both interactive learning and students’ personal and professional success. The present study will test the validity of the hypothesis through a qualitative method of research analysis. The following hypothesis will be addressed:

H₁: the use of technology in interactive learning creates independent learners.

The answer to those research questions will contribute to the field of teaching foreign languages and to higher education in general. It will also serve at demonstrating how important technology is to enhance the needed personal skills of students to integrate the world of work.

Methods

The overarching purpose of this study was to provide insights into the dynamics involved in an effective interactive learning environment. Specifically, the study sought to examine teachers’ perceptions towards the positive impact of interactive “technology-based” activities on students’ self independence. The research population is 6 interviewees and the research environment is the Moroccan higher institutions.

Understanding teachers’ perspectives on the way they teach undergraduates students and how they observe, comment and assess their levels of improvement necessitates rich data. This requires obtaining detailed explanations of teachers’ methods, ways, activities and tools of teaching interactive activities. To obtain such data, the present study employed a qualitative interview methodology. It used a semi structured interview to elicit factors genuinely generated by the subject. This qualitative method evokes an exploratory strategy that aims at collecting and exploring teachers’ perceptions of the research questions in an inductive way, so as to confirm or reject the research hypothesis.

a) Teacher Background

In this study, interviews were conducted with 6 EFL teachers with long teaching experience, the research participants are the university teachers of the English department, 4 males and 2 females. Some interviewees were full-time faculty members at Moroccan universities, other interviewees taught at private higher schools and others were teaching in higher academic institutions.

b) Research Instrument

This study utilized a guided interview sample. In order to ensure that teachers could provide rich descriptions of their methods, techniques and new perspectives for teaching foreign language in an effective and interactive way. The questions underwent several modifications before they were asked, to increase clarity and politeness. Most interviews lasted 30 minutes.

c) Interview Procedures

Teachers welcomed the research subject. They did not hesitate in helping with their insights, visions, opinions and experiences to support and give an added value to the research analysis. An e-mail request was sent for participating and fixing the meeting dates for some of the interviewees who had a busy schedule. Most interviews were held in teachers’ offices or classrooms, all were face to face. When meeting the interviewees, several questions were asked and issues related to research subject were discussed; the interview guide helped for more concentration on the questions even if some emerging questions took place for more creativity and for a better result.

Based on this preliminary understanding, this interview was designed to accomplish the following objectives: 1) to find out the instructors’ perceptions of integrating technology devices to their teaching methodology, 2) To identify the kind of interactive activities/ tools used in classes, 3) To analyze the teachers’ assessments of the impact of interactive tasks on students’ personal development, 4) To indentify the extent to which technology-based activities lead to better learning outcomes.

Keeping in mind the qualitative nature of the project, all responses were noted and accurately stated. Two lists were then created which listed the summarized interview answers. An overall summary was given for each question based upon the responses. Words and phrases were first highlighted and then pulled from the responses, in order to find common themes that would answer the research questions. The study will seek to test the research hypothesis if the use of technology in interactive learning forms independent learners.

Results

All the interviews results were satisfactory, since they gave a valuable addition and more insights to the subject. This interview is interpreted and analyzed in some emerging themes, which are related to the research questions and that explain the interview questions in order to accept or reject the hypothesis.

Theme1: The Enhancement of Interactive Learning Through Technology Tools' Use

The majority of the interviewees reported, according to their classroom observations, that interactive activities involving the use of electronic devices enhance the learning process quality and motivate both educators and students to give their best.

One of the teachers declared that the major advantage of using ICT in the ESL classes is the vast variety of interactive activities, which allow more sharing of knowledge and more acquisition of language skills. The basic difficulty; however, is that ESL students may encounter obstacles when using the internet for preparing creative assignments, such as in linguistic complexity of materials, the inability to assess materials impartially, or the misuse of information that leads to plagiarism.

One of the teachers expressed that "technology has made a huge impact on communication". Engaging the younger generations requires a greater use of technology than ever before, and with the advent of enhanced use of technology in studying a foreign language and the instant connectivity, educators enjoy the rules of what is assigned.

Interviewees agreed that the adoption of technology devices in classrooms has boosted the teaching productivity, and also students' understanding, especially with the help of the visual aids. Besides, an interviewee affirmed that e-learning now is occupying a great part in students' ways of learning. Internet keeps the connection among the school members and allows teachers to send files, homework and projects to be done. He said "technology complements the teaching and learning process". He also stated that students may be given; for example, tasks to do during holiday that necessitate some explanations or modifications that the teachers are ready to reply on and explain via internet networks.

More than 50% of the interviewees agreed that this generation of connectivity obliges the teachers to go in advance and satisfy students' interests and needs, by introducing and adopting such new and modern digital ways to the syllabus and programs. For example, several teachers remarked that their third year students pay more attention to the effective use of multimedia technology especially the use of "PowerPoint" in giving presentations, which is not the case with first year students. As one of the interviewees explained: "students talk about visual aids in the 1st year course, but usually they don't talk about PowerPoint". "I do explicitly give 1st year students some guidance in using PowerPoint, and most of my students in this course end up using laptops or video projection as part of their works and speeches". As a consequence, he added digital interaction builds students' creativity, sense of research and team working skills.

Another interviewee pointed that students may sometimes interact with multifaceted materials which sometimes the teacher cannot control. He added that it is difficult to have a safe learning environment if students are using e-devices, checking e-mails, texting, facebooking or tweeting. Being able to multitask is a positive characteristic; however, "I am still convinced that eye contact is important" another interviewee stressed.

Theme 2: Digital Interactivity Paves the Way to Independent Learning.

Most interviewees agreed on the fact that the integration of ICT into higher education generates a set of transformations, which modify all the elements that take part in the educational process. Each member affects in a way another member's role and attitudes while interacting and learning in class. A professor said: "Yes, it is a kind of interaction when using new technology; students should use it properly and in an effective way to develop their language skills".

An interviewee stated that teachers must commit to using as much technology as feasible in preparing students for the future, in order to be independent members to cope with the jobs challenges. She added that teachers should pair students' knowledge of technology with their concern for transforming their future lives through education. And, here the teacher could act as developer, adapter and creator of materials and resources in classrooms.

One of the interviewees declared: "there is no success without difficulty", he added that students of this generation "generation of connectivity" have an opportunity and chance to use e-devices and become more intellectual and autonomous. And also the use of social media has helped them enriching their educational knowledge, he declared: « Countries have changed because of Facebook! ». Hence, with the help of technology students have the chance and opportunity to change their current situations to better, and create their own network for more interaction and sharing knowledge. Finally, he confirmed "I believe that digital interactivity creates connections between the school faculty members and favors students' self independence".

Some of the interviewees pointed that the "interactive mobile learning" has facilitated for both teachers and students the task of writing or copying tasks or assignments, it could be easily sent to students' e-mail inboxes.

Students also make use of their phone cameras and take pictures of lessons in the board to save time, they also make use of “USBs” to share files and exchange works between classmates.

The art of learning stylistic devices, as stated by an interviewee, are related to classroom interaction and language use. While learning a foreign language, students are exposed to many interactive activities that create a holistic development in their personality, as developing their team work spirit and reaching the interdependence level of working for the sake of the group’s benefit.

Finally, interviewees agreed upon the fact that within or beyond classrooms students become more independent while making appropriate use of technology tools, in looking for the information and adapting them to their interests and needs. Teaching foreign languages through interactive activities is suitable for students who want to learn on a specific subject, especially with the integration of e-devices for better learning outcomes.

The interviews’ answers lead to a clear vision of the important variables to be considered in this study analysis, in which technology is the mediator element that affects the success of interactive activities and the reach of self independence.

Figure1 : variables relations

Discussion

The present study seeks to explore the EFL teachers’ perceptions towards the adoption of technology in their teaching methodologies, teachers expressed how beneficial are the digital devices in teaching the English language through interactive activities. They see a strong impact of interactive activities on the students’ personal growth; they consider that technology is the key factor for students’ motivation, to give their best in the learning process. Moreover, the study results show that students develop a critical side of their personality, as acquiring self analysis and independence through classroom interactions. Social skills are implicitly enhanced, since the students start to know how and when to use appropriate words in different situations and cope with the surroundings. Teachers see a positive impact of the interactive activities on students’ communication skills, there are technology devices used in the English language classes that foster students’ analysis of performances, confidence in communicating ideas and team work spirit within and beyond the classroom.

The research hypothesis was accepted according to the research themes’ results that have answered the research questions. Findings showed that interactive “technology-based” activities improve both teaching and learning productivity. The adoption of technology offers a diverse set of activities to increase students’ motivations and facilitate the language learning process. For example, the visual aids help in better understanding and developing the visual memory that internalizes information, which improve students’ cognitive skills. Besides, students are more connected to each other, in such learning environment, in sharing knowledge, exchanging ideas, building relationships and understanding peers’ thinking approaches. Those skills are awakened through the learning theory of “connectivism” which encourages the learners to be closer to the source of information, and by creating their own networks for more interactions to occur.

Thanks to e-learning students are having an opportunity to connect via social networks with their teachers and classmates. Educators are engaged in the electronic exchange with their students in supervising and giving explanations, they may even offer a “home schooling” in some circumstances as health problems. Besides, classmates are open to share courses and assignment to help each other. As, students are often waiting for initiatives from teachers to guide and use technology, they always need more. For this reason, teachers try to meet those interests by melting different methods of teaching, to make them at the level of the learners’ expectations.

Furthermore, computer literacy is one of the skills students seek to master, in order to deal with their studies’ challenges. Teachers consider it as a complementary competency to what learners develop in their educational background. It has been raised in one of the interviews that “PowerPoint” is one of the computer techniques that

most students are asked to use in many tasks, this program among others develop students' creativity, sense of research and collaboration. Here, teachers offer a learner-centered environment to trigger students' independence. Digital interactivity is the fact of using technology devices within the teaching methodology. Educators tend to use such modern way of teaching in addition to the methodologies they use, according to the subjects and the students requirements. Through this teaching approach students might transform their future life, by acquiring the necessary skills. Moreover, teachers find the communicative approach suitable to teach language interactive activities. Educators' roles within the interactive learning environment change according to the nature of activities, as Doyle (2008) expressed about the different responsibilities that both students and teachers act and develop in class. Teachers try to lead the learners by giving instructions, positive reinforcement and letting students direct the learning process. In such interactive environment, educators simply act as the creators and adapters of the teaching materials.

While using technology in classroom activities students develop certain independence from the traditional way of learning, as taking notes and being passive towards the learning process. Warring (2010) considered the independent learning as a needed skill for a long-life education circle. In other words, students seek to search the information, select the useful ones and share knowledge. This enhances students' cognitive skills and multiple intelligences to independently assess their work; this fits Millis's (2010) consideration of the cooperative activities as an enhancement to learners' thinking skills.

Teachers find the mobile learning way of teaching as a facilitator to the interactive learning process, thanks to the mobility of the digital devices used in class. Students show certain autonomy while bringing their laptops, tablets and phones to use for academic purposes, and for time saving and for easy access to resources. Group work activities favour more interaction to take place to share thoughts, opinions and complement each other. The research results stressed the idea of Wilkinson (2004) that sometimes students may learn from their peers "peer-tutoring" and transfer knowledge. In such interactive learning process students may also develop an interdependence skill to serve the group work benefit.

The study did not raise an alarming effect of this teaching methodology that may negatively affect the educational process, apart the fact that some interviewees shed light on the decrease of using eye contact while using digital devices. And, the over dependence of students towards internet that may lead to the misuse of information and the non respect of language norms.

Finally, the present study shows the great importance of computer literacy to take part in the educational system. It contributes in promoting the necessity of integrating "technology-based" interactive activities in the teaching methodologies, for undergraduate students to know and master, in order to sharpen their long-life skills and become independent graduates to cope with the job market needs.

Conclusion

Higher education is a phase of transition from high school studies system to higher education challenges and then to the professional life. This exploratory study uses a semi-structured interview with 6 EFL university teachers, to probe their perceptions towards the integration of technology to diverse interactive activities, to teach the English language. This study shows that the interactive learning environment gives rise and improvement to many skills as cognitive, communicative and collaborative. The research findings shed light on the crucial role of technology, as a learning mediator that both improves the use of interactive activities and boosts students' self independence. The study also shows that students' autonomy is enhanced through learning experience that basically gained through digital interactivity, and the connections to faculty members' in sharing knowledge. This study makes a contribution in a way to raise the quality of teaching foreign languages, through an interactive learning "technology-based" environment. It also makes the teachers more engaged in adapting and updating their methods of teaching, to enhance students' independence to safely integrate the job market.

Özet

Bilgi ve iletişim teknolojilerinin gelişmesiyle beraber çocuklar çok küçük yaşlardan itibaren internete erişim sağlayarak, markalar için potansiyel bir tüketici pazarını internet üzerinden oluşturmaktadır. Çocuk yaşlardan itibaren tüketici davranışlarını elinde tutmak isteyen markalar, internet üzerinden daha ucuz ve kolay bir şekilde reklamlarını yayınlamayı tercih etmektedir. Bu çalışma, internet reklamlarının 8-11 yaş grubu çocukları üzerindeki ürün veya hizmetleri satın alma niyetlerini, reklamlara maruz kalma düzeylerini ve reklamların ilgi çekme düzeylerini yaş, cinsiyet, okul türü ve sosyo-ekonomik düzey değişkenleri açısından incelemektedir. Araştırma sonucunda internet reklamlarının 8-11 yaş grubu çocukları üzerindeki etkisini, yaş, cinsiyet, okul türü ve sosyo-ekonomik düzey değişkenleri açısından tüketici davranışlarında anlamlı bir ilişkisi olduğu görülmektedir.

Anahtar Kelimeler: Çocuk Tüketiciler, İnternet Reklamları, Tüketici Davranışları

Effect Of Internet Advertising On Consumer Behaviours Of The Children In 8-11 Age-Groups

Abstract

With the development of information communication technologies, children are a potential consumer market for brands using the Internet from very small ages. Brands who wants keep consumer behavior data from childhood, prefer to publish their ads on the internet as it's cheaper and easier. This study examines the purchase intent of Internet advertising on children of the age group of 8-11, the level of exposure and levels of interest in terms of age, gender, school type and socio-economic level variables. As a result of the research, the impact of Internet advertising on children of 8-11 age group has been observed to have a meaningful relationship in consumer behaviour in terms of age, gender, school type and socio-economic level variables.

Key words: Child Consumers, Internet Advertisements, Consumer Behaviours

Giriş

Modern toplumun vazgeçilmez teknolojik gelişmelerinden biri olan internet ve bilgisayar kullanımı, çocuklarımızın hayatlarına erken yaşlardan itibaren girmiştir. Taşkiran (2007), Eğlence ve bilgi sağlamanın dışında tüketim değerlerimizi etkileyen internet ve bilgisayar kullanımı çocuklarımızın tüketici davranışlarını etkilemektedir. Tükettiğimiz medya bizi bilinçaltı seviyesinde etkileme kapasitesine sahiptir. Bu özellikle reklam spotlarıyla çocukluk çağlarımızdan itibaren gerçekleşmektedir.

Türkiye’de Çocukların akıllı cihaz kullanımı, Eğitimde Fırsatları Artırma ve Teknolojiyi İyileştirme Hareketi (FATİH) Projesi ile bütün okulları kapsayacak şekilde daha da genişlemiştir. ‘Her çocuğa bir tablet’ uygulaması ile internet erişimi imkânı hale getirilmiştir. Akıllı telefonlar, android sistemler bu teknolojide yerini almış uygulamalar da pek çok şekilde sınıflandırılıp, geliştirilmiştir. Tekli oyunlar, çoklu oyunlar, müzik dinleme, film izleme, alış-veriş, okul işleri gibi uygulamalar çocukların kullanımına sunulmuştur.

İnternetin iletişim ve eğitim gibi farklı dallarda faydaları olduğu bilimsel bir gerçek olsa da, sosyal, psikolojik, zihni ve fiziki değişkenlerde savunmasız olan çocuklar, maruz kaldıkları basılı ve sözlü nitelikleri detaylandırmayıp anlamsallık kazandırmadan kabullendiklerinden, reklamların öz ve yapılarına yönelik teknik uygulamalar sonucu hemen ikna olabilecek ve yönlendirilebilecek konumundadırlar (Ertunç, 2011, s. 3). Bu bağlamda özellikle internet sitelerinde ve uygulamalarda sayısızca çıkan reklamların çocukların psikolojik ve sosyal gelişiminde önemli bir etkisi olduğu görülmektedir.

Türkiye İstatistik Kurumu (2016), bilgisayar ve internet zaman ayırma oranları, 2016 yılı Nisan ayında 16-74 yaş grubundaki bireylerde sırasıyla %54,9 ve %61,2 oldu. Bu oranlar erkeklerde %64,1 ve %70,5 iken, kadınlarda %45,9 ve %51,9’dur. Bilgisayar ve internet zaman ayırma oranları, 2015 yılında sırasıyla %54,8 ve %55,9 oranları git gide büyümekte ve yaygınlaşmaktadır. Tabi bununla birlikte reklama maruz kalma sayısı da artmaktadır.

Barutçu'ya (2011) göre, modern pazarlama anlayışına göre işletmeler hedef kitlelerine ulaşmak için mümkün olduğu kadar düşük bütçeli reklam ve iletişim araçları kullanmaya başlamışlardır. Bu bağlamda bilgi ve iletişim dünyasındaki gelişmeler neticesinde internet ve cep telefonları, geleneksel iletişim yöntemlerine göre daha düşük ücretlerle mesajların iletildiği dikkat çeken bir iletişim kanalı haline dönüşmüşlerdir.

Reklam "insanları gönüllü olarak belli bir davranışta bulunmaya ikna etmek, belirli bir düşünceye yöneltmek, dikkatlerini bir ürüne, hizmete, fikir ve kuruluşa çekmeye çalışmak, onunla ilgili bilgi vermek, ona ilişkin görüş ve tutumlarını değiştirmelerini veya belirli bir görüşü ya da tutumu benimsemelerini sağlamak amacıyla oluşturulan duyuru" olarak tanımlanmaktadır (Gürsoy, 1999, s. 9).

Aynı şekilde reklam kavramını Ünsal (1984)'e göre "Reklam bir işin, bir malın veya bir hizmetin para karşılığında, genel yayın araçlarında, tarif edilerek geniş halk kitlelerine duyurulmasıdır" (s. 12).

"Reklamlar, ürünün tüketicisi olsun ya da olmasın çocukları neredeyse her konuda dramatik yapının merkezi haline getirmiş durumdadır. Tüketime ve tüketim ürünlerine endekslenen hayat, yetişkinle çocuk dünyası arasında bilişsel donanım farkını alt-üst etmektedir. Arabadan, televizyona, bilgisayardan, banka hesaplarına, cep telefonundan, çamaşırların beyazlatılmasına kadar pek çok konuda büyükleri kadar ve hatta daha çok bilgili, tüketim "uzmanı" çocuklar yetişmektedir" (İnceoğlu ve Akıner, 2008, s. 192). Bu bağlamda 8-11 yaş grubu çocukları da birer tüketim uzmanı olarak markaların hedef kitlesini oluşturmaktadır.

Son çocukluk dönemi olarak kabul edilen 8-11 yaş grubu Piaget'in bilişsel gelişim kuramında somut işlemler dönemi olarak yerini almıştır. Benmerkezcilikten uzaklaşan bu yaş grubu, nesneleri birden çok boyut geliştirerek (renk, şekil gibi) gruplandırabilir (İnanç, Atıcı ve Bilgin, 2005, s. 50). John ise Piaget'ten farklı olarak doğrudan bilişsel gelişim üzerinde durmamış, bununla bağlantılı olarak çocukların tüketici olarak sosyalleşmesinde yaşla ilgili gelişmeleri ele almıştır çocukların tüketici olarak sosyalleşmesinin; 8-11 yaş dönemine analitik dönem olarak belirtmiştir (John, 1999; aktaran Madran ve Bozyiğit, 2013, s. 73). Analitik dönem, algısal düşüncenin sembolik düşünceye dönüştüğü ve bilgi işleme yeteneğinin arttığı dönemdir. Orta dönem çocuklukta, çocuklar 'merkezden kaymaya' ve detaylara ilgi göstermeye başlarlar. Bunun sonucunda daha karmaşık medya karakterlerini ve daha sofistike olay örgülerini yeğlerler (Piotrowski, Vossen ve Valkenburg, 2013, s. 54). Markaları ve reklamları daha iyi anlayan çocuklar, uyarıcıları farklı boyutlarda analiz ederek tüketim tercihlerinde karar verme yetenek ve stratejilerinde değişiklikler yaşarlar (Asıl, 2016, s. 171).

Bu bağlamda çocuğun aile satın alma kararları üzerindeki rol ve etkisi de değişmektedir. Bunun en önemli nedeni, çocuğa verilen önemdeki artışla haberleşme teknolojisindeki gelişmelerdir. Çocuklar reklamlarla daha çok muhatap olmakta ve reklamlardaki ürünleri istemektedirler. Nihayet, bu çocuklar günün birinde baba olmakta ve kendi çocukluk dönemindeki tatminsizlikleri çocuklarına yaşatmak istememektedirler (İslamoğlu ve Altunışık, 2003, s. 214). O kadar ki daha şimdiden çocuklar kendi ürünlerinin yanında anne babalarının ürünlerinin de satın alma kararında etkilidir (Odabaşı, 2002, s. 263). Bu yönüyle de çocukların erken yaşlarda internet kullanmaları onları önemli bir potansiyel bir hedef kitle yapmaktadır.

Reklamlar sosyo-ekonomik yönünden imrendirici, özendirici olmasının yanında kimi çocuklarda özendiricilik, kimi çocuklarda kıskançlık yaratmaktadır. Reklamlarda günden güne artan çocuk kullanımı ile çocukları markaya özendirmek ve bu durumu moda haline getirmek istenilmektedir (Müftü, 2013, s. 274). Medya araçlarıyla kontrolsüz bir enformasyon bombardımanına uğrayan çocukluk, hızla yetişkin dünyasına taşınırken, oyun bahçeleri boşalmaktadır. Öyle ki Amerikalı çocuklar bir yılda yaklaşık olarak 20000 - 40000 adet arasında reklam izlemektedirler. En çok reklamı izlenen ürün kategorisi gıdadır ve %50'sinin hedef kitlesini çocuklar oluşturmaktadır (Story, Mary ve French, 2004; aktaran İnceoğlu ve Akıner, 2008).

Reklam filmlerinde çocukların hedef tüketici olmaları ve ilgili ilgisiz pek çok ürün reklamında kullanılmalarının üç temel nedeni ise, öncelikle bir tüketici olarak çocuğun "tüketim" isteğini kamçılamak, ikincisi vaat edilen hayata ulaşmak için kullanılması gereken ürünleri almaları konusunda ailelerine "baskı" yapmalarını sağlamak, üçüncü neden ise gelecekte iyi bir tüketici birey olmalarının alt yapısını oluşturmaktır (Kuruoğlu ve Saygüder, 2007).

Öyle ki bu üç temel hedefe ulaşmak isteyen markalar gelişen teknolojiyle birlikte internet reklamcılığını önemsemektedir. İnternet reklamcılığının markalar tarafından çocuklara yönelik tercih edilmesi internetin sunduğu doğal ortamından kaynaklanmaktadır. Çünkü internet, diğer iletişim kanalları gibi tek bir kişi, kurum ya da ülkenin tekelinde değildir. İnternet, bu teknolojiyi kullanan milyonlarca kişi, firma ve kuruluşun ortak mülkündedir (Şeker, 2005, s. 67). Bu durum reklam sektörünün internet reklamcılığını tercih etmesini olumlu kılar.

Geçmişte kişiye yönelik olmayan, kitlesel ve tamamıyla reklam verenin yönlendirmesi üzerine kurulu olan reklamcılık; internet teknolojisinin gelişmesi, (Web 2.0 ve sosyal medya gibi kavramların interaktif bir hayat tarzının tüketiciler ile pazarlamacılar arasına girmesi gibi sebeplerle kişiye özel ve etkileşimli bir hal almakta olduğu söylenebilmektedir (Lombard ve Snyder-duch, 2011, s. 57).

Sosyal medya en temelinde insanların nasıl keşfedeceği okuyacağı ve paylaşacağı konusunda bir değişimdir. Sosyoloji ve teknolojinin monolog (bir kişiden çok kişiye)'u diyaloga (çok kişiden çok kişiye) çeviren bir birleşimdir (Fehdi ve Aboud, 2013).

IAB'nin Social Advertising Best Practices raporunda da belirtildiği gibi sosyal medya reklamlarını ve internet reklamcılığını geleneksel reklamdan ayıran en önemli özelliklerden biri sosyal reklamın hazırlanmasında kullanılan verinin tüketicinin hangi televizyon kanalını izlediği, hangi gazete veya dergiyi satın aldığı ya da internet üzerindeki hangi sitelere tıkladığı ve web tarama davranışlarının verisinden yola çıkarak değil, tüketicinin açığa vurduğu kişisel profilinden, sosyal bağlantılarından ve bu sosyal bağlantıları ile olan ilişkilerinden hareketle elde edilmesidir. Davranışsal hedefleme (behavioral targeting) reklamın iletilmesi ile ilgili bilgiye dair iken, sosyal reklamcılık bilginin paylaşılması ve mesajların tüketiciler arasında transfer edilmesini göz önünde bulundurmaktadır (Yurttaş, 2011, s. 43).

İşletmelerin faaliyetlerini sürdürebilmesi için, tüketicilerin ihtiyaçlarının belirlenmesi ihtiyaçları belirlenen tüketicilerin bölümlendirilmesi, yeni ürünlerin bu ihtiyaçları karşılayacak şekilde konumlandırılması ve bir kez iletişime geçen müşteri ile bağlılık kurulması için tüketicinin davranışlarının çözülmesine ihtiyaç vardır (Altunışık, Özdemir ve Torlak, 2006, s. 61).

Bu bağlamda internet reklamlarının çeşitli sosyal mecralarda kendini göstermesiyle bu türler tüketici davranışlarını çözümlemek için incelenmektedir. Ortak projeler (örn. Wikipedia), bloglar ve mikroblogger (örn. Twitter), içerik toplulukları (örn. Youtube), sosyal ağ siteleri (örn. Facebook), görsel oyun dünyaları (örn. World of Warcraft) ve görsel sosyal dünyalar (örn. Second Life) (Fehdi ve Aboud, 2013).

Yukarıda bahsedilen alanlara üreticiler, satıcılar, pazarlamacılar, işletme sahipleri tarafından yerleştirilen reklam spotları çocukların tüketici davranışlarını etkilemektedir. Bu araştırma, internet reklamlarının 8-11 yaş grubu çocuklarının tüketici davranışlarına etkisi incelenmiştir. İnternet reklamlarının ikna etmeye yönelik amaçlarında çocukların reklama maruz kalma, ürünü satın alma ve ürünün çekicilik boyutunun yaşa, cinsiyete, soysa-ekonomik düzeylerine göre tüketici davranışlarına yansımaları ele alınmıştır.

Amaç

Günden güne artan internet kullanımı çocuk kullanıcıların da sayısını hızla arttırmaktadır. Kotler'e (2000) göre, TV'nin etkisi giderek azalacak, Gazetelerin traji düşmeye devam edecek, radyo kullanımı artacak, dergiler çoğalacak, internet, e-posta ve sohbet odaları bu internet ortamında doğup büyüyen çocukları artıracaktır. Bu internet kullanıcısı çocuk tüketiciler pazara açık olan internetten ve pazara yön veren en güçlü güç olan reklamlardan etkilenmektedir. Bu etkilenmenin sonucunu açıklamaya çalışan bu çalışma özellikle anne ve babalar için önemli bir araştırma olmaktadır.

Araştırmanın amacı, çocukların yaş, cinsiyet, sosyo-ekonomik düzey ve okuduğu okul türü ekseninde ilköğretim çocuklarının reklama maruz kalma, ürünü satın alma ve ürünün çekicilik boyutlarının tüketici davranışlarına etkisini ölçmektir. Çocukların, fiziksel ve psikolojik değişkenleri olduğu gibi verilen eğitim, öğretim, yetiştirildikleri çevre ve yetiştiriliş tarzlarının farklı olmasının getirdiği bir takım değişkenler nedeniyle farklı satın alma tutum ve davranışları izlenmektedir. Bu farklılıkları azaltmak herkes tarafından kabul gören sonuçlara ulaşabilmek amacıyla çocuklara yönelik çalışmalar ve incelemeler internet reklamlarının etkilerini tüketici davranışlarında ararken internet kullanan ve kullanmayan olarak belli bir genel ayrıma gitmeden amaca hizmet etme planlanmıştır.

Şehirleşme, eğitim seviyesindeki artışın yanında eğitimin öğretimin yaygınlaşması, bunun yanında ekonomik ve sosyal koşulların iyileşmesi gibi olguların yansımaları ile aile içinde ki çocuk sayısında bir iniş görülmektedir ayrıca çocukların ailedeki etkilerinin farklılaştığına ve aile kararlarındaki etkilerinin güçlendiği yönünde bilgiler edinilmektedir. Birçok çalışma ailede tüketim esnasında eşlerin rolü üzerine kurulu iken, artık pazarlama ve uluslararası ticaret alanında çocukların rolüne olan ilgi hızla artmıştır (Gbadamosi, 2012, s. 591). Dolayısıyla çocuğun tüketim davranışlarının şekillenmesinde ailenin doğrudan etkileri; tüketimle ilgili bilgileri edinme ve inanç, norm kalıplarının oluşumunu içermektedir. Bu oluşum gerek sözlü ifadelerle gerekse örnek davranışlarla gelişebilmektedir. Dolaylı etkiler ise; çocuğun tüketiciliği öğrenmesini etkileyebilen diğer sosyalizasyon faktörleriyle etkileşim kalıplarını içermektedir (A.Ersoy, Demirci ve S.Ersoy, 2007).

Pazarlama faaliyetlerinde, satın alma davranışları ve tüketim kavramına değinilerek çocukların önem kazanmasında 3 önemli değişkenden birincisi çocukların pazarlama için artan önemi, ikincisi çocuklara yönelik pazarlama, üçüncüsü çocuğun tüketici olarak sosyalleşmesidir (Berey ve Pollay 1968; aktaran Güleraslan, 2011). Bu üç değişken yukarıda bahsedildiği gibi doğrudan ve dolaylı etkilerle çocuğun tüketime hazırlanması sonucunda pazarda büyük rol oynamaktadır.

"Gittikçe çocuklara uygulanan pazar genişlemektedir. Bakıldığında muazzam bir artış gözlenen çocukların ekonomideki hâkimiyetine eş olarak direkt çocuklara hedef olarak üretilen ürün veya hizmet kuşağında belirgin bir ilerleme vardır. Yurdumuz açısından ele alındığında da her yıl çok sayıdaki şirketin çocukları hedef altında tutan pazarla ilgilendiği görülmektedir. Sayıları yükselen sadece çocuk bazda üretim yapan sektör sayısının fazla olması bu alana verilen önemi gözler önüne sermektedir" (Güleraslan, 2010).

Pazarlama müşteri bulma sanatıdır. Ama daha da önemlisi karlı müşteri nasıl bulunur ve karlı müşteri nasıl tutulur? Bu soruların derdine düşen pazarlamacılar yükselen değer olarak yeni neslin öncekilere kıyasla varlıklı olduğu hipotezi ile çocuk yaşlardan itibaren tüketici davranışlarını çeşitli araçlarla kontrol altına almaya çalışmışlardır (Kotler, 2000).

Bu araçların en başında gelen internet reklamlarının satın alma konusunda aile iletişimde çocuklar üzerindeki etkisi göz ardı edilemez bir gerçektir. Reklamların çocuklar üzerindeki olumsuz işlevlerinin bilinmesi anne ve babaların onların yaşamlarının ilk yıllarından itibaren dikkat etmesi gereken unsurlardır. Yaşamlarının ilk yıllarında çocuklar rastlantısal tüketici iken, içinde yer aldıkları aile çevresinin ve iletişim sisteminin etkisiyle seçici tüketici rolleri ve marka tutumları gelişmeye başlamaktadır (A.Ersoy, S.Ersoy ve Sarıabdullahoğlu, 2009). Bu nedenle reklamlar sadece yetişkin bireyleri değil, toplumun önemli bir kesimini oluşturan çocukları da hedef alarak, çocukların ve yetişkinleri “gereksiz tüketime” yönlendirmektedir.

Özellikle çocuklar, ticari reklamların satış niyetini anlamadıkları için ya da reklamın ikna etme niyetini tahmin edecek ve karşı koyacak uygun bilişsel yetenekten yoksun olduklarından dolayı reklamlara karşı kendilerinin koruma konusunda yetişkinlere göre daha savunmasızdırlar (Brucks, Armstrong ve Goldberg, 1988, s. 471). Çünkü her ne kadar çocuklar reklamlar konusunda belirli bir bilince sahip olsalar da özellikle küçük çocuklar, yaşam deneyimleri az olduğundan, düşünme ve eleştirme yeteneğini henüz kazanamamış olduklarından, yalan ile gerçeği ayırt etmede zorlandıklarından, reklamın asıl amacını bilmediklerinden; 8-11 yaş grubundaki çocuklar da özenmeye meyilli olduklarından dolayı reklamlardan kolayca etkilenecek gerçekte ihtiyaçları olmayan ürünleri elde etmek istemektedirler (Gülnezeol, 2004). Bu durum ebeveynleri zor durumda bırakmakta, bu istekleri yerine getirmedikleri takdirde aile içinde çatışmalar meydana gelmekte ve ailenin tüketim öncelikleri olumsuz şekilde değişmektedir.

Bu bağlamda çalışmada öncelikle 8-11 yaş grubu çocuklarının özellikleri, çağdaş pazarlama ve geleneksel pazarlamadaki tutum ve davranışları dikkate alınarak İnternet reklamlarının çocuklara yönelik pazarlama çalışmalarından çocukların tüketici davranışları üzerinde durulacak ve aile içindeki karar mekanizmaları göz önünde bulundurularak çocuğun ailenin satın alma kararlarına, hane tüketimi ve marka tercihlerine etkisi değerlendirilecektir.

Ebeveynlerin reklamlar tarafından teşvik edilen yanlış algıları kırabilmesi ve çocuğu doğru alana yönlendirmesi oldukça zordur. Bu çalışmanın amacı internet reklamlarının çocuk istek ve arzularını tam olarak kavramaya çalışıp ebeveynlerin çalışmanın sonucundan çıkan unsurlara göre medya okuması yapabilme istek ve arzularını geliştirmektir.

Bu çalışmanın hedefi, 8-11 yaş arası çocuk sahibi ailelerin internet reklamlarının çocuklar üzerindeki etkilerini algılamalarını etik açıdan değerlendirmektir. İnternet reklamcılığının çocuklar üzerindeki tüketici davranışı etkisini şiar edinen bu çalışma ile çocukların tüketici davranışları üzerinde psikolojik ve sosyal kanatlı inceleme ile tüketici davranışları irdelenmeyi hedeflemektedir.

Önem

Günümüz tüketim toplumlarında tüketim kavramını duygusal, hissi ve deneyim boyutunun öne çıktığını satın alma sürecinde geleneksel satın almadan bariz seviyede kaymalar ve farklılıklar gösteren hazzı tüketim, tüketici davranışları açısından giderek daha fazla oranda inceleme konusu olmaktadır (Gümüş, Sungur ve Gülnihal, 2014). Özellikle çocukların tüketim davranışları ve alışkanlıklarında belirgin değişiklikler gözlemlenmektedir. Bu değişiklikler sosyal medyada büyük yankı uyandırırken internet reklamlarının çeşitli mecralarda boy göstermesiyle birlikte daha karmaşık hala gelmektedir. Bu karmaşıklık özellikle anne-babaların ölçmesi, izlemesi ve çözmesi gerekmektedir. Böylelikle daha bilinçli bir tüketici olması beklenen çocuklar yetişmektedir. İnternet reklamcılığı geleneksel medyadan farklı olan özellikleri ile tüketiciler ve kurumlar için farklı bir boyutta öneme sahiptir. Geleneksel medyada reklam kanallarında/araçlarında tüketiciyi reklama cezp etmek ayrı bir çaba iken internet ortamında bizatihi kişiler kendileri yoğun ve dışa kapalı bir cezp olunmuşlukla iç içe geçirilmiş sanal sayfalar ve labirentler arasında dolaşmaktadırlar. Hatta bu durum özellikle küçük yaşlardaki kullanıcılar üzerinde bazı sosyal ilişki ve psikolojik yaklaşım bozukluklarına neden olması teşhisiyle eleştirilmektedir (Görkey, 2008, s. 195). Bu eleştirilere paralel olarak, reklamın çocuklar üzerinde sosyal sorumlulukları bulunduğu için reklamda uluslararası ahlak yasası geliştirilmiştir (Torlak, 1995). Bu bağlamda ebeveynlerin, internet reklamlarının çocuklar üzerindeki etkileri hakkında bilinçlenmeleri önemlidir.

Ailelerin ekonomik faktörleri çocuk tüketiciler açısından doğrudan etkilidir. Reklam endüstrisinin ve pazarlama stratejilerinin ilerlemesinin amaçlarından biri de ekonomik alım gücünün var olduğu katmanları keşfetmektir. İnternet reklamcılığını bu boyuttan ele aldığımızda küresel toplumların bir arada yaşadığı sanal okyanusa çok büyük ağlar atmakla aynı değer görmek mümkündür (Köseoğlu, 2002). Bu anlamda reklam verenlerin alım gücü kanalları ararken anne-babaların çocuklarına ne ölçüde gelir ayırdıklarını bilmeli, ne ölçüde çocuklarına harcama yapması gerektiğini bilmelidir. Bu çalışma çocukların tüketim alışkanlıklarını ortaya koyarken çocukların etkilendiği reklamları açıkça ortaya koyma açısından önemlilik arz etmektedir.

İnternet reklamcılığının pazarlamayı da içine alan kapsamlı ilişkiler ve eylemler dünyasıyla bütünleşmesi açısından da görmek gerekmektedir (Gümüş, Sungur ve Gülnihal, 2014). İnternet dünyasının içerisinde ticari ilişkilerin ve reklamlarında sanal sosyal ortamlar yarattıklarını ya da kendilerine en yakın sanal ortamlarda gerçekleştirildikleri gözlemlenmektedir (Görkey, 2008, s. 202). Bu sanal ortamın çocukların üzerinde yarattığı olgu, çalışmayı incelemeyi değerli kılmaktadır.

Çağdaş toplumlarda üreticinin ürettiği mal ve hizmet doğrultusunda tüketici, kendisini istediği mal ve hizmeti üretmesini ve bunu yaparken toplumu riske atacak bir unsur teşkil etmeden yapmasını görmek ister. Bu durum özellikle reklama maruz kalan çocuklarda endişe verici durumların ortaya çıkmasına zemin hazırlamaktadır (Son zamanların en popüler iletişim, oyun, sosyal alanı olan internet çocukların bu alandaki reklama maruz kalma sayısını arttırmış ve çocuk tüketici davranışlarını değiştirmeyi elinde tutmuştur (Karaca, Pekyaman ve Güney, 2007, s. 240).

Bu çalışma ile evrensel kümeden seçilen örneklemle internet reklamlarının tüketici davranışlarına etkisi analiz edilerek sorumluluk sahibi reklamveren, reklamcı ve çocukların korumasını üstlenen anne baba profillerinin bu çalışmadan yararlanılacağı düşünülmektedir.

Literatür Taraması

Literatüre baktığımızda internet reklamlarının çocuklar üzerindeki etkileriyle ilgili araştırmalar belli bir başlık altında sunulmamakla birlikte genellikle geleneksel iletişim araçlarının çocuklar üzerindeki etkileri incelenmiştir. Bu sınırlı literatürde ele alacağımız araştırmalarda genellikle televizyon reklamlarının çocuk tüketiciler üzerindeki davranışları mevcuttur. Bu çalışma aynı zamanda literatürde eksikliği hissedilen internet reklamlarının çocuklar üzerindeki etkisini, ele alınan boyutlarıyla gösterilmesi açısından önemlidir.

Konuyla ilgili çeşitli araştırmalar bulunmaktadır. Büyükbaykal (2007), “Televizyonun Çocuklar Üzerindeki Etkileri” üzerine bir araştırma yapmıştır. Bu çalışmada televizyonun çocuğun toplumsallaşmasına, beslenme alışkanlıklarına, psikolojisine, zihinsel-duygusal-fiziksel gelişimine olan etkileri irdelenmiştir. Bunun yanında Türkiye’de çocukları içeren şiddetin ve toplumun huzurunu bozan vakaların televizyonda görüntülenmesi, basın meslek ilkelerine uygun ve etik olmayan içeriklerin yayınlanması çocuklar üzerinde silinmeyen izler oluşturabilmektedir. Haberlerin şiddet, kan, kin, kavgı ve savaş gibi unsurlarla topluma servis edilmesi ve bunları çocukların görme ihtimalini düşünmeden yayınlanması çocukların aklına olumsuz içerik yüklenmesi gibi durumlar da çalışmadan çıkarılabilecek durumlardır.

Bu çalışmada televizyonun toplumun faydasına bir iletişim aracı olarak işleyişini ve değerini saklayabilmesi için eğitici programları kullanması ve çocuklar için kaliteli yayınların olması gerektiği vurgulanmaktadır. Bir kitle iletişim aracı olan televizyonun çocukların gelişimleri üzerinde bıraktığı olumsuz etkisi başka bir iletişim aracı olan internet yayıncılığında çocuklarda hissettirdiği bilinçaltı, yönlendirme ve etkilenme içerikleriyle çalışmaya önemlilik kazandırmaktadır.

Aynı zamanda çalışmada markaların farklı türden pazar kategorilerinde varlığını sürdürürken televizyon mecrasının ötesinde bugün en önemli ve en ucuz pazar olarak kendini gösteren internetin, aynı televizyon gibi çocukları erken yaşlarda geleceğin tüketicisi olarak tanımlamaktadır. Ebeveynlerin çocukların ilk modeli olduklarını ve gerekli yerde kendi alışkanlık ve tutumlarını çocuklarının gelişimlerine endeksleyerek düzenlemeleri gerektiğinin önemi vurgulanmıştır.

Çalışmanın bu özelliği ile internet reklamlarının 8-11 yaş grubu çocuklarının ebeveynlerine satın aldırma davranışları ile ailelerin bütçelerini çocukların gelişmelerine bağlı oluşturmalarının gerekliliği yönünden benzerlik içermektedir.

Quadır ve Akaroğlu (2009), “Televizyon Reklamlarının Çocuk Tüketiciler Üzerine Görsel etkilerinin Bir İncelemesi” adlı makalesinde öğrencilerin reklamlardaki öğelerden görsel olarak etkilenme durumlarını incelemiştir. Örneklem grubunu oluşturan öğrencilerin reklamlarda kullanılan görsel öğeler arasında en çok oyuncuların daha sonra sırasıyla ürünün markasından kullanılan renklerden, kullanılan dekordan ve en son tanıtılan üründen etkilendikleri saptanmıştır. Konu öğrencilerin sosyoekonomik düzeylerine göre incelendiğinde, özel okulda okuyanların, tanıtılan ürüne devlet okulunda okuyanlardan daha çok dikkat ettikleri devlet okulunda okuyanların da kullanılan renklere, özel okulda okuyanlara göre daha çok dikkat ettikleri belirlenmiştir. Öğrencilerin yaşları söz konusu olduğunda, her iki yaş grubu da komik reklamları benzer oranlarda severken yaş grubundakilerin çizgi filmli hikâye içeren ve çocukların rol aldığı reklamları 12-14 yaş grubundakilerden daha çok sevdikleri saptanmıştır.

Öğrencilerin reklâmını izledikleri bir ürünü satın almak istemesinin oranlarını şöyle verilmiştir. Örneklem grubundaki öğrenciler, izledikleri bir reklamdan sonra o ürünü satın almayı % 45.5 oranında her zaman, % 46.0 oranında bazen isterken, % 8.5 oranında hiçbir zaman istemediklerini bildirmişlerdir.

Yukarıdaki çalışma çocukların reklamlardan etkilenme boyutlarını yaş, cinsiyet, ekonomik düzey ve okul türü açısından incelemesi yönünden bu çalışmaya benzerlik göstermektedir. Çalışmada öğrencilerin televizyon reklamlarında izledikleri ürünü satın almak istemesi oranı saptanırken, bu çalışmada internet reklamlarında izledikleri ürünü satın almak istemesi verileri incelenmiştir. Yine aynı şekilde öğrencilerin televizyon reklâmı yapılan bir ürünü satın alma şekillerinde Katılımcı öğrenciler, reklâmı yapılan ürünü daha çok anne ve babalarından satın almalarını istemektedir, daha sonra kendileri satın almakta, en az oranda ise kardeşlerinden ve diğer akrabalarından ya da bir arkadaşlarından kendileri için satın almalarını istemektedirler. Bu çalışmada ise internet reklamlarından etkilenen çocukların ebeveynlerinin online satış ya da yüz yüze satış tercihleri faktör analizi ile gösterilmektedir.

Seferoğlu ve Yıldız (2013)'a göre çocuklar üzerinde günden güne artan bir internet bağımlılığı oluşmaktadır. Bilgi teknolojileri okuryazarlığını ölçmek ve internet bağımlılık oranını belirlemek için yaptıkları araştırmada, ortaokul beş ve altıncı sınıf öğrencilerinin farklı değişkenlere göre internet'e bağımlılık düzeylerini ve facebook kullanım durumlarını belirleyerek, facebook kullanım durumları açısından internete bağımlılık düzeyleri incelenmiştir.

Çalışmada elde edilen bulgular katılımcıların %85,5'inin İnternet bağımlılık ölçeğinden alınan puanlara göre "Bağımlılık Göstermeyenler" grubunda olduğunu göstermektedir. Öte yandan İnternet bağımlılık ölçeğinden alınan puanlar erkeklerde (33.79) kadınlara (17.72) göre daha yüksektir. Yine benzer şekilde facebook hesabı olanların İnternet bağımlılığı ortalamaları facebook hesabı olmayanlara göre daha yüksektir. Ayrıca facebook kullanma sıklığı ile İnternet bağımlılığı puanları arasında anlamlı bir farklılık olduğu belirlenmiştir.

Görüldüğü gibi internet bağımlılık derecesinin oluşması, bu çalışmada internet reklamlarının çocuklar üzerindeki tüketici davranışlarının önemli ölçüde etkileneceğini göstermektedir. Aynı zamanda reklama maruz kalma boyutunda gösterilen verilerde internette oyun oynayarak, video izleyerek ve facebook gibi sosyal medya kullanarak reklama ulaşma değerlendirmeleri faktör analizi ile gösterilmektedir.

Karaca, Pekyaman ve Güney (2007), "Ebeveynlerin Televizyon Reklam İçeriklerinin Çocuklar Üzerindeki Etkilerini Etik Açısından Algılamalarına Yönelik Bir Araştırma" yapılmıştır. Bu çalışmanın amacı; 4-13 yaş arası çocuk sahibi ailelerin televizyon reklamlarının çocuklar üzerindeki etkilerini algılamalarını etik boyuttan incelemektedir. Yaygın olarak kamuda bilinen televizyon reklamlarının çocukları olumsuz etkilediği savıdır. Bu savın etik açıdan boyutlarını tespit etmek için bir anket çalışması yapılmıştır. Elde edilen veriler SPSS paket programı yardımı ile frekans analizi ve faktör analizine tabi tutulmuştur. Çıkan sonuçlara göre genellikle ailelerin görüşü; reklamların çocuklara zarar verdiği ve reklamların etik açıdan sorunlu olduğu yönündedir. Çalışmanın amacı, 4-13 yaş çocuk sahibi ailelerin televizyon reklamlarının çocuklar üzerindeki etkilerinin etik açıdan algılandığının incelenmesidir. Bu bağlamda, televizyon reklam içeriklerinin çocukları etik (ahlaki) yönden olumlu ya da olumsuz etkileyip etkilemediği araştırılmıştır. Araştırmanın sonucunda 4-13 yaş arası çocukların reklamları beğendiği, reklamların inandırıcı olduğu ve reklamlardaki karakterin yerinde olmayı arzuladıkları görülmektedir. Reklamların çocuklar üzerindeki etkisini etik perspektiften değerlendiren çalışmanın sonuçları ilgili çalışmadaki reklamların çocuklar üzerindeki tüketici davranışlarını baz alarak paralel çıkarımlar gözlemlenmektedir.

Varyans analizine göre ise çocukların yaşı ve çocukların reklamlardan etkilene düzeyleri, ailelerin gelir düzeyleri ile çocukların reklamlardan etkilene düzeyleri arasında anlamlı bir ilişki yoktur. Çalışma sonucunda çocukların yaşı, Yine varyans analizine göre, ebeveynlerin eğitim durumu, gelir düzeyi, yaşları, cinsiyetleri ile TV reklam içeriklerinin çocuklar üzerindeki etkilerini etik açıdan algılama düzeyleri arasında anlamlı bir ilişki yoktur.

Yukarıdaki çalışmada bahsedilen çocukların televizyon reklamlarından etkilene düzeyleri yaş ve sosyo-ekonomik yönden ele alındığında bir ilişkiye rastlanılmamıştır. Oysaki bu çalışmada bir ilişki düzeyi bulunmaktadır. İnternet reklamlarının 8- 11 yaş çocukları üzerindeki tüketici davranışı analizi sonucunda her yaş grubunun internet reklamlarından etkilene düzeyinde farklılıklar gözlenmektedir. Ayrıca bu fark okul türü ekseninde de etkisini göstermektedir. Özel okulda okuyan öğrenci ile devlet okulunda okuyan öğrenci arasında internet reklamlarından etkilene düzeylerinde fark vardır.

Turgut, Akyol ve Giray (2016), "Sosyal Medya Reklamlarında Tüketici Algılamaları İle Satın Alma Niyeti Ve Ağızdan Ağıza İletişim Arasındaki İlişki" adlı bir çalışma yapmışlardır. Bilgisayar ve internetin kullanım sıklığı sosyal medyanın hayatımıza girmesine neden olmuştur. Tüketicilerin kimsenin etkisi altında kalmadan ürün ve hizmetlerin hakkında bilgi sahibi olduğu ve bu bilgileri kendi iradesince paylaştığı savunulmuştur. Ağızdan ağıza iletişimle bilgilerin paylaşılması sosyal medyadaki reklamların da önemini arttırmıştır.

Sosyal medyanın katkılarının birisi, tüketicilerin satın alma davranışlarını etkileyecek olan ağızdan ağıza iletişim üzerine olmuştur. Kullanıcılarına, zaman ve mekan sorunu yaşatmadan kullanım imkanı veren sosyal medya, reklam ve sayfalarıyla ağızdan ağıza iletişim ile tüketicilerin satın alma niyetlerini etkilemektedir. Herhangi kimsenin etkisi altında kalmadan

beğenilerek paylaşılan, yorum yapılan videolar, fotoğraflar insanların bir araya gelerek birbirleriyle fikir alışverişi yapmalarına olanak sağlaması sosyal medyanın gücünü arttırmıştır. Sosyal medyanın gücünü gösterdiği alanlardan birisi sosyal medyanın reklama uygun bir ortam olmasından dolayı reklamcılıktır (Akyüz, 2013, s. 1).

Turgut vd'nin yapmış olduğu çalışmada sosyal medya reklamlarında tüketici algılamaları ile satın alma niyeti ve ağızdan ağıza iletişim arasındaki ilişki ortaya konmuştur. Online anket sonuçlarına göre; online reklamlar ile tüketicilerin satın alma davranışı üzerinde olumlu bir ilişkinin olduğu tespit edilmiştir.

Samurçay (1983), "Televizyon Reklamlarının Çocuklar Üzerine Etkisi" adlı bir çalışma yapmıştır. Bu çalışmada 8-11 yaşındaki ilköğretim çocuklarının televizyon reklamlarını tüketici davranışına etkisi ölçülmektedir. Bu etkiyi tespit etmek için yaş, cinsiyet ve sosyo-ekonomik düzeyi açısından televizyon reklamlarının çocuklar üzerinde tüketici davranışlarına etkisi incelenmektedir.

Reklamlarda görüp satın almak istedikleri açısından 8-9 yaş grubu satın alma konusunda daha istekli iken 10-11 yaş grubu daha küçük yaş grubuna göre daha az eğilimlidir. Reklamların faydalı olduğunu düşünen 8-11 yaş grubu ile reklamları daha eleştirili bir nitelikte bakan 10-11 yaş grubu çalışmanın sonucu gösteren reklama inanırılık dereceleri olarak karşımıza çıkmaktadır. Öte yandan kadın ve erkek 8-11 yaş grubu çocukların beğendikleri ve sevdikleri reklamlar açısından bir fark gözlemlenmemiştir. Kadın çocuklarla erkek çocuklar arasında, kendi reklamlarını anlama ve ifade etme açısından da hiçbir fark bulunmamaktadır. Reklamların etkisi altın da kalıp satın alma davranışı sergileyen çocuklar açısından alt grup çocukları, üst sosyo-ekonomik düzeyindeki çocuklara oranla çok daha hevesli ve istekli durumdadırlar.

Bahsedilen çalışma televizyon reklamlarının 8-11 yaş grubu çocuklarının tüketici davranışlarına etkisini yaş, cinsiyet, sosyo-ekonomik düzey boyutlarında incelerken bu çalışma ise internet reklamlarının 8-11 yaş grubu üzerinde etkisini yaş, cinsiyet, sosyo-ekonomik düzey boyutlarını irdelemesi yönünden benzerlik göstermesinin yanında çıkan sonuçlar bakımından da paralellik söz konusudur.

Battalar ve Cömert (2015)'in yapmış olduğu çalışmada tüketicilerin tercihlerinde sosyal medya reklamlarının etkileri araştırılmıştır. Sosyal medyanın ve sosyal medyada yer alan reklamların tüketicinin satın alma davranışları üzerindeki etkisi üzerine gıda sektöründe Gazi ve Başkent Üniversitesi Turizm ve Otelcilik bölümü öğrencilerine yönelik anket uygulanmıştır. Anket sonucuna göre; Katılımcıların sosyal medya kullanma sıklığı ile sosyal medya reklamlarının ilgi çekme olasılığı arasında ilişki bulunmaktadır. Sosyal medyada gösterilen reklamlarının geleneksel medyada yer alan reklamlardan daha fazla ilgi çektiği de araştırmanın bulguları arasında yer almaktadır. İşletme yöneticileri tarafından hak ettiği önemi görmeye başlayan sosyal paylaşım sitelerinin gerekenden daha fazla önem gösterilmesi gerektiği düşünülmektedir. İşletmeler adına sosyal medyada reklam yapmanın en önemli nedeni müşterilerin bir ürün satın almak istedikleri zaman ürün hakkındaki ilk araştırmalarını internet üzerinden yapıyor olmalarıdır. Aldıkları ürün ve hizmetler hakkında da sosyal medyada yorum yapıyor olması sosyal medyanın cazibesini arttırmıştır. Bu sebeple işletmeler için büyük bir avantaj olarak kullanılan sosyal medya, sürekli kontrol altında tutulması gereken bir reklam aracıdır. Reklam eğilimleri sosyal medya üzerinde hızlı bir değişim geçirmekte olduğundan sosyal medyada reklam yapan kişiler için bir eğitim programı geliştirilmelidir (Goyal, 2013'den aktaran Battalar ve Cömert, 2013, s. 222-223). Bu çalışma internet reklamlarının cazip bir pazar olmasını kanıtlamak açısından önemli bir çalışmadır.

Atesoglu ve Türkkahraman (2009), "Çocukların Tüketici Olarak Sosyalleşmesi" adlı bir çalışma yapmıştır. Bu çalışmada çocukların tüketici olarak sosyalleşmesi değeri incelenmektedir. Çocuklar tüketici olarak sosyalleşme esnasında tüketicilikle ilgili bilgi, yetenek ve tutum gibi bazı edimler kazanmaktadır. Bu edinimleri bireysel faktörler, sosyalleşme araçları ve öğrenme sistemleri etkilediği gözlenmektedir. Bulgular eşliğinde çıkan sonuç gelir seviyesi yükselen ailelerin tüketim harcamaları artmakta, belli değişkenlere bağlı olarak lüks tüketime harcamaları kaymaktadır. Ailenin tüketim alışkanlıkları çocukları da etkilemekte, böylece ihtiyaç fazlasını tasarruf etmek yerine tüketime sarf etmektedir. Sosyal statünün artması ve kent yaşamı da aynı şekilde tüketim harcamalarını artırmaktadır. Kadın çocukları dış görünüşlerine daha önem verdikleri için giyim ve aksesuar harcamaları daha fazla olmaktadır. Ayrıca kadın çocukları anneleri ile sık alışverişe çıktıkları için tüketim davranışlarında erkeklere göre daha deneyimlidirler. Yaşlarının büyümesiyle birlikte çocukların analitik düşünme kapasitesi gelişmektedir. Böylece çocukların ürünler, fiyatlar, markalar ve reklamlar hakkındaki bilgileri ve deneyimleri artmakta, ailenin satın alma kararlarında daha fazla rol almaktadırlar.

Literatür bölümünde yer alan çalışmalarda internet reklamlarının tüketicinin satın alma davranışı üzerinde etkili olduğu sonucuna ulaşılmaktadır. Ayrıca çocuklar ebeveynler üzerinde satın alma etkisi oluşturarak ailenin tüketim alışkanlıklarında etkisi olduğu gözlenmektedir. Yapılan araştırmalar sosyal medya ağlarının daha çok tüketicinin satın alma davranışları üzerindeki etkisini ortaya koymakla beraber çocuk tüketici kesimini de etkisi altına almaktadır. Literatür incelemesinde özellikle çocuklar üzerinde televizyon reklamlarının tüketici davranışlarına etkisi çözümlenirken internet reklamlarının etkisi literatürde sınırlı bulunmaktadır. İnternet reklamlarının çocuklar üzerindeki tüketici davranışlarında yapılan araştırmaların yetersizliği nedeniyle bu araştırmada çocukların internet reklamlarının tüketici davranışlarına etkisinin ölçülmesi amaçlanmaktadır.

3. Yöntem

Problem cümlesi

İnternet reklamlarının 8-11 yaş grubu çocukları üzerindeki tüketici davranışlarına etkisi nedir?

Hipotezler

H₀: İnternet reklamlarının 8-11 yaş grubu çocukları üzerindeki tüketici davranışlarında, sosyo –ekonomik düzey açısından etkisi vardır.

H₁: İnternet reklamlarının 8-11 yaş grubu çocukları üzerindeki tüketici davranışlarında, her yaş grubunun etkilenme düzeyi farklıdır.

H₂: İnternet reklamlarının 8-11 yaş grubu çocukları üzerindeki tüketici davranışlarında, okul türlerinin farklı olması açısından etkisi vardır.

H₃: İnternet reklamlarının 8-11 yaş grubu çocukları üzerindeki tüketici davranışlarında, cinsiyet faktörü etkiler.

Araştırmanın Modeli

Araştırmada internet reklamlarının 8-11 yaş grubu çocukların tüketici davranışlarında nasıl bir etki bıraktığını ölçmek için nicel yöntem kullanılacaktır. Öncelikle kavramsal çerçevenin oluşması adına literatür taraması yapılmıştır. Daha sonra mevcut literatür içerisinde araştırma ile ilgili olanlardan yararlanılmıştır. Uygulama olarak 20 soruluk bir anket kullanılmıştır.

Araştırmanın Evren ve Örneklemi

8-11 yaşındaki ilköğretim çocuklarını kapsayan evreni temsil etmek üzere yaş, cinsiyet, ailenin sosyo-ekonomik düzeyi yönünden belirlenen örneklem, her yaştan 10 kadın, 10 erkek olmak üzere özel okulda okuyan 80 ve devlet okulunda okuyan 80, toplam 160 denek içermektedir. Denekler, Sakarya ilköğretim okullarından seçilmiştir. Devlet okulunu temsil eden İsmet İnönü İlkokulu ile özel okulu temsil eden Sakarya Özel Serdivan Kale Koleji İlkokul kısmı alınmıştır.

Veri Toplama Aracı

Terkan (2014), tarafından geliştirilen “Tüketici Davranışları Değerlendirme” anketi 20 soruluk bir ankettir ve çalışmada araç olarak kullanılmıştır. Sorular, 2014 yılında yer alan internet reklamlarına ilişkindir. Sorular o yaş grupları için hazırlanmış olup kısa ve dikkat dağınıklığı oluşturmada benzer sorular üzerinden şekillenmiştir. Sorulardaki internet sitelerinin, uygulama adlarının ve kategorilerin analizi yapılmış olup elde edilen bulgularla belirlenmiştir. Bu kategoriler; banka, besin maddesi, ev eşyası, giyecek, gazete, deterjan, otomobil olmak üzere sınıflandırılmıştır. Anket bireysel olarak uygulanmıştır. Anket uygulamasında belirlenen anketörler çocukların yanlarında bulundurularak her maddenin açıklamasını yapmak üzere görevlendirilmişlerdir. Böylelikle soruların çocuklar tarafından daha net anlaşılması sağlanmıştır. İstatistiksel bir yanılığa düşmemek için hiçbir soruyu boş bırakmamak ön koşul olarak belirlenmiştir.

Varsayımlar

1. İnternete erişim şartları her iki okul için eşittir.
2. Öğrenciler anket sorularını dürüst bir şekilde yanıtlamıştır.
3. Sakarya ilköğretim okulları 8-11 yaş grubunu temsil etmektedir.

Sınırlılıklar

Bu çalışma sadece Sakarya ilinde bulunan İsmet İnönü İlkokulu, üst sosyo-ekonomik düzey için de Sakarya Özel Serdivan Kale Koleji İlkokul kısmı ile sınırlandırılmıştır.

Tanımlar

Reklam: Hizmet ya da ürünü geniş yığınlara tanıtmak, beğendirmek, özendirmek, istek uyandırmak ve alınmasını, satılmasını sağlamak için yapılan her türlü tanıtma çabası.

İnternet Reklamcılığı: Markaların gerek satışlarını arttırma, gerekse kurumsal kimlik ve imajını göstermek amacıyla kullandığı gelişmiş reklamcılık türlerinden biridir.

Tüketici Davranışları: Toplumların, kişilerin veya örgütlerin istek ve ihtiyaçlarını gidermek için ürün ve hizmetleri farkına varma, araştırma, tercih etme, satın alma, kullanma ve elden çıkarmadaki kararları izleyen bir süreçtir.

Metot

Verilerin analizi konusunda; Tanımlayıcı istatistikler frekans, yüzde, ortalama, standart sapma değerleri ile sunulmuştur. Kitlenin grup ortalaması değerinden farklı olup olmadığının test edilmesi için bağımsız örneklem t testi kullanılmıştır. Üç evre grubun karşılaştırılmasında Varyans analizi (ANOVA) testi ve ikili karşılaştırmalar (post. hoc.) için Sidak testi kullanılmıştır. Değişkenler arasındaki ilişkinin tespit edilmesi amacı ile korelasyon (ilişki) analizi uygulanmıştır. Çalışmada 0,05'ten küçük p değerleri istatistiksel olarak anlamlı kabul edilmiştir. Analizler SPSS 22.0 paket programı ile yapılmıştır.

Güvenilirlik ve Geçerlilik

Anket çalışmasında öğrencilerin internet üzerindeki tüketici eğilimleri ile ilgili görüşlerini ölçülmesi ile ilgili 20 adet ifadenin güvenilirliğinin test edilmesi amacı ile Co. Alpha analizi uygulanmıştır. Analiz sonucunda Co. Alpha katsayısı 0,90 olarak tespit edilmiştir. Elde edilen katsayı ölçeğin yeterli sayılacak kadar güvenilir olduğunu göstermektedir. Bunun sonucu olarak çalışmadan herhangi bir soru çıkarmaya gerek olmadığı görülmektedir. Güvenilirlik analizinin ardından yapı geçerliliğinin test edilmesi amacı ile 20 ifadenin bulunduğu ölçeğe faktör analizi uygulaması yapılmıştır.

Faktör analizi sonucunda üç adet alt boyut tespit edilmiştir. Bu boyutlar internet reklamlarına göre satın alma niyeti, internet reklamlarına maruz kalma, internet reklamlarının ilgi çekme düzeyi boyutları olarak adlandırılmıştır. Faktör analizinde hesaplanan KMO örneklem yeterlilik katsayısı 0,88 olarak tespit edilmiştir. Katsayı yapılan 160 adet anketin faktör yapısını orta koymak için yeterli olacağına göstergesidir. Ayrıca faktör

yapılarının anlamlılığının test edildiği Bartlett küresellik testi sonucuna göre ($p=0,001, p<0,05$) elde edilen boyutlar yapısal olarak anlamlı olduğu tespit edilmiştir.

Elde edilen 3 boyut toplam varyansın yaklaşık olarak %73'nü oluşturmaktadır. Açıklanan varyansın bu tip çalışmalarda %60 ve üzerinde olması beklenir. Boyutlar incelendiği zaman internet reklamlarına göre satın alma niyeti boyutu açıklanan varyans yüzdesi %26, internet reklamlarına maruz kalma memnuniyeti boyutu açıklanan varyans yüzdesi %17, İnternet Reklamlarının İlgi Çekme düzeyi boyutu açıklanan varyans yüzdesi %30 olduğu tespit edilmiştir. Kısacası ölçek ile ilgili 20 adet ifadenin yapısal düzeyde geçerli olduğu tespit edilmiştir.

Cinsiyete Göre T-Testi Sonuçları

Anket sorularının F değerine ilişkin p (sig. değerleri) 0,05'ten en büyük olduğu için varyansların homojen dağıldığı varsayımı ile bütün soruların analizini devam ettirebiliriz.

Tablo 1- İnternet Reklamlarında Tanılan Hizmet ya da Ürünler Satın Alma Davranışını Etkiler.

Cinsiyet	N	Mean	Standart sapma	t	Df	P
Soru1 Kadın	80	3,4430	1,39364	3,296	158	,001
Erkek	80	2,7778	1,15109			

T değerine ilişkin p (Sig. (2-tailed)) göre hesaplanan α 0,001, normal değeri değeri 0,05'ten küçük olduğu için verilen cevaplar arasında cinsiyete göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında kadın öğrencilerin verdiği cevapların ortalaması daha yüksektir. Yani internet reklamlarındaki hizmet ya da ürünlerin, kadın öğrencilerin satın alma davranışlarını erkek öğrencilere göre daha çok etkilediği sonucuna varılır.

Tablo 2- İnternet Reklamlarında Beğendiğim Ürünü Satın Almadan Önce Aile Bütçeme Uygun Olup Olmadığına Bakarım.

Cinsiyet	N	Mean	Standart sapma	T	Df	P
Soru3 Kadın	80	2,5696	1,23707	-2,219	158	,028
Erkek	80	2,9877	1,14558			

T değerine ilişkin p (Sig. (2-tailed)) göre hesaplanan α 0,028 normal değeri değeri α 0,05'ten en küçük olduğu için verilen cevaplar arasında cinsiyete göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında erkek öğrencilerin verdiği cevapların ortalaması daha yüksektir. Cinsiyeti erkek olan çocuk grubu internet reklamlarında tanılan hizmet ya da ürünleri satın alırken kadın çocuk grubuna göre daha fazla aile bütçelerine uygun olup olmadığına bakmaktadır.

Tablo 3- İnternet Reklamlarında Beğendiğim Ürünü Satın Almak İçin Para Biriktirim.

Cinsiyet	N	Mean	Standart sapma	T	Df	P
Soru6 Kadın	80	3,7722	1,16519	2,405	158	,017
Erkek	80	3,2840	1,38956			

T değerine ilişkin p (Sig. (2-tailed)) göre hesaplanan α 0,017 normal değeri değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında cinsiyete göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında kadın öğrencilerin verdiği cevapların ortalaması daha yüksektir. Yani kadın öğrencilerin, internet reklamlarındaki hizmet ya da ürünleri satın almak için erkek öğrencilere göre daha çok para biriktirdiği gözlemlenmektedir.

Tablo 4- İnternet Reklamlarına En Çok Video İzlerken Maruz Kalıyorum.

Cinsiyet	N	Mean	Standart sapma	t	df	P
Soru12 Kadın	80	3,7468	1,22441	-1,941	158	,054
Erkek	80	4,0864	,97721			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,054 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında cinsiyete göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında erkek öğrencilerin verdiği cevapların ortalaması daha yüksektir. Yani erkek öğrenciler, kadın öğrencilere göre internet reklamlarına en çok video izlerken maruz kalmaktadır.

Tablo 5- İnternet Reklamlarında Banka Reklamları İlğimi Çeker.

Cinsiyet	N	Mean	Standart sapma	t	df	P
Soru13 Kadın	80	2,0380	,92602	-5,338	158	,000
Erkek	80	2,9753	1,26467			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,000 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında cinsiyete göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında erkek öğrencilerin verdiği cevapların ortalaması daha yüksektir. İnternet reklamlarında banka reklamlarına ilgi, kadın öğrencilere göre erkek öğrencilerde daha fazladır.

Tablo 6- İnternet Reklamlarında Besin Maddesi Reklamları İlgimi Çeker.

Cinsiyet	N	Mean	Standart sapma	t	df	P
Soru14 Kadın	80	2,6456	1,10984	-3,466	158	,002
Erkek	80	3,2716	1,17274			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,002 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında cinsiyete göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında erkek öğrencilerin verdiği cevapların ortalaması daha yüksektir. Erkek öğrenciler, kadın öğrencilere göre besin maddesi reklamlarına daha fazla ilgi göstermektedir.

Tablo 7- İnternet Reklamlarında Gazete ve Dergi Reklamları İlgimi Çeker.

Cinsiyet	N	Mean	Standart sapma	t	df	P
Soru16 Kadın	80	2,0886	,83497	-3,302	158	,001
Erkek	80	2,5556	,94868			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,001 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında cinsiyete göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında erkek öğrencilerin verdiği cevapların ortalaması daha yüksektir. Erkek öğrenciler, kadın öğrencilere gazete ve dergi reklamlarına daha fazla ilgi göstermektedir.

Tablo 8- İnternet Reklamlarında Deterjan Reklamları İlgimi Çeker.

Cinsiyet	N	Mean	Standart sapma	t	df	P
Soru18 Kadın	80	2,7215	1,31009	2,516	158	,013
Erkek	80	2,2469	1,06690			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,013 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında cinsiyete göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında kadın öğrencilerin verdiği cevapların ortalaması daha yüksektir. Kadın öğrenciler, erkek öğrencilere göre deterjan reklamlarına daha fazla ilgi göstermektedir.

Tablo 9- İnternet Reklamlarında Otomobil Reklamları İlgimi Çeker.

Cinsiyet	N	Mean	Standart sapma	t	df	P
Soru19 Kadın	80	4,0253	,90546	-2,149	158	,033
Erkek	80	4,3210	,83407			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,033 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında cinsiyete göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında erkek öğrencilerin verdiği cevapların ortalaması daha yüksektir. Erkek öğrenciler, kadın öğrencilere göre otomobil reklamlarına daha fazla ilgi göstermektedir.

Tablo 10- İnternet Reklamlarında Giycek Reklamları İlgimi Çeker.

Cinsiyet	N	Mean	Standart sapma	t	df	P
Soru20 Kadın	80	3,9494	,91845	9,189	158	,000
Erkek	80	2,4691	1,10777			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,000 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında cinsiyete göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında kadın öğrencilerin verdiği cevapların ortalaması daha yüksektir. Kadın öğrenciler, erkek öğrencilere göre giyecek reklamlarına daha fazla ilgi göstermektedir.

Okul Türüne Göre T-Testi Sonuçları

Anket sorularının F değerine ilişkin p (sig. değerleri) 0,05'ten büyük olduğu için varyansların homojen dağıldığı varsayımı ile bütün soruların analizini devam ettirebiliriz.

Tablo 11-İnternet Reklamlarında Tanılan Hizmet ya da Ürünler Satın Alma Davranışını Etkiler.

Okul türü	N	Mean	Standart sapma	t	df	P (Sig. (2-tailed))
Soru1 Devlet Okulu	80	2,5500	1,18962	-5,887	158	,000
Özel Okul	80	3,6625	1,20067			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,000 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında okul türüne göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında özel okuldaki öğrencilerin verdiği cevapların ortalaması daha yüksektir. Yani internet reklamlarındaki hizmet ya da ürünlerin özel okuldaki öğrencilerin satın alma davranışlarını devlet okulundakilere göre daha çok etkilediği sonucuna varılır.

Tablo 12-İnternet Reklamlarında Beğendiğim Ürünü Satın Almadan Önce Aile Bütçeme Uygun Olup Olmadığına Bakarım.

Okul türü	N	Mean	Standart sapma	t	df	P (Sig. (2-tailed))
Soru3 Devlet Okulu	80	2,5125	1,20120	-2,882	158	,004
Özel Okul	80	3,0500	1,15726			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,004 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında okul türüne göre anlamlı bir fark vardır. Yani öğrencilerin farklı okul türünde olması internet reklamlarında beğendiği ürünü satın almadan önce aile bütçesine uygun olup olmadığına bakmalarını devlet okulda okuyan çocuklara kıyasla, özel okulda okuyan çocukları şaşırtıcı bir şekilde daha çok etkilemektedir.

Tablo 13- İnternet Reklamlarında Beğendiğim Ürünü Satın Almadan Önce Markasına Bakarım.

Okul türü	N	Mean	Standart sapma	t	df	P (Sig. (2-tailed))
Soru4 Devlet Okulu	80	2,4625	1,12445	-8,501	158	,000
Özel Okul	80	3,9625	1,10744			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,000 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında okul türüne göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında özel okuldaki öğrencilerin verdiği cevapların ortalaması daha yüksektir. Bu sebeple özel okuldaki öğrenciler internet reklamlarında beğendiği ürünü satın almadan önce devlet okulunda okuyan öğrencilere göre daha çok markasına bakar.

Tablo 14- İnternet Reklamlarında Beğendiğim Ürün Olunca Anne-Babam Ve Diğerleri Online Satın Alma Yolunu Seçer.

Okul türü	N	Mean	Standart sapma	t	df	P (Sig. (2-tailed))
-----------	---	------	----------------	---	----	---------------------

Soru7	Devlet Okulu	80	2,5000	1,16923	-7,063	158	,000
	Özel Okul	80	3,7750	1,11350			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,000 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında okul türüne göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında özel okuldaki öğrencilerin verdiği cevapların ortalaması daha yüksektir. Bu sebeple devlet okulundaki öğrencilerin (çocukların) ailelerine kıyasla, internet reklamlarında çocukların beğendiği ürünü anne-baba ve diğerlerinin online satın alma yolunu tercih etme eylemi özel okulda okuyan çocukların ailelerinde daha fazladır.

Tablo 15- İnternet Reklamlarında Beğendiğim Ürün Olunca Anne-Babam Ve Diğerleri Yüz Yüze İletişim İle Satın Alma Yolunu Seçer.

Okul türü	N	Mean	Standart sapma	t	df	P (Sig. (2-tailed))
Soru8 Devlet Okulu	80	2,7625	1,15006	-2,476	158	,014
Özel Okul	80	3,2000	1,08383			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,014 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında okul türüne göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında özel okuldaki öğrencilerin verdiği cevapların ortalaması daha yüksektir. Bu sebeple devlet okulundaki öğrencilerin (çocukların) ailelerine kıyasla, internet reklamlarında çocukların beğendiği ürünü anne-baba ve diğerlerinin yüz yüze iletişim ile satın alma yolunu tercih etme eylemi özel okulda okuyan çocukların ailelerinde daha fazladır.

Tablo 16- İnternet Reklamlarında Banka Reklamları İlgimi Çeker.

Okul türü	N	Mean	Standart sapma	t	df	P (Sig. (2-tailed))
Soru13 Devlet Okulu	80	2,2375	1,10515	-2,962	158	,004
Özel Okul	80	2,7875	1,23958			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,004 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında okul türüne göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında özel okuldaki öğrencilerin verdiği cevapların ortalaması daha yüksektir. Bu sebeple devlet okulundaki öğrencilere (çocuklara) kıyasla internet reklamlarında banka reklamlarına ilgi, özel okulda okuyan çocuklarda daha fazladır.

Tablo 17- İnternet Reklamlarında Besin Maddesi Reklamları İlgimi Çeker.

Okul türü	N	Mean	Standart sapma	t	df	P (Sig. (2-tailed))
Soru14 Devlet Okulu	80	2,6750	1,17759	-3,165	158	,002
Özel Okul	80	3,2500	1,11945			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,002 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında okul türüne göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında özel okuldaki öğrencilerin verdiği cevapların ortalaması daha yüksektir. Bu sebeple devlet okulundaki öğrencilere (çocuklara) kıyasla internet reklamlarında besin maddesi reklamlarına ilgi, özel okulda okuyan çocuklarda daha fazladır.

Tablo 18- İnternet Reklamlarında Otomobil Reklamları İlgimi Çeker.

Okul türü	N	Mean	Standart sapma	t	df	P (Sig. (2-tailed))
Soru19 Devlet Okulu	80	3,9750	,99333	-2,944	158	,004
Özel Okul	80	4,3750	,70036			

T değerine ilişkin p (Sig. (2-tailed)) değeri α 0,004 normal değeri α 0,05'ten küçük olduğu için verilen cevaplar arasında okul türüne göre anlamlı bir fark olduğu sonucuna varılır. Yukarıdaki tablonun betimsel istatistikler kısmına bakıldığında özel okuldaki öğrencilerin verdiği cevapların ortalaması daha yüksektir. Bu sebeple devlet okulundaki öğrencilere (çocuklara) kıyasla internet reklamlarında otomobil reklamlarına ilgi, özel okulda okuyan çocuklarda daha fazladır.

Ekonomik Düzeye Göre Anova Sonuçları

Tablo 19-İnternet Reklamlarında Tanılan Hizmet ya da Ürünler Satın Alma Davranışını Etkiler.

	Sum of Squares	df	MeanSquare	F	Sig.
Soru1 BetweenGroups	52,610	2	26,305	18,554	,000
WithinGroups	222,584	157	1,418		
Total	275,194	159			

F değerine karşılık gelen p (sig.) değeri α 0,000 normal değeri α 0,05'ten küçük olduğu için öğrencilerin ekonomik düzey gruplarına göre verilen cevaplar ile ilgili istatistiksel açıdan anlamlı bir farklılık vardır. Yani internet reklamlarındaki hizmet ya da ürünleri öğrencilerin farklı ekonomik düzeyde olması satın alma davranışlarında en az bir ekonomik düzey grubunda farklılık göstermektedir. Farklılığın hangi gruplar arasında olduğunu görmek için çoklu karşılaştırma testi olan Scheffe Testi kullanılır.

Tablo 20- Scheffe Testi

Ekonomi	Mean Difference (I-J)	Std. Error	Sig.
1000-4000 4000-8000	-1,15984	,19128	,000
8000 ve üzeri	-,26753	,54951	,888
4000-8000 1000-4000	1,15984	,19128	,000
8000 ve üzeri	,89231	,54929	,270
8000 ve üzeri 1000-4000	,26753	,54951	,888
4000-8000	-,89231	,54929	,270

Scheffe testi sonucunda ekonomik düzeyi 1000-4000 arası olan çocuk grubu ile ekonomik düzey 4000-8000 arası olan çocuk grubu ilişkisinde bu soruya verilen cevaplarda istatistiksel olarak ($p < .01$) düzeyinde anlamlı bir farklılık saptanmıştır. Ekonomik düzeyi 4000-8000 arası olan çocuk grubu internet reklamlarında tanılan hizmet ya da ürünleri satın alırken ekonomik düzeyi 1000-4000 arası olan çocuk grubuna göre daha fazla reklamlardan etkilenir. (Ortalama farkı 4000-8000 arası ekonomik düzey grubu lehine +1,15984). Diğer ekonomik düzey grupları arasındaki farklılık istatistiksel olarak anlamlı bulunmamıştır ($p > .05$).

Tablo 21- İnternet Reklamlarında Beğendiğim Ürünü Satın Almadan Önce Aile Bütçeme Uygun Olup Olmadığına Bakarım.

	Sum of Squares	df	MeanSquare	F	Sig.
Soru3 BetweenGroups	11,502	2	5,751	4,107	,018
WithinGroups	219,842	157	1,400		
Total	231,344	159			

F değerine karşılık gelen p (sig.) değeri α 0,032 normal değeri α 0,05'ten küçük olduğu için ekonomik düzey gruplarına göre verilen cevaplar ile ilgili istatistiksel açıdan anlamlı bir farklılık vardır. Yani öğrencilerin farklı ekonomik düzeyde olması internet reklamlarında beğendiği ürünü satın almadan önce aile bütçesine uygun olup

olmadığına bakmalarını etkilemektedir. Farklılığın hangi gruplar arasında olduğunu görmek için çoklu karşılaştırma testi olan Scheffe Testi kullanılır.

Tablo 22- Scheffe Testi

Ekonomi	Mean Difference (I-J)	Std. Error	Sig.
1000-4000 4000-8000	-,54479	,19010	,018
8000 ve üzeri	-,29351	,54611	,866
4000-8000 1000-4000	,54479	,19010	,018
8000 ve üzeri	,25128	,54590	,900
8000 ve üzeri 1000-4000	,29351	,54611	,866
4000-8000	-,25128	,54590	,900

Scheffe testi sonucunda ekonomik düzeyi 1000-4000 arası olan çocuk grubu ile ekonomik düzey 4000-8000 arası olan çocuk grubu ilişkisinde bu soruya verilen cevaplarda istatistiksel olarak ($p < .05$) düzeyinde anlamlı bir farklılık saptanmıştır. Ekonomik düzeyi 4000-8000 arası olan çocuk grubu internet reklamlarında tanılan hizmet ya da ürünleri satın alırken ekonomik düzeyi 1000-4000 arası olan çocuk grubuna göre şaşırtıcı bir sonuçla daha fazla aile bütçelerine uygun olup olmadığına bakmaktadır. (Ortalama farkı 4000-8000 arası ekonomik düzey grubu lehine +,54479). Diğer ekonomik düzey grupları arasındaki farklılık istatistiksel olarak anlamlı bulunmamıştır ($p > .05$).

Tablo 23- İnternet Reklamlarında Beğendiğim Ürünü Satın Almadan Önce Markasına Bakarım.

	Sum of Squares	df	MeanSquare	F	Sig.
Soru4 BetweenGroups	88,308	2	44,154	34,929	,000
WithinGroups	198,467	157	1,264		
Total	286,775	159			

F değerine karşılık gelen p (sig.) değeri α 0,000 normal değeri α 0,05'ten küçük olduğu için öğrencilerin ekonomik düzey gruplarına göre verilen cevaplar ile ilgili istatistiksel açıdan anlamlı bir farklılık vardır. Yani internet reklamlarında beğendiği ürünü veya hizmeti satın almadan önce markasına bakma eylemi en az bir ekonomik düzey grubunda farklılık göstermektedir. Farklılığın hangi gruplar arasında olduğunu görmek için çoklu karşılaştırma testi olan Scheffe Testi kullanılır.

Tablo 24- Scheffe Testi

Ekonomi	Mean Difference (I-J)	Std. Error	Sig.
1000-4000 4000-8000	-1,49434	,18062	,000
8000 ve üzeri	-1,35844	,51888	,035
4000-8000 1000-4000	1,49434	,18062	,000
8000 ve üzeri	,13590	,51868	,966
8000 ve üzeri 1000-4000	1,35844	,51888	,035
4000-8000	-,13590	,51868	,966

Scheffe testi sonucunda ekonomik düzeyi 1000-4000 arası olan çocuk grubu ile ekonomik düzey 4000-8000 arası olan çocuk grubu ilişkisinde bu soruya verilen cevaplarda istatistiksel olarak ($p < .01$) düzeyinde anlamlı bir farklılık saptanmıştır. Ekonomik düzeyi 4000-8000 arası olan çocuk grubu internet reklamlarında beğendiği ürünü veya hizmeti satın almadan önce, ekonomik düzeyi 1000-4000 arası olan çocuk grubuna göre daha fazla markasına bakarak satın alma eğilimi gösterir. (Ortalama farkı 4000-8000 arası ekonomik düzey grubu lehine +1,49434). Diğer ekonomik düzey grupları arasındaki farklılık istatistiksel olarak anlamlı bulunmamıştır ($p > .05$).

Tablo 25- İnternet Reklamlarında Beğendiğim Ürün Olunca Anne-Babam Ve Diğerleri Online Satın Alma Yolunu Seçer.

	Sum of Squares	df	MeanSquare	F	Sig.
Soru7 BetweenGroups	64,082	2	32,041	24,314	,000
WithinGroups	206,893	157	1,318		
Total	270,975	159			

F değerine karşılık gelen p (sig.) değeri α 0,000 normal değeri α 0,05'ten küçük olduğu için öğrencilerin ekonomik düzey gruplarına göre verilen cevaplar ile ilgili istatistiksel açıdan anlamlı bir farklılık vardır. Yani internet reklamlarında çocukların beğendiği ürün olunca anne-babam ve diğerlerinin online satın alma yolunu seçme eylemi en az bir ekonomik düzey grubunda farklılık göstermektedir. Farklılığı görmek için çoklu karşılaştırma testi olan Scheffe Testi kullanılır.

Tablo 26- Scheffe Testi

Ekonomi		Mean Difference (I-J)	Std. Error	Sig.
1000-4000	4000-8000	-1,26307	,18441	,000
	8000 ve üzeri	-1,31948	,52978	,048

	Total	221,775	159			

F değerine karşılık gelen p (sig.) değeri α 0,004 normal değeri α 0,05'ten küçük olduğu için öğrencilerin ekonomik düzey gruplarına göre verilen cevaplar ile ilgili istatistiksel açıdan anlamlı bir farklılık vardır. Yani internet reklamlarında besin maddesi reklamlarına ilgi göstermeleri en az bir ekonomik düzey grubunda farklılık göstermektedir. Farklılığın hangi gruplar arasında olduğunu görmek için çoklu karşılaştırma testi olan Scheffe Testi kullanılır.

Tablo 32- Scheffe Testi

Ekonomi		Mean Difference (I-J)	Std. Error	Sig.
1000-4000	4000-8000	-,58142	,18427	,008
	8000 ve üzeri	-,95065	,52938	,203
4000-8000	1000-4000	,58142	,18427	,008
	8000 ve üzeri	-,36923	,52918	,784
8000 ve üzeri	1000-4000	,95065	,52938	,203
	4000-8000	,36923	,52918	,784

Scheffe testi sonucunda ekonomik düzeyi 1000-4000 arası olan çocuk grubu ile ekonomik düzey 4000-8000 arası olan çocuk grubu ilişkisinde bu soruya verilen cevaplarda istatistiksel olarak ($p < 0,01$) düzeyinde anlamlı bir farklılık saptanmıştır. Ekonomik düzeyi 4000-8000 arası olan çocuk grubu, besin maddesi reklamlarına ekonomik düzeyi 1000-4000 arası olan çocuk grubuna göre daha fazla ilgi göstermektedir. (Ortalama farkı 4000-8000 arası ekonomik düzey grubu lehine +,58142). Diğer ekonomik düzey grupları arasındaki farklılık istatistiksel olarak anlamlı bulunmamıştır ($p > 0,05$).

Tablo 33- İnternet Reklamlarında Otomobil Reklamları İlgiyi Çeker.

		Sum of Squares	df	Mean Square	F	Sig.

4000-8000	-,18462	,39679	,897

Scheffe testi sonucunda ekonomik düzeyi 1000-4000 arası olan çocuk grubu ile ekonomik düzey 4000-8000 arası olan çocuk grubu ilişkisinde bu soruya verilen cevaplarda istatistiksel olarak ($p < 0,01$) düzeyinde anlamlı bir farklılık saptanmıştır. Ekonomik düzeyi 4000-8000 arası olan çocuk grubu, otomobil reklamlarına ekonomik düzeyi 1000-4000 arası olan çocuk grubuna göre daha fazla ilgi göstermektedir. (Ortalama farkı 4000-8000 arası ekonomik düzey grubu lehine +,42358). Diğer ekonomik düzey grupları arasındaki farklılık istatistiksel olarak anlamlı bulunmamıştır ($p > 0,05$).

Yaş Göre Anova Sonuçları

Tablo 35- İnternet Reklamlarında Beğendiğim Ürünü Satın Almadan Önce Markasına Bakırım.

		Sum of Squares	df	Mean Square	F	Sig.
Soru4	BetweenGroups	33,525	3	11,175	6,884	,000
	WithinGroups	253,250	156	1,623		
	Total	286,775	159			

F değerine karşılık gelen p (sig.) değeri α 0,000 normal değeri α 0,05'ten küçük olduğu için öğrencilerin yaş gruplarına göre verilen cevaplar ile ilgili istatistiksel açıdan anlamlı bir farklılık vardır. Yani internet

reklamlarında beğendiği ürünü veya hizmeti satın almadan önce markasına bakma eylemi en az bir yaş grubunda farklılık göstermektedir. Farklılığın hangi gruplar arasında olduğunu görmek için çoklu karşılaştırma testi olan Scheffe Testi kullanılır.

Scheffe testi sonucunda 10 yaş grubu ile 11 yaş grubu arasında bu soruya verilen cevaplarda istatistiksel olarak ($p < .01$) düzeyinde anlamlı bir farklılık saptanmıştır. İnternet reklamlarında beğendiği ürünü veya hizmeti satın almadan önce markasına bakma eylemi 11 yaş grubunda 10 yaş grubuna göre daha fazladır (Ortalama farkı 11 yaş grubu lehine +1,275). Diğer yaş grupları arasındaki farklılık istatistiksel olarak anlamlı bulunmamıştır ($p > .05$).

Tablo 36- İnternet Reklamlarında Beğendiğim Ürünü Almadan Önce Aile Bireylerinin de Kullanıp Kullanamayacağına Bakarım.

		Sum of Squares	df	Mean Square	F	Sig.
Soru5	BetweenGroups	57,369	3	19,123	15,427	,000

Yani internet reklamlarında deterjan reklamlarının ilgilerini çekmesi en az bir yaş grubunda farklılık göstermektedir. Farklılığın hangi gruplar arasında olduğunu görmek için çoklu karşılaştırma testi olan Scheffe Testi kullanılır. Scheffe testi sonucunda 8 yaş grubu ile 9, 10, 11 yaş grubu arasında bu soruya verilen cevaplarda istatistiksel olarak ($p < .01$) düzeyinde anlamlı bir farklılık saptanmıştır. 8 yaş grubu çocuklarının internet reklamlarında deterjan reklamlarının ilgilerini çekmesi 9, 10, 11 yaş grubuna göre daha fazladır (Ortalama farkı 8 yaş grubu lehine sırasıyla +1,17500, +1,02500, +1,67500).

Sonuç Ve Değerlendirme

Markalar tarafından giderek önemleri artan çocuk tüketicilerin satın alma davranışları incelendiğinde internet reklamlarının çocukların üzerinde büyük bir etkisi olduğu görülmektedir. İnternet reklamlarının 8-11 yaş grubu çocukları üzerindeki tüketici davranışlarında, yaş, cinsiyet, okul türü, sosyo –ekonomik düzey değişkenlikleri açısından farklı etkiler gözlenmektedir. Bu doğrultuda ortaya atılan çalışmanın hipotezleri istatistiksel incelemeler sonucu teorik değer kazanmaktadır. Bu bağlamda çocukların kadın erkek cinsiyet farklılıklarında internet reklamlarına göre satın alma niyeti, maruz kalma düzeyi ve ilgi çekme değişkenleri arasında benzerliklerinin yanı sıra anlamlı farklılıklarda görülmektedir. Bu bağlamda İnternet reklamlarındaki hizmet ya da ürünler, kadın öğrencilerin satın alma davranışlarını erkek öğrencilere göre daha çok etkilemektedir. Cinsiyeti erkek olan çocuk grubu internet reklamlarında tanılan hizmet ya da ürünleri satın alırken kadın çocuk grubuna göre daha fazla aile bütçelerine uygun olup olmadığına bakmaktadır. Buna karşın kadınlar internet reklamlarında gördükleri ürün veya hizmetleri satın alabilmek için erkeklere göre daha çok para biriktirmektedir. İnternet reklamlarına genellikle oyun oynarken ve sosyal medyayı kullanırken maruz kalan çocukların, video izlerken reklamlara maruz kalma oranlarında kadın ve erkeklerin ayrıldığı görülmektedir. Bu nedenle erkek çocukların kadın çocuklara göre video izlerken internet reklamlarına daha fazla maruz kaldığı ortaya çıkmıştır. İnternet reklamlarının ilgi çekme düzeyleri bakımından ortaya atılan banka, besin maddesi, gazete ve dergi, deterjan, otomobil, giyim reklamları kategorilerinde cinsiyete göre farklılıklar mevcuttur. İnternet reklamlarında banka, besin, otomobil, gazete ve dergi reklamlarına olan ilgi, kadın öğrencilere göre erkek öğrencilerde daha fazladır. Buna karşın kadın öğrenciler erkek öğrencilere göre deterjan ve giyim reklamlarına daha fazla ilgi göstermektedir.

Çocukların özel okul ve devlet okulu türündeki farklılıklarında internet reklamlarına göre satın alma niyeti, maruz kalma düzeyi ve ilgi çekme değişkenleri arasında benzerliklerinin yanı sıra anlamlı farklılıklarda görülmektedir. Özel okulda okuyan öğrenciler internet reklamlarındaki hizmet ya da ürünlerden etkilenecek devlet okulunda okuyan öğrenciye göre daha fazla satın alma eğilimi gösterir. Şaşırtıcı bir şekilde özel okulda okuyan çocuklar devlet okulunda okuyan çocuklara göre internet reklamlarında beğendiği ürünü satın almadan önce aile bütçesine uygunluğuna bakmaktadır. Buna karşın özel okulundaki öğrenciler internet reklamlarında beğendiği ürünü satın almadan önce devlet okulunda okuyan öğrencilere göre daha çok ürünün markasına bakar. Çocukların satın alma niyetlerinde devlet okulundaki öğrencilerin (çocukların) ailelerine kıyasla, internet reklamlarında çocukların beğendiği ürünü anne-baba ve diğerlerinin online ve yüz yüze satın alma yolunu tercih etme eylemi özel okulda okuyan çocukların ailelerinde daha fazladır. İlgi çekme düzeyleri bakımından ortaya atılan banka, besin maddesi ve otomobil reklamları kategorilerinde okul türüne göre farklılıklar mevcuttur. Bu sebeple devlet okulundaki öğrencilere (çocuklara) kıyasla internet reklamlarında banka, besin ve otomobil reklamlarına ilgi, özel okulda okuyan çocuklarda daha fazladır.

Sosyo- ekonomik düzey değişkenleri incelendiğinde gelir düzeyi düşük olan aileler ile gelir düzeyi yüksek olan ailelerin çocukları karşılaştırıldığında internet reklamlarına göre satın alma niyeti, maruz kalma düzeyi ve ilgi çekme değişkenleri arasında benzerliklerinin yanı sıra anlamlı farklılıklarda görülmektedir. Ekonomik düzeyi 4000-8000 arası olan çocuk grubu internet reklamlarında tanılan hizmet ya da ürünleri satın alırken ekonomik düzeyi 1000-4000 arası olan çocuk grubuna göre daha fazla reklamlardan etkilenir ve ürünlerin markalarına daha çok önem verir. Ekonomik düzeyi 4000-8000 arası olan çocuk grubu internet reklamlarında tanılan hizmet ya da ürünleri satın alırken ekonomik düzeyi 1000-4000 arası olan çocuk grubuna göre şaşırtıcı bir sonuçla daha fazla aile bütçelerine uygun olup olmadığına bakmaktadır. İnternet reklamlarında çocukların beğendiği ürünü anne-baba ve diğerlerinin online ve yüz yüze satın alma yolunu tercih etme eylemi 4000-8000 arası ekonomik düzey grubunun, 1000-4000 arası ekonomik düzey grubuna göre daha fazladır. İlgi çekme düzeyleri bakımından ortaya atılan banka, besin maddesi ve otomobil reklamları kategorilerinde sosyo-ekonomik düzeye göre farklılıklar mevcuttur. Bu sosyo- ekonomik düzeyi düşük olan öğrencilere (çocuklara) kıyasla internet reklamlarında banka, besin ve otomobil reklamlarına ilgi, sosyo- ekonomik düzeyi yüksek çocuklarda daha fazladır. Genel bir bakış

açısı ile okul türü ve sosyo- ekonomik düzey incelendiğinde çocukların ekonomik düzeyleri ile orantılı olarak okul türleri arasında anlamlı bir ilişki vardır.

Çocukların yaşları karşılaştırıldığında internet reklamlarına göre satın alma niyeti, maruz kalma düzeyi ve ilgi çekme değişkenleri arasında benzerliklerinin yanı sıra anlamlı farklılıklarda görülmektedir. İnternet reklamlarında beğendiği ürünü veya hizmeti satın almadan önce hem markasına bakma hem de diğer aile bireylerinin kullanıp kullanamayacağına bakma eylemi 11 yaş grubu çocuklarında daha fazladır. İnternet reklamlarında beğendiği ürünü satın almak için para biriktirme eylemi 8,9,10 yaş gruplarında 11 yaş grubuna göre daha fazladır. 10 yaş grubu çocukların aileleri, çocuklarının internet reklamlarından beğendiği ürünü satın almada 11 yaş grubu çocuklarının ailelerine göre daha fazla çocuklarından etkilenmektedir. 10 yaş grubu çocukları facebook, instagram, twitter gibi sosyal medya reklamlarına 8 yaş grubu çocuklarından daha fazla maruz kalmaktadır. 8 yaş grubu çocukları video izlerken maruz kalınan reklamlara 9 yaş grubu çocuklarından daha fazla maruz kalmaktadır. 11 yaş grubu çocukları internet reklamlarında besin maddesi reklamlarını 8 yaş grubu çocuklarından daha fazla çekici bulmaktadır. . 8 yaş grubu çocukları internet reklamlarında ev eşyası reklamlarını 11 yaş grubu çocuklarından daha fazla çekici bulmaktadır. 8 ve 9 yaş grubu çocuklarının internet reklamlarında oyuncak reklamlarının ilgilerini çekmesi 10, 11 yaş grubuna göre daha fazladır. 8 yaş grubu çocuklarının internet reklamlarında deterjan reklamlarının ilgilerini çekmesi 9, 10, 11 yaş grubuna göre daha fazladır. Çocuk tüketicilerin yaşları ilerledikçe tüketici davranışları da gelişmektedir ve hayat boyu bu gelişme devam etmektedir. Çocuk tüketicilerin markalar tarafından aldatılmaya açık olmaları, ciddi kar satışları dönen bu pazarda deneyimleri az olan çocukları aileleri tarafından korunmaya muhtaç bırakmaktadır. Günümüzdeki en önemli iletişim araçlarını değerli kılan internet ağı, internet reklamcılığını da içinde barındırarak markalar için değerli bir tüketici pazarı oluşturmaktadır. Özellikle çocuk tüketicilerin tüketici davranışlarını yönlendirmede internet reklamları büyük bir öneme sahiptir. Bu sebeplerden dolayı reklamların çocuklar üzerindeki olumsuz etkilerinden kurtarmak için önleyici çalışmalar yapılabilir. Özellikle ailelerin sosyo- ekonomik durumları ile çocukların reklamlardan etkilenme ve satın alma niyetinde güçlü bir bağ vardır. Bu sebeple ailelerin gelecekteki tüketicileri yetiştirdiğini unutmayıp çocuklarının tüketici davranışlarını markaların kontrolünde değil kendi kontrolünde tutmaları ile aile bütçesini korumak ve reklamların çocuklar üzerindeki olumsuz etkilerinden kurtarmak için büyük önem taşımaktadır. Bunun yanı sıra reklamların bilgilendirme amacı yok sayılmadan, çocuk tüketime davet edilmeli ve bilinçli tüketiciler yetiştirilmelidir.

Abstract

There are two types of online course format: an asynchronous online course and a synchronous online course. Unlike asynchronous online courses, synchronous online courses are not time-independent. In a synchronous online course, course participants including the instructor and students interact and communicate with each other in real-time by using a video conferencing tool. The most common form of online course has asynchronous format (Butz & Stupnisky, 2016). As compared with asynchronous courses, synchronous courses have received much less attention. However, over the years, educators and researchers have found several limitations of asynchronous courses. With the understanding on limitations of asynchronous course, online instructors have begun to show interest in using synchronous course elements in their class. Researchers have introduced advantages over an asynchronous course such as immediate feedback, immediate interactive clarification of meaning, high motivation, more engagement and a greater sense of presence. The number of university programs that deliver online synchronous course is increasing (Bell, Sawaya, & Cain, 2014). In this article, we will introduce the concept of synchronous online course including definition, characteristic, and history. And then we will explain the affordances of synchronous online courses that have been introduced by researchers. Affordances are the perceived and actual properties of a thing, primarily those fundamental properties that determine just how the thing could possibly be used (Norman, 1988, p. 9). By conducting systemic review on existing studies on synchronous online courses, we identified how instructors used synchronous online courses in their online courses. Instructors have used synchronous online sessions to use following affordances of synchronous online sessions: developing a sense of community, creating social, cognitive, and teaching presences, promoting interactions, enhancing engagement, increasing motivation and providing immediate feedback. We will explain each affordance with related studies. Based on the result, we will introduce a synchronous online course as an effective way of delivering online courses.

Keywords: *Synchronous online course, Online learning, Affordance*

Introduction

Online learning became one of main course delivery formats in higher education (Yamagata-Lynch, 2014). According to U.S. News Education (2018), there are 357 schools that provide online bachelor's degree programs in the U.S. There are two types of online course format: an asynchronous online course and a synchronous online course. An asynchronous online course can be defined as an online course that is facilitated by communication media, such as email and discussion boards, and that supports work relations among learners and with teachers even when participants are not online at the same time (Hrastinski, 2008, p.51). A synchronous online course can be defined as an online course supported by communication media such as videoconferencing and chat (Hrastinski, 2008, p.51). A key characteristic of synchronous courses is real-time communication and interaction through a video conferencing tool (Butz, Stupnisky, Peterson, & Majerus, 2014; Hrastinski, 2008). In synchronous courses, all participants are logged on video conferencing platform at the same time and communicate directly with each other (Shi & Morrow, 2006; Redmond, Parkinson, Mullally, & Dolan, 2007). In other words, synchronous online courses are place-independent, but not time-independent.

The most common form of online course has been in the asynchronous format (Butz & Stupnisky, 2016; Gibson, 2011; Yamagata-Lynch, 2014). Researcher have identified various benefits of asynchronous courses including flexibility, convenience, increased reflection, in-depth discussion and cost efficiency (Huang & Hsiao, 2012; Hrastinski, 2008; Hrastinski, Keller, & Carlsson, 2010; Johnson, 2006; Wang & Reeves, 2007). These benefits have contributed to the popularity of asynchronous online courses. As compared with asynchronous courses, synchronous courses have received much less attention due to various limitations such as high costs, bandwidth limitations, the difficulty of implementation, insufficient tools, and scheduling issues (Anderson, 2003; Branon & Essex, 2001; Lowenthal, Dunlap & Snelson, 2017; Park & Bonk, 2007).

Recently, the increasing bandwidth of the Internet and improvements in information and communication technologies have made synchronous online instructional delivery more popular and effective (Martin & Parker, 2014; Olson & McCracken, 2015). Increased interest in synchronous courses have motivated the development of various video conferencing tools such as Zoom, Ultra, and Acrobat Connect. There is evidence of an emerging instructor preference toward synchronous online courses (Ahmad & Bokhari, 2011). The number of university programs that deliver online synchronous course is increasing (Bell, Sawaya, & Cain, 2014; Butz, Stupnisky, Peterson, & Majerus, 2014).

The purpose of this study is to introduce synchronous online courses as an effective way of delivering online courses. In this article, we will introduce the concept of synchronous online course including definition, characteristic, and history. And then we will explain the affordances of synchronous online course based on the analysis result of existing studies.

Methodology

In this study, we developed the understanding on a synchronous online course by analyzing existing studies on synchronous online courses. We searched studies through three steps and analyzed those to have full understanding on synchronous online course. Firstly, the search terms to be used were established. Many search terms related to synchronous online course were selected: synchronous learning, synchronous online course, video conferencing, virtual classrooms, and Web conferences. Secondly, with those search terms, we searched studies at various academic databases: ERIC, JSTOR, IEEEExplorer, and Scopus. Lastly, the same searches were repeated on Google Scholar. Most of articles that we found on Google Scholar were the exact same with the articles that we found through the academic databases. However, we were able to find some articles that we were not able find in academic databases. As a result, we found 78 articles. By analyzing collected studies, we defined the concept of synchronous online course, identified its characteristics and history in online course. And then we identified how instructors have used synchronous online sessions in their online courses. Especially, a first author of this study is an experienced instructional designer who has 10 years experiences in designing online courses. He identified the affordances of synchronous online course based on his online course design experiences.

Synchronous Online Course

A synchronous online course is a format in which planned learning events take place in real-time between a remote instructor and students by employing video conferencing tools. The video conferencing tools commonly included in such course platforms are Voice over Internet Protocol (VoIP), synchronized web and shared browsers, interactive whiteboards, 2D/3D chat tools, two-way audio and videoconferencing, application sharing, presentation slide facilities, polling and feedback tools, and group break-out rooms (Butz & Stupnisky, 2016; McBrien, Cheng, & Jones, 2009).

Various video conferencing tools that consists above functions that support synchronous course have been developed such as Elluminate, Interwise, Adobe Acrobat Connect, Zoom and Blackboard Collaborate (Butz & Stupnisky, 2016). These platforms enhance the learning experiences by increasing interactions between participant and building social, cognitive and teaching presence (Barron, Schullo, Kromrey, Hogarty, Venable, Barros & Loggie, 2005; Clauzel, Sehaba, & Prié, 2011). Figure 1 and 2 show a screenshot of one video conferencing tool.

Using closed circuit television for teaching in the 1940s can be regarded as the starting point of synchronous courses, but the discussion regarding a synchronous course became more widespread in the 1980s (Johnson, 2006). In the 1980s ~ 90s, various technologies were developed that could allow students to take a lecture, ask questions, and discuss concepts by connecting to remote classrooms by means of technologies including videoconferencing and interactive television (Bernard, Abrami, Lou, Borokhovski, Wade, Wozney, & Huang, 2004). Researchers investigated the effectiveness of synchronous course lecture compared to face-to-face lecture and developed learning platforms for synchronous courses (Fetterman, 1996; Knox, 1997; Walther, 1996; Yamagata-Lynch, 2014).

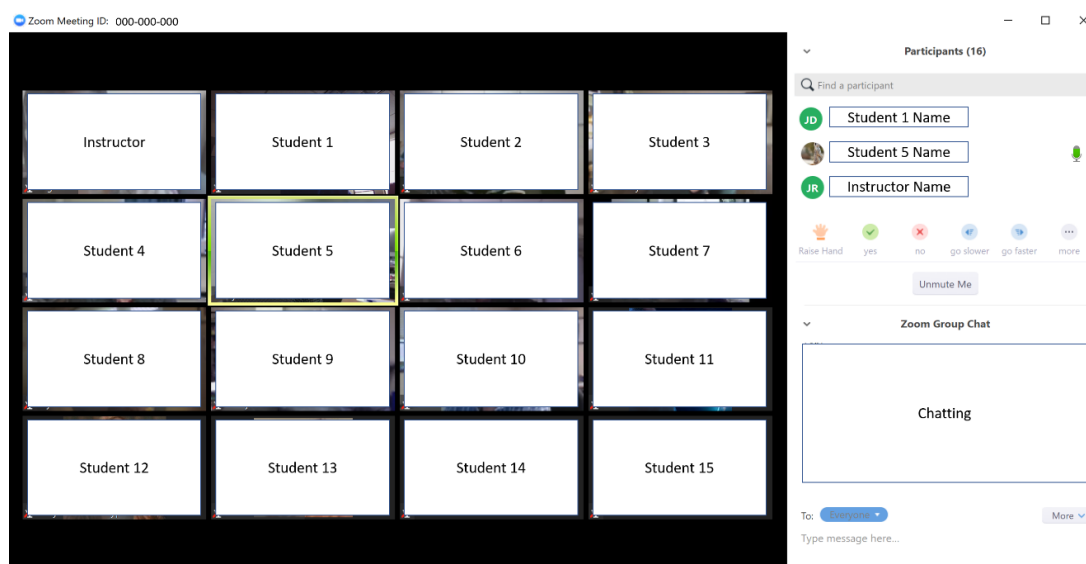

Figure 1. Video Conferencing Tool Interface 1 (Video, List and Chatting)

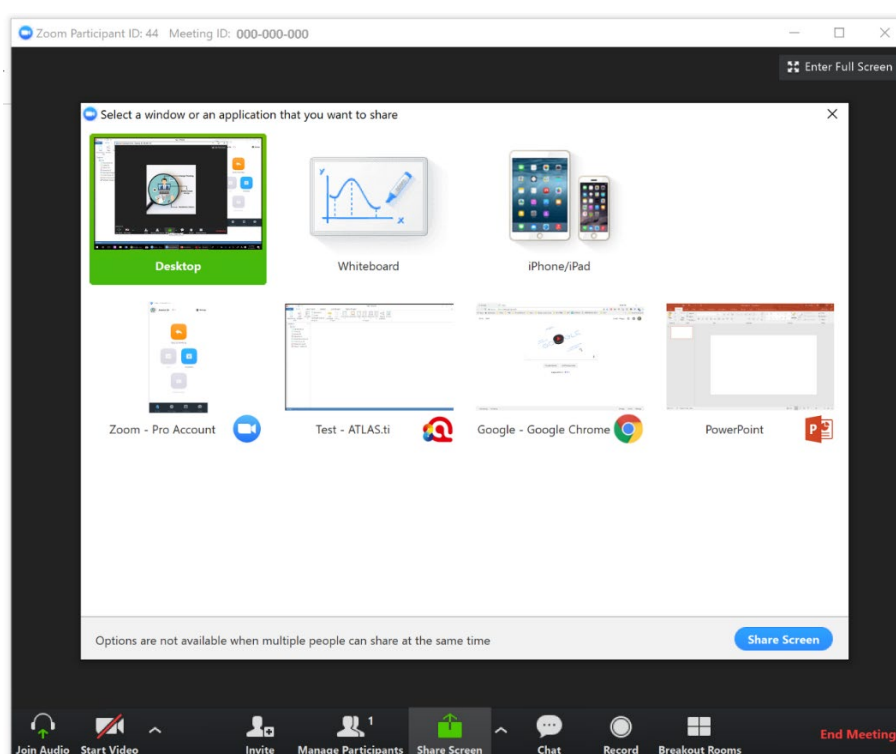

Figure 2. Video Conferencing Tool Interface 2 (Share Screen)

However, the interest in and application of a synchronous course decreased due to various limitations and constraints in implementing this course format. High costs, bandwidth limitations, insufficient tools, a lack of reflection time, and scheduling issues, inherent issues of synchronous courses, have contributed to their lack of popularity (Park & Bonk, 2007, p.245). One specific limitation was the difficulty in arranging the same time and virtual place for all students to participate (Lowenthal, Dunlap & Snelson, 2017). Branon and Essex (2001) pointed out that a limitation associated with a synchronous course was getting students online at the same time. This type of environment requires a precisely set date and time for meetings, but this contradicts the promise of “anytime, anywhere” learning that online courses have traditionally promoted (Skylar, 2009, p.71).

Additionally, in the 1990s and early 2000s, classroom videoconferencing equipment could only be used in designated classrooms. The students and instructor had to be those specific locations, directly contradicting the promise of “anywhere” (Rowe, Ellis, & Bao, 2006). Due to expenses associated with required videoconferencing equipment, it was difficult to establish learning environments for implementing synchronous courses. A lack of

network infrastructure also hampered the growth of synchronous courses and contributed it be location specific. In the early 2000s, the bandwidth of internet access was still insufficient to support an effective synchronous course (Chen et al., 2003; Lowenthal, Dunlap & Snelson, 2017). The most common form of online learning has been depended on primarily asynchronous learning format due to above limitations (Davidson-Shivers, Muilenburg, & Tanner, 2001; Gibson, 2011; Park & Bonk, 2007; Yamagata-Lynch, 2014).

Over the years, by implementing asynchronous online courses, educators and researchers have found several limitations of asynchronous courses such as the isolation students feel, delayed feedback, barriers to interpretation and the lack of bodily communication (Derks, Bos, & Von Grumbkow, 2007; El Mansour & Mupinga, 2007; Bolliger, Supanakorn, & Boggs, 2010). In asynchronous learning environments, learners are likely to report feelings of isolation because of the limited opportunities for social interaction (Cunningham, 2014). A lack of shared context and body language can lead to an interpretation of written text not intended by both instructors and students (Howard, 2012). This miscommunication may reduce a learner's connectivity and sense of belonging (Giesbers, Rienties, Gijssels, Segers, & Tempelaar, 2009; Hara & Kling, 2001). Given these limitations of asynchronous course, online instructors have begun to show interest in using synchronous course elements in their class (Levin, He, & Robbins, 2006).

Synchronous courses have several advantages over an asynchronous course such as immediate feedback, immediate interactive clarification of meaning, high motivation, more engagement and a greater sense of presence (Hastie, Chen, & Kuo, 2007; Martin & Parker, 2014; Giesbers, Rienties, Tempelaar, & Gijssels, 2013; Skylar, 2009). Researchers argue that synchronous online instruction allows students to enjoy the benefits of both face-to-face and online courses (Bower, Dalgarno, Kennedy, Lee, & Kenney, 2015; Romero-Hall & Vicentini, 2017). Students can attend class at their convenient place while also enjoying social interactions, immediate feedback, and intensive learning activities. With this understanding of the limitations of asynchronous courses and strengths of synchronous courses, a number of researchers and practitioners have started including one or two synchronous sessions as course activities in online courses with primarily asynchronous instructional delivery (Chen & Jones, 2007; Gibson, 2011; Lowenthal, Snelson, & Dunlap, 2017; Roseth, Akcaoglu, & Zellner, 2013).

Recently, the increasing bandwidth of the Internet and improvements in information and communication technologies have made synchronous online instructional delivery more popular and effective (Martin & Parker, 2014; Olson & McCracken, 2015). High quality technologies allow for teaching and learning experiences similar to face-to-face classes (Romero-Hall & Vicentini, 2017). For example, most synchronous course platforms have "Breakout Rooms" function that allows an instructor creates smaller groups within an online classroom. In a breakout room, students can engage in team-based activities by collaborating with their team members just like they do in face-to-face classroom. In addition, advanced technology adds an additional convenience to synchronous courses delivery: "any device" (Clawson, Korn, Decker, & Piper, 2016). These days, students can access a synchronous course through their computer, tablet or even cellular phone. Many postsecondary institutions now have a number of programs that deliver online courses with a synchronous format (Bell, Sawaya, & Cain, 2014; Butz et al., 2014). Increased interest in synchronous courses have prompted the development of various synchronous course platforms to be developed such as Eluminate Live, Adobe Acrobat Connect, Zoom, and Ultra.

Comparison Of Asynchronous And Synchronous Courses

The main differences between an asynchronous and a synchronous course are the nature of communication and the simultaneity of interaction (Hrastinski, 2008). In an asynchronous course, participants communicate through asynchronous computer-mediated communication tools such as email and discussion boards. They do not need to be online at the same time, and there are time gaps between action and response as well as action and feedback. In a synchronous course, participants communicate through two-way media such as chat and video-conferencing tools. Students and an instructor are logged on video-conferencing tools at the same time and interact each other.

A lot of studies that compare synchronous and asynchronous courses have been conducted, and these studies introduce 1) the difference between asynchronous and synchronous communication (e.g. Branon & Essex, 2001; Davidson-Shivers, Muilenburg, & Tanner, 2001; Hrastinski, 2008; Oztok, Zingaro, Brett, & Hewitt, 2013), 2) instructors' and students' preferences regarding particular formats of online courses (e.g. Buxton, 2014; Brierton, Wilson, Kistler, Flowers, & Jones, 2016; Johnson, 2006; Levin, He, & Robbins, 2006), and 3) advantages of particular formats over others (e.g. Baker, 2010; Brierton et al., 2016; Clark, 2015; Falloon, 2011; Han, 2013; Hrastinski, 2008; Laat, Lally, Lipponen, & Simons, 2007; Levin, He, and Robbins, 2006; Skylar, 2009; Wang, 2008).

Many studies above point out the benefits of a synchronous course over an asynchronous one. Levin, He, and

Robbins (2006) found that most people before online discussion stated that they would rather use asynchronous discussion but that afterward the majority noted that they would instead favor more synchronous discussions. Their reasons included that they received quick feedback, real-time discussion, the advantage of finishing the chat in one sitting, and the challenge of thinking critically. They stated overall that the use of synchronous discussions was more productive than asynchronous discussions (Levin, He, and Robbins, 2006). In his research, Wang (2008) compared and explored the possibilities of a synchronous communication tool building a sense of a community. Laat, Lally, Lipponen, and Simons (2007) discovered that sustaining communication and expressing emotions is easier with web videoconferencing compared to discussion forums. And Han (2013) found that implementation of video casting in courses was found to attract greater interaction between instructors and peers. Clark (2015) investigated whether asynchronous communication and synchronous communication create higher levels of social and teaching presence. The results of student interviews, surveys, and self-reported perceptions showed that social and teaching presences were significantly higher when student communicate through synchronous communication tool.

Affordances Of Synchronous Courses

Studies have presented and highlighted various benefits of synchronous courses. The identified benefits are affordances of synchronous online course. Affordances are the perceived and actual properties of a thing, primarily those fundamental properties that determine just how the thing could possibly be used (Norman, 1988, p. 9). In other words, an affordance is an object's possible uses by a user to achieve an objective. Studies have presented and highlighted the various benefits of synchronous courses. The identified benefits are affordances of synchronous online course. When instructors include synchronous sessions in their online course, they have perceived uses of those sessions which are affordances of synchronous courses. Instructors have used synchronous online sessions to use following affordances of synchronous online sessions: developing a sense of community, creating social, cognitive, and teaching presences, promoting interactions, enhancing engagement, increasing motivation and providing immediate feedback. Table 1 shows affordances of synchronous online courses along with information about related studies. Among those affordances, we will explain several affordances which are frequently mentioned in each research.

Table 1. Affordances of Synchronous Courses

Affordances	Explanations	Research
Developing a sense of community	Synchronous communications tools play a part in the development of a sense of community in a synchronous online learning environment	Butz et al, 2014; Han, 2013; Hratinski, 2008; Shield, Atweh, & Singh, 2005; Wang, 2008
Creating the presences	There are three types of presence: social, cognitive, and teaching. These are essential in successful online learning. The positive relationship between each presence and synchronous courses has been determined.	Baker, 2010; Clark, 2015; Giesbers, Rienties, Gijsselaers, Laat, Lally, Lipponen, & Simons, 2007; Han, 2013; Giesbers, Rienties, Gijsselaers, Segers, & Tempelaar, 2009; Szeto & Cheng, 2016
Promoting interactions	Synchronous courses improve interactions between student and students, students and instructors, and students and contents through various video conferencing tools.	Bower, 2011; Butz et al., 2014; Chen et al., 2005; Duemer et al., 2002; Han, 2013; Hastie, Chen, & Kuo, 2007; Vu & Fadde, 2013
Enhancing engagement	Synchronous online courses assist and enhance student engagement in learning activities by providing immediate feedback and increasing their motivation.	McBrien, Cheng, & Jones, 2009; Wang, 2005; Hratinski, 2008
Increasing motivation	Benefits of synchronous courses include immediate feedback and a strong sense of community that can enhance student motivation. This affects the incensement of enrollment positively.	Chen, Ko, Kinshuk, & Lin, 2005; Hratinski, 2008; Gijsselaers et al., 2013; Hratinski, 2008; White, Ramirez, Smith, & Plonowski, 2010, Lowenthal, Dunlap & Snelson, 2017
Providing immediate feedback	In synchronous online courses, instructors can provide immediate feedback to students. So students can immediately correct their understanding of a given topic and clarify its meaning.	Chen, Ko, Kinshuk, & Lin, 2005; Laat, Lally, Lipponen, & Simons, 2007; Levin, He, and Robbins, 2006; Schutt, Allen & Laumakis, 2009

Developing a Sense of Community

Many studies found that synchronous learning can develop a sense of community (Butz et al., 2014; Han, 2013; Shield, Atweh, & Singh, 2005; Wang, 2008). In the development of a sense of community in online learning environments, the synchronous tools play a part. Face to face learning environment provide a sense of community. Wang (2008) compared and explored the possibilities of a synchronous communication tool establishing a sense of a community in his research. Shield, Atweh, and Singh (2005) found that a sense of community was found within the use of synchronous tutorials/synchronous tools from a quasi-experimental investigation.

Creating the Presences

Palloff and Pratt (2011) said that establishing presence is the first-order task when designing successful online courses. In relation with presence, three types of presence were noted to be successful in an online course. Garrison, Anderson, and Archer (2000) presented the model with three aspects of a successful educational experience: Social Presence, Cognitive Presence, and Teaching Presence. Social presence incorporates expression of emotion, open communication, and development of group cohesion. Moreover, social Presence comments on the capability of bringing student and instructor personalities into the learning community. On the other hand, Cognitive Presence is the potential to understand and interpret meaning from educational experiences. Lastly, Teaching Presence touches upon design, delivery, and facilitation of the course content with three aspects: instructional management, creating understanding, and direct instruction (Benshoff & Gibbons, 2011).

With an importance of these presence, researchers have found the positive relationship between presence and synchronous learning. Giesbers and his collage (2009) found that social presence is heightened when participants are able to see and hear using the shared workspace in Web video conferencing, expressing themselves social and emotionally within the group. They also found that cognitive presence and teaching presence are one of the effects of using Web videoconferencing. De Laat and his collage (2007) discovered that sustaining communication and expressing emotions is easier with Web videoconferencing compared to discussion forums. In relation to teaching presence, synchronous learning is also less challenging for instructors to allot time and give feedback and instruction in synchronous communication.

Promoting Interactions

In online learning, interaction has been regarded as essential element for successful online learning (Garrison, Anderson, & Archer, 2001; Hillman, 1999). Palloff and Pratt (2007) differentiate online and distance learning environments from traditional classrooms, noting that, "Key to the online learning process are the interactions among students themselves, the interactions between faculty and students, and the collaboration in learning that results from these interactions" (p. 4). Many studies insist that synchronous learning improve interaction between student and students, and students and instructors (Bower, 2011; Butz et al., 2014; Clauzel, Sehaba, & Prié, 2011; Duemer et al., 2002; Han, 2013; Hastie, Chen, & Kuo, 2007; Shield, Atweh, & Singh, 2005; Skylar, 2009; Vu & Fadde, 2013). Han (2013) studied the effects of instructor video casting on his/her 'students' sense of connection to the instructor'. He concluded that classes that implemented video casting and those that did not differed. The implementation of video casting in courses was found to attract interactions with instructors and peers. Clauzel, Sehaba, and Prié (2011) also discovered that use of synchronous tool such as whiteboard sharing and text chatting increased students' interaction. Particularly, Vu and Fadde (2013) insisted that allowing backchannel text-based communication in synchronous course promote student interaction across attendance modes.

Enhancing Engagement

Researchers found that synchronous learning also enhance student engagement. McBrien, Cheng, and Jones (2009) placed virtual spaces and employed through synchronous online classrooms to assist and enhance student engagement in online learning discussions in their research. Wang (2005) found that using open-ended and comparison questions in a synchronous classroom was effective in engaging students and fostering cognitive development. Hrastinski (2008) proved the potential of synchronous communication to enhance students' participation through his case study research. Giesbers, Rienties, Tempelaar and Gijssels (2013) insisted that synchronous learning supported student engagement and collaborative knowledge construction through communicating with each other in synchronistic way.

Increasing Motivation

Students' motivation is crucial to academic success (Keller, 1987, 2009; Wentzel & Wigfield, 1998). According to Miltiadou and Savenye (2003), instructors should motivate online learners to ensure student success in online courses. In an online learning environment, there is the possibility that students feel isolated from the instructor and other participants due to their physical and social distance (Hrastinski, 2008; Bolliger, Supanakorn, & Boggs, 2010; Rovai & Jordan, 2004; Song & Hill, 2007). With the characteristics of an online learning environment, researchers maintained that instructors should develop new strategies and change their teaching practices in order

to maintain online learners' motivation (Bennett & Lockyer, 2004). Giesbers and his colleagues (2013) tried to understand student motivation by combining SDT with technology acceptance theory. They found that students who participated in optional synchronous web conferencing sessions had significantly higher levels of intrinsic motivation. Chen, Ko, Kinshuk, and Lin (2005) also found that synchronous online session enhanced students' motivation.

Providing Immediate Feedback

Delayed feedback, barriers to interpretation and the lack of bodily communication have been regarded as limitations of asynchronous online courses (Branon & Essex, 2001; El Mansour & Mupinga, 2007; Bolliger, Supanakorn, & Boggs, 2010). Immediate feedback can handle these limitations. In synchronous online courses, instructors can provide immediate feedback to students. So students can immediately correct their understanding of a given topic and clarify its meaning (Chen, Ko, Kinshuk, & Lin, 2005). Park and Bonk (2007) also insisted that instructors can immediately correct students' misunderstanding and misconceptions of their intent in synchronous online course and regarded an immediate feedback as one of benefits of synchronous online course. Levin, He, and Robbins (2006) found that most people before online discussion stated that they would rather use asynchronous discussion but that afterward the majority noted that they would instead favor more synchronous discussions. According to them, one of reasons why students preferred synchronous discussions was because they liked immediate feedback in synchronous online discussion.

Conclusion

There is a demand among instructors and students for synchronous courses because of the unique benefits and affordances of synchronous online courses (Bower et al., 2015; Lowenthal, Dunlap & Snelson, 2017; Romero-Hall & Vicentini, 2017). Identified affordances of synchronous online course are developing a sense of community, creating social, cognitive, and teaching presences, promoting interactions, enhancing engagement, increasing motivation and providing immediate feedback. These affordances are regarded as important values and essentials components for successful online learning to modern online instructors and researchers (Bennett & Lockyer, 2004; Cavanaugh et al., 2009; Garrison, Anderson, & Archer, 2001; Miltiadou & Savenye, 2003; Moore, 1989; Palloff & Pratt, 2007, 2011). However, most online courses designed in an asynchronous format are missing these benefits (Bower, Dalgarno, Kennedy, Lee, & Kenney, 2015; Lowenthal, Snelson, & Dunlap, 2017; Olson & McCracken, 2015). Thus, this study insists that synchronous online courses is an effective way of delivering online courses.

However, sophisticated design is required to implementing the affordances of synchronous courses into a real classroom. Instructors need to approach synchronous course design differently than the approach used in designing asynchronous courses and face-to-face courses (Anderson, Fyvie, Koritko, McCarthy, Paz, Rizzuto, & Sawyers, 2006; Bower et al., 2013; Olson & McCracken, 2015; Romero-Hall & Vicentini, 2017). Schullo and his colleagues (2005) assert that there are instructors and instructional designers of synchronous course who are considering using or implementing such aforementioned affordances, and they need to be guided in how to properly implement them in their courses. In addition, designing those affordances requires extensive preparation (Anderson et al., 2006; Bower et al., 2013; Chen, Xiang, Sun, Ban, Chen, & Huang, 2015; Piskurich, 2004).

Most previous studies of online learning examine strictly asynchronous online course delivery (Szeto, 2015). With increased interest and use of synchronous courses, researchers have started to conduct studies on synchronous online course delivery. In 2017, Martin, Ahlgrim-Delzell and Budhrani conducted a systematic review of research on synchronous online learning from 1995 to 2014. They analyzed 157 articles that met their screening criteria (e.g. articles that referred to use any synchronous online technology and were published in peer-reviewed journals). They found that the most common independent variable in the 157 articles was the "synchronous tools" (n=109), and the most common dependent variable was "perception and attitude" (n=96) followed by "interaction" (n=71) (Martin, Ahlgrim-Delzell & Budhrani, 2017). As this study shows, most of the existing studies on synchronous courses focus on the students' perception and attitude on synchronous courses and introduces a specific synchronous courses or tools. Existing studies advocate a synchronous course as a possible way to deliver online courses. However, these studies are too abstract to offer potential instructors practical strategies about how to design synchronous online courses. Thus, future studies need to investigate how to design and implementation synchronous courses to use the affordances effectively.

Investigating The Reflective Thinking Skills Of Students For Problem Solving

Elif AKDEMİR

Ereğli Education Faculty Zonguldak Bülent Ecevit University Turkey
akdemirelif@gmail.com

Abstract

Being part of the German didactic tradition, reflective thinking was first coined by Wilhelm von Humboldt two-century ago. Reflective thinking helps individuals to develop strategies in order to overcome the problems that they encounter. Investigating the reflective thinking skills of students for problem solving is important to identify students that may need extra assistance to develop their reflective thinking skills. In this study, the reflective thinking skill level of secondary school students is investigated. The cross sectional survey design is used in this study. The data were collected from 297 middle school students who are in 6th, 7th and 8th grades in Zonguldak city center of Turkey. The scale measuring the reflective thinking skill towards problem solving was used for the data collection. The descriptive statistic, the one-way ANOVA and the Bivariate correlation were used for data analysis. Findings revealed that secondary school students' reflective thinking skill levels are above the average. However at the same time participating students' course grades for the math course and for the science and technology course were close to the maximum score. This shows that academically successful students' reflective thinking skill level tend to be high. Another significant finding of this study is that female students' reflective thinking skills are higher than male students' reflective thinking skills. The third finding of the study revealed that there is no correlation between the math course grades and the reflective thinking skills of the secondary school students. Similarly no correlation was found between the science and technology course grades and the reflective thinking skills of the secondary school students. However a statically significant relationship is found between the questioning skill level of the students and their course grades in the science and technology course. It is suggested that reflective thinking skill level should not be used as a predictor of the course grades for investigated courses for the study population. More research studies are needed to make generalizable conclusions about the relationship between the reflective thinking skills of the elementary school students and their academic achievement. The results of the study reveal that the reflective thinking skill of secondary school students are above the average but there is a room for improvement. It is also found that female students' reflective thinking skills are higher than the male students'. Moreover a statically significant relationship is found between the questioning skill level of the students and their course grades in the science and technology course. It is suggested that reflective thinking skill level should not be used as a predictor of the course grades for investigated courses.

Keywords: *Reflective thinking, problem solving skill, secondary education*

Introduction

Reflective thinking, one of the higher-order thinking skills, has been defined by Ünver (2003) as a way of thinking that aims to determine the factors that affect the learning level and methods of the individual, positively or negatively to solve the problems. Although it was Wilhelm von Humboldt, who spoke the concept of reflective thinking for the first time two centuries ago, John Dewey advocated that the concept of reflective thinking was developed in the early twentieth century by one of the primary priorities of the society, reflecting the knowledge that learners learned in school (Alp and Taşkın, 2008). Reflective thinking is a form of thinking that is associated with a progressive movement based on pragmatic philosophy and that is developing continuously. In 1933, Dewey defined reflective thinking as "any thought or knowledge, and an information structure that supports attainment of its intended results, in an effective coherent and careful way".

John Dewey stated that the reflective thinking process is made up of five stages without a specific order. These are the five stages:

1. Suggestions: Ideas and possibilities in the mind when an individual is confused with a complex situation. As proposals grow, the need to think more and more.
2. Problem: When an individual is confronted with a complex situation, he tries to see the big picture instead of small details.
3. Hypothesis formation: It is an effort to determine what is feasible by looking at the proposal. This phase ensures that you do not think more on information, purify the problem, the proposals are testable, measurable.
4. Reasoning: Information, ideas and experiences are intertwined to provide advice, hypothesis and testing.
5. Testing: A new problem may arise as well as existing probabilistic clarification (Kızılkaya & Aşkar, 2009).

Reflective thinking begins when a problem is recognized. It ends when the problem is resolved. In addition, there is

an aim to understand the problem well and solve it better in the process. Furthermore, the analysis and restructuring of the information in this way of thinking is the subject of question (Çubukçu, 2011). Identification of reflective thinking skills that will give pupils the opportunity to improve themselves after school and, if so, clarification of the development of these skills, will contribute to the solution of problems that students will encounter in real life.

The results of the studies in the literature about reflective thinking differ. When the results of the studies done in time are summarized chronologically; Özçalı (2007) conducted a study to investigate the relationship between teacher efficacy and reflective thinking. In the study it was also investigated whether an in-service education program change teachers' reflective thinking level. Quantitative and qualitative data were collected from 25 Turkish EFL teachers. Results of the study revealed that there is no relationship between the teacher efficacy and reflective thinking. It was also found that as a result of the in-service education program, teachers' reflective thinking did not change significantly.

In another study, Alp and Taşkın (2007) completed a study to determine the perspectives of primary school teachers about reflective thinking. Data related to the study were collected from 134 teachers working in primary education using a scale developed during the study. The results showed that the teachers did not know the concept of reflective thinking, but they were aware of the reflective thinking as part of the critical thinking and problem solving dimensions. In the study, the necessity of initiating in-service programs for teachers about reflective thinking was proposed.

Also, Baki, Güç and Özmen (2012) collected qualitative data from 10 pre-service teachers in order to determine the reflective thinking skills of primary school mathematics teacher candidates for problem solving. Qualitative data were obtained through observations. In order to reach the aim of the study, reflecting reflective thinking situations were determined by monitoring the teacher candidates participating in the activity. As a result of the study, it was found that the teacher candidates were focused on solving the given problem as soon as possible and the reflective thinking skills were found to be at a low level in the dimensions of questioning, reasoning and solution stages of the problem.

In the study, Baş (2013) collected data from 254 elementary school students by using the screening model to examine the relationship between the reflective thinking skills of the elementary school students for problem solving and their academic achievement in science and technology course using the structural equation model. The results of the study showed that the sub-dimensions of the questioning, reasoning and evaluation of the reflective thinking skills scale for problem solving were an important predictor of their academic achievement.

Kaplan, Doruk and Ozturk (2017) collected data from 31 gifted students using mixed research method to investigate the reflective thinking skills of gifted students for problem solving. At the end of the study, it was found that the reflective thinking skills of the gifted students towards problem solving were at a high level, but used relatively less than the skills of inquiry and evaluation.

Furthermore, Eğmir and Ocak (2018) examined the effect of the curriculum prepared for critical thinking skills on students' reflective thinking levels. In this study, the critical thinking skill levels of the students in the experimental and control groups were compared in two classes consisting of 5th grade students. The results of the study indicated that the reflective thinking skill levels of the students in the classroom who participated in the curriculum prepared for critical thinking skills were higher than the control group.

In the study conducted by (Bakar, 2018) the effect of technology usage on reflective thinking of students was investigated. The study was carried out with 109 12th grade students by using quasi-experimental method. The results of the study showed that the level of reflective thinking of the students was higher in experimental group which used technology for teaching than the control group.

Studies carried out up to date in the field of literature are inadequate in providing information about the current reflective thinking skills of secondary school students. An examination of reflective thinking skills that helps individuals develop strategies to overcome the challenges they face is important for identifying those students who need to develop these skills. Therefore this study was designed with the purpose of examining the reflective thinking skills of middle school students.

In order to achieve the study purpose, answers to following research questions are investigated;

- What are the reflective thinking skill level of secondary school students?
- Does the level of reflective thinking skill of secondary school students change by the gender?

- Is there a relationship between the math course grades and reflective thinking skills of students in secondary school?
- Is there a relationship between the science and technology course grades and reflective thinking skills of students in secondary school?

The Study

Research Design

Being one of the quantitative research methodology, the cross sectional survey design (Creswell & Creswell, 2017) is used in this study to collect data about the reflective thinking level of the middle school students and their course grades for the math course and for the science and technology course.

Setting and Participants

The data were collected from 297 middle school students who are in 6th, 7th and 8th grades in Zonguldak city center of Turkey. 5th grade students were excluded from the study because 5th grade is the first year of the middle school. Therefore the researcher cannot collect the data from students about their math course grades and their science and technology course grades through the use of the cross sectional survey.

The math course and the science and technology course were specifically selected in the study because middle school students attend to the nationwide administered test at the end of the middle school to make selection for their high school. Students' scores on the math course and the science and technology course are the major determinants for the calculation of the nationwide exam scores.

Measure

The data were collected using the scale measuring the reflective thinking skill towards problem solving (Kızılkaya & Aşkar, 2009). There are 14 items in the scale with response options ranging between always and never. The scale measure three dimensions of the reflective thinking. These are questioning, reasoning and evaluation. With the scale, also gender, previous year's math course grade and previous year's science and technology course grade were asked to the participants for data collection purposes.

Data Analysis

The data were analyzed using the descriptive statistic, the one-way ANOVA and the Bivariate correlation. SPSS (Statistical Package for the Social Sciences) were used for the data analysis. All statistical tests were conducted with a significant level of 0.05.

Findings

What are the reflective thinking skill level of secondary school students?

The first research question investigated the reflective thinking skill level of secondary school students. 297 students involved the study by completing the scale. The reflective thinking skill of the secondary schools students is presented at the Table-1.

Table 1: The reflective thinking skill of the secondary schools students

Scale Results	N	Min	Max	Mean	Std. Deviation
Questioning	297	5,00	25,00	17,72	3,94
Evaluation	297	7,00	25,00	17,92	3,77
Reasoning	297	5,00	20,00	14,95	3,22
Reflective Thinking Skill	297	21,00	70,00	50,59	9,24

The reflective thinking skill of the secondary school students is presented at the Table-1. Findings show that reflective thinking skill of the secondary school students are above the average. Also results indicate that for all sub-dimensions (questioning, reasoning and evaluating) of the reflective thinking skill are above the average for the secondary school students. Out of 297 secondary school students, 193 students completed and shared their math course grades and science and technology course grades for the study. The mean math course grades and the mean science and technology course grade of the secondary school students are close to the maximum grade of 100 (Table-2).

Table 2: The course grades of the secondary school students

Course Grades	N	Min	Max	Mean	Std. Deviation
Math Course Grade	193	48,00	100,00	88,89	10,75
Science and Technology Corse Grade	193	56,00	100,00	91,49	8,15

Does the level of reflective thinking skill of secondary school students change by the gender?

The second research question investigated whether the reflective thinking skill of secondary school students change by the gender. The results of the One-way ANOVA revealed that the reflective skills of secondary school students change by the gender ($F(1, 295) = 5.91$; $p < 0.05$) (Table 3). The female students' reflective thinking skills ($\bar{x} = 52.0$, $SD = 8.49$) are higher than male students' reflective thinking skills ($\bar{x} = 49.4$, $SD = 9.66$). The One-way ANOVA results also revealed that reasoning dimension of the Reflective Thinking Skill is different for the gender ($F(1, 295) = 6.49$; $p < 0.05$) (Table 3). The female students' reasoning skills ($\bar{x} = 15.4$, $SD = 2.8$) are higher than male students' reasoning skills ($\bar{x} = 14.5$, $SD = 3.4$).

Table 3: The reflective thinking skill of students change by the gender

		Sum of Squares	df	Mean Square	F	Sig.
Questioning	Between Groups	61,01	1	61,01	3,96	,047
	Within Groups	4540,79	295	15,39		
	Total	4601,80	296			
Evaluation	Between Groups	40,09	1	40,09	2,84	,093
	Within Groups	4159,12	295	14,09		
	Total	4199,21	296

	Total	25269,70	296			

* $p < 0.05$

Is there a relationship between the math course grades and reflective thinking skills of students in secondary school?

The third research question investigated whether there is a relationship between the math course grades and reflective thinking skills of students in secondary school. The results of the Pearson's correlation coefficient revealed that there is no correlation between the math course grades and the reflective thinking skills of the secondary school students (Table 4). No correlation is also found between the math course grades and the other sub-dimensions of the reflective thinking skills.

Table 4: The correlation between the reflective thinking skills and the math course grades

		Questioning	Evaluation	Reasoning	Reflective Thinking Skill	Math Course Grades
Questioning	PearsonCorrelation	1	,59*	,60*	,87*	,09
	Sig. (2-tailed)		,00	,00	,00	,17

Math Course Grades	PearsonCorrelation					1
	Sig. (2-tailed)					
	N					193

* The correlation is significant at the 0.05 level.

Is there a relationship between the science and technology course grades and reflective thinking skills of students in secondary school?

The last research question investigated whether there is a relationship between the science and technology course grades and reflective thinking skills of students in secondary school. The results of the Pearson's correlation coefficient revealed that there is no correlation between the science and technology course grades and the reflective thinking skills of the secondary school students (Table 5). However statistically significant positive correlation is found between the science and technology course grades and questioning skills ($r = 0,14^*$, $p < 0,05$). On the other hand for the reasoning skill and for the evaluation skills, statistically significant correlation is not found.

Table 5: The correlation between the reflective thinking skills and the science and technology course grades

		Questioning	Evaluation	Reasoning	Reflective Thinking Skill	Science and Technology Course Grades
Questioning	PearsonCorrelation	1	,59*	,60*	,87*	,14*
	Sig. (2-tailed)		,00	,00	,00	,04

	N					19
Science and Technology Course Grades	PearsonCorrelation					1
	Sig. (2-tailed)					
	N					193

* Correlation is significant at the 0.05 level.

Conclusion

Findings revealed that secondary school students' reflective thinking skill levels are above the average. However at the same time participating students' course grades for the math course and for the science and technology course were close to the maximum score. This shows that academically successful students' reflective thinking skill level tend to be high. This finding can be used as a proclaim to support the conclusion of Baş (2013) that the reflective thinking skills are an important predictor of their academic achievement. In fact, Kaplan, Doruk and Ozturk (2017) also found that reflective thinking skills of the gifted students towards problem solving are at a high level. These findings support the idea that the relationship between the reflective thinking skill level and the academic achievement should be investigated. Another significant finding of this study is that female students' reflective thinking skills are higher than male students' reflective thinking skills. Bağçeci, Döş and Sarıca (2011) found that female students' metacognitive awareness level is higher than male students. Female students seem to be more successful in cognitive skills than males. The third finding of this study revealed that there is no correlation between the math course grades and the reflective thinking skills of the secondary school students. Similarly no correlation was found between the science and technology course grades and the reflective thinking skills of the secondary school students in this study. However a statically significant relationship is found between the questioning skill level of the students and their course grades in the science and technology course. It is suggested that reflective thinking skill level should not be used as a predictor of the course grades for investigated courses for the study population. However in a different study, Baş (2013) while investigating the relationship between the reflective thinking skills of the elementary school students for problem solving and their academic achievement in science and technology, it was found that the reflective thinking skills scale for problem solving were an important predictor of their academic achievement. Because of the contradiction between the results of this study and Bas (2013)'s finding, more research studies are needed to make generalizable conclusions about the relationship between the reflective thinking skills of the elementary school students and their academic achievement.

Abstract

The goals of this advanced physics laboratory course emphasized not only to improve students' physics knowledge but also spectrum scientific abilities in particular for preparing their future-ready competencies. One of those scientific abilities was initiated to study that was "the ability to design experiment". It was the fundamental ability in help enhance students' higher order thinking in solving problems and self-operating their own labs scientifically. Besides, this corresponds to a crucial national policy of Thailand. There has been promoted innovative thinking skills to step onward driving the Thailand economy. This study was a preliminary report on the students' experimental design ability towards the students' learning engagement in a guided inquiry lab which involved to the physics concept of heat transfer. To investigate the ability, 18 senior-physics students enrolled the course were required to work in three groups of 4 to 6. In the investigation, a guided-inquiry lab set and worksheets were substantially designed and validated by three physics university lecturers who had teaching experiences for over 10 years. The guided worksheets were straightforwardly structured by considering five sub-abilities dealing with the ability to design experiment. Those worksheets were viewed as a lab report and also used as a main research tool to help follow and collect data about the students' experimental design ability. The key format of the worksheets was that guided inquiry questions and black spaces were contained. This aimed to actively engage the students in the experiment since (1) linking physics concept, (2) defining measurement variables, (3) clarifying an experimental procedure, (4) selecting equipment and materials, and (5) minimizing errors. In each of the five abilities, the students had to individually investigate the answers of guided-inquiry questions and then shared ideas with their groups till they could solve the main problem of the lab. Additionally, video recordings were collected to triangulate qualitative data of the students' learning engagement. From observation, we found that the students spent about 6 hours in total (3 hours for designing the experiment by working on answering the guided-inquiry questions and 3 hours for doing the experiment) to complete the experimentation. The most time-consuming (about an hour) was in the step of linking physics knowledge to formulate a situation in order to solve the problem. The result found that there were no students who could design the experiment to solve the problem correctly but all of them were able to formulate the situations relating to the solving problem. All experiments designed could be practical. The main difficulty was from the students' misunderstanding of heat transfer. They did not determine the heat transfer from all objects in the closed system. This was the most difficult point in enhancing this ability. Moreover, there were many unexpected sub-abilities: basic measurements, using scientific equipment, and also identifying variables. Besides, the students were required to self-assess their proficiency on a 4-point rubric test. The first-two lowest average scores were in items relating to the sub-abilities to link physics knowledge and to clarify an experimental procedure.

Introduction

The several goals of physics laboratory courses are to develop students' understanding underlying physics principles, laws, or conceptions together with spectrum basic skills which involve to the art of experimentation—carrying out experiments and designing investigations to solve problems, data analysis—interpretations, and collaborative learning—social exchanges and expansion of ideas (AAPT, 1998; Hofstein & Lunetta, 2004). Such those skills are viewed as scientific practice. These are processes or methods that scientists use when they construct knowledge and solve experimental problems (Etkina et al., 2006; Etkina et al., 2006; Karelina & Etkina, 2007). In addition, in this twenty-first century, science educators and researchers have awaked to disseminate a focus on preparing learners' future-ready competencies. These particularly cite to four of these—creativity, critical thinking, collaboration, and communication (Tan et al., 2017). These correlate to the competencies having been driven in Thailand. Nowadays, there has been launched a government policy concerning to enhance economics by science, technology, and innovations called Thailand 4.0 policy (Jones & Pimdee, 2017) as Thailand has been trapped in a middle-income level. This will then affect Thailand's education reform by promoting innovative thinking and problem solving abilities.

Furthermore, based on the context of this study, to monitor an advanced physics laboratory course, the goal was covered specialized skills for working on advanced physics apparatus and challenging experiments. However, many universities in which are not leading universities in Thailand have been not ready for administering advanced lab apparatus for students as they are facing budget constraints. Under this condition, we lacked any advanced physics lab sets. Therefore, this condition reinforced us to think about how to gain support student learning efficiently and mutually took into account of the national education policy of Thailand. Then, we had an agreement to arrange the course in help students prepare some abilities for their future career or future learning which aimed to enhance innovative thinking abilities. One of the crucial abilities we referred to that was the experimental design ability. This aligned with the summary of introductory physics laboratory goals of the American Association of Physics Teachers (AAPT) (AAPT, 1998). This would affect an improvement of students' higher order thinking in solving problems and self-operating their own labs scientifically.

Consequently, to get deep understanding of students' the experimental design ability that will be a useful guideline to further help improve students' scientific learning process abilities substantially. The main purpose of this study is to primarily investigate students' experimental design ability in the advanced physics laboratory course. A strategy that was selected to help track the students' ability was inquiry.

Inquiry based learning has been disseminated to several laboratory classes and viewed as an alternative approach to enhance students' scientific inquiry skills and attitudes towards science instruction (Myers & Burgess, 2003). It is an inductive approach. The inquiry learning is generally expressed as four-levels of carrying on scientific investigations. As our participants were seniors, they were considered to get involve with a high level of carrying on scientific investigations called 'guided inquiry' (Banchi & Bell, 2008; Domin, 1999). The students would be provided with a problem or a question. They would be required to plan how to solve an experimental problem or to test a hypothesis. Therefore, the students have to formulate an investigation procedure to find an undetermined outcome by themselves. This allows the students to think like scientists. Later they will acquire knowledge and develop their own understanding of concepts, principles, or even theories.

Research Methodology

Participants

The participants were 18 fourth-year physics students from a university in Bangkok. They enrolled an advanced physics laboratory course. For the four-year study curriculum, the students had not learned physics labs since they became juniors. They were enrolled two fundamental physics laboratory courses for first-year students and two electronics lab courses for sophomore students. The teaching style of these courses was in a format of cookbook labs. The experiments were mostly selected and adapted from physics Olympics labs used for training high-school physics Olympics students. The labs involved challenging physics ideas and using basic measurement tools and simple physics apparatus. In each lab, students would be given a cookbook handout and then follow the direction of the lab till they completed and sent their individual lab report.

Research Design

Defining Sub-Abilities Relating To The Ability To Design Experiment

We initiated this study by defining sub-abilities which were relevant to the experimental design ability. Reports from Hantula *et al.* (2011) and Etkina and Murthy (2006)' research about analyses and interpretations of teaching and learning in physics laboratories, we later used to clarify the relevant sub-abilities as follows:

- (1) the ability to link physics concepts, principles, or laws in order to develop an experimental situation(s) for solving a problem or testing a hypothesis. This covers applying correct physics knowledge which corresponds to the problem solving;
- (2) the ability to identify measurement variables which relate to such that experimental situation defined;
- (3) the ability to clearly clarify an experimental procedure that can be used in the real practice;
- (4) the ability to use available equipment and materials for experimentations and measurements; and
- (5) the ability to minimize errors of experimentation. This relates to techniques used for setting-up an experiment or methods designed for collecting data.

Designing the research tools for data collection: a guided-inquiry lab, worksheets, and a 4 point rubric test

After clarifying such those sub-abilities, we then developed a guided-inquiry lab underlying the concept of heat transfer. It was about finding "the specific heat capacity of a one-baht coin".

Besides, guided-inquiry worksheets were developed to employ while students conducted the heat-transfer experiment. These guided-inquiry worksheets were not only used as a guideline to assist the students' active engagement in the laboratory but also used as a survey for investigating students' the five-experimental design sub-abilities. The lab consumed 6 hours to complete: first-three hours for planning and designing their experimental situation for solving the problem and left hours for conducting the experiment, collecting and interpreting data, summarizing results, and communicating their findings and shortcomings. The students were

required to collaborate on designing an experiment in groups of 4 to 6 throughout the lab class. Then, all of the students' individual worksheets would be collected to analyze research data. Lastly, the students were required to self-assess their five sub-abilities on the 4 point rubric test.

Data Collection

To assess the students' experimental design abilities, we collected the students' individual lab worksheets and the students' self-assessment about their sub-abilities by using the four-point rubric.

The Guided-Inquiry Lab Worksheets About Heat Transfer

The guided-inquiry lab worksheets were developed to be relevant to the five sub-abilities and then validated content and wordings by three physics teachers who had experienced in teaching for many several years. To assist student learning, the guided-inquiry lab worksheets were proposed and used during the lab class with the hidden reason about the key feature of using the worksheets. They included some key questions for guiding how to design the procedure for solving the problem and information with blank spaces as well as were embedded with the guided-inquiry approach. Many reports found that this could encourage students' interactive engagement of learning, improve their comprehension, and retention of the content (Sujarittam et al., 2016; Tanamatayarat et al., 2017)

In the worksheets, the students were initially given the information about a brief physics theory, a problem, and available equipment as follows;

Part1: Short-physics theory that is *"heat gained by an object resulting a high or low temperature change depends on its own specific heat capacity"*.

Part2: Problem statement that is *"what is the specific heat capacity of a one-baht coin?"*.

Part3: Equipment and materials which consist of *"one-baht coins, a calorimeter, a mercury glass thermometer, water at room temperature, hot water, and ice"*.

After the students were given the above information. They would then have to design how to solve the given problem. Here is the structure of inquiry activities about "Heat transfer" contained in the worksheets.

Step1: Sketch and describe the experimental situation(s) that will be used to solve the problem based on the available equipment and materials.

For this step, we prepared two hint cards for the students who had no ideas and need teacher's guides. The hint cards consisted of card 1: need to set at least two objects with different temperatures and card 2: need to define which objects will be gained or lost heat.

Step 2: Connect the situation designed to a physics concept and formulate the corresponding formula which will be used to find the specific heat capacity of a one-baht coin.

The hint cards will be contributed to the students who need help. Card 1: Heat Gained is equal to heat Lost and card 2: Heat gained by object(s) will be (the black space left for the students' response) and Heat lost by object(s) will be (the black space left for the students' response).

Step 3: Share ideas with your own groups, rethink whether you will change your ideas if 'yes' please inform your reason(s), and lastly summarize the experimental situation and the formula will be used to solve the problem.

Step 4: Identify the measurement variables.

Step 5: Identify the experimental procedure and the technique(s) will help minimize the errors of experimentation. In this step, we emphasized the students to write for letting someone else duplicate their experiment exactly.

Step 6: Select the measurement tools according to the experimental procedure and give the reasons of the selections.

In this step, we allowed the students to walk around the laboratory room to search for the measurement tools they needed.

Step 7: Create a table for collecting and recording experimental data.

All students were asked to carry out each step by themselves before exchanging ideas with their groups. The experiment would be then conducted following what they had designed on the worksheets.

Four-Point Rubric Assessments

The rubric assessment had 5 items designed in line with Karelina and Etkina (2007). There were: Item 1- linking physics concept, Item 2- defining measurement variables, Item 3- clarifying an experimental procedure, Item 4- selecting equipment and materials, and Item 5- minimizing errors. Each rubric item had a 4-rating scale from 'missing', 'inadequate', 'needs improvement', to 'adequate'. Examples of criteria are "Is able to link physics knowledge to design a reliable experiment that solves the problem?" and "Is able to use available equipment to make measurements?". Each student was asked to evaluate their own sub-abilities after completing the experimentation.

Results And Discussion

The results from the preliminary study were from observations of the students' practices in the laboratory, the analysis of the students' individual lab worksheets, and the students' self-assessment about their experimental design ability. Mostly the students seemed awkward in designing the experimental situation. They took over 30 minutes to think individually about formulating the situation(s) and the formulas which linked to such that designed situation(s). About 30 minutes were consumed for brainstorming with their groups.

Summary Of The Situations Designed From 3 Groups Of The Students

For the first group, the students designed three situations and created the wrong equation for calculating the heat of a coin and water as shown in Table 1. The students planned to put a coin at the room temperature into a calorimeter containing water at the room temperature. Another one was putting a coin at the room temperature into the hot water and the last one was putting a coin into the cool water contained in the calorimeter respectively. Besides, we found that the students planned to pour out the water from the calorimeter to measure the final temperature of the coin. They did not think of the thermal equilibrium between the coin and the water.

For the second group, this group found themselves had a big problem about determining the temperature of a coin at the room temperature. They realized that it could not be measured by directly touching a glass thermometer on the surface of a coin. Even though, they could not find a way to determine that even they paid most of time to brainstorm with their group. They skipped that and moved to propose two situations for solving the problem. One was putting a coin into the cool water contained in the calorimeter and the other one was quite similar to but it was pouring hot water instead of the cool water. They also formulated two equations with misconceptions of heat transfer as follows;

$$\text{heat gained by the coin} = \text{heat lost by the hot water}; \quad \text{Equation (1)}$$

$$\text{heat gained by the cool water} = \text{heat lost by the coin}. \quad \text{Equation (2)}$$

The initial temperature of the coin was calculated from these equations. The same equations also were then used to find the specific heat capacity of the coin.

Table 1: The examples of students' difficulties corresponding to the five sub-abilities

Sub-ability	Students' difficulties	Group No. (Number of students)
1. Linking to physics concepts	-Found heat of an object by using the formula $Q = mct$.	Group1 (4)
	-Do not include the calorimeter as a system of heat transfer.	Group1 (4) Group2 (6) Group3 (4)
	-Did not setup the heat transfer equation by corresponding to the created situation.	Group1 (4) Group3 (4)
2. Identifying measurement variables	-Did not consider to measure the temperature of a calorimeter.	Group1 (4) Group2 (6)
	- Defined heat (Q) as a variable to be measured from a calorimeter.	Group1 (4) Group3 (4)
3. Clarifying an experimental procedure	- Designed an incompleteness procedure.	Group1 (4) Group2 (6) Group3 (4)
	- Could not define the practical method to measure the coin's temperature.	Group2 (6)
4. Employing available equipment and materials	- Planned to measure heat directly from a calorimeter.	Group1 (4) Group3 (4)
	- Did not record data according to the resolution of equipment.	Group1 (4) Group2 (6) Group3 (4)
	Did not use ice because of the change of its state.	Group3 (4)
5. Minimizing errors	Used a coin (mass of a coin = 3 grams) with a large amount of water (e.g. 50 ml or greater) to find heat transfer.	Group1 (4) Group2 (6) Group3 (4)

	Did not repeat the experiments.	Group1 (4)
--	---------------------------------	------------

For the third group, we found that this group had much no understanding of physics knowledge. They created the same situations as mentioned in groups 1 and 2. One was putting a coin into the water at the room temperature contained in the calorimeter and next there was pouring hot water instead of the water at the room temperature. Even all of them asked for the guided cards, they could not help recall any physics idea. They suddenly created the formula of $c_{coin} = \frac{Q}{m\Delta t}$ to find the specific heat capacity of a coin. They thought that they could measure heat (Q) from a calorimeter and a temperature change (Δt) from a thermometer. Anyway, they confused which mass of water or of coins should be substituted in the above equation. Therefore, they could not achieve a procedure for experimentation.

The Students' Difficulties In Designing The Experimental Situations For Solving The Problem

To interpret the students' difficulties according the 5 defined sub-abilities, the observations of the students' practices in the laboratory and the students' individual lab worksheets were analyzed. The examples of the students' difficulties were presented in Table 1.

Sub-ability 1: Linking to physics concepts. The result shows that all of the students still had misunderstanding of the physics concept about heat transfer. All students could not think that the calorimeter should be included in the system of heat transfer. 8 students from groups 1 and 3 could not setup the heat transfer equation s which conformed to their created situations. This implied that the students did not understand about the conservation of energy and the thermal equilibrium. Furthermore, there were 4 students from group1 had an alternative conception about calculating the heat. They believed that they could calculate the heat of an object at any temperature (See the equation in Table 1). These results informed that the students had difficulties in designing the reliable experiment in order to solve the problem.

Sub-ability 2: Identifying measurement variables. All students could list the unknown variables that they had to find out but there were 8 students from groups 1 and 3 had misunderstanding of using a calorimeter. They thought that it could be used to measure heat. In addition, 10 students from groups 1 and 2 neglected to measure the temperature of a calorimeter.

Sub-ability 3: Clarifying an experimental procedure. All group still had a missing or incompleteness procedure. We observed that students took long time to argue what they should do exactly during they conducted their experiment. For example, they did not clarify how many coins and the amount of water would be used and weighted. The students did not aware of when the system would reach to the thermal equilibrium state. Consequently, they did not mention to stirring the water in the calorimeter or estimating the time for eventually reaching to the final temperature. We found some groups took just a moment to observe the temperature change and suddenly recorded the value.

Sub-ability 4: Employing available equipment and materials. Unexpectedly, there were 8 students from groups 1 and 3 could not remember or had not ever known about the function of a calorimeter. They thought that the calorimeter could be used to determine heat of an object directly. Furthermore, the third group decided not to use ice because it would be changed the state. Besides, the second group had waited ice melting and decided to measure the temperature of cool water only. To weight water and a coin, all groups used a digital balance with the resolution of 0.1 grams but all of them recorded the mass without the decimal numbers.

Sub-ability 5: Minimizing errors. All groups used only a coin for transferring heat from or to water. Even the students found that putting a coin into the water caused a little change of temperature, they still did not increase the number of coins. The third group also provided a comment about the technique that was "we should pour just 3 grams of water into the calorimeter to cover the height of the coin in order to measure the changing of temperature. About repetition, there was only the first group who did not think of repeating the measurements.

Students' Self-Assessments About Their Experimental Design Ability

The result from the self-assessments found that the students thought themselves had quite low sub-abilities in particular for the sub-ability to link the physics concept to solve the problem (Sub-ability 1) and to clarify the experiment procedure (Sub-ability 3). This result also relates to our observation (See Figure 1).

Figure 1: The students assessed their own sub-abilities after completing the experiment(s).

Conclusions And Implication

The goal of this study was to investigate the students' experimental design ability in the advanced physics laboratory course, which involved to the five sub-abilities: linking physics concept, identifying measurement variables, clarifying an experimental procedure, selecting available equipment and materials, and minimizing errors, respectively. To elicit the students' sub-abilities, a guided-inquiry lab and worksheets were substantially designed which were involved to the physics concept of heat transfer. Even all students had prior experiences in physics laboratory courses, they could not provide correct or even satisfactory responses on the worksheets. The results showed that the students spent about 6 hours to complete the experimentation. They took about 3 hours for designing the experiment by working on answering the guided-inquiry questions and left 3 hours for doing the experiment.

The step of linking physics knowledge to formulate at least a situation in order to solve the problem was the most time-consuming which took an hour to complete. This indicated that the linking physics concept was the most difficult process for the students. The major difficulty was from the students' alternative conceptions of heat transfer about incompletely determining the heat transfer in their designed system. This also led to the impractical procedures causing the unreasonable results. Furthermore, there were many unexpected difficulties such as lacking of basic measurements, using scientific equipment, and also identifying variables. Besides, the result from the students' self-assessments their proficiency showed that the lowest average scores were in items relating to the sub-abilities to link physics knowledge and to clarify an experimental procedure.

This report will be availed to the teachers and general educators in order to develop laboratory courses. Instructors can use these results to create or to develop effective instructional materials or teaching strategies for enhancing students' experimental designed ability.

Acknowledgements

We are extremely thankful for Thailand Center of Excellence in Physics (ThEP) for funding this research project. Additionally, we would also like to extend our sincere thanks to Asst.Dr.Narumon Emarat and Asst.Dr.Kwan Arayathanitkul for their valuable assistance in reviewing our work.

Investigation Of Computer / Computer Technology Course Teaching Programs

Asst. Prof. Dr. Burcu KARABULUT COŞKUN

Asst. Prof. Dr. İlkey AŞKIN TEKKOL

Kastamonu University, Faculty of Education Kastamonu, Türkiye

Abstract

The purpose of this study is to examine the conceptual framework of the changes in the curriculums of the Information Technologies course, which was started in 2006 and redeveloped in 2012 and 2018. These three curricula approved and implemented by the Board of Education within the Ministry of National Education in the survey will be examined by taking into account the aims, achievements, educational status and test cases. In the review, content analysis method will be used from qualitative research methods and the results are presented comparatively.

Introduction

There are a number of skills for individuals must have in order to be able to keep up with the rate of increase of knowledge, to adapt to developing technology, to follow different ways of accessing information, and to provide indicators of being an "information society".

Adams (2007) has addressed these skills in seven key areas and emphasized technology literacy. Also Demirel (2009) states that successful individuals of the future are individuals who can effectively use technology in information retrieval and that every student / individual who grows up in the information age must have the ability to effectively access and evaluate this knowledge from various sources by using rapidly changing information technology.

According to this, it is clear that one of the basic ways of accessing information by using different resources of individuals who should have 21st century skills is to use the computers of today's technology correctly. In order to ensure that computers are used to access information, assimilate knowledge, and produce new information, it is essential that the courses of Information Technologies be carried out in schools and that technological skills are acquired from the right source, not just individual development but also social development; It is important to be able to catch up with the world standards and the technology age and be a productive society.

For this reason, considering that computer lectures are important in our country, it was decided by the Board of Education to take computer courses as elective courses in primary schools in 1998 (MEB, 1998). In 2006, "Elementary Computer Course (1-8th Grades) Curriculum" was prepared. This program was reorganized in 2012 after six years, and it was named "Information Technologies and Software Course Teaching Program". This program was restructured in 2018 with the same name under the scope of updating and development of all programs. In summary, although the name and content of the course between 1998 and 2013 have been changed, the course has been continued electively. After 2013, it was decided by the Ministry of National Education that the course should be held as compulsory for the 5th and 6th grades of secondary school and as elective course for the 7th and 8th grades.

In our country, the informatics technologies and the software courses are organized by the Ministry of National Education in accordance with the Standard Based Program. In order to be able to raise the 21st century needs of the appropriate individual, the education authorities of the other countries in the world are establishing this standardized framework program by determining the education standards at the national level (MEB, 2012). For this reason, programs used in Technology education in many countries are also standards-based teaching programs (Uzgun&Aykaç, 2016).

According to the taxonomy established by Tomei in accordance with the classification made as the sufficiency levels established by Schulz, Fraillon and Ainley (2011), the achievements of Information Technologies and software lessons were established in our country (MEB, 2012).

Teacher views were obtained for the formation of other program items with the achievements determined according to the levels. After this phase, the reorganized instructional technology curriculum includes important themes such as; ethical values in technology use and production, personal and socially information literacy, aesthetics, information security and cybercrime (MEB, 2012).

As you its seen, the need to update the programs in order to catch up with the social changes has been realized. The evaluation of developed programs is also important to determine how effective the program is and can be performed by many methods.

Although there are studies in our country that examined the change of the computer course teaching programs in different methods (Bayrak and Erden, 2007; Yılmaz Tanatas, 2010, Firat, Durdukoca and Arıbaş, 2011), it is seen that researches which examines all programs comparatively are needed. It is thought that determining how the curricula have changed in terms of purpose, achievement, educational status and test situation will be important to determine the way in which social needs have changed over the past 20 years.

Method

Research Method

In the research, document analysis method was used as one of the qualitative research methods. The analysis of the document includes analysis of the materials about the facts or planned phenomena (Yıldırım and Şimşek, 2011). Accordingly, in this research, educational programs related to computer which developed from elementary to secondary schools since 2006.

Data Collection

Teaching programs developed for primary and secondary school computer lessons were examined in the research. These curriculums were "Elementary Computer Teaching (1-8th Grades) Teaching Program" implemented in 2006;; "Information Technologies and Software Course Teaching Program (5th and 8th Grades)" which was put into practice in 2012 and "Information Technologies and Software Course Teaching Program (5th and 6th Grades)" which started to be implemented since 2018. By accessing the mentioned curricula, these programs have been evaluated comparatively for the aims, achievements, educational conditions and test cases.

Data Analysis

The instructional programs developed for the computer course were analyzed in terms of naming, class levels, goals, achievements, unit / learning areas, topics and measurement-evaluation topics. Descriptive statistics are used in the analysis of the data. Findings are also supported by expressions located in the curricula.

Findings

Naming of Teaching Programs

When the curriculums were examined in terms of nomenclature, it was found that the curriculum that was put into practice in 2006 was named as "Primary Computer Teaching Curriculum" and it was found that it was named "Teaching Technologies and Software Course Teaching Program" in 2012. In 2018, the name of the program has not changed. In addition, this course has become a compulsory course since 2018, while it has been elective course in 2006 and 2012.

Levels of Teaching Practices

It has been demonstrated that computer course teaching programs applied in primary and secondary schools are applied at different grade levels in different years. Findings related to this are given in Table 1.

Table 1. Distribution of Teaching Programs in Terms of Grade Levels Applied

Teaching Programs	1. Grade	2. Grade	3. Grade	4. Grade	5. Grade	6. Grade	7. Grade	8. Grade
2006 (Elective)	+	+	+	+	+	+	+	+
2012 (Elective)	-	-	-	-	+	+	+	+
2018 (compulsory)	-	-	-	-	+	+	-	-

When Table 1 is examined, the "Primary Computer Teaching Curriculum", which was put into practice in 2006, has been developed to cover all primary education from first grade to eighth grade. The "Information Technologies and Software Course Teaching Program", which was started to be implemented in 2012, was prepared for secondary schools. It is seen that the education program implemented in 2018 is directed to the fifth and sixth classes.

Aims in Teaching Programs

While the aims of the program of the computer lesson curriculums applied in elementary and junior high schools are under the heading of vision in 2006; In 2012 the program was included in the title of objectives and competences. In 2018, it was mentioned as a special purpose of the program. The table for the purposes of the curricula is given below (Table 2).

Table 2. Aims of Teaching Programs

	2006	2012	2018
Aims	<ul style="list-style-type: none"> • Correct, effective and beautiful use of Turkish Language • Competencies of Information Technologies • Critical thinking • Decision making • Being a judge in case of unexpected situations • Work within the group • Having communication skills • Very versatile enough 	<ul style="list-style-type: none"> • Informatics literacy • Communicating, information sharing and self-expression using information technologies • Researching, information structuring and working collaborative • Problem solving, programming and original product developing 	<ul style="list-style-type: none"> • Understanding of technological concepts, systems and processes as being digital citizens and creating technical know-how • Searching information by technology and internet, learning opportunities that are effective and purposeful • Acquisiting and developing the problem solving, reasoning and computational skills, • Acquiring cooperative working skills, benefit from the social environment and share what they learn as part of the learning process, • Developing an understanding of algorithm design to be able to express both verbally and visually. • Having accumulation of programming skills to use at least one of the programming languages. • Making execution on product design and management • Developing innovative and original projects to solve problems in daily life (problems faced by elderly and disabled people, etc.) • Gaining awareness about lifelong learning

When Table 2 is examined, it appears that the foremost aims are the use of information technologies, the ability to work collaboratively, and the development of problem-solving skills. 2012 and 2018 curricula are both have aims about product development. In addition, it has been determined that the 2018 curriculum includes objectives for lifelong learning.

Achievements of Teaching Programs

Findings regarding the number of achievements of curricula are given in Table 3.

Table 3. Number of Achievements in Teaching Programs

	1. Grade	2. Grade	3. Grade	4. Grade	5. Grade	6. Grade	7. Grade	8. Grade	Total
2006	19	19	19	21	23	24	17	21	163
2012	Frame Program								183
2018	-	-	-	-	75	78	-	-	153

When Table 3 is examined, it is seen that 163 in the education program in 2006, 183 in 2012 and 153 in the education program in 2018. In the curricula of 2006 and 2018, achievements were identified separately by class levels. In the 2012 curriculum, it is expressed as a framework program and the achievements without class level are mentioned. It is stated that the curriculum developed in 2012 should determine the levels of the students for different proficiencies and leave the level or subjects to the teacher's preference. The reason for not distributing the gains according to the class levels is due to the structure of the program.

Learning Areas / Units in Teaching Programs

While the learning areas were included in 2006 and 2012 regarding the computer program teaching programs applied in elementary and junior high schools, "unit based approach" was taken as basis in 2018. The distribution of learning areas and units of the programs are given in Table 4.

Table 4. Learning Areas / Units in Teaching Programs

	2006 (Learning Areas)	2012 (Learning Areas)	2018 (Units)
Learning Areas/Units	<ul style="list-style-type: none"> • Basic Operations and Concepts • Usage of Information Technologies • Advanced Practices in Information Technologies • Scientific Process in Information Technologies • Ethics and Social Values of Information Technologies 	<ul style="list-style-type: none"> • Informatics Literacy • Establishing Communication, Information Sharing and Self-Expression Using Information Technologies • Researching, Information Structuring and Collaborative Work • Problem Solving, Programming and Developing Original Product 	<ul style="list-style-type: none"> • Information Technologies • Ethics and security • Communication, Research and Cooperation • Product Creation • Problem Solving and Programming

According to Table 4, it is seen that the concepts commonly used in learning areas / units are the use of information technologies. Examples of activities and learning areas and activities related to the units are not included in the curriculum implemented in 2018, while they are included in the curricula implemented in 2006 and 2012. In 2006 and 2012, detailed lesson plans and activity examples were given.

Measurement and Evaluation Approaches in Curriculums

The data about measurement and evaluation approaches in curricula are given in Table 5.

Table 5. Measurement and Evaluation Approaches in Curriculums

	2006	2012	2018
Measurement and Evaluation Approaches	<ul style="list-style-type: none"> • Performance evaluation • Rubrics • Check lists • Interview • Self-assessment and peer review • Project • Digital product file (portfolio) • Concept maps • Short response materials • Multiple choice questions • Matching materials • Open-ended questions 	<ul style="list-style-type: none"> • Grading scale • Rubrics • Checklist • Performance evaluation • Product file (portfolio) • Peer review • Self-assessment 	<ul style="list-style-type: none"> • The curriculum does not draw definitive boundaries to the practitioners in terms of the measuring instruments and methods that can be used in the measurement process, but only guides them. • Measuring results are handled in unison with the processes being followed. • The academic development of a student can not be measured and evaluated by a single method or technique, evaluation is carried out with the active participation of the students.

The measurement evaluation tools recommended in 2006 and 2012 curricula are mentioned and examples of these tools are presented. In 2018, examples of measurement evaluation tools are not included, but only the principles to be considered in the measurement evaluation process are specified.

Conclusion And Recommendations

As a result of the examination of the programs, it is seen that informatics courses became compulsory at primary level in 2018 while it was an elective course in 2006 and 2012. Computer Teaching Program was developed for 1-8 grades in 2006 and it was developed for middle school (grades 5-8) in 2012. In 2018, it was developed to be applied in 5th and 6th grades.

When nomenclature is examined, it is seen that the name of the course was changed from "Primary Computer Course" in 2006 to "Information Technologies and Software Course" in 2012 and 2018. While the objectives of the program were placed under the title of vision in 2006; In 2012 the program was included in the title of objectives and competences. In 2018, it was mentioned as a special purpose in the teaching program.

When it is examined in terms of learning areas, while learning areas are included in curriculums of 2006 and 2012; units were included directly in 2018. When the curricula are examined in terms of achievements, the achievements in 2006 and 2018 are stated separately by class level. It was expressed as a framework program in the 2012 curriculum and includes achievements without class level. Examples of activities were included in 2006 and 2012 curricula. However, it is determined that there are no examples in this issue in 2018. In 2006 and 2012 curricula, the recommended assessment tools were mentioned and examples of these tools were presented. In 2018, examples of measurement evaluation tools are not included, but only the principles to be considered in the measurement evaluation process are specified. A comprehensive review can be conducted with different curriculum evaluation methods by considering all past curriculums that are relevant to the studies. However, in-depth examination can be made in comparison with different program evaluation methods. By examining the curriculums of computer courses abroad, it can be compared with the curriculums of computer courses in our country.

Abstract

A physician must be well educated to be able to provide qualified health care. The way to be a successful and a good physician in this occupation is to learn the human anatomy correctly and permanently. Mobile devices such as mobile phone, tablet, etc. have changed the habits of young populations. These devices can be used not only for tracking social media, watching videos, taking photos, but also for education.

Different activities, such as laboratory lessons and clinical skills exercises in the medical faculty, help students understand lessons better. Examinations also contribute to student studying and learning. In the constructivist learning approach, assessment and evaluation are part of the teaching process and take place at every important point throughout the learning process, not just at the beginning and end of the learning. Web-based student response systems that can be used with mobile devices are also being used by lecturers. One of these systems, Kahoot help lecturers create, share, organize and apply multiple-choice questions. After this preparation, students can answer these questions via mobile devices or computers. It makes easier for lecturers to evaluate students. It also allows students to answer questions in the style of competition with their friends.

The aim of this study is investigating the evaluations of 2nd class students of Kocaeli University School of Medicine on Kahoot application.

At the first stage, 27 students (10 male, 17 female students) were asked to choose the names of the anatomical structures indicated by the arrows in the pictures of the models showed in the laboratories of the Nervous System and Sensory Organs Committee before. At the second stage, 6 students (4 female, 2 male) were asked to answer the questions prepared from the theoretical courses of Anatomy in the committee. After these quizzes, satisfaction or displeasure of the students with Kahoot were evaluated by 5 points with a questionnaire consisting of likert type questions.

The number of students participating in the survey is 16 (9 males, 7 females) and the mean of ages is 20.75 ± 1.238 . According to the survey, 81.3% of the participants have found Kahoot very interesting. The percentage of students who think that they have learnt any knowledge when solving the quiz is 75%. On the other hand, students get excited during these quizzes and similar exams. And also a competition may arise between them. The rate of students who are excited during the exam is 50% and the rate of students who think that they compete with their friends is 56.3%. In conclusion, Kahoot is an on-line measurement and evaluation system that the lecturer can make students repeat important parts of the lecture, that he/she can see how much of his/her teachings transmit to

learners, and detect most done mistakes. We believe that using the application of this platform in addition to normal teaching process may increase the motivation of the students, contribute to the success of them. Also, efficiency in the student assessment and evaluation can be provided for the lecturer.

Keywords: *Anatomy, education, Kahoot, assessment and evaluation*

Introduction

Today, medical education is divided into pre-graduate, post-graduate (specialization) and continuous medical education (in-service training). In our country pre-graduate education is integrated in some of the medical faculties and classical in some of them. it is taught in lecture halls in the first 3 years. However, in the second 3 years, it is taught in faculty hospital as applied and theoretical education. As is the case in the world, classical educational alternatives are becoming increasingly common in our country (Gürakın et al., 1997 ; Ögetürk et al., 2003)

A physician must be well educated to be able to provide quality health care. The way to be a successful, good physician in occupation is to learn the human anatomy correctly and permanently (Sabanciogullari et al., 2016). Different activities, such as laboratory lessons and clinical skills exercises in the medical faculty, help students better understand lessons. Examinations also contribute to studying and learning of students. Measurement and evaluation in the constructivist learning approach are part of the teaching process and take place at every important point throughout the learning process, not just at the beginning and at the end of the learning period (Gelbal & Kelecioğlu, 2007).

Smart phone, tablet, etc. mobile devices have changed the habits of youngs. The use of smartphones has become especially widespread. For example, the smartphone usage rate for the 16-24 age population in the UK increased from 86% in 2012 to 93% in 2016. (Smartphone usage in the United Kingdom (UK) 2012-2016, by age-Statista) Students use their mobile phones for viewing course related material, finding locations, checking weather forecasts, acquiring traffic updates and connecting to social networking platforms such as Facebook, Twitter and WhatsApp as well as for making voice calls. (Iqbal et al.2017)

Researchers built prototypes on student response systems (SRS) in the 60s (Judson 2002), and SRSs started to be used in education in the early 70s (Bessler & Nisbet 1971, Casanova 1971). In the recent years, game-based learning has become more common in learning environment along with the introduction of game-based student response systems (GSRS). The gamebased version focuses more on engagement and motivation by stimulating the students through multimedia. GSRS also uses score to motivate or compete against fellow students also (Wang & Lieberoth, 2016)

Kahoot!, one of the GSRSs, offers teachers the opportunity to create, share, and effectively apply multiple-choice questions to students. Students can enter the exams using a mobile device or computer without opening an account. The correct answers given by the students are scored by time. The faster true answers refer to the higher scores. This platform presenting the competition environment to the students with their friends is advantageous in that the teacher can easily evaluate the learning of students.

The aim is investigating of evaluations of the 2nd class students in the school of medicine on Kahoot platform about anatomy education

Matherial-Method

At the first stage, 27 students (10 male, 17 female students) were asked to choose the names of the anatomical structures indicated by the arrows in the pictures of the models showed in the laboratories of the Nervous System and Sensory Organs Committee before.

At the second stage, 6 students (4 female, 2 male) were asked to answer the questions prepared from the theoretical courses of Anatomy in the committee.

After these quizzes, satisfaction or displeasure of the students with Kahoot were evaluated by 5 points with a questionnaire consisting of 10 likert type questions. 16 surveys were collected.

Before of both these two stages, adaptation of the students was provided with a pilot test consisting two questions. All of the students voluntarily did the quizzes and filled out the surveys.

Permissions have been obtained from the Deanship of the School of Medicine of Kocaeli University for the processes.

Results

The number of students participating in the survey is 16 (9 males, 7 females) and the mean of ages is 20.8 ± 1.24 . According to the survey, 81.3% of the participants have found Kahoot very interesting. The percentage of students who think that they have learnt any knowledge when solving the quiz is 75%. On the other hand, students get excited during these quizzes and similar exams. And also a competition may arise between them. The rate of students who are excited during the exam is 50% and the rate of students who think that they compete with their friends is 56.3%.

Table – 1 – Descriptive statistics of participants of the survey

	Male	Female	Total
<i>Numbers</i>	N:9	N:7	N:16
<i>Age</i>	21 ± 1.32	20.4 ± 1.13	20.8 ± 1.24
<i>Means of Scores of Last Three Committees</i>	79.3 ± 8.75	81.3 ± 14.6	80.1 ± 11

Table – 2 – The questions and collected answers of the survey

	Male	Female	Total
<i>Interest of this quiz was fine.</i>	n:6 (%66.7)	n:7 (%100)	n:13 (%81.3)
<i>This quiz increased my concentration.</i>	n:8 (%88.8)	n:3 (%42.9)	n:11 (%68.7)
<i>The quiz was funny.</i>	n:8 (%88.8)	n:6 (%85.7)	n:14 (%87.6)
<i>My heart rate increased, I was excited during the quiz.</i>	n:5 (%55.5)	n:3 (%42.9)	n:8 (%50)
<i>I competed with my friends during the quiz.</i>	n:7 (%77.8)	n:2 (%28.6)	n:9 (%56.3)
<i>I learnt something during the quiz.</i>	n:8 (%88.8)	n:4 (%67.2)	n:12 (%75)
<i>This quiz advanced my Anatomy Laboratory motivation.</i>	n:6 (%66.6)	n:5 (%78.8)	n:11 (%68.7)
<i>This quiz may increase my Anatomy Laboratory exam success.</i>	n:7 (%77.8)	n:5 (%78.8)	n:12 (%75)
<i>I want these quizzes in Anatomy theoretical lectures also.</i>	n:6 (%66.6)	n:7 (%100)	n:13 (%81.3)
<i>If these quizzes are applied in Anatomy theoretical lectures, my theoretical exam success may increase.</i>	n:8 (%88.8)	n:7 (%100)	n:15 (%93.7)

Discussion

Wang & Liberoth (2016) made a study on 593 students. They did a survey about Kahoot. The students responded %95 positively to “I learnt something from playing the quiz” and %93 negatively to “Playing the quiz made me less motivated about the subject”. The results are similar with our study. Kahoot platform has also audio and score components. They also found that concentration, engagement, enjoyment, and motivation of students can be effected by audio and score usage in Kahoot. Students may feel as a competitor if score is used. Audio may effect hearing sense positively to focus more.

Zengin et al.(2017) made a study about Kahoot and Plickers on 15 pre-service mathematics teachers. According to the results of the research Kahoot! and Plickers software have made an important contribution to the learning and teaching process. It has become clear that the gamification of these softwares increase student interaction and participation in the learning-teaching process.

In the guidance of the teachers, students play in the role of a competitor. Kahoot!, which increases the attendance and motivation of the course, creates a visual and detailed data source for the teacher's formative evaluation and presents a detailed report at the end of the game (Wang, 2015). For example, after a question in Kahoot, teacher can see how much of students have truly or wrongly answered. If wrongs or blanks are more than true answers, teacher can repeat the subject. Therefore, lessons are taught more effectively.

McCabe (2006) found also that in such practices, the fact that the student felt compulsive at the point of responding enhances active participation. This is a crucial point. In classic course, teacher asks a question to a class. With one or more true answers, teacher can interpret wrongly as most of the class have understood the lesson. However, in

game-based learning activities like Kahoot, students mostly answer the question whether they know. In this way, teacher can realize more precisely, the understanding levels of the students.

Iwamoto et al. (2017) made a study on the 49 first year Psychology students. They split 49 students into control and experimental groups. Kahoot application was applied on experimental group. They found that Kahoot had a significant effect on academic performance of experimental group when compared with control group. Their qualitative findings also supported this result. Our results are parallel to these results.

Smith & Brauer (2018) gave some hints for effective use of Kahoot. One of them is that well designed Kahoot! questions can lead to better student engagement, motivation and learning. The other one is appropriate time limit. They told that longer time limit caused students to be bored and little time created frustration for them. They also suggested not to use long questions in quizzes. Difficulty of the questions was set optimally as for the authors. Hardworking students should do much more questions than unprepared students. Besides, they had students fill out surveys that were. %95 of students found Kahoot funny. %100 of students told that Kahoot provided them to understand concepts better in thermodynamics course. Our results show similarity with these results.

Applying Kahoot depends on Internet connection. Therefore, if there is Internet connection problem on server computer or mobile phones and tablets of students, applying Kahoot may fail. We suggest instructors to try a Kahoot quiz before the main quiz in the class.

With the use of appropriate technologies in the learning environment, the participation of students in the classroom is increasing and the learning of the students can be evaluated rapidly. (Johns, 2015)

Conclusion

Kahoot is an on-line measurement and evaluation system that the lecturer can make students repeat important parts of the lecture, that he/she can see how much of his/her teachings transmit to learners, and detect most done mistakes. We believe that using the application of this platform in addition to normal teaching process may increase the motivation of the students, contribute to the success of them. Also, efficiency in the student assessment and evaluation can be provided for the lecturer.

Abstract

The primary purpose of this research is to investigate the level of psychological need satisfaction of team and individual athletes. The secondary purpose of the study is to determine whether the athletes are professional or amateur athletes and to examine the level of psychological need satisfaction according to gender variable. A total of 231 (Age average = $21,35 \pm 2,111$) (104 female and 127 male) athletes participated in the study voluntarily. The Basic Psychological Needs Scale and the personal information form created by the researchers were used to realize the research purpose. SPSS 21.0 computer package program was used in analyzing the data. Weighted mean, percentage, frequency, and t-test analysis techniques were used in the study. A significance level of 0.05 was used in the interpretation process of the obtained findings. When the findings of the study were examined, it was determined that the satisfaction of basic psychological needs of team and individual athletes did not differ statistically. In addition, when examined with respect to gender variable, it was found out that there is a statistical difference in the autonomy and relatedness subscales in favor of female athletes. As a result, it can be said that the whether athletes are a team sport or an individual athlete does not constitute a basis for differentiating the levels of their basic psychological need satisfaction.

Keywords: *Need Satisfaction, Team Sports, Individual Sports, Athlete*

Introduction

Athletes should have many basic psychological skills (Bozkurt, 2014). While these skills are tried to be discovered by the researchers (Mahoney, Gabriel & Perkins, 1987; Jackson et al., 2001), theoretical structure and related psychological factors are also tried to be revealed (Fletcher & Hanton, 2001, Şahin, Bayköse & Civar Yavuz, 2017b; Bayköse et al., 2017). The studies conducted based on the opinion that an athlete's having a psychological skill would contribute to his/her performance (Sheard & Golby, 2006; Thomas, Murph & Hardy, 1999) are mostly focused on soliloquy (Hardy, 2006; Theodorakis et al., 2000; Nergiz, Bayköse & Yildiz, 2015; Bayköse, N. (2018).), mental endurance (Jones, 2002; Crust & Clough, 2005), awareness (John, Verma & Khanna, 2011; Scott-Hamilton, Schutte & Brown, 2016), imagination (Şahin, Bayköse & Civar Yavuz, 2017a). Self-determination theory is one of the main hypothetic approaches which were developed for explaining how psychological factors could influence motivation of an individual (Deci & Ryan, 2000).

Basic psychological needs are accepted to be associated with many psychological needs. The theory predicts that an increase or decrease in basic psychological needs could influence many psychological structures (Deci & Ryan, 2000). Autonomy is defined as the individual's selecting his/her behaviors and experiences with his/her own free will. Deciding for the behavior and acting independently for initiating the behavior and making free choices are the main indicators for showing self determination. The individual completely accepts, approves his/her own behaviors and stands behind them (Deci & Ryan, 2008).

Competency need is defined as adaptation to environment, influencing environment, controlling events and feeling competence. Satisfaction of competency need is realized through good relations with environment and high adaptation ability (Deci & Ryan, 1985). Relatedness need is defined as being in relation with other people and individual's feeling him/herself to belong to the social environment which he/she is in (Kowal & Fortier, 1999). Basic psychological needs are required for development, maintaining life, psychological and physiologic health (Kasser ve Ryan, 1999). Individuals are psychologically durable and wellness level is high when three basic needs are satisfied (Deci & Ryan, 2000). On the other hand, three needs' not being satisfied is explained with low motivation level, higher ill-being. In other words, unsatisfied needs is accepted as relation with psychopathology (Williams, Cox, Hedberg & Deci, 2000).

Under the light of these data, the aim of the present study is to investigate psychological need satisfaction level of the athletes who do sports individually or within a team.

Method

Study group

The study was conducted with participation of the athletes who do sport actively (wrestle, taekwondo, volleyball, football, basketball etc) at 2016-2017 season. A total of 231 (104 females, 127 males) athletes with mean age of $21,35 \pm 2,111$ years were voluntarily included in the study.

Data collection tools

The Basic Psychological Needs Scale and the personal information form created by the researchers were used to realize the research purpose.

The Basic Psychological Needs Scale

This scale was created by Deci and Ryan (2000) and adapted to Turkish by Kesici et al. (2003). The Basic Psychological Needs Scale is composed of 21 items. It is a 5 Likert type scale of which options vary between “completely true” and “never true”. The scale has three subscales as autonomy need, competency need and relatedness need. Internal consistency coefficient is 0.73 for autonomy need, 0.61 for competency need and 0.73 for relatedness need. Overall confidence coefficient was found as 0.76 (Kesici et al., 2003).

Personal data form

The form which was developed by the researchers includes data about age, gender, branch with the aim of inquiring personal data of the participants.

Data analysis

Skewness and Kurtosis values were tested for examining normality distribution before data analysis. Skewness (0.593) and Kurtosis (-0.503) values of both scales were found between +1 and -1 reflecting normal distribution, and parametric test techniques were planned. Data were analyzed using descriptive statistics, percent, mean and t test. Data were analyzed using SPSS 21.0 package program and a p level of 0.05 was accepted as level of significance.

Results

Table 1: Satisfaction level of the athletes according to branch variable

	Branch	N	Mean	Std. Deviation	t	p
Relatedness	Team	92	5,3164	1,06764	-0,904	0,367
	Individual	135	5,4617	1,26460		
Autonomy	Team	92	5,2888	,84342	1,012	0,313
	Individual	135	5,1587	1,01806		
Competency	Team	92	4,8413	1,21177	0,862	0,390
	Individual	135	4,7037	1,15890		

Mean score of relatedness subscale of athletes who do team sports was not found statistically significant compared to the scores of the athletes who do individual sports. Mean score of autonomy subscale of the athletes who do team sports was not found statistically significant compared to the scores of the athletes who do individual sports. Mean score of competency subscale of the athletes who do team sports was not found statistically significant compared to the scores of the athletes who do individual sports (Table 1).

Table 2: Satisfaction level of the athletes according to gender variable

	Gender	N	Mean	Std. Deviation	t	p
Relatedness	Female	104	5,6186	1,32067	2,747	0,006
	Male	127	5,1925	1,03670		
Autonomy	Female	104	5,3709	,89081	2,629	0,009
	Male	127	5,0416	,99042		
Competency	Female	104	4,8577	1,22155	1,254	0,211
	Male	127	4,6630	1,13381		

Mean score of relatedness subscale of female athletes was found statistically significantly higher compared to mean scores of male athletes. Mean score of autonomy subscale of female athletes was found statistically significantly higher compared to mean scores of male athletes. Mean score of competency subscale of female athletes was not found statistically significant compared to mean scores of male athletes (Table 2).

Table 3: Satisfaction level of the athletes according to being professional or amateur athlete variable

		N	Mean	Std. Deviation	t	p
Relatedness	Amateur	132	5,3779	1,00717	-0,094	0,925
	Professional	99	5,3928	1,40172		
Autonomy	Amateur	132	5,2219	,94979	0,585	0,559
	Professional	99	5,1472	,97436		
Competency	Amateur	132	4,7167	1,13751	-0,507	0,613
	Professional	99	4,7960	1,22881		

Mean score of relatedness subscale of amateur athletes was not found statistically significant compared to mean scores of professional athletes. Mean score of autonomy subscale of amateur athletes was not found statistically significant compared to mean scores of professional athletes. Mean score of competency subscale of amateur athletes was not found statistically significant compared to mean scores of professional athletes (Table 3).

Conclusions

The aim of the present study is to investigate psychological satisfaction level of team and individual athletes. Among satisfaction need subscales, mean score of relatedness subscale of team athletes was found not to be significantly different compared to individual athletes. Mean score of autonomy subscale of team athletes was found not to be significantly different compared to individual athletes. Mean score of competency subscale of team athletes was found not to be significantly different compared to individual athletes. When we have reviewed related literature, we have detected that results of our study are inconsistent with those of Bilge (1992) who have investigated psychological needs of athletes. Because Bilge (1992) have reported that psychological needs of team and individual athletes differ. However this conflict is suggested to result from differentiation of psychological needs that studies are based on. Our study was conducted based on self determination theory.

According to this, athletes are considered to be psychologically durable when three basic needs are satisfied and their wellness is high (Deci & Ryan, 2000). How these three basic needs are satisfied was analyzed considering that the sport which team and individual athletes do is an environmental factor. Ünlü (2009) has obtained similar results in autonomy and competency subscales with regard to gender variable.

Among need satisfaction subscales, mean score of relatedness subscale of female athletes was found statistically significantly higher compared to mean scores of male athletes. Mean score of autonomy subscale of female athletes was found statistically significantly higher compared to mean scores of male athletes. Mean score of competency subscale of female athletes was not found statistically significant compared to mean scores of male athletes. Results of the study of Ünlü (2009) conducted with physical training students were found partially consistent with ours. Ünlü (2009) has reported that need of relatedness was higher among individual athletes. However this conflict is suggested to result from sample difference.

When athletes were analyzed with regard to athletics level, mean score of relatedness was found not to be significant between amateur and professional athletes. Mean score of autonomy subscale of amateur athletes was not found statistically significant compared to mean scores of professional athletes. Mean score of competency subscale of amateur athletes was not found statistically significant compared to mean scores of professional athletes.

In conclusion, it may be stated that doing team or individual sports is not a factor for differentiation of basic psychological need satisfaction.

Investigation Of Predictive Effects Of Athletes' Self-Esteem On The Level Of Mental Toughness

Mehmet Emre ERYÜCEL

Faculty of Sport Sciences Akdeniz University
emreeryucel@akdeniz.edu.tr

Nazmi BAYKÖSE

Faculty of Sport Sciences Akdeniz University
nazmibaykose@akdeniz.edu.tr

Abstract

The primary purpose of this study is to examine the predictive effect of the athletes' self-esteem on their level of mental toughness. The secondary purpose of the study is to examine the levels of self-esteem and mental toughness of the athletes according to gender variable. Mental toughness questionnaire developed by Sheard et al. (2009) was used to determine the level of mental toughness in sports environment, and self-esteem scale developed by Rosenberg (1965) was adopted to determine the levels of self-esteem. The data were obtained with the participation of 231 athletes who were actively doing sports in different cities and branches. It was announced that participation in the study is in a volunteer basis, and after then the study was practiced to those who volunteered. Data that was left blank or not found to be filled seriously during the application was not included in the analysis. T-test, Pearson's correlation test and regression tests were used in the analysis of the data. Data were analyzed with SPSS 21.0 package program, and $p < 0.05$ was used as significance level. When the research findings were examined, it was found out that the confidence subscale of mental toughness had a positive relationship with self-esteem. As a result, it can be said that self-esteem has a weak correlation role in determining mental toughness.

Keywords: *Self-Esteem, Mental Toughness, Sport*

Introduction

Self-esteem is one of the variables tested in the literature, often in research. There are many different definitions of self-esteem. In some definitions, self-esteem is taken as emotionally based while in some definitions it is defined as one's thoughts about talents and skills (Brown, 1998).

There seems to be a general consensus among researchers and sport psychologists that mental toughness (MT) is an important and multidimensional structure of successful performance and sport-specific outcomes (Crust, 2008; Jones et al., 2007; Sheard, 2010). Among the qualities that represent MT most frequently are self-doubt, self-believe and confidence, coping with pressure and distress effectively, resistance, exposure to pressure, continuation of effort and superior concentration skills (Connaughton et al., 2010; Crust, 2008; Sheard, 2010). Thus, MT represents a set of positive psychological variables that help buffer the harmful effects of stress and allow individuals to perform consistently well regardless of situational factors (Clough, Earle and Sewell, 2002). However, new researchers have suggested that MT is more than a source of resistance working at times of distress, and that MT also provides proper focus and motivation when it goes well (Gucciardi, Gordon and Dimmock, 2008).

Discussions continue as to whether MT is more stable and permanent or a set of minds that can be manipulated through education and experience (Crust, 2008, Sheard, 2010). By defining MT as a psychological boundary that may be "natural or developed", Jones et al. (2007) shows the importance of both nature and nutrition. Recent research has shown that the development of MT is a lengthy and complex process that is affected by personal qualities, environmental conditions and critical events (Connaughton et al., 2010).

In this context, the purpose of this study was to examine the athlete's self-esteem on the mental endurance levels.

Methodology

Research Model

The research was based on the relational screening model. Relational search models are research models that aim to determine the presence and/or extent of change between two or more variables. Although the relational search model does not provide a real cause-and-effect relationship, it allows the prediction of the other when an alternative state is known (Karasar, 2006). In this study, it was aimed to investigate the predictive effect of athlete's self-esteem on mental tolerance levels.

Study Group

The data was obtained with the participation of 231 athletes who are active in sports in different cities and branches and who continue active sports life. It was announced that participation in the study is in a volunteer basis, and

after then the study was practiced to those who volunteered. 103 of the athletes participating in the survey are female and 127 are male athletes. The average age of the participating athletes was calculated as 21-32.

Data Collecting Tools

Sport Mental Toughness Questionnaire

The sport mental toughness questionnaire developed by Sheard et al. (2009), consists of 14 items and 3 sub-dimensions to determine the level of mental toughness in the sport environment. In addition to the general mental toughness, the three subscales and Cronbach Alpha values are, Confidence 0.72, Continuance 0.71 and Control 0.66, and in 4-point Likert structure (1 = completely wrong, 4 = very accurate). The Turkish adaptation study of Sport Mental Toughness Questionnaire (SMTQ) was done by Altıntaş and Koruç (2016). The Cronbach Alpha values for the subscales of the questionnaire were 0.84 for the confidence subscale; 0.51 for continuity sub-dimension; and control is 0.79 for the lower 23 dimensions. With these results, it is seen that the questionnaire is a reliable scale (Altıntaş, 2015). In this study, internal consistency coefficients were obtained as 0.56 for control, 0.57 for continuity and 0.73 for confidence.

Rosenberg Self-Esteem Questionnaire

The first 10 articles of the self-esteem questionnaire developed by Rosenberg (1965) and adapted to Turkish by Çuhadaroglu (1986), were used to measure self-esteem. The original form of the questionnaire consists of 63 articles and 12 sub-tests. These subcategories are; self-esteem, continuity of self-concept, trust in people, sensitivity to criticism, depressive affect, imagination, psychosomatic symptoms (persistence in sleep, shivering in hands, nervousness, paleness, nail-biting, shortness of breath, sweating in hands, headache, nightmare) threatening, participating in discussions, parental interest, relationship with father and psychic isolation. In addition, Rosenberg also stated that these subscales could be used separately in research if requested (Balat & Akman, 2004). In the self-esteem subscale, there are ten articles with positive and negative meanings. Articles 1,2,4,6,7, evaluate the positive self-esteem whereas 3,5,8,9 and 10 evaluate the negative self-esteem (Çuhadaroglu, 1986). The validity and reliability of this measure on the Turkish sample was first obtained by Çuhadaroglu (1986). In this study, the self-esteem questionnaire was assessed on 7-step questionnaires (1 = not at all, 7 = strongly agree) and high internal consistency coefficient (Cronbach alpha = 90). The first 10 are used to assess self-esteem. In this research, the first 10 articles of the questionnaire were used to assess self-esteem, and Cronbach's alpha is = 0.73. The answers were given through a 4-point Likert-type scale. A study was conducted by Schmitt and Allik (2005), with the aim of assessing the universal and cultural specificities of the questionnaire. In this study, the questionnaire has been translated into 28 languages and has worked with 53 nations consisting of 16.998 participants. For the factor structure of the scale, when a nation-wide compatibility analysis was conducted, it was found that there was an average of 0.99 compatibility coefficient in 52 nations and that this coefficient dropped below 0.95 in only 5 nations. For all these nations, the average reliability coefficient was 0.81. The results show that this questionnaire has universal values and has an international validity in harmony with different cultures (Akt. Hamurcu, 2014).

Personal Information Form

The Personal Information Form developed by the researcher includes questions about gender and age.

Data Analysis

The data were obtained from 528 athletes who were active in sports in different cities and branches. It was announced that participation in the study is in a volunteer basis, and after then the study was practiced to those who volunteered. Data left blank or defined it has not been seriously filled during the implementation were not included in the analysis. In the analysis of the data, t test, Pearson's correlation test and regression tests were used. Data were analyzed with SPSS 21.0 package program and $p < 0.05$ was used as significance level.

Finding

Table 1: The relationship between the level of self-esteem and mental toughness of the athletes

	Self-esteem	Confidence	Toughness	Control
Self-esteem	Pearson Correlation	1	,173**	,006
	Sig. (2-tailed)		,009	,934
	N	230	230	230
Confidence	Pearson Correlation	,173**	1	,087
	Sig. (2-tailed)	,009		,191
	N	230	230	230
Toughness	Pearson Correlation	,006	,087	1
	Sig. (2-tailed)	,934	,191	

	N	230	230	230	230
Control	Pearson Correlation	-,027	,032	,160*	1
	Sig. (2-tailed)	,685	,628	,015	
	N	230	230	230	230
**. Correlation is significant at the 0.01 level (2-tailed).					
*. Correlation is significant at the 0.05 level (2-tailed).					

The relationship between self-esteem and confidence ($r: .173$) was significant ($p: 0.05$), the relationship between self-esteem and toughness ($r: .027$) were not significant ($p > 0.05$) and the relationship between self-esteem and control was not significant. A correlation between control and toughness was found to be statistically significant in the relationship between mental toughness subdivisions ($r: .160$).

Table 2: Regression Analysis Results Regarding the Role of Athletes in Determining Mental Toughness (Confidence) Levels of Self Esteem Levels

Model	β	t	p
Self-Esteemed	,173	2,646	,009
R=0,173; R ² =0,030; Adjusted R ² =0,026; F(1,228)= 6,999; p=0.009			

When the simple linear regression analysis model was examined, a significant relationship was found between self-esteem and mental toughness subscale and confidence subscale ($R = 0,173$, $F = 6,999$, $p < 0,01$). There was a positive and significant relationship between self-esteem level and mental toughness subscale and confidence subscale ($\beta = 0,173$; $p < 0,01$). The self-esteem scores of the athletes participating in the study, account for 3% of the total variance of the confidence component of the athletes' mental toughness components ($R^2 = 0.030$, $p < 0.01$).

Table 3: Regression Analysis Results Regarding the Role of Athletes in Determining Mental Toughness (Toughness) Levels of Self Esteem Levels

Model	β	t	p
Self-Esteem	,006	0,083	,934
R=0,006; R ² =0,000; Adjusted R ² =0,000; F(1,228)= 0,007; p=0.934			

When the simple linear regression analysis model was examined, it was observed that there was no significant relationship between the self-esteem and the toughness subscale from mental toughness subscale ($R = 0.006$, $F = 0.007$, $p < 0.01$). There was no correlation between the self-esteem level and the mental toughness subscale of the athletes participating in the study ($\beta = 0.006$, $p < 0.01$).

Table 4: Regression Analysis Results Regarding the Role of Athletes in Determining Mental Toughness (Control) Levels of Self Esteem Levels

Model	β	t	p
Self-esteem	,032	0,407	,685
R=0,027; R ² =0,001; Adjusted R ² =0,004; F(1,228)= 0,165; p=0.685			

When the simple linear regression analysis model was examined, it was observed that there was no meaningful relationship between self-esteem and toughness subscale from mental toughness subscale ($R = 0.006$, $F = 0.007$, $p < 0.01$). There was no correlation between the self-esteem level and the mental toughness subscale of the athletes participating in the study ($\beta = 0.006$, $p < 0.01$).

Table 5: Levels of self-esteem and mental toughness of the athletes according to gender variable

	Gender	N	Mean	Std. Deviation	t	p
Self-esteem	Female	103	1,9117	,42295	-1,290	0,198
	Male	127	1,9858	,44235		
Confidence	Female	104	3,1554	,62459	1,361	0,175
	Male	127	3,0420	,63689		
Toughness	Female	104	2,7476	,43019	0,856	0,393
	Male	127	2,6890	,57968		

Control	Female	104	3,1346	,64980	4,113	0,000
	Male	127	2,7402	,77562		

When Table 5 was examined, it was observed that there was no statistical difference between the self-esteem levels of male and female athletes participating in the study ($p > 0,05$). In addition, there were no statistically significant differences in the confidence and toughness subscales of the mental toughness subscales of the male and female athletes participating in the study ($p > 0,05$). As seen in Table 5, it was observed that there was a statistically significant difference in the control subscale from the mental toughness subscales in favor of female athletes ($p < 0,05$).

Discussion

The aim of this study was to examine the role of the athletes' self-esteem levels in determining their level of mental toughness. In line with the objective, research data was obtained with the participation of 231 athletes who were active in sports in different cities and branches. Participant athletes were notified that the participation to this study is in volunteer basis and after it has been practiced to the athletes who wanted it. 103 of the athletes participating in the survey were female and 127 were male athletes. The average age of the participating athletes was calculated as 21-32.

When the findings we obtained in our study were examined, it was determined that the relationship between self-esteem and confidence was significant, the relationship between self-esteem and toughness was not significant, and the relationship between self-esteem and control was not significant. The relationship between mental toughness subscales itself is statistically significant only between control and toughness. When the findings obtained within the scope of the research are examined, it is determined that the relations are low level relations. When the simple linear regression analysis model was examined, only a significant relationship was found between self-esteem and mental toughness subscale and confidence subscale. The relationship between the self-esteem level of the athletes participating in the study and the mental toughness subscale to the confidence subscale is a positive and significant relationship. The self-esteem scores of the participating athletes explain 3% of the total variance of the confidence component of the athletes' mental toughness components. When examined in the literature, (Pruessner, Hellhammer and Kirschbaum, 1999) high cortisol levels are associated with anxiety, depression and neuroticism in individuals with low self-esteem (Anisman & LaPierre, 1982). It seems that it requires more effective coping with stress, suppression of cortisol response and resistance to catecholamine depletion (Dienstbier, 1989). Evidence suggests that the cortisol response to standardized stressors may be attenuated by cognitive behavioral interventions (Clow, 2004). In the sence of this information, the increase in mental stability can mediate the relationship between self-esteem and mental endurance by affecting individuals physiologically. In this context, a positive relationship between self-esteem and mental toughness is available in the relevant field. But the findings we have obtained partially overlap with the literature. In addition, there is much evidence that mental toughness is related to self-belief and self-esteem (Bull et al., 1996, Favre & Benzel, 1997, Goldberg, 1998, Gould et al., 1987, Graham & Yocom, 1995, Luszki, 1982, Pankey, 1993, Taylor, 1989, Woods, Hocton, & Desmond, 1995).

It was observed that there was no statistical difference between the self-esteem levels of male and female athletes participating in the survey. In addition, it was observed that there was no statistically difference in the confidence and toughness subscales of the mental toughness subscales of the male and female athletes participating in the research. It was observed that, there was a statistically significant difference in the control subscale in favor of female athletes from the mental toughness subscales. When the literature was examined, it was reported by Masum (2014) that there was a significant difference in the level of mental toughness in terms of gender variation in a sample of Pakistani tennis athletes. When the findings obtained by Masum (2014) are examined, it is reported that there is a significant difference between gender and MT, and male athletes have a higher arithmetic average in terms of MT average scores than female athletes. But this research does not overlap with our findings. In another study, Yazıcı (2016) reported that, female basketball players had higher mental toughness than male basketball players. This research findings in our country supports our research.

As a result, it can be said that self-esteem has a role in determining mental resilience due to a weak correlation. Moreover, limited research results in the sample of our country with respect to gender variable suggest that, female athletes may have higher mental toughness.

Abstract

This study aims to investigate the communication patterns of teacher candidates. For this purpose, 577 teacher candidates were examined (420 women, 157 men). A Demographic Information Form and the Revised Family Communication Pattern Instrument were used to collect the required data. Paired-samples t-test was used to investigate whether there was a difference between participants' conversation-orientation and conformity-orientation scores, and independent-samples t-test was used to investigate whether there was a difference in scores across the genders. Further, one-way ANOVA was used to determine whether there was a relationship between the parent's level of education, the region where the teacher candidates grew up in, and the size of these places. Least significant difference (LSD) test was used to follow up on the significant results. The results revealed a significant difference in conversation- and conformity-orientation average scores across the genders. According to these results, female teacher candidates were found to have higher conversation-orientation scores, whereas male candidates were found to have higher conformity-orientation scores. Additionally, it was found that as parents' education level increase, the conversation-orientation in the family communication also increases. In the framework of family communication, it has been determined that the teacher candidates with the highest conversation-orientation scores were from Marmara Region, whereas the teacher candidates with the highest conformity-orientation scores were from Black Sea Region. A positive relationship was found between the region where teacher candidates grew up and the conversation-orientation scores. Moreover, their conformity-orientation scores were found to be negatively related with the size of the place where the teacher candidates grew up.

Keywords: *Family communication patterns, teacher candidates, communication*

Introduction

Wambolt and Reiss (1989) defined the concept of family as “as a group of intimates who generate a sense of home and group identity, complete with strong ties of loyalty and emotion and an experience of history and a future,” Although “the perception about the concept of family” continues to be an important unit of demographic and social analyses, it varies according to different groups and communities. In the framework of social norms and values, a family unit may comprise a married couple and their children, two sisters living together, a single mother with her children, a married couple with their children and grandchildren, an unmarried couple, a divorced couple, a remarried couple and their children, or a family network (Tillman et al., 2008). Martha Minow (1998) “argued that it is not important whether a group of people fits to the legal definition of family; instead, what is important is whether this group of people functions as a family.” Accordingly, Martha Minow (1998) indicated that there are important questions to understand whether a group of people functions as a family, such as “do they share affection and resources?” and “Do they think of one another as family members and present themselves as such to neighbors and others?”

Although a family carries the general elements of a society, it carries extremely different social, economic, psychological, structural, interactive, and communicative elements as well. Moreover, no family is identical with one another even though a family constitutes the building blocks of society. This unique structure of a family stems from the fact that household rules are established and applied by the family members themselves (Pembecioğlu, 2006). One of the most important instruments for the establishment and application of household rules is communication.

Communication is a concept that cannot be easily defined. Therefore, defining human communication is as much complex as defining the institution of a family. Academicians have made various attempts to define communication, but they concluded that finding “the best” definition of communication is impossible and

unfortunately this is not a desirable conclusion (Fitzpatrick & Ritchie, 1993; Littlejohn & Foss, 2010). In the Oxford Dictionary, 1200 words have been used for defining communication (Adler & Rodman, 2006). According to Cüceloğlu (2012), communication is a process that is both individual and social. In other words, communication is a psychosocial process that establishes a relation between at the least two people. Furthermore, Adler and Rodman (2006) categorized communication as internal communication, interpersonal communication, small group communication, public communication, and mass communication. In addition, they explained the function of communication as fulfilling physical, identity-related, social, and practical needs.

Family communication can be defined as the communication between spouses, between mother and her child or children, between father and his child or children, between children and parents, and between siblings (Şahin & Aral, 2012). We can specify the duties for constructing an effective family communication as accepting and listening to the individual who is being communicated with, developing empathy toward the individual who is being communicated with, being honest, and using “I language” in the communication.

The traditional aspect of families is gradually diminishing, and different family styles are developing due to the increase in the number of lone-parent families, stepfamilies, and adoption (Galvin et al., 2015). Different variables are used to classify families. Two mass media specialists, McLeod and Chaffee (1972), at Wisconsin University, developed a new model by classifying families according to their communications. According to this model, there are two models of family communication patterns—socio-oriented and concept-oriented. While concept-orientation explains how the arguments between parents and children affect children’s information processing mechanisms, socio-orientation explains how parents use authority to persuade their children to interpret their social environments (Horstman et al., 2018). Regarding this, McLeod and Chaffee suggested that the use of these two strategies by parents varies systematically and predictably to establish an agreement and constructing a social reality with each other. This process aims to predict diverse ways of the socialization of children in processing and interpreting the information in media messages. Some families prefer concept-orientation over socio-orientation; others may prefer vice versa (Koerner & Schrod, 2014). McLeod and Chaffee underlined how mass media and families process or interpret television shows and other media messages. Their studies about the concept- and socio-orientation of families are still widely used in media-effect studies (Koerner & Schrod, 2014).

Ritchie and Fitzpatrick (1990) again addressed family communication patterns for more general purposes. They renamed “concept-orientation” as “conversation-orientation” in order to reflect the degree of encouragement of interactions about different subjects among family members. Conversation-orientation is about the subjects discussed in a family, sharing of expectations, how decisions are made, open discussions, and how freely opinions are discussed (Horstman et al., 2018). Further, socio-orientation was renamed as “conformity-orientation” in order to better explain how family members approach to the conflicts in common beliefs, values, child obedience, and conformity. Families with high conformity-orientations encourage family members for independence by promoting shared values and beliefs (Koerner & Fitzpatrick, 2002).

Koerner and Fitzpatrick (2004) divided the institution of family according to communication patterns into four categories—consensual, pluralist, protective, and non-interventionist—according to the high or low levels of conversation- and conformity-orientation of families.

It should be assumed that, although family communication patterns are affected by culture, there are fundamental and universal communication behavior patterns that do not stem from culture and therefore are independent from the western culture as such in the many other family communication theories (Koerner & Schrod, 2014). The universal applicability of this theory is supported by its successful applications in cultures different from western cultures such as the Chinese (Zhang, 2007), Iranian (Koroshnia & Latifian, 2008; Hashemi et al., 2015), Japanese (Shearman & Dumlao, 2008), Malay (Omar, Mustaffa, & Nordin, 2007), and Indonesian cultures (Pramono et al., 2017).

Studies on family communication have a long history; some of the most influential works were done on this subject during World War II, and these works are influencing thoughts of present-day academicians. In recent years, there have been exciting developments happened in the domain of family communication, which fundamentally restructured the way of thinking about functional and dysfunctional family interaction. Lately, academicians, therapist, clergymen, and communication students have started understanding that subjects such as divorce, child abuse, domestic violence, and mental health problems were actually communication problems. Accordingly, by understanding the patterns, functions, and processes of family communication, people hope to start taking steps for understanding the reasons behind these problems and maybe for preventing them in the future (Segrin & Flora, 2005).

Method

Objective

This study investigates teacher candidates' family communication patterns in Turkey according to various variables in order to understand which types of families these Turkish teacher candidates are coming from. Additionally, the study aims to shed a little light on the similarities or discrepancies between Turkish family structures and family structures of other cultures. The research questions of the study are listed below.

Q1. Is there a difference between the family communication patterns and the conversation- and conformity-orientation of teacher candidates?

Q2. Is there a gender difference between the family communication patterns and the conversation- and conformity-orientation of teacher candidates?

Q3. Do the family communication patterns and conversation- and conformity-orientation of teacher candidates vary according to their fathers' education levels?

Q4. Do the family communication patterns and conversation- and conformity-orientation of teacher candidates vary according to their mothers' education levels?

Q5. Do the family communication patterns and conversation- and conformity-orientation of teacher candidates vary according to the geographical region where they grew up?

Q6. Do the family communication patterns and conversation- and conformity-orientation of teacher candidates vary according to the size of the region where they grew up?

The Research Design

To investigate the family communication patterns of teacher candidates, a survey was conducted. Survey research provides a quantitative definition of tendencies, attitudes, or opinions by investigating a sample of a population. It contains cross-sectional or longitudinal studies that employ questionnaires or structured interviews to collect data by representing a population with a sample (Fowler, 2009).

Population and Sample

The population of this study comprised 577 teacher candidates studying at Kastamonu University's Faculty of Education. The sample size of the study was 17.4 % of the population. Teacher candidates voluntarily participated in the present study. Turkey is divided into seven geographical regions. The city of Kastamonu is located in northern Turkey; namely, in the Black Sea Region. There were 420 female (72.8%) and 157 male (27.2%) participants. Participants were students of mathematics teaching (66, 11.4%), science teaching (47, 8.1%), Turkish language teaching (81, 14.0%), computer and instructional technologies teaching (80, 13.9%), psychological counseling guidance (45, 7.8%), preschool teaching (96, 16.6%), primary-school teaching (76, 13.2%), social sciences teaching (73, 12.7%), and art teaching (13, 2.3%). Participants' ages were between 18 and 35 years, and the mean age was 20.16.

Data collection

To collect data, legal permissions were obtained from the Deanship of Kastamonu University's Faculty of Education. A Demographic Form and the Revised Family Communication Pattern Instrument (RFCPI) developed by Ritchie and Fitzpatrick (1990) were utilized. The participants voluntarily filled the surveys on computers under the supervision of the experimenter.

Materials

The materials used in the research were a Demographic Form and the RFCPI.

Demographic Information Form

To determine the demographic profile of the teacher candidates, a demographic information form comprising 13 questions was used. The questions were about age, sex, grade, program, high-school type, parent's level of education, number of siblings, birth order among siblings, family type, geographical location and the size of region where the participant grew up, and the number of divorced first-degree relatives.

Rfcpi

The RFCPI is a five-point Likert-type scale that contains 26 items. The scoring is ranked between "I strongly disagree" (1) and "I strongly agree" (5). In the scale, there are two sub-dimensions—"conversation-orientation"

and “conformity-orientation.” By using the scores from these two sub-dimensions, family communication patterns were determined.

As presented in Figure 1, the families with high scores on both the sub-dimensions are defined as consensual; families with high conversation-orientation and low conformity-orientation scores are defined as pluralist; families with low conversation-orientation and high conformity-orientation scores are defined as protective; and families with low scores on both the sub-dimensions are defined as non-interventionist. The original scale was translated under the supervision of two linguists and then the data was collected. Ritchie and Fitzpatrick (1990) gave the internal reliability value (Cronbach alpha) for conversation-orientation as 0.84 and for conformity-orientation as 0.76. In the present study, Cronbach alpha values were found to be 0.89 and 0.84, respectively. Per these findings, it was concluded that the adapted version of the scale was reliable to measure family communication patterns.

Analysis

Parametrical statistical methods were preferred to analyze the data. Paired-samples t-test was used to investigate whether there was a significant difference between conversation- and conformity-orientation scores, and independent-samples t-test was used to test whether participants significantly differed according to gender. One-way ANOVA was used to investigate the relationship between parents' education levels, region in which they grew up, and the size of this region. Lastly, least significant difference (LSD) test was used to follow up on the significant results.

Result And Discussion

In this section, findings regarding teacher candidates' conversation- and conformity-orientation scores in their family communication patterns, considering gender, father's education, mother's education, region in which they grew up, and the type of this region are presented in tables and discussed.

Table 1: Results of the paired-samples t-test on conversation- and conformity-orientation scores of the teacher candidates.

Score	<i>f</i>	\bar{X}	<i>d.f.</i>	<i>t</i>	<i>p</i>
Conversation-orientation	577	3.5321	576	15.829	.000*
Conformity-orientation	577	2.8324			

* $p < .01$

Paired-samples t-test results investigating the difference between conversation- and conformity-orientation scores of teacher candidates were presented in Table 1. The mean conversation-orientation score (3.5321) was significantly higher than the conformity-orientation score (2.8324), $t = 15.83$, $p < .01$. Therefore, it may be interpreted that teacher candidates have higher conversation-orientation than conformity-orientation in their family communications. These findings conform with the previous findings of High and Scharp (2015) (3.46 and 2.69), Hashemi et al. (2.94 and 2.03), Koerner and Fitzpatrick (2002), Zhang (2007) (3.18 and 2.69), Huang (1999), Curran and Allen (2017) (3.81 and 3.12), and Koerner and Fitzpatrick (1997) (3.77 and 2.47).

Table 2: T-test results of the Revised Family Communication Pattern Instrument scores according to gender.

Dimension	Gender	<i>f</i>	\bar{X}	<i>d.f.</i>	<i>t</i>	<i>p</i>
Conversation-orientation	Female	420	3.60	575	3.771	0.000**
	Male	157	3.38			
Conformity-orientation	Female	420	2.79	575	-2.460	0.014*
	Male	157	2.94			

* $p < .05$, ** $p < .01$

In Table 2, independent-samples t-test results on RFCPI scores according to gender were presented. These findings suggest that female teacher candidates have significantly higher conversation-orientation mean scores (3.60) $p < .01$, whereas male teacher candidates have significantly higher conformity-orientation scores (2.94) $p < .05$. Çakmak and Koçyiğit (2017) indicated a similar result in their research, and their results suggested that female teacher candidates have higher conversation-orientation scores, whereas male teacher candidates have higher conformity-orientation scores. The findings of Çakmak and Koçyiğit (2017) support the point that female teacher candidates have higher conversation-orientation scores and male teacher candidates have higher conformity-orientation scores in their family communication patterns.

Table 3: Results of the one-way ANOVA on the conversation- and conformity-orientation scores of the teacher candidates according to father's level of education.

Conversation-orientation

Father's level of education	<i>f</i>	\bar{X}	<i>SD</i>	Source of variation	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>p</i>
1. Literate	11	3.109	.952	Between	4.601	4	1.150	2.963	.019*
2. Primary-School Graduate	198	3.445	.623	Within	222.069	572	.388		1-3
3. Secondary-School Graduate	141	3.576	.950	Total	226.670	5676			1-4 1-5
4. High-School Graduate	132	3.594	.562						2-4
5. Bachelors or higher	95	3.604	.618						2-5
Conformity-orientation									
Father's level of education	<i>f</i>	\bar{X}	<i>SD</i>	Source of variation	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>p</i>
1. Literate	11	2.686	.845	Between	2.154	4	.539	1.233	.296
2. Primary-School Graduate	198	2.911	.680	Within	249.944	572	.437		
3. Secondary-School Graduate	141	2.788	.687	Total	252.099	5676			
4. High-School Graduate	132	2.777	.584						
5. Bachelors or higher	95	2.823	.662						

* $p < .05$

The results of the one-way ANOVA on conversation-orientation scores according to father's level of education are presented in Table 3. They show that father's level of education was significantly related to the conversation-orientation scores of teacher candidates ($p < .05$). However, father's level of education was not significantly related to the conformity-orientation scores of teacher candidates ($p > .05$). To follow up on the significant results, LSD post-hoc test was used. The results showed that there was difference between literate fathers and primary-school graduate, secondary-school graduate fathers and between primary graduate fathers and high-school and bachelor graduate fathers. Accordingly, it can be concluded that as father's levels of education increases, his conversation-orientation in communication with his children increases.

Table 4: Results of the one-way ANOVA on conversation- and conformity-orientation scores of the teacher candidates according to mother's level of education.

Conversation-orientation									
Mother's level of education	<i>f</i>	\bar{X}	<i>SD</i>	Source of variation	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>p</i>
1. Literate	74	3.385	.667	Between	7.885	4	1.971	5.154	.000**
2. Primary-School Graduate	290	3.490	.615	Within	218.785	572	.382		1-4 1-5
3. Secondary-School Graduate	97	3.513	.637	Total	226.670	576			2-4 3-4
4. High-School Graduate	84	3.780	.550						
5. Bachelors or higher	32	3.532	.627						
Conformity-orientation									
Mother's level of education	<i>f</i>	\bar{X}	<i>SD</i>	Source of variation	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>p</i>
1. Literate	74	2.882	.683	Between	5.052	4	1.263	2.924	.021*
2. Primary-School Graduate	290	2.901	.676	Within	247.047	572	.432		2-3 2-4
3. Secondary-School Graduate	97	2.706	.571	Total	252.099	576			
4. High-School Graduate	84	2.732	.655						
5. Bachelors or higher	32	2.832	.662						

* $p < .05$, ** $p < .01$

The results of the one-way ANOVA on the conversation-orientation scores according to mother's level of education are presented in Table 4. They show that mother's level of education is significantly related to the conversation- ($p < .01$) and conformity-orientation scores ($p < .05$) of the teacher candidates. To follow up on the significant results, LSD post-hoc test was used. The results showed that the difference in conversation-orientation was between literate mothers and high-school graduate, bachelor (or higher) graduate mothers and between primary graduate mothers and high school, secondary-school graduate mothers. Additionally, the difference in conformity-orientation was found to be between primary and secondary-school graduate mothers and high-school

graduate mothers. Similar to the results of father's level of education, mother's level of education was positively related to conversation-orientation in communication.

Table 5: Results of the one-way ANOVA on conversation- and conformity-orientation scores of the teacher candidates according to the geographical regions where the candidates grew up.

Conversation-orientation									
Geographical region	<i>f</i>	\bar{X}	<i>SD</i>	Source of variation	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>p</i>
1. Marmara	89	3.701	.546	Between	7.426	6	1.238	3.218	.004*
2. Aegean	59	3.578	.537	Within	219.244	570	.385		1-4
3. Mediterranean	67	3.513	.623	Total	226.670	576			1-5
4. Eastern Anatolia	33	3.283	.775						1-7
5. Southeastern Anatolia	43	3.366	.697						2-4
6. Central Anatolia	145	3.560	.635						4-6
7. Black Sea	141	3.455	.615						5-6
									6-7

Conformity-orientation									
Geographical region	<i>f</i>	\bar{X}	<i>SD</i>	Source of variation	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>p</i>
1. Marmara	89	2.670	.698	Between	2.177	6	.363	.827	.549
2. Aegean	59	2.868	.714	Within	249.922	570	.438		
3. Mediterranean	67	2.851	.628	Total	252.099	576			
4. Eastern Anatolia	33	2.788	.771						
5. Southeastern Anatolia	43	2.867	.624						
6. Central Anatolia	145	2.840	.651						
7. Black Sea	141	2.885	.627						

* $p < .01$

The results of the one-way ANOVA on the conversation- and conformity-orientation scores according to the geographical region where the candidates grew up are presented in Table 5. The results showed that there is a significant relationship between the conversation-orientation scores of the teacher candidates and the geographical region in which they grew up ($p < .01$). However, there was no significant relationship between conformity-orientation and the geographical region where the teacher candidates grew up. To follow up on the significant results in conversation-orientation scores, the LSD post-hoc test was used. The results revealed differences between Marmara, Eastern, Southeastern, and Black Sea regions; Aegean and Eastern Anatolia regions; Eastern Anatolia and Central Anatolia regions; Southeastern Anatolia and Central Anatolia regions; and Central Anatolia and Black Sea regions.

Teacher candidates who grew up in Marmara Region had the highest conversation-orientation scores (3.701), while those who grew up in Black Sea Region had the highest conformity-orientation scores (2.885). Further, candidates who grew up in Eastern Anatolia Region had the lowest conversation-orientation score (3.283), whereas those candidates who grew up in Marmara Region had the lowest conformity-orientation scores (2.670).

Table 6: Results of the one-way ANOVA on conversation- and conformity-orientation scores of the teacher candidates according to the size of the region where they grew up.

Conversation-orientation									
Region	<i>f</i>	\bar{X}	<i>SD</i>	Source of variation	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>p</i>
1. Metropolitan city	62	3.700	.671	G.Arasi	3.902	4	.975	2.505	.041*
2. City	248	3.546	.618	G.İçi	222.768	572	.389		1-5
3. County	157	3.538	.622	Toplam	226.670	576			2-5
4. Small town	17	3.502	.685						
5. Village	93	3.381	.627						

Conformity-orientation									
Region	<i>f</i>	\bar{X}	<i>SD</i>	Source of variation	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i>	<i>p</i>
1. Metropolitan city	62	2.764	.751	Between	4.738	4	1.185	2.739	.028*
2. City	248	2.774	.656	Within	247.361	572	.532		1-5

3. County	157	2.888	.658	Total	252.099	576	2-5
4. Small town	17	2.594	.621				4-5
5. Village	93	2.984	.662				

*p < .05

One-way ANOVA results on the relationship between the type of orientation (conversation-orientation and conformity-orientation) and the size of the region where they grew up are presented in Table 6. Accordingly, the results showed that both conversation-orientation and conformity-orientation scores of the participants are significantly related with the region in which they grew up ($p < .05$). To follow up on these results, the LSD post-hoc test was used. The results showed that the significant difference in the conversation-orientation was between village, metropolitan city, and city. Besides, the significant difference in conformity-orientation was between village and metropolitan city and between city and town. The teacher candidates who grew up in a metropolitan city had the highest conversation-orientation scores (3.700), while those who grew up in a village had the highest conformity-orientation scores (2.984). Furthermore, the candidates who grew up in a village had the lowest conversation-orientation scores (3.381). Per these findings, it can be interpreted that individuals who grew up in bigger locations have higher conversation-orientation in their family communication patterns, whereas those who grew up in smaller locations have higher conformity-orientation in their family communication patterns.

Findings And Suggestions

The present study investigated the family communication patterns of teacher candidates in order to understand from what kinds of families the teachers of tomorrow will be coming. The findings of the present study, which was conducted with teacher candidates of Kastamonu University's Faculty of Education, are summarized below. Gender was a significant predictor of the conversation-orientation and conformity-orientation scores. Accordingly, it has been shown that female candidates had higher conversation-orientation scores than male candidates in their family communication patterns, whereas male candidates had higher conformity-orientation scores in their family communication patterns.

Moreover, it has been found that the education levels of fathers affected teacher candidates' conversation-orientations in their family communication patterns. Accordingly, it has been shown that as fathers' education levels improve, the conversation-orientation in family communication increases and that as mothers' levels of education improve (apart from mothers with bachelors or higher level of education), the conversation-orientation increases. In addition, a non-linear relationship between conformity-orientation and mothers' levels of education was found. It has been determined that teacher candidates with primary-school graduate mothers had higher conformity-orientation scores.

Furthermore, it has been found that teacher candidates who grew up in Marmara Region had the highest conversation-orientation scores and those who grew up in Black Sea Region had the highest conformity-orientation. The candidates from Eastern Anatolia Region had the lowest conversation-orientation, whereas those with the lowest conformity-orientation scores were from Marmara Region.

Accordingly, it was found that as the size of the location where the teacher candidates grew up increases, their conformity-orientation decreases. The candidates who grew up in metropolitan cities had the highest conversation-orientation and the lowest conformity-orientation in family communication, and those who grew up in villages had the lowest conversation-orientation. Therefore, it has been found that the family communication patterns of teacher candidates vary according to the size of the region in which they grew up.

Future studies may be conducted with teacher candidates from different universities, so that comparisons can be made. The sample of the present study included only teacher candidates. However, future studies can include students from different disciplines and thus the findings can be compared in terms of family communication patterns. Lastly, future studies can investigate whether family communication affects parental attitudes.

Abstract

The aim of this research is to examine the relationship between the peer pressure levels of prospective teachers and their risk-taking tendencies. In order to achieve this aim, 503 students at Erciyes University studying in the physical education and sports, mathematics, physics, chemistry, classroom, biology, geography and Turkish teaching departments were selected by coincidental methods for this research. To collect data, the students filled out, the 'Peer Pressure Scale' for Peer Pressure Levels (UOI) developed by Kıran Esen (2003), the Risk-Taking Scale developed by Bayar and Sayıl (2005), and the "Personal Information Form" prepared by the researcher. The survey data were used to determine the students' risk-taking tendencies. The data obtained from the Personal Information Sheet were analyzed via the SPSS 20.0 package program. The personal information and inventory total scores and factor scores for the candidates were determined by determining the frequency (f) and percentage (%) values. Multiple regression analysis (β) was used to determine whether Pearson Moments Multiplication Correlation analysis (r) and their scores were predictive of each other in order to reveal the relationship between the scores obtained from the scales. Indirect peer pressure and direct peer pressure have significant effects on the risk-taking tendencies of teacher candidates. At the same time, when looking at the general dimension of peer pressure, it was found that it increased the risk-taking tendency significantly and accounted for 38.1% of the total variance.

Key words: *Peer Pressure, Risk-Taking Tendencies, Teacher Candidates*

Introduction

Today's candidate teachers, who will train future generations, face many different situations in universities where they are educated. Some of these experiences are undesirable. It tends to take risks without thinking in a way that is an important one.

Taking risk is the act of putting an individual's health at risk and creating life-threatening behaviors. In other words, risk-taking means that the individual evaluates the current situation and chooses the direction with a high hazard ratio (Kıran, 2002). Davidsson (2010) defines the likelihood of encountering undesirable outcomes and the fact that these probabilities are used as a numerical phenomenon. Fisherman (2009) is the risk; the probability of occurrence of an undesirable event or effect. On the other hand, risk-taking; (Wakkee et al., 2010), without knowing what the consequences will be, in an unknown territory or on unknown conditions. Risk is actually used to draw attention to the possibility of losing more in daily life, although it is a word that points to uncertainty (Yılmaz, 2002). According to another definition, risk is defined as behaviors that may include threats to the life of the individual or of the later life (Machamer and Gruber, 1998). There are variables such as socioeconomic status, peer groups, sexual identity, educational status, perceived success of the individual, which may affect risk-taking behavior. Especially when considering the age range, it covers the university education; it also coincides with periods of isolation and gaining identity against adulthood, corresponding to adolescence. From this point of view, one of the first factors that comes to mind about risk-taking tendency may be a group of friends or peers. It is thought that peer pressure may affect the tendency to take risks in college to start from high school years.

The risk-taking behaviors that are thought to be related to peer pressure are, in general, health, and life-threatening behaviors that are likely to result in disease or death (Smith, 2001). Psychosocial consequences of risky behaviors

are claimed to be as damaging as biomedical consequences. Peer pressure is often perceived by adults as a cry of fear. The peer pressure was loaded with negative associations as a word. Young people feel comfortable sharing their problems with their peers and feel their peers understand their feelings better than adults. (Kiran, 2002). Clasen and Brown (1985) defined peer pressure as pressure from peers, whether or not they want to, or avoiding doing something or doing something (act Aktuğ, 2006).

The aim of our work in the light of the above statements is to determine if the level of peer pressure of university students influences the tendency to take risks, and if so, what level. When the literature is examined, it is possible to find out about studies related to childhood and adolescence period, but it is seen that the number of studies done to university level people is very low. Particularly this work on teacher candidates can guide the next studies and authorities in the faculty who teach the teacher.

Material And Method

Studying Group

This research is in the relational screening model. This screening model can be defined as "... research models aimed at determining the presence and / or degree of exchange between two and more variables" (Karasar 2007). Research; Erciyes University in order to examine the peer pressure levels and risk-taking tendencies of the students who are studying in various teaching areas. In addition, these people were applied with socio demographic information form

Creation of Voluntary Groups:

The research will be conducted through the working group. Working group Erciyes University; 503 students selected by coincidental methods studying in the 4th grade in physical education and sports, mathematics, physics, chemistry, classroom, biology, geography and Turkish teaching departments.

Data Collection Tools

During the application of the questionnaires that will be applied to the students in the research, besides the researcher, the academic staff working at the university tried to create a healthy evaluation process for the candidates by making the necessary explanations in a timely manner without rushing to each of the candidates. 'Peer Pressure Scale' for Peer Pressure Levels (UOI) was developed by Kiran Esen (2003) and is a likert type of 5. The Risk-taking Scale developed by Bayar and Sayıl (2000) as a 5-point Likert type and the "Personal Information Form" prepared by the researcher were used to determine the risk-taking tendencies of the students.

Socio-demographic Information Form

While creating the socio-demographic information form of the study, the socio-demographic information forms of the personality traits and achievement orientations studies were examined and a pool consisting of the characteristics to be examined in the students was created. Later on, sociodemographic information form was created by help of statistical experts. This socio-demographic information form created contains 6 questions in order to obtain participants' age, gender, department, general academic grade average, mother and father education status.

Table 1. Socio-Demographic Characteristics of the Participants

	Variables	N	%
Gender	Male	259	51,5
	Female	244	48,5
Age	18-21	125	24,9
	22-25	267	53,1
	26-29	111	22,1

Peer Pressure Scale

Developed by Kiran (2002), the Peer Pressure Scale (SIS) is a five-point likert type measure aiming to measure the peer pressure experienced by adolescents. There are two sub-scales of the SOP. For the whole scale, the Cronbach alpha coefficient (34 items) is .90, for the Direct Peer Pressure Subscale (19 items) .89, for the Indirect Peer Pressure Subscale (15 items) .82. In addition, the test-retest reliability coefficient was .82 for the entire scale, .74 for the Direct Peer-Pressure Subscale, and .79 for the Indirect Peer-Pressure Subscale. In the validity study of the SFA, factor analysis was conducted to determine the validity of the structure. The total variance explained by the two factors obtained is 40, 527%. Only one score is obtained from the scale. High scores on the scale indicate that peer pressure is high and low peer pressure is low.

Risk-taking Tendency Scale

Risk Assessment Scale (RAD): Risk-taking behavior was developed by Bayar and Sayıl (2000) to determine the frequencies and types of risk-taking behaviors. The one-dimensional scale consists of 25 items and is a self-report scale. Each item is scored as a 5-point Likert, "never," "rarely," "sometimes," "frequently," or "very often." Internal consistency coefficient of your scale. (Bayar and Sayıl, 2000). In this study, the first six items (more than 50%) were identified in the frequency analysis in order to make the scale suitable for the university period (Uludağlı and Sayıl, 2009), taking into consideration another study using the same scale crossing over, spending too much money, coming home late at night, friendship with people not approved by the family, wearing seat belts in the car); The analyzes were carried out using the values calculated on the scale of 19 items. The Cronbach Alpha internal consistency coefficient obtained from this study sample in this state of the scale. 88 (n = 199)

Analysis of data

Data from the Personal Information Form, Peer Pressure and Risk-taking Tendency scale were entered into the SPSS 20.0 package program and analyzes were conducted through this program. The personal information and inventory total scores and factor scores for the candidates were determined by determining frequency (f) and percentage (%) values. Multiple regression analysis (β) was used to determine whether Pearson Moments Multiplication Correlation analysis (r) and Achievement scores were predictors of relationship between the scores obtained from the scales.

Findings

Table 2. Descriptive statistics of the students' responses to the questionnaire

	N	Minimum	Maximum	X \pm SS
Direct Peer Pressure	503	19.00	69.00	25.07 \pm 8.97
Indirect Peer Pressure	503	15.00	54.00	21.94 \pm 7.81
Peer Pressure Total	503	34.00	123.00	47.02 \pm 16.01
Risk-taking Tendency	503	18.00	75.00	30.28 \pm 11.48

When Table 2 was examined, the mean scores of the direct peer pressures of the volunteers were 25.07, the mean of the indirect peer pressures was 21.94, the average of the peer pressure scores was 47.02 and the average of the risk-taking tendencies was 30.28.

Table 3. Correlation Coefficients Between the Students' Peer Pressure and Risk-taking Tendency (n=503)

		1	2	3	4
Direct Peer Pressure¹	r	1			
	p				
	n	503			
Indirect Peer Pressure²	r	.852**	1		
	p	.000			
	n	503	503		
Peer Pressure Total³	r	.967**	.957**	1	
	p	.000	.000		
	n	503	503	503	
Risk-taking Tendency⁴	r	.563**	.629**	.617**	1
	p	.000	.000	.000	
	n	503	503	503	503

When Table 3 was examined, it was found that there was a significant positive risk-taking tendency between the risk-taking tendency and the direct peer pressure ($r = .563$ $p = .000$) was found to be positively correlated in the positive direction.

Table 4. Regression Table for Students' Peer Pressure to Predict Risk-taking Tendency

		B	T	P	R	R ²	F	P
Direct Peer Pressure	Risk-taking Tendency	.563	15.162	.000	.563	.317	229.896	.000
Indirect Peer Pressure	Risk-taking Tendency	.629	18.057	.000	.629	.396	326.071	.000
Peer Pressure Total	Risk-taking Tendency	.617	17.475	.000	.617	.381	305.375	.000

F(1,497)

When Table 4 is examined, the model between the direct peer pressure and the risk-taking tendency presents a meaningful relationship ($t = 15.162$ $p = .000$) when the t-test results of the significance of the regression coefficient are examined ($R = .563$ $R^2 = .317$; $p < .005$) peer pressure predicted a tendency to take risks and explained 31.7% of the total variance. $F(1,497) = 229.896$ $p < .005$

When the results of the t-test on the significance of the regression coefficient are examined ($t = 18.057$ $p = .000$), indirectly the relationship between the indirect peer pressure and the risk-taking tendency presents a meaningful relationship ($R = .629$ $R^2 = .396$; $p < .005$) peer pressure predicted a tendency to take risks, and the total variance explained 39.6%. $F(1,497) = 326.071$ $p < .005$

When the results of the t-test on the significance of the regression coefficient are examined ($t = 17.475$ $p = .000$), the model shows a significant relationship between the peer pressure sum and the risk-taking tendency ($R = .617$ $R^2 = .381$; $p < .005$), peer pressure predicted a tendency to take risks and explained 38.1% of the total variance $F(1,497) = 305.375$ $p < .005$.

Discussion And Result

In this study, the peer pressure as a predictor of the risk-taking tendency, which is closely related to the sociability and personality development of the teacher candidates, was examined and whether or not their relations were examined.

Both general peer pressure and sub-dimensions; there was a high level of positive correlation between positive and indirect peer pressure and risk-taking tendency. When study findings are examined, it is seen that tendency to take risks increases as peer pressure increases. Regression analysis reveals that peer pressure explains the risk-taking tendency by 38.1%.

Pearl, Bryan and Herzong (1990) stated that young men have more peer pressure and are more likely to participate in risky behaviors. Kıran-Esen (2003) found that there was a significant relationship between peer pressure and risk-taking in a study conducted by high school students. Uludağlı and Sayıl (2009) reported an increase in the frequency of risk-taking behaviors in girls' high school and university students according to all university, high school first class; an increase in risk-taking behaviors with the transition to university in men and a decrease in college in the last year. When studies on age differences in risk-taking behaviors are examined, it is seen that young people show higher risk behaviors due to increased autonomy in the adolescence period compared to the middle adolescence period (Byrnes et al., 1999, Shucksmith, Glendinning and Hendry, 1997). According to the findings of the study on dusty (2014) university students, after leaving the high school environment, they form young and new groups of friends who enter a new university in the university, which can cause them to spend less time on groups of old friends. Along with the changing environment, the agenda and occupations are changing, and they are experiencing similar processes to the group that they created with their new friends who share the same environment. This makes it more than necessary to spend more time with colleagues in college. Research findings show that college students' groups of friends are influential on themselves and that sometimes it is negative and sometimes negative. Morsünbül (2013) found that university students showed higher risk behaviors than high school and non-student groups in their study of high school students, university students and non-student individuals comparing them in terms of identity dimensions and risk-taking behaviors.

As a result, in our study, the results of the teacher candidates reading at university have been reached, expressing that they might be affected by their friends and take risks. It can be said that not only in adolescence but also in youth and higher education era, teacher candidates are influenced by their peers. In the teaching departments, field activities such as the intense social relations, the availability of practical courses and the internship for the curriculum have made the teachers closer to the groups of friends. It is thought that the reasons such as fear of

humiliation in the group, need for belonging, showing themselves and living away from the family lead the people to submit to negativities of peer groups and to take negative risks.

Suggestions

- Families can communicate with their children more intensively and in a healthy way, preventing them from going to inappropriate places to meet their needs, such as love, devotion.
- Higher education institutions may plan for self-esteem improvement activities.
- How students can distinguish situations where risk is planned and beneficial from negative situations can be given as a course in the curriculum
- When parents need it, they can teach their children that they can say no and that they can decide for themselves.

Abstract

To examine family fat talk levels of university students who do and do not do sports. The study was conducted by adopting a screening model. The research group consists of 284 (23,10 + 9,103) volunteer participants who do and do not sports (170 women (22,94 + 11,351) and 114 men (23,35 + 3,835). In accordance with the purpose of the research, "Fat Talk Scale in Family" and the "Personal Information Form" prepared by the researcher in accordance with the research design has been determined as means of data collection tools according to the research purpose. Besides descriptive statistics, t test and ANOVA tests were used during the analysis of the research data. The obtained data were analyzed by using SPSS 21 Package program. The level of significance in the analysis process was determined as $p < 0,05$. There was no statistically significant difference in the results of the analysis of the family fat talk subscale to the family subscale according to gender variables. There was a statistically significant difference in the results of the analysis of the family fat talk sub-dimensions to the self sub-dimension according to gender variables. When the averages were examined, there was a significant difference in favor of women. As a result, it is reflected in the results of research that obese individuals are more exposed to family fat talk. In the context of this information, positive and negative effects of obese individuals can be assessed in future researches as well as what psychological conditions they are exposed to, as determined in the research results.

Keywords: *Fat Talk, Exercise, friend support*

Introduction

Today, obesity is among the most critical health problems of developed and developing countries. Obesity can be defined as an increase in the ratio of fat mass to lean mass and an increase in body weight over the desired weight according to height. Nutrition is necessary for us to be able to start our lives in our mother's womb and continue to live our lives. For a person to grow, to develop, to be healthy and productive, food items must be taken in a sufficient and balanced manner and used in the body. Satisfying your stomach, eating what you want, appease hunger is not nourishment. The energy needs of the individual depend on the work, age, sex, physiological condition, and disease. To live healthily, the energy intake and the energy consumption should be balanced. Developing technology together with developing society makes life easier, but it limits the activeness of humans. This inactivity is also one of the most important problems that cause obesity. In genetically predisposed children, it is known that obesity has emerged with environmental factors (Donohoue, 2004).

Physical inactivity and sedentary lifestyles continue to be a primary public health problem. Technological and economic factors tend to isolate children from the activity. Technology does this by reducing the amount of energy needed for daily life activities, while the economy is doing this by paying more than sedentary work for active work. For these reasons, while technology makes our life comfortable, it prepares the environment for the obesity of future generations and pushes our children to an inactive lifestyle (Haskell, 1996).

Anorexia nervosa, which is an eating disorder and an unhealthy method of weight control due to an eating disorder, an intense dietary pattern or desire for being too thin, is defined as a fasting diet; bulimia, another one, is to avoid gaining weight by eating like crazy and then vomiting. Eating disorders are understood by obvious cultural components; 95% of those who suffer from anorexia nervosa or bulimia are women, most of them white and from rich families. For women, the slimness in American culture is synonymous with being successful and attractive to men. In contrast, stereotypically overweight women (it reflects men lesser) are viewed as lazy, rude, and even stupid (Becker & Burwell, 1999; Levine, 1987).

Research shows that most teenage girls believe that "men love slim girls", that slimness is the prime attraction for men, and that men don't want girls if they are not thin. In fact, many college girls want to be even thinner than men

want them to be. Men, on the other hand, typically express more satisfaction in their own body forms (Fallon & Rozin, 1985).

In the light of this information, it is vital to recognize the wider sociocultural pressures that may be associated with the tendency to engage in negative body speech (Arroyo & Harwood, 2012).

In this context, the family factor is included in this research as a socio-cultural factor. The purpose of this study was to examine the family fat talk levels of university students who do and do not sports.

Method

Research Design

The research was carried out by adopting a screening model. Screening patterns are descriptive research approaches that reflect the past or present situation (Büyüköztürk et al., 2008). Within this framework, it is aimed to determine the differences in the family fat talk levels of university students by gender, sports branch, age, and BMI. Furthermore, regarding the research design, in this study, convenient sampling method was chosen from the purposeful sampling methods to determine the research group (Karasar, 2014).

Research Group

The research group consists of a total of 284 ($23,10 \pm 9,103$) volunteers who do and do not sports, including 170 women ($22,94 \pm 11,351$) and 114 men ($23,35 \pm 3,835$). The distribution of the participants by their sports branches is given in table 3.2.1. In addition, the distribution of the participants by their gender is given in 3.2.2.

Table Sports Branch Distribution of Participants in the Study

<i>Branch</i>	<i>n</i>	<i>%</i>
<i>Yes</i>	<i>178</i>	<i>62,7</i>
<i>No</i>	<i>106</i>	<i>37,3</i>
<i>Total</i>	<i>284</i>	<i>100,0</i>

When the table was examined, 62,7% ($n = 178$) of the participants participated in the study had branches, 37.3% ($n = 106$) had no sports branch.

Table 3. Gender Distribution of Participants in the Study

<i>Gender</i>	<i>n</i>	<i>%</i>
<i>Women</i>	<i>170</i>	<i>59,9</i>
<i>Men</i>	<i>114</i>	<i>40,1</i>
<i>Total</i>	<i>284</i>	<i>100,0</i>

When the table was examined, 59.9% ($n = 170$) of the participants participated in the survey were female, 40.1% ($n = 114$) were male participants.

Data Collection

For the purpose of this study titled "**Investigation of the Family Fat Talk Levels of University Students**" within the scope of the dissertation course of the Faculty of Sports Sciences of Akdeniz University, scales were applied by face to face interviews with the participant students.

The "Fat Talk Scale in Family" and the "Personal Information Form" prepared by the researcher in accordance with the research design were determined as data collection instruments in accordance with the research purpose.

Fat Talk Scale in Family

"The Fat Talk Scale in Family" is a measure developed by McDonald, Dimitropoulos, Royal, Polanco and Dionne (2015) and consists of two sub-dimensions as the family fat talk sub-dimensions and the self fat talk sub-dimension. The scale consists of 16 items. The adaptation of the scale, which is of the Likert type of 5, was made by Bayköse and Bal-Turan (2016).

Data Analysis

Descriptive statistics, as well as t-test and ANOVA, were used in the analysis of the research data. The obtained data were analyzed by entering it into SPSS 21 Package program. The level of significance in the analysis process was determined as $p < 0,05$.

Findings

T-Test Results of Fat Talk Levels of Participants by Gender Variable

Gender						
	Gender	N	Mean	S.s	t	p
Self Sub-dimension	Women	169	1,8476	,86897	2,707	0,008
	Men	114	1,5680	,84110		
Family Sub-dimension	Women	168	1,8951	,86173	1,109	0,269
	Men	114	1,7774	,88322		

When the table was examined, there was no statistically significant difference by gender variables in the results of the analysis of the family sub-dimensions of the family fat talk sub-dimension ($p > 0.05$).

When the table was examined, there was a statistically significant difference by gender variables in the results of the analysis of the self sub-dimensions of the family fat talk sub-dimension ($p < 0.05$). When the means were examined, there was a significant difference in favor of women.

T-Test Results of Fat Talk Levels of Participants by Sporting Situation Variable

Sporting Situation						
		N	Mean	S.s	t	p
Self Sub-dimension	Do sports	178	1,6903	,84750	-1,112	0,268
	Do not do sports	106	1,8107	,89890		
Family sub-dimension	Do sports	178	1,7935	,83406	-1,326	0,186
	Do not do sports	106	1,9399	,92727		

When the table was examined, it was found that there was no statistically significant difference by sports branch in the results of the analysis of the self and family sub-dimensions of the family fat talk sub-dimension ($p > 0.05$).

Anova Test Results of Fat Talk Levels of Participants by BMI Variable

ANOVA						
			Sum of squares	df	Mean Square	F
Self Sub-dimension	Between Groups		21,158	4	5,290	7,700
	In Group		190,965	278	,687	
	Total		212,124	282		
Family Sub-dimension	Between Groups		20,911	4	5,228	7,535
	In group		192,189	277	,694	
	Total		213,100	281		

1: 18,5 and below (Low Weight), 2: between 18,5-24,9 (Healthy Normal), 3: between 25,0-29,9 (Overweight), 4: between 30,0-39, 9 (Obese), 5: 40 and over (Morbid Obese)

When the table was examined, it was observed that there was a statistically significant difference by the BMI variable in the results of the analysis of the self and family sub-dimensions of the family fat talk sub-dimension ($p < 0.05$). When looking at which groups have these significant differences, the mean scores of obese individuals were found to be higher in both the self and family sub-dimensions of fat talk in family sub-dimension comparing to the low-weight, healthy, normal, and overweight individuals.

Conclusions

The aim of this study was to examine the family fat talk of students according to some demographic variables. 62,7% ($n = 178$) of the participants in the study consist of individuals who do sports and 37,3% ($n = 106$) of them did not participate in sports. 59,9% ($n = 170$) of the participants in the study are women and 40,1% ($n = 114$) of the participants are men. The average age of participants was calculated as 23.10, and the standard deviation is calculated as 9.103.

According to the gender variable, there was no statistically significant difference in the results of the analysis made on the family sub-dimension from the family fat talk sub-dimension. Statistically significant difference was found by gender variable in the analysis of the self sub-dimension of the family fat talk sub-dimension. When the means were examined, there was a significant difference in favor of women. According to the sports branch variable, there was no statistically significant difference in the family and self sub-dimension from the family fat talk sub-dimension. When the related literature is examined, women are reported to have greater body dissatisfaction than men of all ages (Esnaola & Goñi & Madariaga, 2008). Although the importance given to the physical appearance, especially due to body size and weight, decreases with age, women's dissatisfaction with their bodies remains unchanged for life (McCabe, & Ricciardelli, 2004). Older women reported "cognitive control" (reduction of reassessment and expectation) to their bodies (Montepare, 1996). Although it is less documented than it is among women, men and male children are increasingly dissatisfied with their body, it is observed that but gender differences in adulthood are less prominent than in adolescence and old age (Feingold & Mazzela, 1998; Janelli, 1993; Webster, & Tiggemann, 2003). Due to this information, the fact that the age ranges of participants in the study are close to each other may be a cause of statistical indifference.

It was observed that there was a statistically significant by BMI variable difference in the results of the analysis of the self and family sub-dimensions of the family fat talk sub-dimension. When looking at which groups have these significant differences, the mean scores of obese individuals were found to be higher in both the self and family sub-dimensions of fat talk in family sub-dimension comparing to the low-weight, healthy, normal, overweight, and morbidly obese individuals. When the relevant literature field was examined, research findings by Martz et al. (2009) in the sample of American college students support our research. In another study, Gapinski, Brownell & LaFrance, (2003) reported that talking about obesity is associated with BMI.

In conclusion, it is reflected in the research results that Obese individuals are more exposed to family fat talk. In the light of this information, what kind of psychological conditions obese individuals are exposed to as determined by the results of the research, or the positive and negative effects of this situation can be evaluated in future studies.

Author Note

This study is an improved version of the oral communication presented in the International Conference on New Horizons in Education, which took place between 18-20 July 2018.

Abstract

The purpose of this study was to examine the relationship between stress coping styles and marital adjustment in married individuals. To this end, 274 (158 female, 114 male) married individuals selected by convenience sampling were included in the study group. The participants who composed the study group answered the Locke-Wallace Marital Adjustment Test and the Ways of Coping Questionnaire. The Pearson correlation coefficient and regression analysis were used in the data analysis. The analysis results showed that the desperate approach and the search for social support are related to marital adjustment. Psychological counselors who want to improve marital adjustment can teach married people how to get social support to cope with stressful situations and give information about the ways in which they cope with nonfunctional stress such as a helpless approach.

Keywords: *Marital adjustment, stress, ways of coping, Turkey.*

Introduction

The concept family has taken part in every society from the past to the present day. Family is a social cluster based on emotional attachment, with vital characteristics for its members and a framework of solidarity that cannot be passed on to others (Ersanlı & Kalkan, 2008). The structure of family changes over time with the change in the general structure, functioning, and functionality of societies. If expectations are not satisfied for various reasons while making a marriage decision, it has an adverse effect on the marital relationship.

Marriage is described by qualities such as freedom of choice in partner selection and bilateral relations, equality in sexual life, and close relations (Tutarel-Kışlak, 1999). A marriage that begins when a woman and a man come together forms the basis of the family life. In marital relationships, people struggle to maintain their psychological, physical and social existence and well-being (Erişti, 2010). Marriage is an institution that is the product of the most important contract that ensures continuity in human life from beginning to end and this contract leads to the birth of the family considered the cornerstone of society (Taşbaş, 2010).

Marriage adjustment refers to one's perceived marital satisfaction. A marriage can be defined as harmonious in case of happiness with the relationship, sexual satisfaction, positive communication, and the desire to marry the same person if they had to do it again (Eskin, 2012). Marriage adjustment describes the nature of the marital relationship of couples. The quality of marriage is expressed as couples' subjective evaluation of their marital relationship. One of the most important elements in marriage adjustment is the capability of each partner to maintain a successful relationship (Erbek, Beştepe, Akar, Eradamlar & Alpkan, 2005). Investigating marital adjustment and the factors affecting this adjustment has been of great importance in recent years. Couples' perceptions of marriage, personality traits, attitudes towards each other, processes of living romantic relationships, and social interest affect marital adjustment (Erbek et al., 2005; Erişti, 2010; Taşbaş, 2010; Tutarel-Kışlak, 1999). Ways of stress coping are among many factors that may affect marital adjustment.

Stress refers to a bodily response to physical or emotional threats, feelings of being threatened, a state of compulsion, or a new situation that requires adjustment (Korkut Owen, 2015). Stress can be positive or negative; however, negative stress is necessary for people to survive. It is not stress but how we cope with it affects our health and well-being. Stress coping is defined as reactions aimed to reduce physical, emotional and psychological burdens associated with events and daily rush (Şahin & Durak, 1995). The literature includes research on marital adjustment. It has been reported that people who exhibit a destructive and less constructive communication style have low marital adjustment (Malkoç, 2001). A negative correlation has been found between negative coping style and marital adjustment (Stanley, Markman & Whitton (2002). It has been suggested that anxiety and education predict women's marital adjustment, while anxiety and working status predict men's marital adjustment and

women and men with high marital adjustment are be less likely to cheat (Gürsoy, 2004). Marital adjustment is a complex phenomenon stemmed from the combination of a large number of biological, social, and situational factors (Fıfıloğlu & Demir, 2000). The literature includes a great volume of international research on marital adjustment but lacks domestic research investigating the relationship between marriage and married people's mental state in the Turkish culture. Thus, there is a need for a research to identify factors affecting marital adjustment in the Turkish culture. Against this background, the present study aimed to explore married people's marital adjustment and ways of stress coping. Accordingly, the study attempted to determine whether ways of stress coping predict marital adjustment. Thus, the study is expected to reveal the association between marital adjustment and stress and to contribute to the comprehensive understanding of factors affecting marital adjustment. Additionally, the study is of importance in that it helps to raise awareness of marital adjustment. The results of the study can provide information to family counselors and psychologists about their work on nonfunctional behaviors affecting marital adjustment.

Methods

Research Design

This study used a correlational research design to investigate ways of stress coping as the predictor of marital adjustment (Büyüköztürk, Akgün, Demirel, Karadeniz & Kılıç Çakmak, 2015). The dependent variable is marital adjustment; the independent variables are ways of coping including optimistic approach, self- confident approach, helpless/self-accusatory approach, submissive approach, and social support-seeking.

Sample

The sample consisted of 274 people residing in the Bafra district, Samsun. The sample was selected through convenience sampling, a type of non-probability sampling (Büyüköztürk et al., 2015). The sample consisted of 158 (57.7%) women and 116 (42.3%) men. The age range was 24 to 67 and the mean age was 40.16 (SD: 8.84). Most of the participants were university graduates ($n=210$, 76.6%). The age of marriage range was 25 to 29 for more than the half of the sample (51.5%). Additionally, most of the participants had a free choice marriage ($n=187$, 68.2%) and were married for more than 21 years ($n=72$, % 26.3). Almost half of the participants had two children ($n=133$, 48.5%). A great majority had a moderate income level ($n=233$, 85%).

Data Collection Instruments

The data were collected using a personal information form (asking gender, age, length of marriage, educational background, age of marriage, etc.) designed by the researchers, the Marital Adjustment Test (MAT) developed by Locke and Wallace (1959) and adapted to Turkish by Tutarel-Kışlak (1999), and the Ways of Coping Questionnaire developed by Lazarus and Folkman (1984) and adapted to Turkish by Şahin and Durak (1995).

Data Analysis

The data were analyzed using SPSS 23statistics. Prior to the statistical analysis, missing values and outliers, and the assumptions of the statistics were analyzed. The correlation between marital adjustment and ways of coping was analyzed using the Pearson correlation coefficient. Multiple regression was used to analyze the extent to which ways of coping predict marital adjustment. The margin of error was accepted as .05.

Results

Table 1 shows the correlations between marital adjustment and different ways of stress coping.

Table 1. Correlations Coefficients, Means and Standard Deviations of the Variables

	1	2	3	4	5	6
1. Marital Adjustment						
2. Self-confident approach	.14*					
3. Helpless/self-accusatory approach	-.18**	-.25**				
4. Submissive approach	-.11	-.15*	.53**			
5. Optimistic approach	.09	.64**	-.09	.02		
6. Social support-seeking	.11	.11	.19**	.06	-.04	
Mean	106.47	15.00	9.26	6.33	9.72	6.95
SD	20.50	3.66	4.11	3.46	2.94	2.10

Note. $p < .05^*$, $p < .01^{**}$.

As seen in Table 1, marital adjustment had a low positive correlation with self-confident approach ($r = .14, p < .05$) and a low negative correlation with helpless/self-accusatory approach ($r = -.18, p < .05$). However, marital adjustment had no correlation with submissive approach ($r = -.11, p > .05$), optimistic approach ($r = .09, p > .05$), and social support-seeking ($r = .11, p > .05$).

A multiple regression analysis was performed to determine the extent to which ways of coping predict marital adjustment. Table 2 presents the variation statistics for the regression analysis and Table 3 presents the results of the regression analysis.

Table 2. Variations Statistics for the Variables Predicting Marital Adjustment Scores

Model	<i>R</i>	<i>R</i> ²	Adjusted <i>R</i> ²	<i>SEE</i>	Variation Statistics				
					ΔR^2	ΔF	<i>df</i> ₁	<i>df</i> ₂	<i>p</i>
Model 1	.24	.06	.04	20.07	.06	3.38	5	268	.006*

Note. * $p < .01$, SEE: standard error of the estimate, df: degree of freedom.

Table 3. Regression Analysis Results of the Variables Predicting Marital Adjustment Scores

Model		Unstandardized Coefficients		Standardized Coefficients	<i>t</i>	<i>p</i>
		<i>B</i>	<i>SEE</i>	β		
Model 1	(Constant)	98.93	7.24		13.65	.001**
	Self-confident approach	.22	.46	.04	.48	.630
	Helpless/self-accusatory approach	-.88	.37	-.18	-2.43	.016*
	Submissive approach	-.13	.42	-.02	-.32	.752
	Optimistic approach	.38	.56	.05	.68	.496
	Social support-seeking	1.37	.61	.14	2.26	.025*

Note. * $p < .05$, ** $p < .001$.

The analysis results showed the significance of the model developed to determine the extent to which married people's ways of coping predict their marital adjustment and the model had a small effect size ($F(5, 268) = 3.38, p < .01, R = .24, R^2 = .06, R^2_{adj} = .04$). Table 3 shows the individual contribution of each way of coping in the regression equation. As seen in Table 3, self-confident approach ($\beta = .04, t = .48, p > .05$), submissive approach ($\beta = -.02, t = -.32, p > .05$), and optimistic approach ($\beta = .05, t = .68, p > .05$) scores were not significant predictors of marital adjustment scores. However, helpless/self-accusatory approach ($\beta = -.18, t = -2.43, p < .05$) was a negative predictor of marital adjustment scores, while social support-seeking ($\beta = .14, t = 2.26, p < .05$) was a positive predictor of marital adjustment scores. In other words, one unit increase in helpless/self-accusatory approach scores while holding all other variables constant is related to a decrease of -.88 unit in marital adjustment scores. On the other hand, one unit increase in social support-seeking scores while holding all other variables constant is related to an increase of 1.37 unit in marital adjustment scores.

Discussion

The study analyzed the association between ways of stress coping and marital adjustment in married people. The analysis results showed that the self-confident approach, submissive approach, and optimistic approach were not significant predictors of marital adjustment. However, the helpless/self-accusatory approach was a negative predictor of marital adjustment, while social support-seeking was a positive predictor of marital adjustment. Accordingly, it seems that a helpless/self-accusatory approach to coping with stress has a negative effect on marital adjustment, while social support-seeking has a positive effect. To further clarify, people often using social support-seeking are more likely to have a low marital adjustment. This result is consistent with the research results reporting that preferring a helpless approach, a dysfunctional way of solving problems, adversely affect marital adjustment (Folkman & Lazarus, 1980; Yüksel & Dağ, 2015). Previous research reported that problems experienced in marriage negatively predict psychological health. To put it differently, a high marital adjustment is associated with being more psychologically healthy; the less common use of emotion-focused ways of coping such as submissive and helpless approaches strengthens the marriage relationship. Thus, ways of coping can affect the predictive power of the marital relationship for psychological health (Yüksel, 2013).

The study found that social support-seeking positively predicted marital adjustment scores. Social support resources play an important role in marital adjustment. Social support can be defined as a system that promotes the sharing of values and emotions that reduce the negative consequences of stressful situations and supports the ability to adapt to roles and novelties brought about by the life and social roles. This system may include relatives,

family or close friends. The social support system affects parents' and children's behaviors and strengthens their capabilities, thereby fulfilling educational functions (Kaner,2010). This situation, in turn, has a positive effect on marital adjustment. Okanlı et al. (2003) reported a considerable improvement in the problem-solving skills of mothers receiving social support from their husband. Based on the analysis results, the study offers that it can be helpful to give coping skills training to married people using a helpless approach to cope with stress.

İslam Ceza Hukukunda Bir Nitelikli Hal Örneği: Fâilin Sıfatı

Dr. Öğr. Üyesi Mustafa Hayta
Çukurova Üniversitesi, İlahiyat Fakültesi, Adana 01380, Türkiye
m-hayta@hotmail.com

Özet

Karşılığında had veya kısas yaptırımları konulan ya da yaptırımın türü, miktarı ve keyfiyeti, ulul'l-emrin takdirine bırakılan yasaklanmış icrâi ve ihmâlî davranışlar, *suç* olarak tanımlanmaktadır. Tanımdaki "ihmâlî" kaydı, gerek bireyin gerekse kamunun maslahatını ihtiva eden bir davranışın ve hukukun koruduğu yararın mükellef tarafından yerine getirilmemesi şeklindeki pasif bir halin de suç olarak niteleneceği anlamına gelmektedir. Birey ya da kamu ile ilgili yararların tam anlamda muhafaza edilmesi, ceza normlarında suç olarak tanımlanan bu fillere bir cezaî müeyyide uygulanmasına bağlı olduğu bilinen bir husustur. İslam ceza hukuku, suça maruz kalmış mağdurun maslahatı kadar, suçu bulaşmış fâilin niteliğini ve koşullarını da dikkate almıştır. Bir başka ifadeyle cezada eşitlik kadar, cezaların bireyselleştirilmesi de önemli bir ilkedir. Burada bireyselleştirme ile kast edilen, normal koşullarda verilecek bir cezanın fâilin örnek kişiliği, yaşı, hastalığı, sakatlığı, toplumsal statüsü ve cinsiyeti dikkate alınarak ya ağırlaştırılması veya hafifletilmesidir. Bir başka ifadeyle, öngörülen yaptırımın fâilin kişiliğine uydurularak tatbik edilmesidir. Bu tebliğde, cezaların bireyselleştirilmesi gerekliliğine ve fâilin sıfatının nitelikli hal olduğuna referans teşkil eden naslar üzerinden bu ilkenin teorisi ele alınacak; gerek Tanzinat öncesi Osmanlı kanunnamelerinde gerekse Tanzimat sonrası kodifiye edilen ceza kanunlarında bu ilkenin nasıl düzenlendiği ve pratiğe döküldüğü inceleme konusu yapılacaktır.

Anahtar kavramlar: *Suç, ceza, eşitlik, nitelikli hal, bireyselleştirme*

Giriş: Suçun Kavramsal Çerçevesi

Klasik fıkıh kitapları, modern hukuk eserlerinden yöntem ve muhteva açısından farklılık arz eder. Meselecî/kazuistik metotla kaleme alınan fıkıh kitaplarında konular, Roma hukukunu temel alan günümüz modern hukuk bakış açısıyla kaleme alınmamıştır. Bu nedenle suç ve ceza teorisi hakkında bütüncül ve sistematik bilgiler bulmak nerdeyse imkansızdır. Tebliğin adıyla ilgili bilgi elde etmek isteyen birisinin bakabileceği spesifik bir başlık bulunmamaktadır. Ceza hukukuna ilişkin hususlar, dağınık olarak *kitâbu'l-had*, *kitâbu'l-kısas*, *kitâbu't-ta'zîr*, *kitâbu'd-diyet*, *kitâbu'l-cinâyât*, *kitâbu's-serika*, *kitâbu haddi'l-kazf*, *kitâbu haddi'z-zinâ* vb. ana başlıklar altında incelenmiştir. Başlıklar arasında göreceli mantikî münasebetler kurmak da mümkündür. Örneğin irtidat suçunun hadlar ana başlığı altında değil de *kitâbu's-siyer* veya *kitâbu katli ehi'l-bağy* ana başlığının altında ele alınmış olması müellifin irtidat suçuna bir had suçu değil aksine ta'zîr suçu olarak baktığına işaret olarak yorumlanabilmektedir (Orhan, 2014: 212). *Hidâye* sahibinin rehinden sonra *cinâyât* konusunu ele almasını Kadızâde (ö. 988/1580), her ikisinin de muhafaza görevi ifa ettiği; rehnin malı korurken, cinayet başlığında ifade edilenlerin ise canı koruduğu, ayrıca malın canın yongası ve vesilesi olduğu şeklinde izah etmektedir (2003: X, 220).

Fâilin sıfatının bir nitelikli hal olup olmadığının tayin ve tespiti için suç ve suçun unsurlarından söz etmek yerinde olacaktır. Suç, furû-i fıkıh eserlerinde mala veya cana karşı işlenen, haram kılınmış (Serahsî, XXVII, 84), karşılığında had ya da ta'zîr cezaları konulan (Maverdî, s. 285) ihmâlî ya da icrâî davranışlardır (Udeh, 2012: I, 98). Bir fiilin emredilmiş olması, onun ihmâl edilmemesi gerektiğine; bir fiilin yasaklanmış olması da onun işlenmemesi gerektiğine delalet etmektedir. Bir fiilin ya da ihmâl/terkin suç olarak nitelenebilmesi için unsur ya da rükün denilen hususlara sahip olması gerekir. Bunları dört başlık altında sıralamak mümkündür.

I) Kanunî Unsur

Kanuni unsurdan kasıt, bir fiil ya da ihmalin suç olduğunun henüz fiil ya da ihmâl vaki olmadan nasta veya kanunda suç olduğunun tayin ve tespit edilmiş olması demektir (Udeh, 2012: I, 172). Bir fiil veya terkin daha önce suç olarak tanımlanmadan, vaki olduktan sonra suç olarak nitelenmesi ve buna ceza terettüp ettirilmesi, güç yetiremeyeceği bir şeyle kulun yükümlü tutulması (teklîf-i mâ lâ yutâk) anlamına geleceği gibi insan hürriyet ve teşebbüsüne de aykırılık arz edecektir. Nitekim bir fiille mükellef kılınmanın temel şartı, hem yapma-etme hem de hükmü hakkında bilgi sahibi olma açılarından onun kulun kudretinde olması olmasıdır. Kanun koyucunun elçi göndermediği sürece hiçbir topluma azap etmeyeceğini bildirmesi (İsrâ, 17/15), yüce Şâriin, akledilmesi, sakınılması, tefekkür ve tezekkür edilmesi için ayetleri açıklandığını ifade etmesi (Bakara, 2/187; 221; 266. Nisa, 4/176. Nur, 61) suçun bu unsuruna dikkat çekmektedir.

II) Maddî Unsur

Hareket-illiyet-netice bağı, suçun maddi unsurunu teşkil eder. İrade ve niyetin dışı vurumu ve tezahürünü fiil olarak tanımlayabiliriz. Fiili bir bütün olarak tasavvur ettiğimizde ilk safhasına hareket, dış dünyada meydana getirdiği değişikliğe de netice denilebilir. O halde fiile dökülmediği sürece irade ve niyet ne kadar kötü olursa olsun cezayı gerektirmeyeceğinden ceza hukukunun konusu olmayacaktır (Avcı, 20015: 193). Nitekim Hz. Muhammed'e nispet edilen insanların içinden geçirdiklerini -söylemedikçe ve yapmadıkça- bağışlanacağı

şeklindeki hadis (Müslim, “İmân”, 201, 202, 209) bu duruma işaret etmektedir. Ayrıca İbn Nüceym (ö. 970/1563), sadece niyet ve düşünce nedeniyle kişiye caza verilemeyeceği hususunda icmâdan söz eder (s. 14).

Fiil dendiğinde genelde aklımıza icrâî davranışlar gelir; ancak emirlerle güvence altına alınan hukukî yararların ihmal edilmesi de bir fiil olarak düşünülmelidir. O halde nehye konu bir fiili icrâ etmek, ne kadar suç ise emre konu bir fiili ihmal etmek de o kadar suç teşkil edecektir. Hadiste yedi büyük günah olarak sayılan hususlardan (Buhârî, “Tıb” 48; Müslim, “İman” 38) “haksız yere insan öldürmek, riba ve yetim malı yemek, sihir yapmak” icrâî suçlara; “savaş meydanından kaçmak” ise ihmâlî olana örnek oluşturur. Fail-i meçhul cinayetin meydana geldiği mahalle yakın ev sahiplerinin cinayete iştirak etmediklerine dair yemin etmelerini ve neticesinde diyete mahkûm edilmelerini de kendi bölgelerindeki güvenliği sağlama vazifelerinde ihmalkâr davranmalarının bir neticesi olarak okumak mümkündür (Bardakoğlu, 2001: XXIV, 528-530).

İhmal, fetva kitaplarında da suç olarak değerlendirilmiştir. Mesela: Hind, hidanesinde olup bir iki yaşında olan veled-i sağırını hâlî oda içinde bırakıp âhar yere gitmekle sağır ateşe düşüp helak olsa sağırın diyeti Hind üzerine lâzime olur mu? el-Cevab: Olur (Şeyhulislâm Abdullah, 2011: 606).

Fiilin hazırlık hareketleri ve teşebbüs de kendi başına bir suç teşkil etmedikçe cezalandırılmayacaktır (Ebu Zehra, 1994: I, 330). Bir iradeyle başlayan düşünce, şayet dış dünyada bir değişiklik meydana getirmişse artık fiilin tamama ermesinden bahsedebiliriz. Neticedeki tezahür şekline göre suçlar “zarar ve tehlike suçları” şeklinde ikili bir tasnife tabi tutulmaktadır. Buna göre insan öldürme, başkasının malını telef etme ve hırsızlık yapmak, zarar suçlarına örnek teşkil ederken anarşi döneminde silah satışı, umuma açık mahalde kuyu ve çukur kazmak vb. fiiller, kanunda suç olduğunun belirtilmesi halinde tehlike suçları kapsamında değerlendirilebilir (Ebu Zehra, 1994: I, 210).

Suçun maddî unsurunun teşekkülünden bahsedebilmek için hareket ile netice arasında illiyet denilen bir sebep-sonuç (nedensellik) bağının bulunması da gerekir. Aksi halde ilgisiz ve bağlantısız iki ayrı fiilden söz ediyoruz demektir. Bu bağın kurulması halinde zararlı neticeyi ya da tehlikeyi doğuran sebep ister doğrudan ister dolaylı olsun fail, söz konusu neticeden sorumlu tutulabilecektir (Ayдын, 2017: 164).

III) Manevi Unsur

Manevî unsur, İslam hukukunda niyet terimleriyle ifade edilir. Bir fiile suç nazariyle bakılabilmemesinin ön şartı, ona failin niyet etmiş olmasıdır. Bir başka ifadeyle faile, fiilinden dolayı ceza verebilmek için onun isnat yeteneğine sahip olması gerekir. Isnat yeteneği, kişinin temyiz kudretine ve irade hürriyetine sahip olması demektir. Bu nedenle ikrah altında bir eyleme zorlanan ya da temyiz öncesi dönemde suç işleyen veya akıl hastalığına müptela olan kimsenin cezai ehliyeti bulunmamaktadır (Avcı, 2014: 61). Muhammed Hamidullah İslam’ın hukuk ilmine en büyük katkılarından birinin niyet ilkesi olduğunu ifade eder (Hamidullah, 2015: 25). Nitekim Hz. Peygamber, *bir işten maksat ne ise hüküm de ona göre dir* (Buhârî, “Bedü’l-vahy”, 1; Müslim, “İmâre”, 155; Ebu Davud, “Talâk”, 11), demek suretiyle bu hususa dikkat çekmiştir. İslam hukukçuları bu vebbenzeri hadislerden de hareket ederek cezanın dozunu niyetin yoğunluğuna bağlı bulunduğunu ifade etmişlerdir. Buna göre niyet/iradenin hem hareket/teşebbüse hem de sonuca yönelmesi halinde daha ağır ceza gerekirken neticeye yönelmeyen iradenin ise daha hafif bir cezayı gerekli kılacağı dile getirilmiştir (Dağcı, 2020). Cezayı bireyselleştirmek ve adaleti gerçekleştirmek için bilginler, naslardan referans vererek niyeti kendi içinde *kast* (taammüd), *hata* (taksir), *şibh-i amd* (kast/taksir kombinasyonu) şeklinde ayrımlara tabi tutmuşlardır (Merginânî, 2018: IV, 612; Avcı, 2015: 198 vd.).

Denilebilir ki fiil, çeşitli merhalelerden geçerek suç adını alır. Bir çizgi şeklinde bu merhaleler şöyle özetlenebilir: Düşünme ve tasarlama merhalesi (irade/kast/niyet) >>>> hazırlık ve teşebbüs merhalesi >>>> icrâ merhalesi (netice) = ceza (Halil Cin-Ahmet Akgündüz, 2011: 295).

IV) Hukuka Uygunluk

Suç olarak tanımlanan bir fiile ceza terettüp etmesi için onun aynı zamanda hukuka aykırılık teşkil etmesi de gerekir. Bir başka ifadeyle suç olarak nitelenen fiilin, *meşru müdafaa*, *görevin ifası*, *hakın kullanılması*, *ilgilinin rızası*, *zilyetliğin korunması* gibi hukuka uygunluk sebeplerinden biriyle beraber bulunmaması gerekir. Aksi halde saldırganlara zarar vermesi halinde fâil, sorumlu tutulmayacaktır (Avcı, 2014: 79 vd; Cin-Akgündüz, s. 298; Ekinci, 2016: 299; Ebû Zehra, I, 463 vd; Akşit, 2015: 69 vd.). Mecelle’nin ifadesiyle, cevâz-ı şer’î damâna münâfi olur (Mecelle, mad. 91).

Yukarıda tanımı ve unsurları verilen suç, klasik fıkıh eserlerinde **had**, **ta’zîr** ve **cinayet suçları** şeklinde üçlü bir ayrıma ve taksime tabi tutulmuştur (Behnesi, 1983: 123 vd.). Allah hakkı olarak yerine getirilmesi gereken, miktar ve keyfiyeti nasla belirlenmiş cezaî müeyyideler had suçları olarak tanımlanmaktadır (Bardakoğlu, 1996: XIV, 547-551). Hırsızlık (serika) suçu, hırâbe (nitelikli yağma) suçu, zina suçu, kazif (nitelikli hakaret) suçu, içki içme (şûrb) suçu, tartışmalı olmakla beraber meşrû devlet başkanına silâhla karşı koyma (bağy) ve ridde suçu bu kapsamda değerlendirilmektedir (Mevsilî, 2009: IV, 451; Akşit, s. 73 vd.).

Ta’zîr ise had ve kısas cezaları dışında kalan belirli cezası bulunmayan, miktarı ve uygulanması yöneticiye veya hâkime bırakılmış cezaları ifade eder. Zimmet (günlül), rüşvet, kumar ve şans oyunları, yalan tanıklık, tefecilik, ölçü ve tartıda hile, konut dokunulmazlığının ihlali, özel hayatın gizliliğini ihlal (tecessüs) vb. fiillerin günah

olduğu ifade edilmiş; ancak bunlara terettüp eden cezanın miktarı ve keyfiyeti naslarda ifade edilmemiştir (Avcı, 2006: 113-147).

Hakkında kanunî ceza (had) bulunduğu halde suçun unsurlarının tam gerçekleşmemesi nedeniyle kanuni cezası uygulanamayan yasak fiiller de ta'zîr suçuna dönüşmekte ve hâkim, suça orantılı bir ceza takdir edebilmektedir. Kanunnâme-i Osmânî'de geçen zina ile ilgili düzenleme bu duruma örnek oluşturur:

Eğer bir kimesne zina eder görölse, şer'an üzerine sabit olsa lâkin alâ vechi's-ser' recm kılmalı olmasa, eğer evlü olup bay olup bin akçe ve dahi ziyadeye mâlik olsa dört yüz akçe cerime alına; mutavassıtu'l-hâl olsa veya fakir olsa, elli akçe alına (Akgündüz, 1992: 278).

Had suçlarının miktar ve keyfiyeti nasla belirlenmiş olduğunu ve bu edenle değiştirilemez olduğunu belirtmiştik, peki ta'zîr suçları kapsamında yer alan fiillerin cezası ve bunun miktarı ne olacaktır? Burası içtihadı açık bir alan olduğundan birden çok yaklaşım bulunması tabidir. Bedreddîn el-Aynî (ö. 855/1451), ta'zîrin miktarı hususunda 10 celdeden 90 celdeye kadar değişen on farklı görüş aktarır. Onuncu görüşün sahibi Ebû Ca'fer et-Tahâvî'nin de (ö. 321/933) belirttiği üzere esasında ortaya konulan bu yaklaşımlar bize ta'zîr suçlarının kesin bir cezasının bulunmadığını, suça orantılı, zaman ve zemine de bağlı olarak değişebileceğini, bu hususun yasama organının içtihadına bırakıldığını göstermektedir (Aynî, XXIV, 23).

Ta'zîr suçlarına verilecek cezanın celdeden ibaret olmadığını belirtelim. Kulak çekmek, teşhir, meslekten men, sürgün hatta siyaset denilen ölüm cezasına kadar çeşitli yaptırımları içermektedir (Akşit, s. 88).

Üçüncü suç türü, kısas suçları da denilen cinâyet suçlarıdır. İnsanın hayatına ve vücut bütünlüğüne karşı işlenen suçlar, bu kapsamda değerlendirilmektedir. Bu tip suçlarda şahsî haklar ağır basar, bu nedenle mağdura ve/ya velisine sulh, af ve diyet gibi seçenekler sunulur (Suğdı, 1984: II, 658 vd; Serahsî, XXVII, 84; Molla Hüsrev, II, 88 vd.).

1. İslam Ceza Hukukuna Hâkim Olan İlkeler

1.1. Cezaların Kanunîliği

Suçlarda olduğu gibi cezada da keyfilîğe kaçılma ihtimalini önleme amacına matuf olarak kanunilik ilkesi benimsenmiştir. Bu, suç sayılan bir eylemin cezasının henüz suç vâki olmadan nas veya kanunda alenen belirtilmesi anlamına gelmektedir. Böylece ceza normunun geriye yürütülemeyeceği ve makabline şamil olmayacağı anlaşılmaktadır (Ebû Zehra, I, 159 vd). 1858 tarihli Ceza Kanunnâme-i Hümayûn'un ifadesiyle (mad. 15) [her] cinayet ve cünha ve kabahatin taraf-ı hükümetten zâhire ihraç olduğu veya müddeîsi zuhur eylediği zamanda mer'î olan kanun ve nizâm ile tedibi icrâ olunup muahhar olan kanun ile mücazâtı icrâ olunamaz.

Nitekim ribâ yemenin, iki kız kardeşle aynı anda veya üvey anneyle evliliğin haram olduğu belirtilmiş ve Cahiliye devrinde gerçekleşen bu tür eylemlerin affedildiği ve üzerine sünger çekildiği ifade edilmiştir (Nisa, 4/22-3; Bakara, 2/275). Yüce Şâri'in hiçbir toplumu kendi içlerinden onlara mesajlarımızı okuyup açıklayacak bir elçi göndermedikçe yok etmeyiz, ifadesi de bu ilkeye açıkça işaret etmektedir. Ayetin devamında yer alan *[b]iz hiçbir toplumu, üyeleri birbirlerine zulmetmeyi yol olarak benimsemedikçe, yok etmiş değiliz*, ifadesi de (Kasas, 28/59) cezanın ancak suçtan kaynaklanabileceğini öngörmektedir.

Had ve kısas cezalarında kanunilik ilkesinin mevcudiyeti ve naslarda açıkça ifade edildiği bilinen bir husustur. Ancak aynı durum ta'zîr cezaları için söylenemez. Zira günümüzdeki bilindik şeyliyle kanun ve kanunlaştırma faaliyeti, İslam hukuku için ancak çok geç dönemler için söylenebilir. Halife Hârûnürreşîd (ö. 193/809) ile başlayan kanunlaştırma teşebbüsü tarihte birkaç defa daha denenmiş ancak başarılı olamamıştır. Fatih Sultan Mehmet'ten Tanzimat'a kadar kanunname tarzında; Tanzimat fermanıyla beraber kanun tarzında yapılan kodifikasyon faaliyetleri, ta'zîr suçları için kanuni ceza düzenleme yoluna gitmiştir (Aydın, 2006:11-21; Gayretli, 2015; Cin-Akgündüz, s. 315). Bu nedenle bidayetten belirtilen tarihlere kadar ta'zîr suçlarının cezaları, ancak suç işlendikten sonra birçok etken göz önünde tutularak kıyas yöntemine de dayanılarak hâkimin takdiri ile tespit ediliyordu (Aydın, 2017: 174).

1.2. Cezaların Şahsîliği

İslam'da hiç kimse diğer bir kimsenin günahından mesul olmadığı gibi (Fâtır, 43/18) İslam hukukunda da bu ilkenin bir yansıması olarak, bir kimsenin işlemiş olduğu suçtan ancak kendisi yargılanabilir, çocukları, eşi ve yakın akrabaları yardım ve yataklık yapmadığı sürece bu suçtan sorumlu tutulamaz (Karaman, 2014: I, 227-8; Zeydan, 1998: 18) Nitekim Hz. Muhammed'in suçlunun ancak kendi aleyhine suç işleyeceği ve bundan ancak kendisinin sorumlu olacağı (İbn Mâce, "Diyât", 26), babasının ve kardeşinin sorumlu tutulamayacağı (Nesaî, "Tahrîmü'd-dem", 30) şeklindeki ifadesi de bu ilkeye dikkat çeker. Ayrıca Hz. Peygamber, işlediği zina suçunu ikrar eden bir kadının cezasını, hamile olması nedeniyle çocuğunu doğurup, katı gıda ile besleninceye kadar ertelemiştir (İbn Mâce, "Diyât", 36).

İslam'da sosyal sorumluluk örneği diyebileceğimiz ve iyilikte yardımlaşmayı öngören naslardan referansını alan *âkile* müessesesi, ilk bakışta bu ilkeyle çelişiyor görünebilir. Çünkü fâilin kast/taksir kombinasyonu (şibh-i amd) veya taksirle bir cana kıyması halinde ödenecek diyet, sadece fâil/sözde kâtile değil aynı zamanda suçlunun baba tarafından erkek akrabası olan asabeye ve/veya bağlı bulunduğu divana da yükletilebilmektedir (Serahsî, XXVII, 129). Şu kadar var ki suç kastı taşımayan eylemler sonucu ortaya çıkan ölüm ve cismanî zararlarda fâilin ödeme gücünü aşan tazminatın geniş tabanlı bir topluluğun katılımıyla ödenmesi, mağdurun hakkını güvence altına

alırken aynı zamanda toplumda yardımlaşma ve paylaşma duygusunu ikame etmektedir (Dağcı, s. 35; Aktan, 1989: II, 248-249).

1.3. Suç ve Cezanın Denkliliği

Suç işleyen kişi hakkında işlenen fiilin ağırlığıyla orantılı ceza ve güvenlik tedbirlerine hükmolunacağı beklenen bir durumdur (Erturhan, 2008: 178 vd; Yıldırım, 2007). Nitekim,

[Allah'a ortak koşmak, O'na çocuk isnat etmek gibi] günahlar işleyenlere gelince, böylelerinin cezası işledikleri bu büyük günahlara denk bir ceza olacaktır (Yunus, 10/27). [Ey Müminler!] Birine ceza vereceğiniz zaman, size yapılanın aynıyla karşılık vermekle yetinin. Ama eğer aynıyla karşılık vermek yerine sabrederseniz, bilin ki sabrınız sizin için çok daha hayırlıdır (Nahl, 16/126). Kötülüğün karşılığı o kötülüğe denk bir cezadır. Ama her kim kötülüğü bağışlar ve barıştan, sulh-sükûndan yana olursa onun mükâfâtı Allah'a aittir. Şüphesiz Allah kötülüğe karşılık vermede ileri gidenleri sevmez (Şûrâ, 42/40).

mealindeki ayet-i kerimeler de bu ilkeye işaret etmektedir. Fahreddîn Râzî (ö. 606/1210), son ayetin yorumunda bu ilkeye dair ufuk açıcı mülâhazalarda bulunur. Orantılı ceza vermenin fıkıh ilminde büyük bir ilke (asıl) olduğuna dikkat çeken Râzî, bu ayetin fehvasınca her bir suça karşılık misli cezanın verilmesi gerektiğini belirtir. Suçluya insanların canını ve malını heder etmesine müsaade olunması halinde, bunun şer ve düşmanlık kapsını açacağını söyler. Zira her bir insanın tabiatında zulüm etme, taşkınlık yapma ve düşmanlık etme duygusu vardır. Öte yandan suç ve günahın fazla ceza verme de zulümdür. Şeriat ise bundan münezzehtir. Ona göre birçok ayet bu ilkeyle doğrudan alakalıdır (198: XXVII, 179 vd).

Hiz. Peygamber'in müsl (Dağcı, 2001: XXIII, 429-433) uyarısı (Ebu Davud, III, 53), işkence yapılmasına dönük bir yasaklama olduğu kadar, haklı cezalandırmada ölçüyü kaçırıp işkence boyutuna vardırılmamasıyla da ilişkilidir.

Bu minvalde olmak üzere İsrâ, 17/15'te nefsi müdafaa, kısas, savaş hâli gibi haklı bir sebep bulunmadıkça Allah'ın kutsal/dokunulmaz kıldığı cana kıymayın, uyarısı yapılmış ve haksız yere öldürülen kişinin velisine [kısas ve tazminat talebiyle ilgili] yetki verildiği belirtilmiştir. Devamında ise "veli, öldürmede aşırıya gitmesin!" denilmek suretiyle suç ve cezanın denkliliğine dikkat çekilmiştir. Böylelikle bu konuda yetki verilen kişinin kendince adaleti gerçekleştirmek adına bir kişiye karşılık iki veya daha fazla kişiyi öldürmek gibi bir aşırılığa kaçmaması gerektiğine vurgu yapılmaktadır.

1840 tarihli Ceza Kanunnâme-i Hümayun'da düzenlenen sa'y bi'l-fesâdın cezası (mad. 2) bir bütün olarak değil suçun kavli ve fiili olup olmamasına göre kodifiye edilmiştir. Buna göre kavânin ve nizamâta mugayir harekâta terğib vadisinde fesatlı sözler söylemek 1-5 yıl kürek cezasını, esliha ve barut temin etmek gibi fiili sa'y ise katl ve idamı gerektirmektedir (Akgündüz, 2011: 605)

Yaptırımın ağırlığının belirlenmesinde devletin rejimi önemli olduğu kadar, gücü ve suç politikası da önemlidir. Ayrıca suçun toplumsal desteğe sahip olup olmadığı da ceza tayin edilirken dikkate alınan önemli bir etkindir (Avcı, 2014: 37-8).

Naslarda bir kötülüğün misli kadar ve orantılı bir yaptırımı gerekli kıldığına dair ifadeler mevcut olduğu gibi bir kötülüğün kat be kat cezaya maruz kalacağı şeklinde ifadeler de vardır. Bu ifadeler arasında bir tearuz bulunup bulunmadığı dikkate değer bir sorudur. Tebliğimizin konusunu oluşturan ve önem arz eden bu husus bir sonraki başlıkta ele alınacaktır.

1.4. Cezaların Eşitliği ve Bireyselleştirme

İslam'da üstünlük ve imtiyaz; cinsiyet, soy ve ırka göre değil Allah'tan sakınma ve dini ritüelleri yerine getirme oranına göre kazanılır (Hucurât 49/13). Nisâ, 4/123'te ifade edildiği üzere *[g]erçek şu ki her kim günah işlerse bunun cezasını çekecek ve azaba mahkûm olduğu zaman Allah'a rağmen kendisine sahip çıkıp yardım edecek kimse de bulamayacaktır*. Diyânî alandaki bu konumlandırma, kazâi alana da prensip olarak yansımış ve herkesin ve kesimin kanun ve hukuk nazarında aynı muameleye tabi tutulacağı ve imtiyaz hakkının bulunmadığı belirtilmiştir. Tanzimat fermanının ifadesiyle, kavânî-i şer'îyye'ye muhalif hareket edenlerin kabahat-i sâbitelerine göre te'dibât-ı lâîkaları hiç rütbeye ve hâtır u gönüle bakılmayarak icra edilecektir (Ejder Okumuş ve dğr., 2006: 275).

İşte bu nedenle Hiz. Muhammed, soylu bir kadının hırsızlık yapması neticesinde ona kanunî yaptırımın tatbik edilmemesi ricasında bulunan aracılara,

[s]izden önceki milletler, şu sebeple yok olup gittiler: Aralarından soylu, mevki ve makam sahibi biri hırsızlık yapınca onu bırakırlar, zayıf ve kimsesiz biri hırsızlık yapınca da onu hemen cezalandırırlardı. Allah'a yemin ederim ki, Muhammed'in kızı Fâtıma hırsızlık yapsaydı, elbette onun da elini keserdim (Buhârî, "Enbiyâ" 54, "Hudûd" 11, 12; Müslim, Hudûd 8, 9; Ebû Dâvûd, "Hudûd" 4; Tirmizî, "Hudûd" 6),

demıştır. Ülke halkını kastlara, sınıflara ayıran onlardan bir kısmını iyice zayıf ve güçsüz düşürmek isteyen Firavun'un bu tavrının kınanması (Kasas, 28/4) da anılan ilkenin önemsendiğine işaret olarak okunabilir. İslam ceza hukukunda benimsenen bu olgu, TCK mad 3'te, özlü bir şekilde ifadeye dökülmüştür.

Ceza Kanununun uygulamasında kişiler arasında ırk, dil, din, mezhep, milliyet, renk, cinsiyet, siyasal veya diğer fikir yahut düşünceleri, felsefi inanç, millî veya sosyal köken, doğum, ekonomik ve diğer toplumsal konuları yönünden ayırım yapılamaz ve hiçbir kimseye ayrıcalık tanınmaz.

Ceza normu kodifiye ederken suç ve ceza arasında denklik ve eşitlik ilk etapta temel alınması gereken bir ilkedir. Ancak herkesin aynı koşulda bulunmadığı, suça eğiliminin ve insanları etkileme oranının

farklı olduğu ve cezalandırmanın gayesi dikkate alındığında cezadan hissesine düşeni algılama ve ibret almada farklılık arz ettiği düşünüldüğünde cezada özellikle ta'zîr cezalarında *bireyselleştirme* olağan karşılanacaktır. Yaptırımın failin kişiliğine uydurulması ve uyarlanması, bireyselleştirme olarak tanımlanmaktadır (Akşit, s. 140). İlerleyen satırlarda failin sosyal statüsü, örnek kişiliği, cinsiyeti, mesleği vb. etkenlerin failin alacağı cezada bazen ağırlaştırıcı bazense hafifletici olarak nasıl rol oynadığını ve yerleşik cezanın bireyselleştirilerek faille tatbik edildiğini naslardan ve kanunnamelerden referans göstererek ele alacağız.

2. Suça Etkili Haller ve Fâilin Sıfatı

Etkili hal veya nitelikli hal tabiri, suça bulaşmış failin cezasını artıran/ağırlaştırıcı veya eksiltici etkenler için kullanılmaktadır. Bunları tekerrür ve itiyad, mağdurun sıfatı, failin sıfatı, aleniyet, suçun işlendiği zaman ve mekân, suçun yaygın olarak işlenmesi ve kötü çevre vb. olarak tatad etmek mümkündür (Avcı, 2015: 234 vd). Burada münhasıran failin sıfatını ele alacağız.

2.1. Örnek Kişilik

Toplumda rol model olarak tanınan ve örnek alınan kimselerin bu sıfatlarının naslarda cezalarını ağırlaştırıcı bir etken olarak değerlendirildiğine şahit olmaktadır. Çünkü bu kişilerin bir suça bulaşmaları, diğer insanlar üzerinde dolaylı teşvik ve halo etkisi oluşturacaktır (Tantâvî, 1998: XI, 203). Üstelik bu insanların ceza normunu bilinçli bir şekilde ihlal etmeleri, suça dönük kast ve iradelerinin yoğun olduğuna delalet etmektedir. Nitekim yüce Şâri, Hz. Peygamber'in eşlerine hitap ederek Allah'ın ve elçisinin emrine karşı gelmek gibi *apaçık* bir günah işlemleri halinde, bunun cezasının *çok ağır* (*katbekat/ iki kat*) olacağını belirtmiştir (Ahzâb, 33/30). Olağan suç ve ceza politikasında bir günah/suçun karşılığı ancak bir ceza olduğu ifade edilirken burada iki kat/kat be kat olarak ifade edilmiştir. Cezayı burada artıran nitelikli hal, hem onların örnek kişiliği (Zemahşerî, 1407: IV, 536; Şevkânî, 1414: IV, 318) hem de suçun açıktan işlenmesi yani aleniyet halidir (Avcı, 2014: 221).

Örnek kişiliğin cezaları ağırlaştırıcı bir nitelik olduğu sadece naslarda kanun koyucu tarafından ifade edilen bir ilke olmayıp aynı zamanda insanlarda mündemiç tabii bir duygudur. Cezayı hak edenlerin ahirette liderlerini göstererek, "Rabbimiz! Bizi yoldan çıkaranlar işte bunlar! Onların azabını bir kat daha artır." (A'râf, 7/38. Ayrıca bk. Ahzâb, 33/68) demeleri de buna işaret eder (Beyzâvî, III, 12; Şeyhülislam Ebussuud Efendi, II, 227).

Nur, 24/11. ayetinde de bu ilkeye işaret eden bir nas olarak okumak mümkündür. Peygamber'in eşi Âişe hakkında iftirada bulunanların beş-on kişilik bir grup olduğu ve onlardan her birinin işlediği günahın cezasını çekeceği belirtildikten sonra "Bu iftirada başı çeken kişi ise *büyük* bir azaba mahkûm edilecektir" şeklindeki hitapta geçen "büyük" nitelemesinden ele başı olan tiplerin, onlara tabi olanlardan daha ağır bir cezayı hak ettiklerini anlamaktayız (Râzî, 1420: XXIII, 338).

Kamu görevlisini de devleti temsil etmesi bakımından örnek kişi olarak telakki etmek mümkündür. Gerek kanunnamelerde gerekse 1839 Tanzimat fermanından sonra kodifiye edilen ceza kanunlarında bu ilkenin dikkate alındığını görmekteyiz. Örneğin aşağıda görüldüğü üzere 1453 tarihli Fatih Sultan Mehmed'in teşkilat kanunnamesinde (Kanunnâme-i Âl-i Osman) devlet görevlilerine getirilen ceza miktarları, reayanınkinden farklılık arz etmektedir.

Cürm/Suç [mîrî subaşı ve ehl-i timâr subaşı için]	Cerîme/Ceza
Kan dökmek/katl	3000 akçe
Göz çıkarmak	1500 akçe
Kol kırmak	1000 akçe
Baş yarmak	50 akçe
Fuhş ile sövmek	ta'zîr+40 akçe
Birinin haremine nazır olmak	20 akçe

Cürm/Suç [reâyâ]	Cerîme/Ceza
Kan dökmek/katl	400 akçe
Göz çıkarmak	200 akçe
Baş yarmak	30 akçe

1851 tarihli Kanun-ı Cedid'in ırz ve namusa müteallik cürm ve cünhayı düzenleyen bölümünde (fasl-ı sâni; mad. 1 ve 2) hem bireyselleştirme hem de fâilin sıfatı dikkate alınmıştır. İlgili maddede ırz ve namusun kişinin canı kadar aziz ve muhterem olduğuna dikkat çekilerek bir kimsenin itibarına dokunacak söz söylemek bilâ mucip dövmek veya sövmek onun namusunu hetk etmek olacağından buna cesaret edenlerin hadd-i şer'îye maruz kalacağı ifade edilmiştir. Bu nitelikli hakaret suçunun unsurları oluşmamışsa ta'zir cezası gündeme gelecektir. Kanun koyucu ta'zir cezasının ise herkesin *hal ve şanına göre olacağına* (Benzer ifade için bk. İbnü'l-Hümmam, 2003: V, 330) dikkat çekerek fâilin sıfatına göre cezanın değişeceğini belirtmiştir. Buna göre bu suça mütecasir olanlar ulemây-ı fihâmndan, sâdât-ı kiramdan ve zî-rütbe zevattan ise bunların cezası Meclis-i Vâlâ'ya celb etmek olacaktır. Evsat-ı nâs ve ehl-i sük ise cezanın arttığı görülmektedir. Seçenekli olarak bu kimselerin cezasının uyarı, haps, sürgün ve gerektiğinde üçten nihayet yetmiş dokuza kadar değnek darbıyla te'dib kılınmak olarak belirtilmiştir (Gelişgen, 1993: 91).

1858 tarihli Ceza Kanunnâme-i Hümâyûn'da da (mad.105) konut dokunulmazlığı bu ilke dikkate alınarak düzenlenmiştir. Buna göre, *memur olmayan bir şahıs*, ihafe veyahut cebir ile bir kimsenin hanesine girmesi halinde 1 haftadan 6 aya kadar; aynı yasak fiili bir *memur*, kavanin ve nizamâtın tayin ettiği usulden başka olarak memuriyeti sıfatı ile işler ise 6 aydan 3 seneye kadar hapis cezası alabilecektir. Aynı kanuna göre (mad. 117) mahpus kaçırmaya ve erbab-ı cinayeti ihfaya mütecasir olan şahıs 1 haftadan 6 aya kadar; *memur olması halinde* ise 6 aydan 3 seneye kadar hapis cezasına maruz kalacaktır.

Örnek kişiliğin bazen de cezayı hafifleten bir etken olduğuna tanık olmaktayız. 1858 tarihli Ceza Kanunnâme-i Hümâyûn'un teşhir cezasını düzenleyen maddesi (mad. 19) bu duruma misal oluşturur. Kanun koyucu, teşhiri kişinin cezasının kalın haruf ile yazılarak göğsüne asılması ve suçlunun bulunduğu şehirde bir meydana veya memerr-i nâs olan bir mahalle götürülerek orada iki saat tevkif ve halka irâe olunması olarak tanımlamış ve ehl-i İslam'dan ulema ve meşâyih ve hutebâ ve eimme ile milel-i sâireden sıfat-ı ruhâniyesi olanların bu tür bir cezadan muaf ve müstesna olduğunu öngörmüştür.

Temsil kabiliyeti olan ve örnek kişiliğe sahip kimselerin cezasında ağırlaştırma söz konusu ise buna mukabil sosyal statüsü düşük olanların cezalarında bir hafifletme olacağı beklenen bir durumdur (Kurtubî, 1964: VI, 145; Şevkanî, *Fethü'l-kadir*, I, 520). Nitekim, ilgili ayetin amir hükmüne göre köle statüsüne sahip kimseler zina suçunu işlemeleri halinde hürlerin cezasının (100 celde) (Nur, 24/2) yarısına maruz kalacaktır (Nisa, 4/25).

II. Bayezid döneminde çıkarılan kanunnamede zina cezasının bu statü dikkate alınarak düzenlendiği görülmektedir: *Ve eğer kul ve karavaş zina kılrsa hür ve hürre cürminin nısfı vere; yukarı tafsil mucibince baylıkta ve yoksullukda* (Akgündüz, 2. Kitap, s. 40). Zina cezasının 50 celde olmasına rağmen para cezası (cürm) alınmasına şaşılmalıdır. Kanunnameler, had cezalarını değil, aslen veya bedel olarak ta'zir cezalarını düzenler. Her ne kadar II. Bayezid kanunnamelerinde suçun unsurlarından bir bulunmadığında anılan para cezasının asıl cezanın yerine kaim olacağı şeklinde bir kayıt bulunmasa da biz bu kayda yukarıda da zikrettiğimiz üzere Kanunnâme-i Osmânî'de zina ile ilgili düzenlemede rastlamaktayız. Orada geçen alâ vechi's-şer' recm kılmalı olmasa, şeklindeki kayıt zina suçuna verilecek cezanın önce had olacağı açıkça ifade edilmektedir. Kaldı ki bu kaydın bir benzerine II. Bayezid kanunnamelerinde serika ve gasb ile ilgili düzenlemelerde de tesadüf etmekteyiz:

Eğer kaz ve ördek uğurlasa kadı ta'zir ede, iki ağaca bir akçe cürm alına. Ve eğer at uğurlasa elin keseler; kesmezler ise iki yüz akçe cürm alına. Yancuk veya destar uğurlasa, elin kesmeli olmasa kadı ta'zir ede, iki ağaca bir akçe cürm alına. Ve eğer birâgunun tahılın uğurlasa ganî olsa cürm kırk akçe; orta hallü olsa yirmi akçe, fakir olsa on akçe alına (Akgündüz, 2. Kitap, s. 42.).

Münasebet düşmüşken yanlış bir anlamaya da işaret edelim. Büyük tarihçimiz Halil İnalıcık bir tv programında (Teke Tek - Halil İnalıcık 2009 ^{HD} | Tarihin Hocasına Saygıyla; 1. 25. dakikalarda) Osmanlı'nın Hanefi mezhebi sayesinde büyüdüğü ve gayet müsamahakâr olduğunu, bunun Hanefi mezhebi sayesinde mümkün olduğunu, zira Hanefilikte hırsızlık cezasında el kesme yerine akçe alındığını ifade etmektedir ki buna katılmak mümkün gözükmemektedir (<https://www.youtube.com/watch?v=cWAFhbQkqZQ&t=1186s> (29.08. 2018 tarihinde girildi)).

2.2. Medeni Hal ve İstisâfî Koşullar

Recmin varlığı ve yokluğu, İslam'a yamayan sanal şiddet olup olmadığı tartışılarsun doktrin dikkate alındığında medeni halin zina cezasında etkili olduğu görülmektedir. Evlilerin zina suçunun cezasının recm olduğu belirtilmiş; Nur 24/2'de geçen 100 celde cezasının ise bekarlara münhasır kılındığı ifade edilmiştir. Mezheplerin ittifakla benimsediği bu yaklaşım Osmanlı kanunnamelerinde dikkate alınmıştır. Zina suçunun *recm kılmalı olmasa* demek suretiyle cezasının ilkin recm olduğu, suçun unsurlarından birinin sağlanamamış olması halinde kanunnamelerde para cezası alınacağı belirtilmiştir. Para cezasının takdirinde hem medenî durum hem de fâilin iktisadi gücü esas alınmıştır:

Eğer bir kimesne zina eder görölse şeran üzerine sabit olsa lakin alâ vechi's-şer' recm kılmalı olmasa, eğer *evlü olup* bay olup bin akçe ve dahi ziyadeye malik olsa dört yüz akçe cerime alına; *mutavassıtu'l-hâl* olsa veya *fakir* olsa elli akçe alına. Eğer zina eden *ergen* olsa bay olursa ki yüz akçe; *mutavassıtu'l-hâl* elli akçe alına; *fakir* olursa otuz akçe alına. Eğer zinayı *kız* etse anun cürmi dahi ergen cürmi gibidir (Akgündüz, 4. Kitap s. 278)

2.3. Cinsiyet

Had cezalarında cinsiyetin farklılığa yol açan bir işleve sahip olduğu iddia edilmez. Zina, hırsızlık, şarap içmek, zina iftirası vb. suçlarda kadın-erkek için eşit cezalar düzenlenmiştir (Bustan, 2014: 256). Ancak Hanefi mezhebine

göre dinden dönen bir kadının erkeğin aksine öldürülmesi öngörülmez (Karabâği, 2017: II, 384). Çünkü savaşçı bir karaktere sahip olmadığından irtidat nedeniyle bir güvenlik zafiyeti oluşacağı düşünülmemiştir. Bu nedenle Hanefî hukuk düşüncesinde cinsiyet cezası hafifleten bir niteliğe sahiptir. Gerekçeden anlaşılacağı üzere bir kadının örgüt kurması, yönetmesi veya sözüne itibar edilecek düzeye yükselmesi durumunda sa'y bil'-fesâd gündeme geleceğinden cinsiyetin bir etkisinin olmayacağı beklenen bir durumdur (İbnü'l-Hümmam, VI, 68).

II. Bayezid kanunnamelerinde zina için yapılan ta'zir cezası düzenlemesinde; *eğer evlû müslime avret zina kılsa şer' ile sabit olsa ganiyye ola, ganî er kılığın vere. Eğer zina eden dul avret olsa anun cürmi ergenler gibi ola azlıkda ve çoklukda ana itibar edeler*, ifadesinden cinsiyetin bir rol oynamadığı anlaşılmaktadır.

1851 ceza kanununda (mad 15), *[n]isâdan katil zuhurunda kâtil ve kâtile hakkında diyet ve kısas muktezây-ı şer'i şerif üzere bir raddede olduğundan o makule kâtile hakkında zükûr hakkında kanun icra olunup*, demek suretiyle kasten ve mübaşeretle öldürmelerde cinsiyetin cezada dikkate alınmayacağı ifade edilmiş; ancak kâtile yardım ve yataklık halinde bunu yapan erkek ise 1-3 sene arasında değişen oranlarda vaz-ı kürek ve pranga cezası öngörülürken *muîn-i kâtil nisâdan ise tâifey-i nisâyâ muhsus mahbeslerde ıslah-ı nefis edinceye kadar haps ile (...)* demek suretiyle cinsiyet dikkate alınmıştır. Çünkü kadınlar yapısı gereği kürek ve pranga cezasına uygun değildir (Ayrıca bk. Mad. 19). 1858 Ceza Kanununda (mad. 43) *Mücazât-ı kanuniyede nisanın zükûrdan farkı yoktur. Ancak bazı cezaların suret-i icrâyesinde onların hususiyet-i hallerine riayet olunmak lazım gelir*, demek suretiyle had ve kısas cezalarında cinsiyetin bir rol oynamadığı ancak *hususiyet-i halleri gereği cezaların infazında* bireyselleştirmeye gidileceği ve failin cinsiyetinin dikkate alınacağı daha açık bir ifadeyle düzenlenmiştir.

3. Sonuç Yerine

Hukuk, müreffeh ve düzenli bir toplumsal yaşam için emir ya da nehiy tarzında kurallar koyan, bu kuralların ihlal edilmesi halinde ise çeşitli yaptırımlar öngören bir sistemdir, denilebilir. Hukukun amacı, kamu vicdanını rahatlatmak ve güven duygusunu tesis etmektir. Hukuk, bu amaca ancak adalet idesini dikkate almak suretiyle ulaşabilir. Bu ise insanlara eşit davranmanın ötesinde adil davranmakla olabilir. Hukukun adaleti itibara alması demek, yaptırımları failin kişiliği, hal ve şanına göre bireyselleştirerek tatbik etmesidir. Naslarda teorik zemini bulunan bu ilke, gerek Osmanlı-İslam hukukunda gerekse pozitif hukukta dikkate alınmıştır. Bu ilkenin bir sonucu olarak günümüz ceza kanunları, yaptırımları maktu olarak yani herkese ve her olaya aynı şekilde değil, failin kişiliğine ve suçun isleniş şekline göre aşağı ve yukarı sınırlar (mesela 3 ilâ 5 yıl) içinde, hâkime de takdir yetkisi tanımak suretiyle düzenlemektedir.

İslam Eşya Hukukunda Mülkiyete Dayalı Tasarrufları Sınırlandıran Bir Etken Olarak Şüf'a Hakkı

Dr. Öğr. Üyesi Mustafa Hayta
Çukurova Üniversitesi, İlahiyat Fakültesi, Adana 01338, Türkiye
m-hayta@hotmail.com

Özet

Mülkiyet, bir eşya üzerinde sahibine yararlanma, kullanma ve hukukî tasarrufta bulunma yetkisi veren en geniş aynî hak olarak tanımlanmaktadır. Bu yönüyle hem çıplak mülkiyeti (rakabe) hem de menfaat mülkiyetini kapsamaktadır. Mülkiyet, her ne kadar sınırsız aynî hak olarak tanımlansa da hem pozitif hukukta hem de İslam hukukunda gerek mülk edinme ve bu mülkiyeti koruma gerekse kullanım ve yararlanma gerekse de mülkiyete dayalı tasarruflar açısından bu yetkide bazı sınırlamalar söz konusudur. Söz gelimi, dinen meşru olmayan eşya üzerinde mülkiyet ilişkisi kurulamadığı gibi kamu yararına istimlak örneğinde olduğu üzere mâlikin mülkiyeti rayiç bedel karşılığında cebren izale edilebilmektedir. Kezâ, şüf'a, mâlikin mülkiyete dayalı tasarruflarını sınırlandıran bir örnek olarak öne çıkmaktadır. Mecellenin ifadesiyle şüf'a, bir milk-i müştêrây-ı müşteriye her kaç mal oldu ise ol miktar ile temellük etmektir. Bu tebliğde şüf'anın hikmeti, sebepleri, ne tür eşyada cari olduğu ve hangi durumlarda bu hakkın sakıt olduğu vb. hususlar Hanefî mezhebi açısından ele alınacak münasebet düştükçe diğer mezhepler ve pozitif hukuk ile mukayese yoluna gidilecektir.

Anahtar kavramlar: *Mülkiyet, hukukî tasarruf, şüf'a hakkı, Hanefî mezhebi*

Job Application Preparations In The Process Of Career Awareness

Zehranur KAYA

School for the Handicapped Anadolu University Turkey

znkaya@gmail.com

Abstract

It is aimed in this action research to develop the career perception of the hearing-impaired students in the final years of the School for the Handicapped (SfH) of the Anadolu University by planning activities, designed to raise their career awareness and cause them to get to know about strategies for job seeking and application for a job. The research data were gathered through video recordings, interviews, researcher, and student diaries, audio recordings of planning and assessment meetings, course plans, course assessments, home-works and course products. When the research data were examined, it was seen that eleven sub-activities had been realized under three fundamental activities, designed for the objective. At the article, it is focused on the activities of "Job Application Portfolio (Document Portfolio) and Job Interview-Simulation" taken place under the fundamental activity of "Job Application". The Job Application Portfolio preparation activity were realized between the dates of March 22 – April 26, 2016 and Job Interview-Simulation activity, however, between April 12-26, 2016. The courses, realized between these dates, have been analysed and processes depicted accordingly. Within the direction of findings of the research, it is determined that the career perceptions of the students for graduation have been developed and they had knowledge on job application and acquired courage on job interviews.

Introduction

The education is a process for the development of individual and acquirement of necessary characteristics for the achievement of duties that he may take up during his life. In the meantime, the education is a means preparing the individuals for their future professions. When it is taken into consideration that the professional development of the individual is a long and complex process, it may be possible to say that there are many factors affecting this process. The career development theories explain the factors affecting the individual's choice of profession and rates of these factors to affect the individual in a detailed manner (Adıgüzel & Erdoğan, 2014; Brown & Brooks, 1985; Yeşilyaprak, 2016). The theories are, in the meantime, a guiding light on how the support services to be offered to the individual within the career process will be.

The foundation of these theories and pertaining applications were laid down by the book of Frank Parsons, titled as "Choosing a Vocation" in 1908-1909. The choice of career is one of the important decisions of the individual in his life. When the researches pertaining to the theories are examined, it is indicated that it is necessary to give an opportunity to the individuals to choose up their professions and the career is a lifelong continuing process and the choices of career might be changed during this process. At the same time, it is understood that the atmospheres in the childhoods of the individuals affect their choice of profession and personal characteristics and self-conception play an important role in the choice of profession (Adıgüzel & Erdoğan, 2014; Brown & Brooks, 1985; Sharf, 2006; Yeşilyaprak, 2016). It is possible to clarify the choices of professions of the individual through the theories, however, when the matter is taken into consideration from the point of requirements of our current educational and business world, it is seen that the choices of profession of individuals and their progress in their professions are affected by various numbers of factors such as economic conditions of the country concerned, available work environments in economy, employment conditions and policies of the country etc.

The career is the process of progress in profession, chosen up by the individual. The choices of profession by the individuals are generally realized in the educational process (Sharf, 2006; Yeşilyaprak, 2012). In this context, it is possible to say that the education process is a stage affecting the choice of profession and career process of the individual. Therefore, it is necessary to plan and use the education process in an effective manner for career planning (Sharf, 2006). When researches are examined, it is proposed for the educational programs to support the career developments of individuals by giving the concepts with relation to the career full play along with the provision of professional knowledge, providing communications with the guests representing various professions, offering informative platforms with those, who have career experiences and organizing courses that may imitate their career experiences (Campbell, 1997; Isaacson & Brown, 2000; Sharf, 2006; Yeşilyaprak, 2012). It is sufficiently clear that this matter will play an important role in the choices of profession of the individuals and their career planning and finding job as well after the graduation.

When it is looked at the professional training and career awareness from the point of view of the handicapped individual, it is seen that all researches so far made remained limited. When the researches are examined, it is determined that educational methods, career perception, employment policies, discrimination matters and contents

of educational programs have been handled predominantly.

It is seen in the body of literature what the applications due to be made in the professional education process for career awareness are and there are no researches where these applications are explained in a detailed manner and they are really needed in this respect.

The communication and reading-writing disabilities of the hearing-impaired persons come forth as an important disability that they face in their education process (Paul, 1996). It is also necessary for the hearing-impaired individuals to acquire fundamental skills and attributions that are required by the professional education process. In this context, the career planning activities due to take place within the professional education appear to be important for them in respect of finding place at business environment (Greinert, 1989; Gussenhoven, Anema, Witte, Goverts and Kramer, 2017). It is necessary to organize these activities to be made with the hearing-impaired students by the use of appropriate atmospheres and strategies conforming to the disabilities of the students.

The problem of finding job in our country is the common problem of all graduates whether handicapped or not. Failure to create appropriate environments at workplaces for the hearing-impaired individuals because of their special requirements and the point of view of the employer towards the hearing-impaired individual makes it more difficult for the hearing-impaired individuals to find job. Various measures are taken by way of both legal aspect and education in order to overcome these difficulties. Despite of these difficulties, when the problems of the hearing-impaired individuals, who get into a job, are focused on despite of these difficulties, however, it appears that the personal characteristics and talents of the individuals are not taken into consideration. Likewise, the problems of “discrimination” against the handicapped with relation to their promotion at workplaces are also indicated at the related studies (Erdiken, 2005; Erdiken, 2007; Kaya, Özten Anay & Girgin, 2014; Yılmaz, 2004). The communication of the hearing-impaired individual at the work environment with other individuals and employer is important. The arrangement of the education, organized with the hearing-impaired students within the professional education process, in order to increase the communications skills of the students, especially, professional communication skills, is an important requirement from this point of view.

When the hearing-impaired individuals wanted to continue their careers with the university education, they come face-to-face new obstacles that they have to overcome. Before all else, they have to achieve necessary examinations for the entry into university. The hearing-impaired students, who are placed in related university departments either by succeeding these examinations or passing from vocational high schools to vocational schools for higher education without examination, get into difficulty this time to adopt themselves to the education programs, environments and strategies that are organized for hearing students as a result of their restrictions in the language skills as well and require language support (Karasu G., 2011; Kaya, 2012; İstel, 2018; Uzuner, Girgin, Girgin, Erdiken, Karasu, Kaya, Cavkaytar & Tanrıdiler, 2011). When they do not get such support, however, it is evident that they will get into immense difficulty in reading and understanding the professional texts and set up professional communication.

Finding jobs for the hearing-impaired individuals, who complete the higher education process of the professional education, where they will work, confront them as a separate problem. It is seen that the hearing impaired individuals, graduated from the university, experience problems on the matters such as job searching-finding, setting up communication at work environment, lack of experience for application and discrimination (Erdiken, 2007; Kaya, Özten Anay & Girgin, 2014; Yılmaz, 2004). Therefore, along with the acquirement of professional knowledge with relation to the fields of the hearing impaired individuals, who will graduate from the institutions giving vocational education, it is important for the same to read and write at a level to be able to share such knowledge and express their knowledge, know about the methods of job searching and learn what to be done at a job application.

The Study

While the hearing impaired individuals determine their careers, they can take a university education at the same environments with their hearing peers when they want to take university education and in the meantime, there is an higher education institution, organized for the hearing impaired young individuals. The School for the Handicapped (SfH) of the Anadolu University providing university training for the hearing impaired individuals is a starting step, made for integration of the hearing impaired to the university education (Kaya, 2017). The vocational courses at the School for the Handicapped of the Anadolu University (SfH) are supported with the language courses and scientific-based researches for the improvement of the vocational education, maintained thereunder, are made (Derican, 2010; Genç, 2013; Karasu G., 2011; İstel, 2018; Karasu G., Uzuner & Beral, 2018; Kaya, 2012; Kaya, at al. 2014; Kaya, Özten Anay, Abalı, Karasu & Girgin, 2017; Kaya, Özten Anay, Karasu, Abalı & Girgin, 2017; Uzuner, at al. 2011). Along with the works so made, there is requirement for the works

towards the preparation of the hearing-impaired young individuals for the post-graduation period as well. At the same time, it is required to increase the works to be carried out in this respect by diversification in order to be spread over all departments providing vocational education and explained the same in a detailed manner. Therefore, our research from this point of view has a separate importance for the fact that it is the only research depicting the activities of career awareness, proposed to take in the vocational education of the hearing-impaired individuals at university level.

The research has been effectuated between the years of 2013-2016. It is aimed at the research to plan activities in order to raise the awareness of the attending hearing impaired senior students at the School for the Handicapped of the Anadolu University and enable them to develop their career perceptions and learn and use the job finding strategies. It is aimed to depict the activities of the “Job Application” that is one of the basic activities, realized for the fundamental objective of the research in the article so presented. An answer is looked for to the question of “How the basic activity of the Job Application process has been realized?”

The Method

The planning and how to effectuate its application bears importance at the education researches and in this respect, the researches, realized in this manner, are required. The action research answering the question of ‘How?’ is able to provide theoretical knowledge, application and related improvements and arrangements that are required for the solution of the problematic case at the end of the research at issue. Therefore, the research has been realized as an action research by the examination of process of activities systematically in order to raise the career awareness and depiction of the products.

The application takes place in the centre of the action research. The qualitative and quantitative data collection techniques are taken advantage in the action researches especially for the solution of a problem. Cyclical models are used in order to determine the problem, collect data with relation to the problem, evaluation of data so collected and ensure the improvement with relation to the problem (Fraenkel, 2015; Jhonson, 2012; Zuber-Skerritt, 2003). The action research cycle is seen in the Figure no. 1.

Figure 1: The action research cycle (Zuber-Skerritt, 2003)

The Setting

The research data have been realized at The School for the Handicapped taking place at the Anadolu University (SfH). The “professional language” and “language courses” taking place at the SfH programs have been used in the research. The data are collected in a total numbers of six different courses (Table: 1) and five classrooms/labs taking place in the Graphic Arts, Architectural Drafting Associate Degree and Computer Operator Training Associate Degree programs having a final year education in the SfH in the 2015-2016 educational year.

Table 1: Career Awareness Activities

Departments	Course	Required/ Elective
Architectural Drafting Associate Degree	• Professional Language for Architectural Drafting IV	Required
	• Writing and Speaking Skills for Architectural Drafting IV	Required
Computer Operator Training Associate Degree	• Professional Language for Computer Operator Training IV	Required
	• Writing and Speak. Skills for Computer Operator Training IV	Required
Graphic Arts	• Professional Language for Graphic Arts VIII	Elective
	• Turkish Language Skills for Graphic Arts IV	Elective

The educational year of 2015-2016 is not included in the research as a result of the fact that there was no student in the senior class of the Ceramic Undergraduate Program. The SfH labs and classrooms of the SfH where the

research has been effectuated were equipped with appropriate sound insulation and equipment within the direction of the students' requirements (Girgin, 2003). There are equipment supporting the education atmosphere such as smart board, projection, curtain and so on, at the class rooms/labs where the research data are collected (Figure no. 2).

Figure 2: The Classrooms and Laboratories Used in the Courses

The Participants

The participants of the research may be examined in two groups as *student participants* and *research team*. The *student participants* are 27 severe level hearing impairment and profound level of hearing-impaired students having education at the Graphic Arts, Architectural Drafting Associate Degree and Computer Operator Training Associate Degree programs in the educational year of 2015-2016. The average age of the students is 24. The students apart from a student, who uses a cochlear implant, use ear level hearing aid. “*All Communication Method*” has been used at the courses. The students were informed about the objective of the research and circumstances that they may come face to face in the application process, publication of findings and that they may leave the research when required (Biber & Leavy, 2011; Ryen, 2011). All of the students have taken part in the research voluntarily. The *research team* consists of three academic members, Internship Coordinator and a Consultant having expertise in the field of the hearing impaired. The academic members, who conduct the courses, have a minimum expertise of 20 years in their professional fields and field of education with the young hearing-impaired individuals. The Internship Coordinator is the instructor of the SfH responsible for internship affairs. The latter has followed up the research courses within the research process, taken part in the activities, and contributed on the provision of collaboration between the researchers within the education process. The Internship Coordinator, in the meantime, holds a sign language certificate and has provided support on communication with the students when required in the research process. The Consultant is an academic member, who has an experience of 35 years in the field of the hearing-impaired education and realizes the validity works of the research. All of the researchers apart from the Internship Coordinator have doctorate theses, book translation experiences and projects that have been realized by way of action research. The work, carried out by them, on the subject matter hereof have been presented at related national and international congresses and published in magazines pertaining thereto. The validity and reliability study of data collection instruments, used at the research, is realized by the research team.

Data Collection and Analysis

The quantitative and qualitative data collection methods and techniques have been taken advantage thereof within the research process (Jhonson, 2012; Henning, Stone & Kelly, 2009). The part of the research, presented in the article, has been effectuated through the analysis of data, collected in the Spring Semester of the educational year of 2015-2016. The data have been collected by way of video records of the courses and activities, class observations, sound records and reports of the planning and evaluation meetings, course plans and reflected appraisals, periodical examination results, student products, documents, meetings/negotiations, e-mails, student and researcher diaries, Whats App messages, Facebook messages and student sharing taking place at Facebook media. An expert opinion has been taken for the validities of the data collection instruments and accuracy of data and the analyses realized as simultaneously.

The data were analysed systematically, cyclically and in a reflected manner according to the decisions, made in planning and evaluation meetings, held by the research team within the direction of the objective of the research. According to the data of the research, eleven activities have been organized within the direction of the research objective in the research process. The activities were made in a successive and synchronous manner. The activities so effectuated were classified as three basic activities. The research questions have been answered within the direction of basic objective of the research in this article.

Findings

The research process consists of *problem determination*, *pilot study* and *application* processes. The research began with a problem determination work in 2013. Kaya, Özten Anay & Girgin (2014) effectuated a questionnaire study with the SfH graduates and gathered information on the problems tha the graduates have faced in employment arena and their job finding efforts. At the end of the studies so made, it has been understood that the graduates did not have sufficient knowledge about where they would take up employment and experienced problems on

application for employment.

At the end of problem determination study, it has been decided to carry out a pilot study in the autumn and spring Semesters of the educational year of 2014-2015. Relevant activities have been planned for the career awareness of senior students during the pilot study. The senior students of the Architectural Drafting and Computer Operator Associate Degree programs have been worked with in the pilot study at the SfH. It has been resolved to diversify and increase the activities within the direction of findings, obtained at the end of the said pilot study. The research data were collected with the activities, determined in the research team planning and evaluation meetings in the autumn and spring Semesters of the educational year of 2015-2016 within the direction of the decisions so made.

The research was conducted in a weekly systematic and cyclical process (Figure no. 3). The weekly “*Planning and Evaluation*” meetings were held on Monday. The decisions pertaining to the application of courses have been shared through reports and e-mails together with all research team. The course plans of the focus courses to be made in that week have been examined and necessary arrangement made therein. After the courses, every researcher wrote an evaluation of his course and reflected diary thereof and shared the same with all research team by way of e-mail. The research team set up communication through face-to-face meetings, e-mail and WhatsApp within the direction of due requirements and made information studies in that respect. The plans of the next week were written at the weekend and the same was shared with the research team again through e-mail.

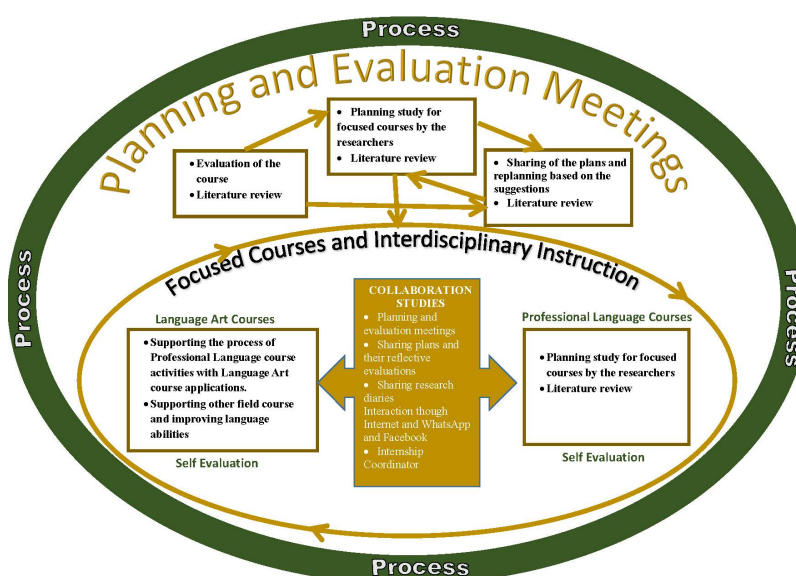

Figure 3: Weekly Cycle of the Research

When the research data are examined, it is seen that the activities, realized in this respect, were gathered under three basic activities. Every basic activity was formed up with sub-activities spreading over weeks (Table 2). The activities so planned were conducted as simultaneously and successively in the focus courses at the autumn and spring Semesters of the educational year of 2015-2016. Notwithstanding that some activities started after the completion of the preceding activity, some activities have been realized in parallel with other activities. When the activities were completed, the student products have been formed up for each activity. The products come forth and studies, carried out within the process, have been evaluated within the scope of the visa-homework-final.

Table 2: The Activities of Career Awareness

The name of the basic activity.	Date
Recognizing Business Environments	October 19, 2015– April 08, 2016
Job Application	March 02, 2016 – April 26, 2016
ISKUR (ISKUR is a government instution to apply for a job in Turkey)	October 22, 2015 – March 23, 2016

At this article, the process of “*Preparation of Job Application Portfolio*” and “*Job Interview-Simulation*” sub-activities, conducted within the scope of the “*Job Application*” basic activity containing the job seeking and finding strategies within the career awareness process of the senior students of the SfH in the spring Semesters of

the educational year of 2015-2016 will be depicted in a detailed manner.

“How the basic activity of the Job Application (the Job Application Portfolio and Job Interview-Simulation) process has been realized?”

The Turkish Employment Organization “ISKUR” in our country offers an intermediation service to find worker and work within the direction of the labour market and develops active programs in order to increase the level of employment (ISKUR, 2018). A communication was set up with the ISKUR (Turkish Employment Organization) within the research process and permission was taken from the manager of the related department and collaboration was conducted with the related Job and Profession Consultant serving duty at Eskişehir branch. The “Job Application Techniques” obtained from the Job and Profession Consultant and prepared at the ISKUR and used in trainings have been arranged in respect of language and content and prepared anew according to the language levels of the hearing-impaired students within the scope of the collaboration. The presentation so prepared has been used in the Professional Language and language art courses. While it was studied on the process of writing documents taking place at the art courses, the study was made on where those documents would be used at the Professional Language courses and how they would be gathered within a file. Job interview and job interview simulation has been made towards the use of the file so prepared. The process of the activities is shown in the Figure no. 4.

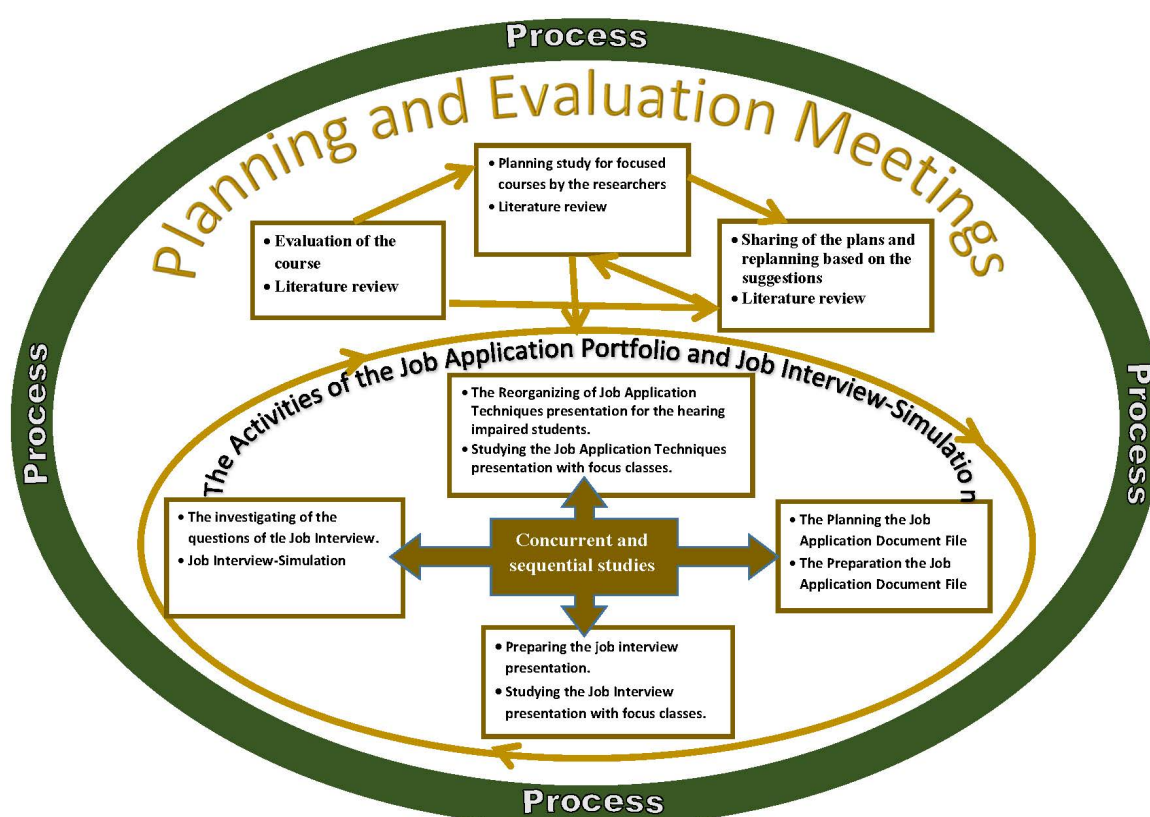

Figure 4: The process of the Job Application Portfolio and Job Interview-Simulation Activities

Job Application Portfolio Preparation Activity

It was studied in the Professional Language and language arts courses through the help of the presentation of the “Job Application Techniques” that indicated what necessary documents are for the job application and were prepared by the ISKUR and adopted by the researchers according to the language level of the hearing-impaired students. The Curriculum Vitea, job application letter/cover letter, reference letter, and job application form filling works have been realized in the language arts courses. In the Professional Language courses, however, it was studied on the maintenance of these documents in a file and how this file would be used within the job application process. The files, selected by the students, have been used as the “*Job Application Portfolio*”. The product of the activity is the Job Application Portfolio, prepared by the students. The files have been evaluated by the visa grade. Every product having taken place within the file, however, was evaluated within the scope of homework. The courses where the Job Application Portfolio was studied on and weeks take place at the Table no. 3.

Table 3: The Table of the Job Application Portfolio Activity Courses.

Departments	Courses	Date
Architectural Drafting Associate Degree	• Professional Language for Architectural Drafting IV	• 30/03/2016, 31/03/2016, 06/04/2016
	• Writing and Speaking Skills for Architectural Drafting IV	• 07/04/2016, 06/04/2016
Computer Operator Training Associate Degree	• Professional Language for Computer Operator Training IV	• 23/03/2016, 30/03/2016, 06/04/2016
	• Writing and Speak. Skills for Computer Operator Training IV	• 29/03/2016, 05/04/2016, 26/04/2016, 03/05/2016

	• Turkish Language Skills for Graphic Arts IV	• 31/03/2016, 07/04/2016, 14/04/2016

Requirement of why the file had to be used was discussed with the students. It has been agreed upon with the students that the Job Application Portfolio was required. Subsequently, the job application presentation and use of the file has been shared. The matters taking place within the Job Application Portfolio have been the studies, carried out on the cover, job application form, CV/Curriculum Vitea, job application letter/cover letter and reference letter and any other documents for the student qualifications/characteristics. Each activity has been realized sometimes successively and other times, however, simultaneously. It has been worked in collaboration in all focus courses for the preparation of documents. The management of the process has been ensured through planning and evaluation meetings, and contacts of the researchers with face-to-face meetings and by way of whatsapp and e-mail. The study of depicting the activity of the Job Application Portfolio will be realized by the depiction of the process for the preparation of documents taking place within the activity. The study of depiction will be presented under a separate topic for each document.

Preparation Process of the Cover Page

The knowledge why the cover page is necessary in the Professional Language and arts language courses was studied on with the students through question-answer and brainstorm activities. The levels and requirements of the students have been taken into consideration in the realization of study in this way (Schirmer, 2000). The cover work home-works were given in the Professional Language courses and their evaluation was made in Professional Language courses. The process of the study, however, has been followed up in the arts language courses within this process. At the Table no. 4, the courses where the Cover page was studied on, course hours and works being made with relation to the cover in courses have been presented on the basis of sections.

Table 4: Cover Page Lessons Table

Departments	Course Name	Date
Architectural Drafting Associate Degree	• <i>Professional Language for Architectural Drafting IV</i> The topic of the “What is being done for a job application?” was discussed with the students. The topic of the Documents, used for presentation of business application, was shared with students. The topic of cover page was studied with students. Preparation of a cover page was given as homework.	30/03/2016
	• <i>Professional Language for Architectural Drafting IV</i> The prepared cover pages were evaluated. The Job Application Portfolio was discussed with the students. Homework: Reorganization of cover page according to the recommendations. Selecting and purchasing a Job Application Portfolio .	06/04/2016
Computer Operator Training Associate Degree	• <i>Professional Language for Computer Operator Training IV</i> It was explained the development of job search skills. It was continued to the presentation. The question of what needs to be done to look for a job? was discussed. The cover page's importance was discussed. Preparation of a cover page was given as homework.	23/03/2016

- *Professional Language for Computer Operator Training IV* 30/03/2016
The prepared cover pages were evaluated. Documents to be included in the job application file were explained. Homework: Reorganization of cover page according to the recommendations. Selecting and purchasing a Job Application Portfolio .
- *Professional Language for Graphic Arts VIII* 22/03/2016
What do we do to look for a job? What is the difference between state and private sector? What can be done for a job application? The cover page's importance was discussed. Preparing Cover page was given as homework.

Graphic Arts

- *Professional Language for Graphic Arts VIII* 29/03/2016
The prepared cover pages were evaluated. Job Application Portfolio was explained and discussed with the students. Homework: Reorganization of cover page according to the recommendations. Selecting and purchasing a Job Application Portfolio .

At the cover work, while the Graphic students were making their own cover designs, the cover work of the the Architectural Drafting and Computer Operator Training students has been realized out of a joint cover design. It has been jointly decided with the students that the name and surname of the student, communication information, department of graduation and his/her photo would take place on the cover. The decision of the students on the product content has caused them to appropriate the product and raise their motivation (Asselin, 1999). There are two examples from the Graphic and computer Operator Training students take place in the Figure 5.

Figure 5: Cover Page Designs of the Students

Job Application Form Process

The notification with relation to the job application form was made in language courses and example forms, obtained from various media, were studied on at the said language courses and relevant form filling activities effectuated accordingly (Figure 6). The form study was worked on simultaneously with the Curriculum Vitea (CV) activity. The form samples, filled in thereunder, were placed in the Job Application Portfolio. However, after the graduation, the necessity of the attachment of the form for the workplace where the application will be made thereof, instead of sample forms, has been shared with the students.

Figure 6: Job Application Form

Curriculum Vitea /CV Preparation Process

The necessity of how an effective curriculum vitea should be has been realized in the language arts courses through

The “Job Application Techniques” and application studies. It has been studied in the language arts course what the information has to be available at the curriculum vitae and sample curriculum vitae have been examined. The repeat study has been realized in the language arts courses in a manner of examination of the studies so made and expression of the study so made by the students. The researchers have worked on effective curriculum vitae design containing common information in all departments in the planning and evaluation meetings and a common design has been determined upon participation of the students and the curriculum vitae of each student been prepared in this respect (Table no. 5).

Table 5: The Activities of Job Application Form and CV Lessons

Departments	Courses	Date
Architectural Drafting Associate Degree	<ul style="list-style-type: none"> • <i>Writing and Speaking Skills for Architectural Drafting IV</i> The documents in the Job Application Portfolio were studied with students. CV and Job application form. Homework: Students will write their curriculum vitae.	31/03/2016
	<ul style="list-style-type: none"> • <i>Writing and Speaking Skills for Architectural Drafting IV</i> The prepared CVs were evaluated. CV examples. Homework: Reorganization of CVs according to the recommendations.	07/04/2016
Computer Operator Training Associate Degree	<ul style="list-style-type: none"> • <i>Writing and Speak. Skills for Computer Operator Training IV</i> CV and Job application form were studied with students. The properties of CV. CV and job application form examples. Homework: The students will prepare their CVs with new information.	29/03/2016
	<ul style="list-style-type: none"> • <i>Writing and Speak. Skills for Computer Operator Training IV</i> The prepared CVs were evaluated. CV examples. Homework: Reorganization of CVs according to the recommendations.	05/04/2016
Graphic Arts	<ul style="list-style-type: none"> • <i>Turkish Language Skills for Graphic Arts IV</i> Important features about CV. Information about CV and job application form were given. CV examples. Homework: Students will write their curriculum vitae.	31/03/2016
	<ul style="list-style-type: none"> • <i>Turkish Language Skills for Graphic Arts IV</i> The prepared CVs were evaluated. The properties of CV. CV examples, Homework: Reorganization of CVs according to the recommendations.	07/04/2016

The graphic students have created their own designs by applying their cover designs to their curriculum vitae. However, the information-taking place within the content of the curriculum vitae remained the same (Figure 7). Other departments worked on a common design. It is seen that the graphic students have transferred the design information, learned by them in the vocational courses into the CV preparation work. The students, at the same time, wanted to reflect the designs that they used in their vocational course where the “Portfolio” preparation works are made and the design works of the graphic students have taken place. The execution of this work upon proposal of the students indicates that the students attribute importance to the activities so made and the awareness of the career in them rises.

Job Application Letter / Cover Letter Process

The matters referring to what the presentation of “Job Application Techniques” and job application letter are and how it should be written have been studied on at the Professional Language and arts language courses. The sample job application letters are examined in the art language courses, job advertisements conforming to the vocational fields of the students have been gone through, and different scenarios were formed up and job application letters written (Figure 8). The instructor has been a model within the process at the studies so made and given a feedback to the studies. The repetitions, made in this context, have caused persistency of the students to learn new knowledge (Schirmer, 2000). The job application letters, prepared by the students, have been placed in the job application portfolios. They are told that it was necessary for them to write the letter anew according to the work that they would apply for after the graduation.

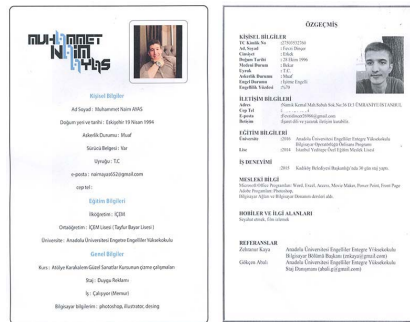

Figure 7: CV Examples

Figure 8: An example for Job Application Letter

Preparation Process for Reference Letter

The information such as “What is a Reference Letter?”, “How is it written?” and “Who writes them?” have been studied on at language arts courses. Homework is given to the students being supposed to ask reference letters from the persons, who may be a reference for them (Figure 9). After the reference letters, taken from the teachers of the vocational courses and workplaces where they may have done internship, were examined and approved, they have been placed in the job application portfolios.

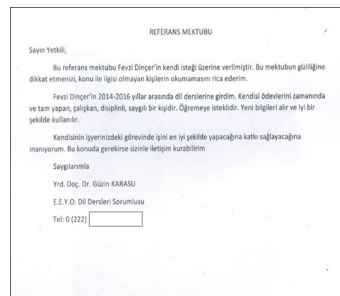

Figure 9: An example for Reference Letter

Preparation Process for Other Documents

The decision of what other documents that will take place in the Job Application Portfolio may be again has been determined together with the students at the Professional Language and arts language courses (Asselin, 1999; Schirmer, 2000). It was also resolved again together with the students on the requirement of the inclusion of the documents clarifying the states of impairments since the students were the hearing impaired, and the health report showing the degree of impairment, audiogram showing the degree of hearing, diploma, transcript indicating the courses taken and certificates so awarded have been determined for each student and procedure and placed in their files (Figure 10). The files have been examined in the courses and with appointments, given to the students out of the classes and by doing so, the study for the completion of all files was realized.

Figure 10: Other Documents

Following the completion of all documents, the “Job Application Portfolios” of the students have been prepared (Figure 11). The graphic students desired to use the designs, made by them while they prepare the cover letter and curriculum vitae, and have created their own files.

Figure 11: Job Application Portfolios

Job Interview-Simulation Activities Process

A “Job Interview-Simulation” activity for application and acquirement of experience has been made at the planning and evaluation meetings in order to use the files so created in an effective manner. The information pertaining to the job interview has been shared with the students by way of presentation in the Professional Language courses. The questions, asked in the job interview within the course process and possible solution thereunder have been discussed. A job interview-simulation has been made with the scenarios, prepared in advance, in order to ensure the permanence of the work so made (Figure 12). The scenarios have been developed in a manner of defining the workplaces looking for employees in certain qualifications, carrying out works with relation to the professional field of the student and ensuring the students to make application for this work. A different scenario has been developed for each department. The students are requested to prepare necessary documents in order to apply for an employment within the direction of the determined scenario and come for the interview. The courses and studies, made within the activity process have been presented in the Table no. 6. This is the preparation of the work for the product activation by the activity as a poster/film.

Table 6: Job Interview-Simulation Activities Lessons

Departments	Courses	Date

	Job interview presentation. Job interview questions and answers. Job interview practice.	
	Sample scenarios were given.	
Graphic Arts	• <i>Professional Language for Computer Operator Training IV</i>	13/04/2016
	According to the scenario, job interview-simulation was done. Feedback was given to the students after the simulation.	
	• <i>Professional Language for Graphic Arts VIII</i>	12/04/2016
Graphic Arts	Job interview presentation. Job interview questions and answers. Job interview practice.	
	Sample scenarios were given.	
	• <i>Professional Language for Graphic Arts VIII</i>	26/04/2016
	According to the scenario, job interview-simulation was done. Feedback was given to the students after the simulation.	

At the end of job interview-simulation activity activation, a feedback has been given to each student and class whether they are offered or not an employment with due grounds for it. How to behave in what case and how to speak to the persons related thereto and their causes have been dwelled upon and it has been explained that why the students makes the things and what is the reason for it. These explanations, realized as upper-cognitive, supported to the permanence of the information (Joseph, 2006). All of the students have taken part in the activity and said that they benefited from it (Application video records, student diaries.)

Figure 12: Job Interview-Simulation Activity

The products of the “Job Application Portfolio Preparation and Job Interview Simulation” activity have been shared with all students at the end-of-year SfH exhibition. The exhibition representation of the process has been realized by the students of the Graphic and Architectural Drafting students by the use of computer application where they have learned at vocational courses and design information as a poster. The computer students, however, told about the process as a film by the use of the computer software, learned at the vocational courses (Figure 13). The students in the realized activity has transferred the professional knowledge that they have learned in vocational courses and seen how the knowledge that they learned in the course is used in a real product. This case is important from the point of view of the permanence of information. The language and design arrangements of the prepared poster and film works have been worked on both a group and individual basis in the professional language and arts language courses (Kolb, 1984; Schirmer, 2000). It is aimed to strengthen the learning by the students by the feedbacks, given within the arrangement work period.

Figure 13: The end-of-year SfH exhibition: Career Planning Presentation

Conclusions

It is indicated in the literature that the repetition of the knowledge, learned by the students at the classes through experiences, their use of the same in meaningful contexts and sharing the studies so made with their fellows make a positive contribution to their learning (Schirmer, 2000; Uzuner et al. 2011). The research is a study that is informative, bearing objective for application and based on experience (Isaacson & Brown, 2000; Kolb, 1984; Schirmer, 2000; Sharf, 2006). It has been determined that the provision of opportunity by the research to use the vocational knowledge and transfer of the knowledge, learned by the them (students) into a real product and telling their teachers about the studies carried out by the same, provided positive contribution to the vocational knowledge and skills of the students with relation to the subject matter thereof.

Provision of active participations of the students in the activities, indication of their opinions with relation to every activity in writing, conduct of individual studies with the students, viewing of the use of files, prepared by them, by the students at a media, created by way of activation, realization of the courses through the use of all components of the language and their metacognitive and interdisciplinary studies have increased the affectivity of the study in the activities so materialized.

It has been understood within the direction of findings, acquired from the interviews, diaries of the student and instructors, videos of the courses and records of the planning and evaluation meetings that the career perceptions of the students towards graduation have developed and they acquired knowledge about application for job and had

courage on the job interviews.

In the research, the communication is still continued even after the graduation of the student. Various planning are made for the systematic collection of the monitoring data. At the same time, various meetings have been realized with the focus students, graduated within this process, through e-mail Facebook, WhatsApp and on face-to-face basis. The feedbacks having come from the students are in nature of supporting the results and affectivity of this research. In the meeting, made with M.A., who is a Graphic program graduate and got a job, he indicated that he had applied to the organization where he was employed at that time through a "Job Application Portfolio" that he had prepared within the research process and given answers to the questions asked at the job interview and that the experiments, experienced at the activation process assisted him at the activation process and did not experience too much experience as a result of activation activity, made at the class (History Researcher Diary, 2017).

When the works have been exhibited at the end-of-year exhibition, made at the end of 2015-2016, the lower-class students asked about when they will acquire this knowledge and prepare files for themselves. This case gives rise to the thought that the presentation of the study so made to the SfH raises the career awareness of other students apart from the graduated students.

The research has been supported by the SfH management. Within this scope, a study of adding the awareness studies to the contents of the Professional Language and arts language courses has been carried out and new contents have taken their places at the catalogue of the educational year of 2017-2018 upon approval of the school Director. The provision of support by the Director of the SfH, existence of a researcher from the research team at the management cadre and availability of courses that will be able to place the career awareness matters in the SfH course programs have provided ease in the conduct of the research. The research has continued in the (educational) year of 2017-2018 with the inclusion of all programs. The study is continued on by the expansion of activities and addition of new activities. It is thought that the study so made will provide a point of view to the lawmakers, managers and teachers working in the vocational education of the hearing-impaired individuals. The study may be repeated by the addition and development of new activities, it is possible to suggest the use of the activities in the vocational education at the secondary-education stage the same as the vocational high schools.

Kazakhstan Country Image On The Websites Of Turkish Newspapers

Birol BÜYÜKDOĞAN

Dr. Lecturer, KTO Karatay University, SBBF, Communication Design and Management,
birol.buyukdogan@karatay.ed.tr

Abstract

Country image can be defined as the feelings, thoughts and attitudes of other people about any other country. The formation of the country's image is influenced by different factors such as the discourses of the leaders, the quality of the products, democratic practices, education level of the people, cultural and artistic activities and tourism potential. The current image of a country can be changed very quickly due to different reasons.

The aim of this study is to examine the representation of Kazakhstan in the news of internet web sites of Turkish newspapers. In the study, it is evaluated how the country image take place in the newspapers through this representation. It is thought that this study will also contribute to the field of the international public relations. The study sample consists of Turkey's first four best-selling newspaper's web sites. In the study, the news of the relevant newspapers are examined between 01 October-31 December 2017. The study is analyzed with content analysis method. 381 news are analyzed in the study. According to results of the study, the representative of Kazakhstan in Turkish press is generally positive. Politics, economy and sports news are the top three topics in the news. Most of the news about politics, economics, culture, arts and education are positive. Negative news belongs to judicial, politics and other topics respectively. Most of the news are about the Kazakhstan citizens living in Turkey or who participated in the activities related sport, economy and cultural/art in Turkey. Result of the study, the news about promotional activities related to Kazakhstan country image are very few. It is thought that Kazakhstan government should start the promotion activities about its country and wealth of the country.

Key words: International public relations, country image, Kazakhstan, content analysis

Knowledge Classification and Boundaries Between and Within Fields of Practice in Universities of Technology (Uots)

Isaac Ntshoe and Ntsoaki Malebo,
Central University of Technology, Bloemfontein, 9300.
intshoe@cut.ac.za; nmalebo@cut.ac.za

Abstract

Specialisation in curriculum that provides graduates with specialised knowledge and skills required to function in specific occupations and professions remains a contested terrain. Specialisation is expressed in actual or perceived knowledge classification and boundaries which define their focus and objects of study. In particular, knowledge classification and boundaries between disciplines in curricula of professional sectoral fields of practice in universities of technology (UoTs), and professional fields in higher education more generally is inconclusive. Contested areas of this topic are: i) knowledge classification and boundaries between and within disciplines of professional and sectoral fields of practice in UoTs; ii) the nature of differentiated knowledge and knowledge boundaries between and within different fields of practice and how these boundaries shape curriculum design practices of professional fields and sectoral fields offered in UoTs; iii) knowledge boundaries and specialisation in the inter-disciplinarity and cross-disciplinarily contexts.

This paper examines knowledge classification and boundaries between and within disciplines of professional and sectoral fields of practices of UoTs. We explore the extent to which knowledge differentiation and boundaries between and, within disciplines of professional and sectoral fields of practice may enhance the quality of offerings in terms of specialist disciplinary that are the basis of the different fields of practice selected by students after graduation and knowledge addressing practical problems experienced within the different occupations. Selected fields are: Biomedical Technology, Radiography, Mechatronics, Biochemistry, Tourism and Hospitality. While some work has been done concerning knowledge classification in curricula of conventional universities, research on knowledge classification and boundaries in curricula of professional and sectoral fields of practice in UoTs is generally skeletal.

Knowledge classification typologies are used to frame discussions on in the paper. Quantitative and qualitative data will be collected through a purposeful sampling from lectures teaching the courses. Quantitative data will be collected through a questionnaire, while qualitative data will be solicited from written responses from the participants.

We argue for knowledge differentiation and boundaries between and within disciplines of professional and sectoral fields of practices arguing though that these boundaries are not fixed, but changeable because of changing nature of occupations, new markets and innovations. Further that although a neat and rigid boundaries are unsustainable, knowledge differentiation and boundaries are indispensable because, success in cross-disciplinary research and learning, depend on discipline-based knowledge. Knowledge and boundaries highlights the boundedness of disciplines, the significant of separation of concepts and the boundaries in the different disciplines them from everyday knowledge concepts.

Key words: knowledge boundaries, disciplinary identities, knowledge classification

Learning Difficulties In Students Of The 3rd Year Of A Public School In The State Of Alagoas, Brazil: A Vision Of Psychoeducation

Abstract

This article seeks to analyze learning difficulties in students of the third year of schooling and to relate some sociodemographic, family and school factors that contribute to failure rates in elementary education in a school in the state of Alagoas, Brazil. A quantitative, exploratory-descriptive study was carried out on a sample of 178 students from a public school. The results indicate that one third of the students live with only one parent and the same percentage say that the family environment is bad or very bad. More than half of the parents (53.4%) do not help their children in studies or homework and 41.6% of the parents do not have education.

With our study we found students with high failure rates as 26.4% have already failed and 42.6% of these have failed twice and 36.2% have failed 3 or more times. Educators should reflect on these rates and on the influence the family has on children's learning and takes appropriate actions as poorly structured, uneducated, and uninvolved families influence the failure of students.

Introduction

The problem of school success/failure is transversal in all levels of education, in all institutions and has always been a concern both for the school and for families and other entities involved in the school environment.

Several studies have addressed the issue and multiple factors are identified as being related to school failure, including psychosocial, family, cultural, political and economic factors.

If in a more advanced degree of studies, social support is more directed to the peer group, at an earlier stage, such as elementary education, the role of the family becomes essential in promoting the education of children.

Entering school generates changes in the child with the adaptation to different environments and contexts, with the relationships with the teachers and colleagues, with the habits and lifestyles of the students. The family plays a fundamental role in the children's school performance, both at home and in school relations, for the accompaniment and active involvement that it should have in educational projects. The school, in turn, should involve the students' families in school activities and in their educational projects, making them a stimulating factor for learning.

Alongside the school, the family has an important role in the teaching/learning process and in addition to the support they can give at home in the students' school tasks, their presence at school in meetings or accompaniments leads them to become aware of their children's school life. This approach helps the school to be aware of the difficulties and concerns of the parents and, on the other hand, the parents are led to take an interest in the school activities and assume greater responsibility in the teaching and learning process of their children.

We know that this relationship isn't always easy or simple, but it is an effort worth investing in. Several authors have concluded that it is only possible to achieve good levels of success and prevent school dropout if there is a good relationship between the school and the family (Peixoto & Rodrigues, 2003; Jacinto, 2006; Spoth, Shin & Randall 2008; Topor et al.

Family interactions and the affective environment are stimulating for the development of the child, but in today's society we see rapid changes that can lead to instabilities in the families with consequences on the education and accompaniment of the children. Today's families have undergone profound transformations, sometimes with weak structures, with changes in family functionality and living in circumstances that are not conducive to this relationship with the school.

Often the school demonstrates that it has no responsibility and assigns the problems that it faces only to the family, which in turn hopes for solutions and believes that it should be the school solving the problems. This way, the school attributes the student's academic failure to the influence, or lack of influence, of the family, diverting attention from what the school can do to solve the problem, such as, for example, in relation to student learning, rules and discipline.

The causes of school failure are varied and may depend on factors endogenous and exogenous to the school. In the first case are the socioeconomic and cultural characteristics, the profession and the qualification of the parents and caretakers, the type of habitation in which they live and the distance to the school. Exogenous factors include professional qualification and preparation of teachers, institutional conflicts, interpersonal relationships in school, management of classroom activities, existence and availability of teaching equipment, physical and material conditions and structures.

Constâncio (2013) refers to a survey conducted by UNESCO on the profile of public and private school teachers throughout Brazil, which revealed that most teachers have a precarious academic background, which is a determining factor in the educational process. The role of the teacher and his/her characteristics is recognized as one of the main factors that influence the students' learning in school. Veloso (2011) emphasizes the importance of teacher education because as agents of transformation they need to have a solid, ethical and mainly continuous scientific basis, since they receive children from several family and social environments with different sociodemographic situations.

It is up to the teacher to analyze the particularities of each student and, when perceiving any disturbance related to learning, provide actions to minimize the problem. The teacher can instruct the family to seek specialized health professionals, acting in a complementary way between the school and the family, with this preventing major disorders.

We reinforce the importance of the teacher creating situations involving content and social environment that arouse the interest of students, especially those who cannot connect to certain subjects related to learning. Capturing the attention and interest of these students is a great challenge, which can be favored by psychopedagogical actions such as knowing each student, each family and the social environment.

The academic failure of some children may be linked to learning disorders. Psychological disturbances cause several academic problems to some children during their schooling journey, more precisely in languages, writing and mathematical calculations.

Carrera's studies (2013) address learning difficulties as a low school performance related to the age of each individual and also indicate that such difficulties may be related to speech, hearing, reading, writing and mathematical reasoning. The term can be applied to children with a normal Intellectual Quotient (IQ) but with sub-achievement in some subjects. These difficulties can manifest themselves in several ways: dyslexia, dysgraphia, dyscalculia, attention deficit, hypo or hyperactivity.

Martins and Figueiredo (2011) affirm that there is not only one single cause for learning difficulties because they must be understood from a multidimensional perspective. According to Lopes (2005), the causes of learning difficulties may be multiple and there may be interaction between them, being able to be grouped into neurophysiological, psychological, sociocultural and institutional factors.

The teacher must bear in mind that each child is unique and learns differently from the other, respecting the time and level of learning of his student, acting in a conscious way and contributing to the development of students' potentialities and autonomy.

It is necessary an early diagnosis to identify learning difficulties in children and to guide them to specialists in the area. In this context it is considered of great importance the role of a psycho-pedagogical professional since it is necessary to have a special vision of the practice of the teacher in the classroom, in the relation of the student with the knowledge and learning and an evaluation of the clinical aspects that can interfere in the learning of the student. This discipline emerges as a link between psychology and pedagogy, between the part of affective and intellectual development seeking to improve learning. According to Souza and Vasconcelos (2012, p.54) "the psycho-pedagogue is a professional who can help students cope with their circumstantial learning difficulties, understand the school process and discover (or rediscover) their potential". Cruvinel (2014, p.96) quoting Bossa, says that "clinical psychopedagogy seeks to comprehend in a global and integrated way the cognitive, emotional, social, cultural, organic, and pedagogical processes that interfere in learning in order to enable situations that rescue the pleasure to learn in its entirety". In his intervention in problems of conduct and learning, he seeks to include parents, teachers and specialists in the educational process, through meetings, enabling the monitoring of work with teachers.

The psychopedagogue seeks differentiated methodologies to be worked on with teachers and with these students. The importance of promoting the self-esteem of these students is valued, as well as the motivation for learning by directing the content to its surroundings giving priority to what the student already knows, so that he/she feels pleasure in learning and feels able to learn.

The Study

The relevance of the research arises from the knowledge we have of the reality lived in the day to day with the difficulties of learning that we find in students of the third year of schooling. Our study aims to identify areas of learning difficulties in the curriculum component of portuguese and mathematics and to analyze the relationship of sociodemographic, family and school variables with learning difficulties.

We conducted an exploratory-descriptive, quantitative and correlational study in a sample of 178 students, 3rd year, in a public school in Taquara, Alagoas, Brazil. We used a questionnaire to characterize the socio demographic and scholastic characteristics of the students and a scale of formal evaluation of the learning used in the school to evaluate the portuguese language (orality, reading, writing and production, linguistic analysis) and mathematical evaluation (numbers and operations, space and form, magnitudes and measures, information processing).

To carry out the study, authorization was requested from the school, the questionnaire was filled out by the class management teacher. The application of the scale for the formal evaluation of learning has fulfilled the schedule

foreseen in the school year. The students were informed and invited by the teacher to collaborate on the answers to the questionnaire. Respondents' anonymity and confidentiality were guaranteed, and the teachers completed the answers in the questionnaire. The application of the questionnaires was carried out during a class in its normal timetable.

Findings

The participants were mostly male (55.6%). The ages vary between 8 and 14 years old with an average age of 8.53 years, distributed in 6 classes (3 morning and 3 afternoon) in which the smallest has 25 students and the largest has 35. There were 69.1% of students were 8 years old, 18.5% were 9 years old and 12.4% of the students were 10 years or older.

It takes an average of 20 minutes for students to get to school. We found that 34.3% lived with single parents, separated divorced or widowed. About a third of the students (31.5%) report having very bad, or bad family environment and there are classes where this is more evident.

41.6% of the students' dads and 37.1% of the mothers do not have education. 53.4% of the students reported that the parents did not help in their studies or homework, a fact that is related to the parents' lack of education.

26.4% of the students have been held back at school (failed). Out of the students who have failed, 42.6% have failed twice and 36.2% have failed 3 or more times. The failure rates are high but, at the school where this study was developed, no one is held back a year (fails) until the 3rd year of school (except by absences) so many students reach this stage without the knowledge and performance required for the 3rd year. The subject of reproaches has already been debated with arguments in favor and against, and in this situation, we find many of the held back are unmotivated students and classes with large age differences which is disturbing in peer relations and attitudes regarding school.

The learning difficulties in portuguese were evaluated in four parameters. In orality the greatest difficulties were found in the presentation of ideas in a clear way and in the adequacy of the discourse. In reading the greatest difficulties were in the recognition of sentences and in the reading and comprehension of texts. In the writing and production of texts, they showed more difficulty in ordering and organizing the text, in the construction of text with correct punctuation and in the revision of texts with coherence. In linguistic analysis the greatest difficulty was in the recognition and use of orthographic rules.

The learning difficulties in mathematics were also evaluated by four parameters: numbers and operations; space and form; magnitude and measures; treatment of information. With regard to numbers and operations the greatest difficulty was in identifying operations to solve problems (addition, subtraction, multiplication and division). In space and form the difficulties were smaller, in the greatness and measures they felt more difficulty in interpreting problems using the monetary system. In the treatment of information, the greatest difficulty was in the elaboration of tables and graphs and in their interpretation.

The learning difficulties in portuguese and mathematics are greater in the older students, male students, who have already failed more than once and with histories of behavioral problems and with a bad or very bad family environment, and who do not have help at home with homework.

We noticed that the positive data came from students with married/living together parents who presented good/very good family environment, who organize themselves to help their children with homework. Most of these students did not have difficulty in performing the tasks proposed in the evaluations.

Conclusions

We found that our results pointed to some groups with higher learning difficulties due to some variables, among them are those students with history of failure, older students with a distortion in age/year of schooling, male, living in poor / very poor family environment, with parents with low level of education who do not offer help in tasks and homework. We also noticed that the opposite occurs with the other groups, those students who live in a good/very good family environment, married parents or together in a stable union, who have never failed and who receive help in tasks and homework, follow their cycle of learning at the indicated age and without many difficulties for the appropriate class and year.

We found that parents were poorly involved in their children's school life, not helping them in school tasks or encouraging them to study. Family caring about the learning of their children is of fundamental importance for a good school development of the child and many of the problems emerge from the existing relationships in the family.

There is a need to attend to the structure and phases of psychological development as there are classes with large age differences among students and with several held back students that require individualized and continuous care to proceed. Due to the need to attend to the dimension of affection in learning and to the sociocultural origin of the students and the problems they live with the families, in our opinion, the existence of a psycho pedagogue in the school team, is justified.

It is necessary to raise awareness of all those involved in the learning process, since many causes contribute to the development of learning difficulties and can appear in any child, regardless of the social stratum to which they belong.

The results obtained are of great importance and show that we should invest more in the study of this subject and identify the learning difficulties in this area and at this level of education, because it is about preparing the women and men of tomorrow.

The pedagogical project of the school should be open to family participation and it should also organize joint and complementary actions in order to enhance student learning and lead to a better perception of families by teachers so that they can understand the children and some of their behaviors in a better way.

Acknowledgments

We would like to thank the Instituto Politécnico de Viseu and CI&DETS for their support.

Abstract

The main aim of this research was to investigate the effects of learning leadership of school administrators and teachers' teaching behavior toward teacher professional development. A total of 412 samples consisting of 103 school administrators and 309 teachers participated as respondents. Researchers utilized a quantitative survey design with a questionnaire instrument. Descriptive statistics were used to examine the perceived level of all variables and inferential statistics, applying hierarchical linear model using teacher and school administrator level. Results showed that all the independent variables either school administrators' learning leadership or teachers' teaching behaviors are positively associated to teacher professional development at significant level 0.01. Teachers' teaching behavior was correlatively explained to the variance of teacher professional development of 20.60 percent. The learning leadership factors namely creativity and integration and advanced technologies were significantly affecting teacher professional development at 0.01 and 0.05 levels respectively. Finally, learning leadership was correlatively explained 95.50 percent to the variance of teacher professional development and learning leadership factors namely creativity and team learning were significantly affecting teachers' teaching behavior at significant level of 0.01 and 0.05 respectively.

Keywords: *Learning leadership; teacher professional development; teachers' teaching behavior*

Introduction

According to Kouzes and Posner (2016), learning leadership is so influential of direction and outcomes whether at the micro level of schools and learning environments, or of extensive systems. Somprach and Tang (2016) defined learning leadership is a leadership style that engaging in the design, implementation, and sustainability of powerful innovative learning environments. A teacher professional development can be described as a collegial group of teachers and principals who work and learn together in their commitment to enhance learner achievement (Leclear, 2015).

Somprach, Tang, and Popoonsak (2017) explored the role of essential leadership styles of school principals in encouraging teachers' participation in professional learning community to 731 teachers in basic education in northeastern of Thailand. Their findings indicated that learning, transformational, collaborative, and invitational leadership styles are the four significant predictors for promoting teachers' participation in professional learning community. In addition, Thailand Manual for Strategic Plan, Ministry of Education (2010) emphasized that Thailand needs to have comprehensive guidelines to develop teachers' professional skills to prepare its future global citizens of the 21st century.

Somprach, Prasertcharoensuk, and Tang (2016) surveyed 375 teachers regarding the relationship and effect of administrative factors that affecting the effectiveness of Thai World Class Standards Schools. Their findings indicated that the four significant predictors are factors for using information and communication technology, teacher professional development, internal process management and the focus on learners and stakeholder that have successfully contributed 65.60 percent variance of effectiveness of Thai World Class Standard Schools at 0.01 significance level with multiple correlation coefficient as 0.81.

Research Objectives

Based on the previous literatures above, researchers would like to investigate learning leadership of the school administrators, teachers' teaching behavior toward teacher professional development in schools under the administration of the Office of Secondary Education Region 22, Thailand. The following are the specific objectives of this study:

- i. To identify the perceived level of learning leadership of school administrators, teachers' teaching behavior and teacher professional development.

- ii. To examine the fixed and random effects of null model.
- iii. To examine the fixed and random effects of simple model.
- iv. To examine the fixed and random effects of hypothesis model.

Method

Survey design was employed using questionnaire as a method to collect quantitative data. A total of population 2,843 consisted of 137 school at macro level and 2,706 teachers at micro level from 137 schools under the Office of Secondary Education Region 22, Thailand. A total of 103 schools were selected out of 137 schools in accordance with the Krejcie and Morgan's Table (1970). A multistage sampling technique followed by proportional simple random sampling technique was administered to select samples according to the two levels. Therefore, the target groups were divided into two levels, namely school administrator level and teacher level with a ratio one school administrator to three teachers. Consequently, the sample size of 103 school administrators was randomly selected in proportion to different sizes of schools namely small, medium, and large. This is followed by simple randomized teacher-level samples under the sample of 103 school administrators at macro level. As a result, the total samples of teacher were comprised of 309 teachers at micro level. Since researchers employed Hierarchical Linear Modeling (HLM), a large sample size is needed in order to find accurate group variation. Hair, Back, Babin and Anderson's (2013) proposed that the proper ratio of samples is 20:1 or 20 samples per one observable variable. Since there were 11 observable variables in this study, the required sample size was 220 samples of teachers. On this line of reasoning, simple random sampling technique was utilized to select 309 of teachers to fulfill Hair et al. (2013) suggestion that sample size should not less than 100.

Two types of survey questionnaire were used in this study catering for macro and micro levels respectively. The two types of questionnaire were administered in the Thai language to ensure that the respondents could understand about the statements. This survey questionnaire method benefits this study in terms of obtaining data more efficiently as time, energy, and costs would be minimized (Wyse, 2012), hence provides an excellent means of measuring attitudes and orientation in a large population which can, therefore, be generalized to a larger population (Gay, Mills, & Arirasian, 2012).

Teachers' teaching behavior was the micro level independent variable consisted of six factors namely learning management plan, learner centered teaching activities, use of media and technology, assessing the actual condition, classroom management, and classroom action research. On the other hand, learning leadership of school administrators was the macro level independent variable was comprised of creativity, powerful learning environment, flexibility, integration, advanced technologies, team learning, and school-directed learning. Dependent variable was teacher professional development included professional learning community, specific curricula, student-learning needs, quality teaching, and enterprising collaboration.

Results Of The Study

Results of this study are presented based on the research objectives that are indicated above. The initial result is the descriptive results related to the three variables namely teachers' teaching behaviors, learning leadership of school administrator, and teacher professional development. This is followed by results from HML analysis for null hypothesis testing.

Descriptive results of all the perceived level of learning leadership of school administrators, teachers' teaching behavior and teacher professional development.

Descriptive results indicated that all the variables of this study are perceived at high levels. Specifically, the perceived level of learning leadership of school administrators, teachers' teaching behavior, and teacher professional development were found at high level as their mean score was 4.43, 4.26, and 4.27 respectively. Table 1 shows the average score of the perceived level of each variable.

Table 1: Results of the perceived level of practice on each variable

Variable	Mean score	SD	Interpretation
Learning leadership	4.43	0.32	high
Creativity	4.46	0.43	high
Powerful learning environment	4.43	0.37	high
Flexibility	4.44	0.51	high
Integration	4.41	0.44	high
Advanced technologies	4.43	0.36	high
Team learning	4.45	0.38	high
Self-directed learning	4.43	0.41	high
Teachers' teaching behavior	4.26	0.49	high

Learning management plan	4.32	0.50	high
Learner centered teaching activities	4.25	0.54	high
Use of media and technology	4.24	0.55	high
Assessing the actual condition	4.22	0.63	high
Classroom management	4.32	0.57	high
Classroom action research	4.18	0.64	high
Teacher professional development	4.27	0.46	high
Professional learning community	4.21	0.56	high
Specific curricula	4.27	0.59	high
Student-learning needs	4.27	0.61	high
Quality teaching	4.34	0.50	high
Enterprising collaboration	4.35	0.49	high

Null model analysis

The micro-level analysis of HML was conducted in two steps. The first step (null model) was conducted on the dependent variables without considering any independent variables. As indicated in Table 2, the results of fixed effect test showed that the total mean score of teacher professional development was 4.251 ($\gamma_{00} = 4.251$) with a statistical significance at 0.01. Therefore, researchers were able to use the simple model analysis for the second step (simple model).

Table 2: Results of null model from fixed effect and random effect

Fixed effect	β	Standard Error	t-test	df	p-values
INTRCPT, γ_{00}	4.251**	0.040	107.351	102	<0.001
Random effect	Variance	df	χ^2	p-values	
Mean difference of school (U_{0j})	0.132	102	559.695	<0.001	

**p<0.001

Simple model analysis

Based on Table 3, the results of fixed effect test showed that the total mean of the teacher professional development was 4.245 ($\gamma_{00} = 4.245$) with a statistical significance at 0.01, $t = 216.284$. Independent variables at micro-level that provided positive effects on teacher professional development were learning management plan and learner centered teaching activities with every factor variable having a statistical significance of 0.01. The regression coefficient of each factor was 0.317 and 0.355 respectively. Both of the factors were used to explain the variance of teacher professional development of 20.60 percent. This implies that the promotion of learning management plan and learner centered teaching activities can improve teacher professional development. Analysis of random effect was illustrated through the following equation:

Teacher professional development = $4.245^{**} + 0.317^{**}$ (learning management plan) + 0.355^{**} (learner centered teaching activities)

Table 3: Results of simple model from fixed effect and random effect

Fixed effect	β	Standard Error	t-test	df	p-values
INTRCPT, γ_{00}	4.245**	0.020	216.284	102	<0.001
LMP	0.317**	0.065	4.864	102	<0.001
LCTA	0.355**	0.049	7.275	102	<0.001
Random effect	Variance	df	χ^2	p-values	
TPD	0.009	85	133.650	0.001	
LMP	0.151	85	119.945	0.008	
LCTA	0.021	85	122.510	0.005	
Mean difference between teachers	0.071				

**p<0.01

Hypothetical model analysis

Factors of learning leadership of school administrators that were positively affecting teacher professional development namely flexibility, integration, and advanced technologies. The regression coefficient of each factor was 0.169, 0.129, and 0.083 respectively, with statistical significance 0.01 and 0.05. The analysis result was illustrated through the following equation.

Teacher professional development = $4.238^{**} + 0.169^{**} (\text{Flexibility}) + 0.129^{*} (\text{Integration}) + 0.083^{*} (\text{Advanced technologies})$

These factors were used to explain the variance of teacher professional development of 31.21 percent. This implies that the learning leadership of school administrators were affecting learning management plan were creativity and team learning factors. Both factors have influence over regression coefficient at 0.370 at significant level of 0.05. The analysis result was illustrated through the following equation:

Learning management plan = $0.283^{**} + 0.370^{**} (\text{Creativity}) + 0.335^{*} (\text{Team learning})$

The factors at the level of school administrators can be explained by the variance of learning management plan of 11.18 percent. The factors at the level of learning leadership of school administrators affecting activities that learner centered teaching activities were creativity, integration, and advanced technologies which having influence over regression coefficient at 0.425 and 0.284 significantly at 0.01 and at 0.443 significantly at 0.05 as illustrated through the following equation:

Learner centered teaching activities = $0.333^{**} + 0.425^{**} (\text{Creativity}) + 0.284^{**} (\text{Integration}) + 0.443^{*} (\text{Advanced technologies})$

The variables at the level of school administrators can be explained by the variance of learner centered teaching activities of 14.39 percent. The administrator-level model can be explained the variance of teacher professional development of 95.50 percent.

Discussion And Conclusion

Results of this study revealed that predictors of teachers' teaching behavior that affecting teacher professional development were learning management plan and learner centered teaching activities. This implies that teachers' teaching behavior is important because it can directly affect teacher professional development. The results are found to be in line with Buntos's (2014) and Somprach et al.'s (2017) studies. Buntos's study revealed that there are three predictors for teacher professional development namely self-awareness, broad vision, and teaching skills with a multiple-correlation coefficient of 0.727, predictor coefficient or predictive power of 52.80 percent significantly at 0.05 level. Somprach et al. demonstrated that the greater the flexibility of the hierarchy through learning leadership, the higher the teachers' participation levels in professional learning communities.

The learning management plan and learner centered teaching activities were positively affected teacher professional development. This implies that the learning management plan allows teachers to be prepared to face problems and prepare classroom activities to suit the lessons and learners. On the other hand, learner centered teaching activities also contributed to teacher professional development because the changes in current education requires more dynamic educational management according to the principle that all learners are able to learn and develop themselves. In addition, results revealed that learning leadership factors namely flexibility, integration, and advanced technologies are important to promote teacher professional development. Therefore, all the educational agencies should encourage teachers to participate in teacher development planning, monitor the evaluation of supervision, follow up the work, prepare themselves to handle a variety of learning styles, and provide adequate budget and training needs.

Results showed that creativity and team learning are significantly affected the learning management plan. This implies the importance of learning leadership in fostering the learning skills of 21st century learners through the design and development of innovative learning environment to meet the needs of learners. Besides, results also found that creativity, integration, and advanced technologies are the most influential independent variables toward learner centered teaching activities. Teachers are encouraged to play a role in implementing the curriculum. They have to manage class to achieve the objectives of the curriculum in order to raise the quality of education to become realistic. They should also integrate between sciences and cross-sciences to promote and develop the learners to be able to associate knowledge appropriately, leading to potential and intelligence. The aim is to provide the learners with the opportunity to search for information and select useful information, learn how to work with others happily. In addition, the school administrators should encourage teachers and school personnel to utilize appropriate technologies to improve the quality of teaching and learning in accordance with the curriculum standards and facilitate and support a variety of technologies to lead to further learning innovations.

Results of this study contribute to the growing interest in incorporating teachers' teaching behavior coupled with school administrator's learning leadership to improve teacher professional development into accountability of educational policy will be informed according to these results of the study. Similar to previous studies, researchers include school fixed effects in all of the three models, which helps to reduce this and other potential sources of bias. However, as a result, our estimates are restricted to within-school comparisons of teachers and school administrators and cannot be applied to inform the type of across-school comparisons that district typically seek to make.

Researchers believe that HLM is an important statistical tool to investigate the relationship between learning leadership of school administrators, teachers' teaching behavior, and teacher professional development. By taking into account the hierarchical nature of educational data, HLM separates variation in teachers' teaching behavior into between teachers and between learning leadership of school administrators and then analysis each factor in relation to the other. Hence HLM offer better statistical adjustments and more accurate estimations and promote better educational policies and practices.

Finally, researchers would like to suggest to the Office of Educational Service Area should focus on the development of learning leadership of school administrators by organizing seminars and study tours to provide educational administrators with opportunities to develop themselves. Participatory action research is recommended by using the results of this research as a guideline for teacher professional development.

Abstract

In this paper, we discuss the extraction of knowledge from cardiac data by implementing hidden Markov chains (HMM). This method is experimented in the field of cardiac arrhythmia recognition (ventricular, atrial and abnormal pathologies) from (Holter) long periods of ECG signal recordings, in order to evaluate its performance for such time and to prove that biological models are capable of giving good results, the results of the analysis are shown with experiments.

Introduction

The rates of mortality relative to cardiovascular diseases are high. According to the (Who, 2010), cardiovascular diseases are one of the most important causes of mortality in the world. Sudden death represents the half of deaths that have cardiac origins, the average age is between 50 and 60 years old but it can occur at any time. The mechanisms of this sudden death are principally ventricular arrhythmias with a percentage of 75% where the presence of extra systole is considered as an eventual predictor. An ECG signal is frequently used in clinic practices by cardiologists in order to determinate the origins of cardiac anomalies.

We deal in this paper the extraction of knowledge from cardiac data for implementation of a neural classifier of cardiac pathologies. Most classifiers cardiac arrhythmias developed in recent years (Yeh and al, 2009) Have Given Method (FLM) method Fuzzy Logic for analysis of ECG signals, neuronal approach (Mateo, 2011) (Chalabi, 2009).

This article is organised as follows:

At first we will give a related works in this field, and the most representative parameter of data base. As a result we will focus on the HMM method, after we give the results obtained, and finally a conclusion.

Related Works

Various methods of automatic classification of the ECG are found in the literature. We can mention the work carried out by several researchers for the detection of cardiac arrhythmias. Quiniou et al (Quiniou, 2006) used the inductive logic programming that is a machine learning technique for the recognition of chronic their system called CRS (Chronicle Recognition System) developed at France Telecom R & D Lannion, allows to treat effectively important event flows and chronic databases of consistent size. Chalabi et al (Chalabi, 2009) combined two networks (SOM: Self Organization Map and LVQ: Learning Vector Quantization) whose main goal is to have a better classification rate in a minimum time, they used the wavelet transform to extract the parameters that characterize various arrhythmic pathologies and thus constituting the bases of learning and generalization of neural networks. Hendel et al (Hendel, 2009) have proposed a diagnostic aid system for four very common cardiac arrhythmias: Extrasystole Ventricular (EV), Extrasystole Auricular (EA), Right Branch Block (BBD), and Branch Block. Left (BBG), in addition to the normal beat (N). They began by locating the QRS, P, and T waves and by calculating the temporal and morphological parameters that characterize a beat using mainly the wavelet technique. Then the implementation was done through a self-organizing map of Kohonen which is responsible for determining the type of beat according to its characteristics which gave them a classification rate of 95%. Messaoud et al (Messaoud, 2005) gave a fuzzy approach to the classification of cardiac arrhythmias in the atrial fibrillation family. Benali et al (Benali, 2009) did a knowledge extraction and classification of cardiac arrhythmias (ventricular extrasystoles, ESV) using a hybrid approach called neuro-fuzzy that combines neural networks with fuzzy logic. This approach gave a classification rate of 98.71% .Yeh et al (Yeh, 2009) gave the Fuzzy Logic Method (FLM) for the analysis of ECG signals, which classifies and distinguishes the two heartbeats. , these are normal beats and abnormal beats, the method gave a classification rate of 93.78% .Mateo et al (Mateo, 2011) used Radial Basis Function neural networks whose results were satisfactory by offering a large reduction of ectopic beats for ECG recordings.

The Database

Presentation Of The Database

Since 1975, laboratories at Beth Israel Hospital in Boston and MIT have produced an MIT / BIH database, which began to be distributed in 1980. This database contains 48 records extracted from a half-hour of ECG two-way ambulatory recordings, obtained from 47 subjects studied by the BIH arrhythmia laboratory between 1975 and 1979. 23 recordings were randomly selected from a set of 4000 24-hour ambulatory ECG recordings gathered

from a mixed population of patients inpatients (60%) and outpatients (40%) at Beth Israel Hospital in Boston, the remaining 25 registrations were selected from the recordings which, in consideration of rarely observed arrhythmias, have clinical significance.

Description Of The Database

In order to build a database, we used the MIT-BIH database as a raw database, and the Queen's Signal Processing and Imaging (LTSI) database, which is characterized by the Tompkins algorithm (algorithm for the detection of the different waves of the ECG signal).

Knowing that our database is annotated, we designed a matrix that contains several beats from well-chosen records in order to have the maximum example for each class (Table 1).

Recorders	Number of beats 'N'	Number of beats 'V'	Number of beats 'A'	Number of beats 'J'
200	100	100	0	0
234	100	0	0	50
114	0	0	10	0
232	0	0	100	0

Tableau 1: some records from the database.

Paramètres	Definition
RRp	Since the R pic precede the pic R present.
RRn	From the R pic present at the pic R next.
QRS	Represents the larger QRS complex.
PP	From S to R.
E	ECG signal energy.

Tableau 2: meaning of the parameters contained in the database.

Analysis Of Input Variables

The characterization of the heartbeat by relevant descriptors is essential when designing and implementing any model for recognition of a cardiac anomaly. It should be noted that many approaches cited in the literature have focused on the difficulty of measuring and choosing the relevant ECG signal parameters and their classification. We can mention the work done by several researchers, for the reduction of the QRS complex for each heartbeat. Acharya et al. (Acharya 2004) used spectral entropy, standard deviations, and Lyapunov exponent measurement of rhythmic variation for the neuronal classification of cardiac arrhythmias. Zhou (Zhou, 2003) applied the PCA method to reduce the size of the QRS complex. The reduced vector is then presented at the entrance of a neural network, for the detection of the premature ventricular beat. Lagerholm and Person characterized each cardiac cycle by its RR interval and the coefficients resulting from the QRS complex decomposition into basic Hermite functions. These parameters were used to separate the arrhythmias available in the MIT-BIH database, using a Kohonen map. Krishna and Sohambi (Krishna 2003) used a multilayer perceptron to identify ectopic beats, with an input vector composed of wavelet coefficients and the RR rhythm. Minami et al (Minami 1999) calculated the spectrum of each QRS complex for the recognition of ventricular tachycardias via a multilayer neuron network. Fredric and Soowhan (Fredric 1996) calculated two coefficients by the linear prediction method at each QRS complex for the classification of VEBs. Nichola et al. (Nicholas 2004) segmented the ECG signal into a set characteristic values, using the Markov model, lately in the works of Chikh, (Chikh 2003). As we have already pointed out at the beginning of this chapter, the right choice of parameters of the input vector to the classifier is very important. For that we proceed to a geometrical analysis of the data (two-dimensional, three-dimensional) to see the degree of belonging of each parameter with respect to the different targeted classes (Normal, Ventricular, Auricular and Junctional).

Classification

HMMs are very promising alternatives to circumvent some of the limitations of conventional computers. Through their parallel processing of information and their mathematical underpinnings, they infer emerging properties to solve complex problems. Our HMM methodology helps the practitioner to make a decision.

Methodology Of An Hmm

A HMM is described by several stages for its design: evaluation, decoding and learning.

Evaluation

The evaluation lies in the calculation of the probability of the sequences of observations in an HMM $P(O/\lambda)$. We used the Forward algorithm for the evaluation of transitions and emission matrices as well as the initial vector that are specific to each model of the HMM, in fact we created four models for the four classes associated with the four pathologies (normal, Ventricular, Auricular and Junctional).

Evaluation Algorithm

$$P(O/S, \lambda) = \prod_{t=1}^T P(O_t / S_t, \lambda) = \prod_{t=1}^T b_{S_t}(O_t)$$

S is however not known in practice, but we have probabilities:

$$P(S/\lambda) = P(s_1) \prod_{t=2}^T P(s_t / S_{t-1}, \lambda) = \pi_{s_1} \prod_{t=2}^T a_{s_{t-1}, s_t}$$

According to the probabilities we have:

$$P(O, S/\lambda) = P(O / S, \lambda) P(S / \lambda) = \pi_{s_1} b(s_1, O_1) \prod_{t=2}^T a_{s_{t-1}, s_t}(O_t)$$

Resolution of $P(O/\lambda)$ summing on all possible S:

$$P(O/\lambda) = \sum_{S} P(O, S/\lambda)$$

Learning

In order to maximize the probability of generating an observation sequence from the training data, we used the Forward Backward algorithm to adjust the parameters of the four HMM models (cited above). the probability of observing the partial sequence from the beginning to the time t, $\{O_1, \dots, O_t\}$

$$\alpha_t(i) \equiv P(\{o_1, \dots, o_t\}, s_t = S_i / \lambda)$$

So the Baum-Welch algorithm consists in assembling the two procedures (before and after), by calculating the probabilities $\gamma_t(i)$ and $\xi_t(i, j)$: $\gamma_t(i)$: which is the probability in the state S_i at time t knowing the observation sequence O and the model λ .

$\alpha_t(i)$: explains the sequence of time t in the state S_i until time T.

$\beta_t(i)$: explains the sequence from the beginning to the time t in the state S_i .

$\alpha_t(i)$ and $\beta_t(i)$: explains the sequence has the effect that at time t, the system is in state S_i .

$\xi_t(i, j)$: probability of being in the state S_i at time t and in state S_j at time t + 1 being gives the sequence of observations O and the model λ .

$$\begin{aligned} \xi_t(i, j) &\equiv P(S_t = S_i, S_{t+1} = S_j / O, \lambda) \\ &= \frac{\alpha_t(i) \partial_{i,j} b_j(o_{t+1}) \beta_{t+1}(j)}{\sum_k \sum_i \alpha_t(k) \partial_{k,1} b_1(o_{t+1}) \beta_{t+1}(i)} \\ \xi_t(i, j) &= \frac{\alpha_t(i) \partial_{i,j} b_j(o_{t+1}) \beta_{t+1}(j)}{\sum_k \sum_i \alpha_t(k) \partial_{k,i} b_i(o_{t+1}) \beta_{t+1}(i)} \end{aligned}$$

Experimental Results

The results presented in this study, for the classification of ECG signals were obtained by applying to the input of each classifier ECG signals of "LTSI". This work was conceived by first using the Matlab for the

implementation of the multilayer perceptron, then the JAVA programming language to test our technique (hidden Markov chains), we used our own database (Table 1), extracted from the LTSI database to implement the evaluation algorithms Viterbi and Baum-Welch. Our classification system allowed us to obtain a recognition rate of 90% for the multilayer perceptron and a recognition rate of 92.20% for the Markov chains by applying all the ECG recordings of LTSI presented in our study. , with the details concerning the classification rate of each class of which we obtained a rate of 88% for the Normal class, 99% for the Extrasystole Ventricular class, 98% for the Extrasystole Auricular class and 97% for the Extrasystole Junctional class.

Conclusion

Hidden Markov chains have a major advantage in classification compared to other classifiers because of their speed of execution and ease of interpretation. Note that in the medical field, any expert requires any automatic method of diagnosis to justify its decisions, a feature absent in several techniques cited in the literature especially neural networks. The method we present in this article provides physicians with precision and minimal computation time. The quality of the ECG signal represents a major constraint for the recognition of different pathologies. As well as the mode of acquisition has a major role to differentiate between ventricular extrasystole and other pathologies. Our database extracted from the MIT-BIH and LTSI database is essentially composed of DII derivation beats which constitutes a major handicap during the classification. We have successfully implemented a classifier based on hidden Markov chains. The results obtained are very encouraging, 92% is a performance that can be improved if we increase the number of derivations.

Abstract

In science education, the study of Leonardo da Vinci's work constitutes a valuable resource not only in terms of contents and potential in interesting, motivating and engaging students, but also in terms of teaching approaches capable to facilitate learners to perceive the character of necessity of subjects, to conceive science not as a collection of finished and polished products and to emphasize the reasons why concepts, methods and theories are formulated.

The main interest of Leonardo was the physical reality, not its simplified modellization, and therefore the starting point of his approach to knowledge, i.e. of his scientific method, was the experience, to which it ascribed a universal value. He wrote: "la Sapienza e' figliola dell'esperienza" (i.e. knowledge is the child of experience) and "ogni nostra cognizione principia dai sensi, onde bisogna limitare la ragione alla isperienza" (i.e. all our knowledge starts from senses and, hence, one has to limit the reason to experience). Furthermore, Leonardo was against those who believed that sciences "principiano e finiscono nella mente" (i.e. begin and end in the mind), namely those who did not believe in direct observation.

The present contribution deals with a critical view of the Leonardo's scientific method and aims to put into evidence its character of modernity and its usefulness in science education.

Introduction

In the late 1950s the British scientist Charles Percy Snow (Snow, 1959, p. 3.) claimed about the chasm dividing the humanists and scientists, whereas about five hundred years ago in Italy many intellectuals developed expertise in different fields giving rise to the expression "Renaissance man" entered in the vocabulary to describe the underlying interdisciplinary spirit (Whiting, 1992).

Leonardo da Vinci interpreted this spirit in a paradigmatic way, thanks to his multifaceted genius and his innovative approach to knowledge which transcended the unity of science and art and prefigured the methodology of modern empirical science. For these reasons Leonardo can be considered as the first modern scientist and a precursor of Galileo, Newton, and Einstein, just to cite some of the "science fathers".

Differently from other scholars who, following the way of modellization, moved themselves, with a given extent, away from reality, the Leonardo's approach to knowledge made him persistently focused on the phenomenological world which he represented through detailed drawings almost always accompanied by descriptions and remarks (Pedretti, 2003; Capra, 2013; Kemp, 2006). More in details, when possible, Leonardo approached the investigated phenomena through accurate observations and both qualitative and quantitative analyses. In the case of simple machines, for example, such as pulleys and winches, and even in the complex case of friction force, Leonardo quantitatively evaluated the value of the forces and the mutual relations between the physical quantities related to the specific observed phenomenon. In such cases, he used operational definitions for these physical quantities and was able to design and foresee the system physical behaviour. In more complex cases, when it was not possible to approach the problem in mathematical terms, he made recourse to extremely detailed graphical descriptions in order to not give up to the real description of the phenomena. In these cases, he replaced the concept of "operational definition" with the "operational representation" - almost a snapshot - of the processes. In other words, especially when it was not possible to get a satisfying description of reality through quantitative methods he used art, that is "art for science" (Pedretti, 2003, p. 79); Capra 2013; Kemp, 2006). With the expression "sol fallano i nostri giudizi" (i.e. only fail our judgments), Leonardo represented the difficulty - and the fallacy that ensues - of pushing beyond experience, "promettendosi di quella effetti tali che ne' nostri esperimenti causati non sono" (i.e. promising effects that in the experiments are not caused), highlighting how effects that in the experiments are not caused may result by wrongly formulated hypotheses.

This approach made Leonardo a precursor of many disciplines, making him a modern scientist and his work valid

in science education as attention getter and critical thinking stimulant. Moving from sector studies showing that students better learn scientific concepts, e.g. in physics, when they make direct experience (Redish, Saul, Steinberg, 1998, p. 212; Redfors, Ryder, 2001, p. 1283), this contribution aims to highlight the specific aspects of the Leonardo's scientific method through concrete examples of his punctilious interdisciplinary work and his often counterintuitive results.

The Scientific Method Or The “Scientific Methods”?

The modern age is characterized by the figure of Galileo Galilei with his scientific method and his nature laws formulation. The approach of Galileo was essentially based on “difalcare gli impedimenti”, i.e. neglecting impeachments through a low empiric vision of the experiment in which phenomena are at first idealized in an approximate way, by removing the complexities appearing as no determinant, and then explained in abstract terms and where the facts had the role of a check for the formulated hypothesis (Jardine, 1976, p. 277; Lovell Wisan, 1978; Koertge, 1977, p. 389; Drake, 1975; Gilbert, 1960). To report a specific case, one of the most important assumptions of Galileo was limiting the observation to relatively heavy bodies and, in turn, neglecting friction forces. An updated version of his method is sketched in figure 1 where it is shown how, starting from the observed phenomenological world, one selects the system relevant empiric referents through operative definitions of the involved significant physics quantities and tries to determine the relations existing among these measurable quantities, i.e. the empirical laws, these latter constituting the so called “primary model”; at this stage, at a higher epistemological level, explicative conjectures, constituting the so called “secondary model”, are introduced through the formulation of hypotheses; these conjectures are then tested and, depending on the test findings, they can be refined, modified or confuted.

The Galileo's method, especially through the modellization procedure connected with the selection of a limited and controlled number of significant physical quantities and through the use of operative definitions, generated an authentic epistemological revolution which gave an extraordinary impulse to the physics development. The consequences were noticeable and brought to a more and more extended mathematization of physics.

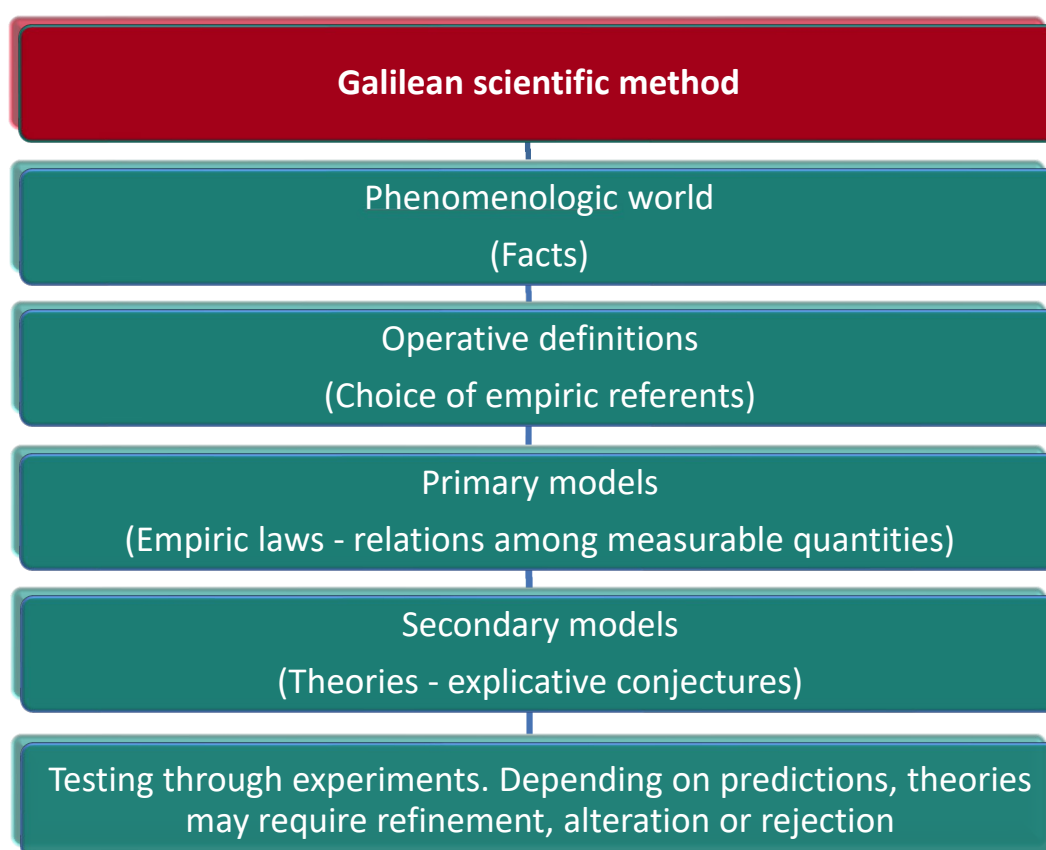

Figure 1 Scientific method approach attributed to Galileo.

However, due to successive science developments, this method did not appear always adequate in those contexts which required a broader vision of reality and nature (Redfors, Holgersson, 2006; Naylor, 1976, p. 398). More in details, generally speaking, at least three “revolutions” can be distinguished (Suppe, 1977):

- The «first revolution», known as Galilean-Newtonian reductionist model, led to an ever higher degree of predictability of phenomena and was based on the belief that world is a mosaic of parts that can be studied independently from the environment; it dominated until the XXth century.
- The «second revolution», that of Einstein's relativity and quantum mechanics, showed the groundlessness of the determinism.
- The «third revolution», started in the second half of the XXth century, saw a research focused on irregular and unrepeatable processes where the reductionist conception is overcome in favor of a global point of view which takes into account complex systems.

As far as the present status of science education is concerned it should be stressed that educators and researchers have substituted the concept of a unique “scientific method” with that of “scientific methods”, depending on the specific discipline, topic and case to be taken into account (Feibleman, 1991, p.83).

A highly appreciated and all encompassing version of scientific method is the so called “5W journalistic-like” method (https://en.wikipedia.org/wiki/Five_Ws) shown in Fig. 2.

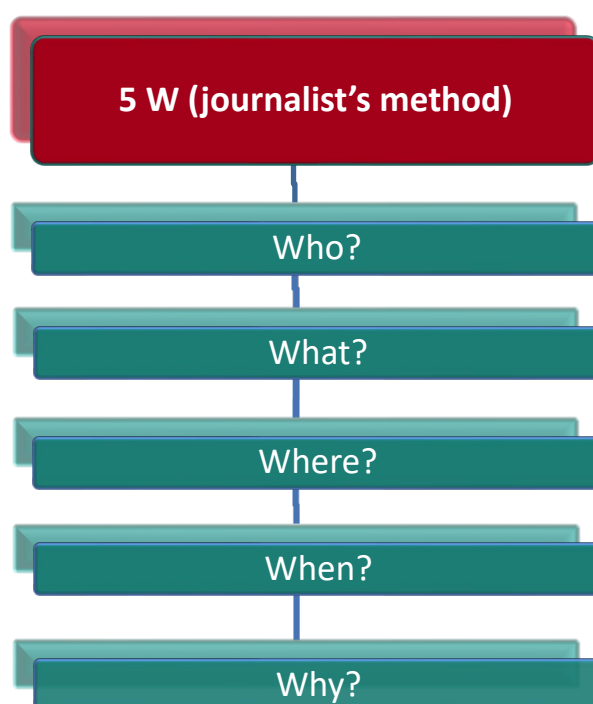

Figure 2 The so called 5W journalistic-like scientific method.

Following this approach (which could be further reduced to the sentence “How and Why?”), it is at first essential to define the investigated system (corresponding to the 1st W, Who?) with its description and configuration variables. Then, the primary model with its phenomenological laws (corresponding to What?) and its context variables (Where and When?) are introduced. Finally, with the 5th W, corresponding to Why? an explication, which requires the formulation of a secondary model, is furnished.

The Leonardo's Scientific Method

In the last few years physicists, mathematicians, engineers, anatomists, botanists have undertaken examinations of Leonardo's work in science and technology, agreeing on the fact that Leonardo can be considered as the first modern scientist (Galili, 2016, p. 115).

The observational skills of modern science were introduced in the Renaissance when there was a rediscovery of the classical antiquity notion that man was the measure of all things (Sholarin, Wogu, Omole, Agoha, 2015, p.178). The fervent environment of artisans, engineers, architects, navies, traders, making use of measurement and calculations, met above all in the “Verrocchio's bottega”, led Leonardo to recognize the fundamental office of mathematics in the investigation of the physical world and to try to approach mathematics thanks to his friend Luca Pacioli (O'Connor, Robertson, 2015).

It should be taken into account that Greeks had always avoided experimentation and Renaissance humanists uncritically took up the assertions of classical texts: compared to them Leonardo developed a new, more empirical approach to knowledge.

The empirical approach was natural for Leonardo, who was both a scientist and an artist: he considered the eye the most important tool at our disposal for understanding nature and for him painting was science; therefore his

science cannot be understood without his art, and vice versa his art needs science. Leonardo followed his own scientific method to formulate a science for complex systems, such as for example the living forms, taking into account the mutual connection among all phenomena and the interdependence of the parts with the whole.

Leonardo believed that the creativity of Nature was superior to the machines designed by man; for him it was wise to learn from Nature, not to dominate it, as Bacon later said (Bacon, 1870).

This holistic and ecological method makes Leonardo da Vinci a «complexity scholar» that only now, after five centuries, has re-emerged in scientific research and which is called «science of complexity».

If he had published his writings, he would probably have been given the title of «father of modern science» that was instead attributed to Galileo (Galili, 2016, p. 115; Geymonat, 1981; Geymonat, 1977).

The starting point of his scientific method was the experience (Kemp, 2011) to which he ascribed a universal value and he had in great consideration mathematics (Marinoni, 1982).

He wrote:

- i) “The merit of painting lies in the exactness of reproduction. Painting is a science and all sciences are based on mathematics” and
- ii) “No human investigation may claim to be a true science if it has not passed through mathematical demonstrations, and if you say that the sciences that begin and end in the mind exhibit truth, this cannot be allowed, but must be denied for many reasons, above all because such mental discourses do not involve experience, without which nothing can be achieved with certainty”.

This latter sentence approaches Leonardo to Einstein who wrote: “As far as the laws of mathematics refer to reality, they are not certain; and as far as they are certain, they do not refer to reality”.

Experience And Science

The main interest of Leonardo was the physical reality and not its simplified modellization.

It is important to take into account that Leonardo formulated the causality principle: «Nessuno effetto è in natura senza ragione; intendi la ragione e non ti bisogna sperienza» i.e. In Nature no effect exists without a reason; you understand the reason and you do not need any experience.

Furthermore, in his Vitruvian man, the standing man inscribed in the square shows vertical and horizontal signs at the level of the hands, knees, pubis, shoulders and along the whole chest. The square, which in symbolism represents the physical reality, could report the Leonardo’s revisited canon referring to the measurement process necessary for the scientific knowledge. The circle could symbolize the sphere of truth, to which man yearns, and which is eccentric with respect to the physical, imperfect and measurable reality represented by the square. Therefore the human body, besides being the object of painting, becomes a measure system, which for Leonardo is an instrument of knowledge based on the analytical observation of the nature.

In this framework, the starting point of knowledge is experience, the phenomenal reality, which he represents in detailed drawings, sometimes accompanied by incisive captions. To the concept of operative definition of the physical quantities he added an operational (quasi-photographic) representation of the processes.

More specifically, in simple cases, such as pulleys, winches, and friction forces analysis, Leonardo performs both a qualitative and a quantitative analyses, quantitatively evaluating the value of the forces involved and the mutual relations between physical quantities at stake and then, by using operational definitions of the physical quantities themselves, designing and predicting the behavior of machines not yet realized. In complex cases, i.e. when it was not possible to deal them with mathematics, Leonardo does not renounce to a realistic description through representation of the processes themselves by means of very detailed drawings, creating an art for science. For Leonardo drawing was a kind of language in images more immediate than words.

Fundamental Role Of Mathematics

Leonardo was well aware of the prodigious applicability of mathematics to natural and technological world and in different other occasions he stressed the importance of mathematics: «Chi biasima la somma certezza delle matematiche si pasce di confusione, e mai porrà silenzio alle contradizioni delle sofistiche scienze, colle quali s’impara uno eterno gridore and ... O studianti, studiate le matematiche, e non edificate senza fondamenti», i.e. who deplores mathematics certitude eats confusion and never will put into silence the contradictions of sophistic sciences, with whom one learns an eternal crowd and... students, study mathematics and avoid building without fundaments.

And again: “l’uccello è strumento operante per legge matematica”, i.e. the bird is an operative instrument by mathematical law; “nessuna umana investigazione si può dimandare vera scienza, s’essa non passa per le matematiche dimostrazioni e nessuna certezza e dove non si può applicare una delle scienze matematiche”, i.e. “no human investigation can be considered a true science, if one does not pass for mathematical demonstrations and no certainty is where one cannot apply one of the mathematical sciences”.

He thought that mathematics furnishes the most appropriate language for the formulation of the laws of nature, as Pitagora believed important to bring the changing aspects of reality to the unique and invariant principle of numbers and as Plato he believed distorting the separation of abstraction and reality.

The conception of the experimental method by which nature is comprehensible through mathematics approaches Leonardo to Galileo. For mathematicians and physicists the recognition of quantifiable regularities, proportions, symmetries and analogies in nature plays a central role. On the remarkable effectiveness of mathematics in describing the laws of nature Eugene Wigner (Wigner, 1960, p. 1) wrote: “The miracle of the appropriateness of the language of mathematics for the formulation of the laws of physics is a wonderful gift, which we neither understand nor deserve. We would be grateful for it and hope that it will remain valid in future research and that it will extend, for better or for worse, to our pleasure, even though perhaps also to our bafflement, to wide branches of learning.” Wigner reputed “a scandal [...] an enormous gap in human understanding” the failure of science in explaining the universe mathematical nature.

In the following we shall report two examples showing how in the simple case of friction Leonardo determined the phenomenological law and was able to perform predictions, while in the complex case of pendulum he did not renounce to a realistic phenomena description.

Educational Examples Based On The Leonardo Scientific Method

First experiments on friction were carried out by Leonardo da Vinci who illustrated them in drawing mainly recorded in the Codex Atlantico and Codex Arundel, the Leonardo's first note and sketches relating to friction being probably written in 1493. Leonardo was able to point out that the value of the coefficient of friction depended on the nature of the surfaces and the state of lubrication.

From the experiments dealing with rectangular block sliding over a plane surface in different ways, Leonardo deduced the laws governing the motion of the block; the first quantitative investigations of friction and the formulations of the two fundamental “laws” of friction, later formally enunciated by Amontons (Amontons, 1699, p. 206), can be attributed to Leonardo, even though the term “tribology” was used for the first time almost half century after the death of Leonardo. Nowadays students still perform similar equipment and they study the classical laws of friction, which can be summed up in four statements:

- i) the frictional force F is directly proportional to the load W ;
- ii) F depends on the nature of the sliding surfaces;
- iii) F is independent of the area of contact between the surfaces;
- iv) F is independent of the sliding velocity;

as enunciated by the three French physicists Amontons, Coulomb and Morin (Amontons, 1699, p. 206; Coulomb, 1785, p. 163; Morin, 1833, p.1); however, the Leonardo's work has no influence because his notebooks were not reproduced and published until after other investigators had carried out and reported such experiments independently.

If the Leonardo's friction experiment were used today for physics students, they will find clear confirmations about intuitive concepts, as “rough and hard with rough and hard – movement of the greatest difficulty; rough and soft with rough and soft – medium difficulty”, and also counterintuitive experiments, as that discussed in Madrid I (Madrid I 173 v.c. 1493–7), where Leonardo putted a series of blocks using two different orientation, as shown in Figure 3, demonstrating that friction is independent on contact area.

Figure 3 Leonardo's sketch showing a series of blocks in two orientations

Students show often astonishment on this counterintuitive behavior, since they suppose that friction is higher in the case of blocks putted in series in the horizontal way than in vertical way. In order to provide to them an explanation, with reference to Figure 3 it is possible to observe that:

- pressure is expressed by $P=R/S$, where S corresponds to the “apparent contact area”
- at the “true contact area” T pressure is higher than P , due to the smaller contact areas
- the number of the welding areas generated by T is proportional to S
- the extension of the single contact areas is proportional to pressure P and hence the “effective contact total surface” $E=S*T$ depends only on R .

The pendulum studies play a crucial role in the development of science, as exemplified by conservation laws, collision laws, gravity acceleration g , earth shape and Newton's terrestrial and celestial mechanics. The historian Richard Westfall remarked that 'without the pendulum, there would be no Principia' (Westfall, 1990, p. 59).

The pendulum role in physics education is also fundamental, since pendulum is one of the most discussed topic in both theoretical and experimental physics courses. In Fig. 4 the Leonardo's sketch describing natural oscillations of a pendulum is reproduced, pointing out an apparent contradiction with real pendulum, due to the distinction of Leonardo between "natural motion" and accidental motion": "L'impulso trasporta l'oggetto che si muove al di là della sua posizione naturale. Ogni movimento ha una lunghezza definita secondo la potenza che lo muove, e basati su questo per stabilire la tua regola. Ogni oggetto che si muove che acquisisce della velocità nell'atto di muoversi, è mosso dal suo movimento naturale, e così, inversamente, quando la perde, si muove di movimento accidentale." (Forster II 141 v.). Such approach could be very useful for students, who would learn to study the pendulum motion as "a decaying oscillating bob rather than an isochronal device" (Galili, 2016, p. 115).

In Fig. 4 the dissipation of energy during oscillations is also described by Leonardo, drawing a decreasing arc described by these oscillations: "The smaller the natural motion of a suspended weight, the more the following accidental motion will be equal in length". With this discovery he anticipated the theoretical formulations of Galileo (Naylor, 1974, p. 23) and the practical applications to the development of pendulum clocks by about a century and a half.

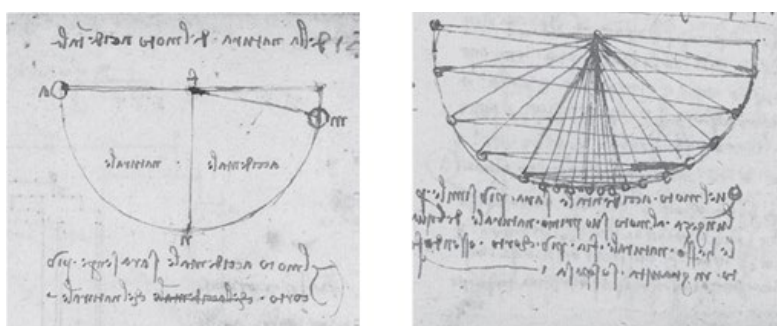

Figure 4 Sketch of natural oscillations.

It should be observed that Galileo was primarily interested in the laws of Nature, highlighting, in spite of its complexity, the regularity of the analyzed events; in the specific case of the bodies fall, or of the inclined plane, the most important adopted shrewdness was that to limit his observation to relatively massive bodies: under such circumstances the fall is independent on the falling body's volume, shape and construction material. In conclusion, in addition to the small-angle simple-pendulum formula commonly exhibited to first-year students, which represents a limit case of a much wider range of real world behavior, a series of educational measurements based on the Leonardo pendulum drawings and experiments extended to large amplitudes and large masses would be a valuable analysis of such milestone for the physics education.

Conclusions

In the early years Leonardo only produced the *De divina proportione*, while during the last part of his life spent in France, invited in 1516 by the king of France Francis I to Amboise located near Tours, he had not enough time to take care of the organization and publication of the scientific contents found in his manuscripts, as it was probably in his intentions. The generous king Francis I, who informed of the Leonardo death rushed to Amboise from Paris, inherited the Mona Lisa, while the Leonardo's manuscripts were assigned to Melzi. Although the corpus of the Leonardo's notes has been spread, by a structured analysis of the Leonardo work addressed to the method for investigating and understanding nature, as the one proposed in this paper, an innovative educational method can be identified: we pointed out that a 500 years old approach to the science can help the 21st century science students.

Abstract

Scientific research is one of the three substantive functions attributed to the university. Its adequate instrumentation allows the achievement of the objectives of the training processes in Higher Education. **Objective:** to determine the level of satisfaction of the professors involved in the implementation of a scientific research and technological innovation strategy in the Faculty of Education, Humanities and Technologies of the National University of Chimborazo, Ecuador, February 2014-February 2015. **Method:** a quasi-experimental study with a mixed approach. Professors linked to research projects constituted population. The techniques of survey, interview, participatory observation, self-report and focus group were applied to researcher professors. The designed questionnaire was validated using the Delphi method. The individual and group satisfaction were established through the Iadov technique. The data obtained were processed using descriptive statistics. **Results:** the diagnosis showed that 85.30% of the sample did not have scientific publications, although 82.35% had fourth level degree and experience as a graduate and postgraduate tutor. The preparation of a SWOT matrix made possible to design the respective strategy and its subsequent application based on the triangulation of the data obtained in the different technique. **Conclusions:** The reorientation of the research process in that academic environment enabled the increase of the scientific production of the professor staff. The group satisfaction index of the participants was established in the “satisfactory” category.

Key words: *Research strategy, individual and group satisfaction, Higher Education, scientific production, training process.*

Introduction

Throughout the last decades there has been an explosion of scientific and technological knowledge, which manifests itself visibly through the wide range of new products and services. Every day, the most developed countries and the most powerful companies exponentially increase their investment in areas of interest for their research policies (Solís-Ríos, Moreno-Loera, & Figueroa-González, 2012).

The scientific investigation constitutes one of the three substantive functions that are attributed to the contemporary university. This intervenes decisively in the formation and generation of new knowledge in the students, as well as the solution of pressing problems of the socio-economic and natural environment (Mur-Villar, Casanova-González, Iglesias-León, & Cortés-Cortés, 2014; Hamodi, López-Pastor, & López-Pastor, 2015; Gutiérrez-Hernández, Herrera-Córdova, Bernabé, & Hernández-Mosqueda, 2016).

In relation to the above information, the institutional scientific policy in higher education plays an important role in the training process. Being that the scientific productivity of the stakeholders is one of the fundamental indicators of proper implementation (Larran & Andrades, 2015).

Authors such as Moreno, Molina and Chacon (2014) recognize the investigative pedagogical style as one of the ways in which teachers and students interact during the teaching-learning process. It is oriented to the identification and solution of problems typical of the profession from a complex and interdisciplinary view.

According to Abello and Prado (2014), strategies aimed at increasing university scientific activity represents an appropriate form of management in higher educational institutions. The challenge of functioning lies in the

establishment of academic and administrative structures for the development of research projects that have a constructive impact on the formation and development of knowledge, as well as in society.

In response to the positivist criteria of professor Rojas Ochoa (2013), scientific publications are one of the fundamental indicators for measuring the results of research activity at the individual and institutional levels. From a constructivist position, the author defends that the investigation forms part of the pedagogical work of the teacher, in his dialectic search for the development of autonomy in learners.

When referring to research strategies, Correa Iglesias (2011) affirms that these constitute an efficient way of organizing, directing and promoting cognitive processes. This author does not disagree on the legitimacy of this resource for planning scientific policy in higher education institutions. However, it emphasizes and warns that science should be the path to its construction, during which all the variables inherent to this phenomenon in the corresponding educational context should be considered.

From a critical examination of the work "The method" by Edgar Morin, the French sociologist explains that for the construction of research strategies, it is necessary to contemplate the conceptual and etymological differences between the epistemological and the methodological, while considering the complementarity of these elements when constructing science (Correa Iglesias, 2011).

During the development of research strategies, the creation of project teams is crucial, and the composition should consider the integration of new with more experienced staff. The socialization, coexistence, interaction and group study allow to deepen the theoretical body that is the basis of the investigative process which increases efficiency, facilitates identification of adequate methodologies for the resolution of problems and solidifies the integration and development in the scientific community. The adequate management of human resources guarantees the exponential increase of individual and institutional scientific production, as well as the academic success of universities (Gómez & Menares, 2014).

All the above leads to the positioning that strategic planning of the research processes in the 21st century university, constitutes an essential tool for professional training in higher education.

In 2013, the National University of Chimborazo was the object of an evaluation and accreditation process. It yielded a series of shortcomings in the processes inherent to scientific research, which were reflected in indicators of fundamental productivity and planning. For this reason, a research team was given the task of designing a strategy to reverse this situation in the faculty of Education, Humanities and Technologies proposing the following scientific problem:

What level of satisfaction did the teachers involved in the implementation of a strategy enhancing the process of scientific research and technological innovation in the Faculty of Education, Humanities and Technologies in the National University of Chimborazo have in the period of February 2014 to February 2015?

Methods

A study was conducted with a mixed methods approach, of a quasi-experimental nature, with the purpose of determining the level of satisfaction of the teachers involved in the implementation of a scientific research strategy and technological innovation in the Faculty of Education, Humanities and Technology Sciences in the National University of Chimborazo, Ecuador, during the period of February 2014 - February 2015.

The population was made up of 57 professors linked to research projects that were developed in the background study, which was a non-probabilistic sampling of an intentional type. It was carried out based on criteria that allowed for the selection of 34 individuals, who fulfilled the following:

Inclusion criteria:

- Those with tenure or are full-time employees.
- Those who expressed their agreement to participate in the research.

Exclusion criteria:

- Less than one year of experience in teaching in higher education.
- Teachers whose academic distributives did not include hours dedicated for research activities.

The research tasks were organized following the work scheme shown below:

1. Diagnosis of the factors that intervene in the research activity in the context studied.
2. Identification of the specific problems to be solved, in addition to the respective approach of the objectives that were required to be reached to give the corresponding solution.
3. Design and application of a scientific research and technological innovation strategy in the Faculty of Education, Humanities and Technologies, at the National University of Chimborazo, Ecuador.
4. Evaluation of the degree of satisfaction of the teachers involved in the study sample.

The data observed to establish the diagnosis of the existing situation with respect to the phenomenon studied, were collected using the techniques described below:

- Survey: applied to teachers with a workload that includes research who are members of scientific project groups, to clarify the fundamental difficulties and insufficiencies, as well as to corroborate the data of interest collected through the revision of documents.
- Interview: for the institutional managers at the major and faculty level, with the purpose of verifying the institutional interests and their vision about the progress and results of the research and technological innovation process.
- Participatory observation: through visits made to work sessions in the different project groups.
- Self-report: it was applied to research project team directors about the progress of research and to carry out research work to perfect the process through the joint search of possible solutions.
- Triangulation of sources: it was used in the analysis of the data obtained through content analysis, observation, survey, questionnaire, interviews.
- Focus group: it was carried out with the managers of the training process at the faculty level to identify the fundamental problems and the possible ways to solve them.
- The questionnaire used was validated through expert criteria, which was the Torgerson scale model which was used and developed from the Thurstone model to determine limits. This procedure constitutes a modification of the Delphi method proposed by Campistrone and Rizo (2006).

The processing of the values of the limits was done through these formulas:

$$x_{ik} = (t_k - m_i)$$

$$T_K = \frac{1}{n} \sum_{i=1}^n x_{ik}$$

$$m_i = \frac{1}{n.(m-1)} \sum_{k=1}^{m-1} \sum_{i=1}^n x_{ik} - \frac{1}{m} \sum_{i=1}^{m-1} x_{ik}$$

Significance:

Xik = The probability pik.

Tk = The upper limit of the kth category.

Mi = The i-th indicator.

Pik = Probability that the i-th indicator is in the kth category.

The group of experts who participated in the validation process of the questionnaire, was made up of seven professors with a Ph. D. degree, in the areas of knowledge corresponding to education and pedagogy, with more than 20 years of experience in university teaching and extensive experience in research, expressed through scientific publications and participation in projects. Therefore, based on the above information the coefficient of individual competence obtained ranged between 0.83 and 0.93, which placed all the members in the high-level category.

The established scale was made up of five categories:

- Very suitable (C1)
- Fairly adequate (C2)
- Adequate (C3)
- Not very adequate (C4)
- Inadequate (C5)

The following indicators were evaluated during the validation procedure of the applied questionnaire:

1. Internal consistency of the questionnaire.
2. Correspondence with the research objective.
3. Relevance of the questions.
4. Ability to obtain the data of the variables of interest.
5. Direct relationship with the object and field of study in which it was entered.

The results of the validation process of the instrument yielded the results shown below:

Table 1. Absolute frequency matrix for the evaluation of the instrument

Indicators	Categories					Total
	C1	C2	C3	C4	C5	
1	4	2	1	--	--	7
2	5	1	1	--	--	7
3	3	2	2	--	--	7
4	5	1	1	--	--	7
5	4	1	2	--	--	7

Source: instrument for validation of questionnaire.

Table 2. Matrix of accumulated relative frequencies for the evaluation of the instrument

Indicatorss	Categories				
	C1	C2	C3	C4	C5
1	0,57	0,86	1,00	1,00	1,00
2	0,71	0,86	1,00	1,00	1,00
3	0,43	0,71	1,00	1,00	1,00
4	0,71	0,86	1,00	1,00	1,00
5	0,57	0,71	1,00	1,00	1,00

Table 3. Abscissa value matrix for the instrument of evaluation

Indicators	Categories		Sum	Average	Range
	C1	C2			
1	0,18	1,07	1,25	0,62	-0,06
2	0,57	1,07	1,63	0,82	-0,25
3	-0,18	0,57	0,39	0,19	0,37
4	0,57	1,07	1,63	0,82	-0,25
5	0,18	0,57	0,75	0,37	0,19
Sum	1,31	4,33	5,65	--	--
Limits	0,26	0,87	1,13	0,56	--

Source: instrument for validation of questionnaire.

The analysis of the distribution of the indicators (table 3) allowed them to be framed in the given category. This was done according to the following criteria:

Category 1 (very appropriate) included those indicators with scale values less than or equal to 0.26. Category 2 (quite adequate) includes those greater than 0.26 and less than or equal to 0.87 and Category 3 (adequate) includes those greater than 0.87. So, only indicator 3 was in the category of quite adequate and the rest in the category of very adequate. Once the questionnaire was applied, the respective strategy was designed and applied where the level of satisfaction among the population studied was assessed using the Iadov technique (Fernández de Castro-Fabre & López-Padrón, 2014).

Individual satisfaction was established through the application of the respective instrument adjusted to the characteristics of the context studied. It consisted of nine questions, whose relationship ignores the subject of the research sample. The scale used was established by the author of the technique mentioned in the following way:

1. Clear satisfaction.
2. More satisfied than dissatisfied.
3. Not defined.
4. More dissatisfied than satisfied.
5. Clear dissatisfaction.
6. Inconsistent.

In the same way, this technique allowed the group to obtain a satisfaction index (ISG), which can obtain values that range between +1 and -1.

$$ISG = \frac{A(+1) + B(+0,5) + C(0) + D(-0,5) + E(-1)}{N}$$

Where N is the size of the sample, while A, B, C, D and E represent the number of subjects with a certain category of individual satisfaction, as shown below:

A: with clear satisfaction

B: more satisfied than dissatisfied

C: not defined or contradictory

D: more dissatisfied than satisfied

E: clear dissatisfaction

The ISG can yield values between +1 and -1 and if they are between -1 and -0.5 this indicates dissatisfaction. While between -0.49 and +0.49 would be a contradiction and between 0.5 and 1 is satisfaction.

The researchers considered the principles of the ethics of scientific research, respecting the self-determination of the subjects involved in the study sample, as well as obtaining the necessary authorizations on the part of the authorities of the Faculty of Sciences of Education, Humanity and Technologies of the National University of Chimborazo.

Results

At the time of diagnosis, the Faculty of Education, Humanities and Technologies at the National University of Chimborazo, Ecuador had 57 teachers with assigned research hours. 18 of them were tenured and the rest had a fulltime contract.

40 professors participated in the guiding methodological activity where the instrument was applied with assigned hours for the realization of scientific research processes, within the respective distributive of teaching hours. 34 responded and delivered the questionnaire used. Those who responded consisted of 9 tenured professors and 25 professors with fulltime contracts.

The experience for the realization of any human activity is of the utmost importance and teaching at the university level is not foreign to this principle. The requirement of rigorous research activity for teachers at this level, make them gain the necessary skills to carry out and direct these processes. In the studied sample individuals prevailed who declared to have teaching experience in higher education from between one and five years at 67.65%.

At the time of the diagnosis, 82.35% of the teachers observed had a master's degree or Doctor of Science and the rest were attending degree programs. Elements from an academic point of view, constitute a strength for the teaching-learning process due to the educational level of scientific preparation of the faculty. Paradoxically, many of the teachers surveyed declared that they lacked experience in scientific publication. 85.30% of these did not have a record of articles in indexed scientific journals in recognized databases.

The results obtained during the research process showed a contradiction between bibliometric production levels and the training achieved by most respondents. In this regard, the authors of the research presented consider that the stages of planning, realization, presentation and defense of the results of the investigative processes, constitute moments inherent to the formation at the university level. However, this not guarantee in their entirety the acquisition of competences related to scientific-academic publication, so that graduates can socialize their results in scientific media, recognized in their respective areas of knowledge.

In relation to the study of the variable "thesis tutorial", it was apparent that about half of the teachers in the study participated in this function in pre and / or postgraduate training at some point. In line with what was stated by the authors in the previous paragraph, the respondents do not have publications resulting from this work and declare difficulties in relation to the research experience, an aspect that would merit establishing a strategy in this regard.

97.06% of respondents reported completing at least one formative scientific research with their students. An analytical look at the results achieved in this study reveals a paradox between this data and the low reports of research results published by the teachers who made up the sample. This is a phenomenon that could be related to an insufficient use of the final reports of the completed research.

It is necessary that the studied sample consider that it needs to overcome the problems identified in methodology and scientific writing in terms of scientific research. This is of great importance, since the problems that are identified at this time are closer to being solved.

In the context studied, the key informants presented difficulties for carrying out methodological work in the academic groups, which could have repercussions on the results of the scientific production of the professionals who made up the study sample.

The results of the applied instruments allowed for the identification of insufficiencies in the formation of the individuals that participated in the study, in subjects related to the implementation and conduction of the scientific processes. Among these observed were:

- Preparation of research projects, with an emphasis on the use of the logical framework methodology.
- Establishment of the theoretical methodological foundations that sustain a scientific process.
- Methods and techniques for data collection, analysis and processing.
- Planning and statistical processing of the data resulting from the application of the different instruments.
- Communication of the partial and final research results, through the writing of scientific articles, books, participation in congresses, among others.
- Conformation of the final report of the research process with an adequate use international standard of writing and bibliographic reference.

When analyzing the need and feasibility of establishing a strategy aimed at reorienting the technical direction for the conduction and development of scientific research in that faculty, the entire sample responded affirmatively.

The design and execution of the strategy presented was carried out from the previous position. The analysis of the data obtained from the application of the instruments applied to the sample and key informants provided criteria that allowed discerning weaknesses, opportunities, strengths and threats (WOST), whose aspects are shown below:

Weaknesses: insufficient

- Experience and preparation of faculty teachers to carry out the investigative process with the required rigor.
- Scientific production of the teachers that made up the sample.
- Number of physical spaces to develop the team activities.
- Development and use of science spaces and scientific-professional knowledge management activities (workshops, scientific conferences, congresses, etc.), in which the scientific projections and the results of the research processes are debated, allowing for shared experiences and for contributing to the execution of projects with greater efficiency and effectiveness.
- Implementation of didactic methods, which limits the development of formative research.
- Agility in carrying out procedures to authorize investigative processes.
- Stability of the teaching staff, predominance of hired teachers that hinders the successful completion of some research processes as well as the preparation and training of new researchers. In addition, this contributes to the disintegration of work or research teams.
- Bibliographic availability on research methodology in the library in the context studied.
- Number of interinstitutional agreements with the public and private sector in search of external financing, which allows for the development of investigative processes to solve the identified needs.
- Little accompaniment of students in research projects and teaching teams.

Opportunities:

- Institutional calls for competitive financial funds for the development of research projects.
- Recently vacated buildings in the faculty's teacher buildings that augur more physical space for work in the teaching research groups.
- Postgraduate courses related to the area of scientific research that not only enhance the preparation, but also constitute spurs to perform the different prospective stages of the project.
- Redesign of the curriculum for the different majors of the faculty, which offer a virgin field for research in this context.
- Institutionalization of research as the axis of the students' training process.

Strengths:

- Provision of teachers to work for their self-improvement, to gain experiences and enhance research activity.
- Projection of the institutional policy to strengthen research.
- Reorganization of the research activity in the Faculty.
- Teachers with greater experience in research and willingness to collaborate with the project teams created.
- Teachers linked to training processes such as Doctors of Science in branches of knowledge directly linked to the areas of training inherent to the academic unit under study.

Threats:

- Budget cuts.
- Possibility of evaluative processes external to the majors.
- Difficulties in the research processes with the participation of external entities.
- Diluted waiting processes for merit and opposition competitions that allows occasional teachers who are part of teams of research projects to opt for tenure.

In response to the results of the diagnosis of the research presented, the following strategic objectives were established:

- Implement training programs in scientific research and communication methodology.

- Plan the research activities in the short and medium term, as well as the possible results.
- Develop a plan for the execution of research projects that require low financial and material resources to achieve their objectives.
- Establish advisors and accompaniment to teachers with a research workload.
- Assess the results of the research activities individually, by project teams and at the faculty level.

At the end of the first year of application of the strategy resulting from the study presented, it could be observed that following the planned schedule, the researchers applied the Iadov technique (described in the "Methods" section). This allowed for determining the degree of individual and collective satisfaction of the individuals included in the sample, with respect to the actions carried out as part of the said strategic procedure.

The degree of individual satisfaction was established by placing the answers to questions 1, 5 and 8 of the respective instrument in the logical table of V. A. Iadov.

Table 4. Level of individual satisfaction

Satisfaction of level	Number	%
Clear satisfaction	14	41,18
More satisfied than unsatisfied	14	41,18
Not defined	5	14,70
Contradictory	1	2,94
Total	34	100,00

Source: Satisfaction Survey.

The individual values allowed to calculate the ISG.

$$ISG = \frac{A(+1) + B(+0,5) + C(0) + D(-0,5) + E(-1)}{N}$$

$$ISG = \frac{14(+1) + 14(+0,5) + 6(0) + 0(-0,5) + 0(-1)}{34}$$

$$ISG = \frac{14 + 7}{34} = 0,62$$

The value of the LIS obtained (0.62) established in the range between 0.5 and 1, so it could be concluded that this was established as satisfactory among the population studied with respect to the research strategy carried out in the context studied.

Discussion

Researchers like González-Puerto, Díaz-Díaz, Alvarado-Peruyero and Maceira-Brito (2013), conducted an analysis of the importance of adequate planning for the availability of human resources to achieve significant scientific productivity. This was highlighting the role of effective collaboration between the components of the science and technology system.

The authors of the research titled *proposal of a strategy for the development of the research activity*, suggest that the consolidation of an experienced teaching staff by the institutions of higher education constitutes an important strength in the fulfillment of the substantive functions of the university of the 21st century. (Saavedra, Salas, Barbe & Leyva, 2007). Regarding the amount of experience for the teachers in their study context, the results obtained were similar to those observed in the present investigation.

The professors that formed the study sample showed a curricular formation at the university and masters level according to the subjects that they taught. For this aspect, Saavedra-Roche, Lopez-Salas, Barbe-Agramonte and Leyva-Barcelo (2007), refers to the importance of the teaching staff having a professional formation related to the area of knowledge in which they coordinate their training research activity.

In correspondence with the observed reality, Arnoux, Borsinger, Carlino, Di Stefano, Pereira and Silvestre (2005) states that the processes of training for masters' programs should work on developing the necessary skills for scientific writing. This will allow the graduates to achieve better productive levels, as well as enriching the heritage of human knowledge in their respective areas of knowledge.

Agno (1992) argues that the fairness of a degree or postgraduate board of examiners in their decision, depends largely on the scientific-academic experience in the area that performs as the evaluator. On the other hand, Segredo-Pérez, Reyes-Miranda, Quintana-Galende, Díaz-Lemus, García-Hernández and Díaz-Hernández (2017) establishes the potential of postgraduate programs with respect to the scientific policy of higher education institutions, in terms of training human resources, generating projects and producing articles.

The development of research skills in university students comes from the teachers' activities in the different subjects, which must be based on the use of problem based teaching by involving the use of the scientific method to reach a solution. The teacher must possess sufficient research, methodological and pedagogical skills to achieve developed and pertinent thinking students (Blanco-Balbeito, Roque-Herrera, Betancourt-Roque, & Ugarte-Martínez, 2013).

Low scientific production is not exclusive to the academic environment in which the research presented and developed. In this regard, the data offered by Carpio-Pérez, Momplet-Pérez, Plasencia-Iglesias, San Gabino-Paredes, Canto-Darias and Pérez-Castillo (2016) show a similar situation, considering these indicators: "publications", "participation in scientific-academic events" and "projects registered in science and technology plans".

The recognition of the individual and collective weaknesses related to the investigative skills on the part of the sample under study, constituted an important starting point within the designed strategy. Rubio (2014) states that the improvement of scientific-academic activity should be based on the Socratic principle, that the fact of being aware of our own ignorance before the universe of possible knowledge, makes us eternal seekers of the truth.

In relation to the difficulties of the methodological work of the teaching collectives, Carpio Pérez et al. (2016) indicated that this activity should be conceived to strengthen the formative and research processes in higher education.

During the implementation of a doctoral training strategy at a medical university, researchers Pérez-Díaz, Véliz and Lorenzo-Rodríguez (2015) determined that the completion of a WOST matrix is a feasible and reliable methodological tool to establish an accurate diagnosis with a view on institutional strategic planning. Researchers such as Salas Perea (2000) recognize that the quality of compliance with the substantive functions of the university is related to the strategic planning of the processes linked to these actions which must be contextualized to each academic reality (Abello-Llanos & Pardo-Sánchez, 2014).

Sepúlveda-Alzate and Fernández-Morales (2017) establish that one of the ways to measure the effectiveness of academic strategies in higher education is the determination of the level of satisfaction of the beneficiaries. These authors applied the Iadov technique in their training environment for this purpose and obtained results consistent with what had been conceived in the research process.

Conclusions

- The triangulation of the data obtained through the different techniques used allowed for establishing the elements that formed the WOST matrix. This served as a starting point for the design of the research strategy and the execution of technological innovation.
- The reorientation of the research process in the academic environment enabled the increase for scientific production of the teaching staff. The teachers involved in the investigation considered the actions carried out as a need to reverse the diagnosed situation.
- The application of the Iadov technique allowed to establish a group satisfaction index from the members of the sample under study in the "satisfactory" category.

Abstract

This paper focuses on an analysis of particular English words that are used in ELT in Slovak primary education (ISCED 1 and 2). A study, conducted in March-May 2018, was aimed at finding out correlations between the reference levels of selected words taught at two proficiency levels (CEFR A1 and A2) in Slovak primary schools and those officially presented in the English dictionary. Several words were judged by Slovak language learners and their judgements were compared with the labels in the dictionary. Course books used in English class are considered compulsory material by many teachers, therefore it is expected that learners' judgements will be affected by the reference levels assigned to the course books. The results achieved in the survey will be presented, discussed and commented on with intent to support the development of teaching materials that will provide learners with words that they are expected to master at their levels.

Introduction

The official edition of the Common European Framework of Reference for Languages: Learning, teaching, assessment (Council of Europe, 2001) was followed by an intense discussion about a new reference framework as some applied linguists considered its scales and particular descriptors due to their wording rather inconsistent. However, the exploitation of the framework as such has proved that it is well-founded, being based on the concepts that enrich communicative approaches. After approximately 20 years of its use its impact is recognizable in many national language curricula not only in Europe, but beyond its borders, for example, in Canada (Piccardo, 2014). The concepts that significantly affected the document entail an action-oriented approach, viewing a language learner/user as a social agent who uses target languages for their needs in real-life situations. The CEFR's action-oriented approach represents a shift from structural syllabi towards syllabi based on needs analysis, focusing on language learners and development of their abilities to be efficient in using the language in real-life tasks, and constructed around purposefully selected notions and functions. A learner-centered approach prevails over a traditional approach that emphasizes a teacher and his/her roles in teaching processes such as viewing him/her as a conductor or an orchestra leader who authoritatively controls learners' behavior in the target language. A learner-centered approach views the teacher as a co-partner of learners in their learning process, giving learners an opportunity to work on negotiating meaning. Both the CEFR descriptive scheme and the action-oriented approach put the co-construction of meaning at the center of the learning process.

The CEFR presents communicative language competence as a set of competences such as linguistic, socio-linguistic and pragmatic combined with general competences entailing intercultural, strategic and existential competences. Four modes of communication (reception, production, interaction and mediation) replace a traditional classification of communicative language skills (listening, reading, speaking and writing).

These new concepts have attracted language professionals who either incorporate them into national documentation related to language teaching and testing, or directly try to link their language documentation to the CEFR. Linking is a complex process and is based on validation of the claims that requires rigorous and long-term team work. These national efforts stimulated international printing houses that have launched sets of course books labelled by six or even nine reference levels (A1, A2, B1, B2, C1 and C2, additionally completed by A2+, B1+ and B2+). International testing centers started to design language examinations and tests, labelling them in the same way. This labelling has exceeded its former intention as 6 reference and 3 plus levels, thoroughly described in the framework, completed by illustrative samples were to define particular language competences learners and/or users of target languages need to be aware of from various reasons such as being properly placed in the language course, assessing their own level of proficiency while applying for a new job or being admitted to foreign universities. The reason the CEFR includes so many descriptor scales is to encourage language learners/users to develop differentiated profiles as it reflects real-life situations in which people use target languages for different purposes (North, 2014).

The CEFR has had practical impact on language teaching and testing and has become a valuable resource for researchers, policy makers, test developers and teachers. The process of linking curricula and language examinations has become challenging and inspiring for the countries in the whole of Europe. Extensive research into vocabulary and grammatical patterns has been carried out as part of a collaborative project led by two departments of the University of Cambridge: Cambridge University Press and Cambridge English Language

Assessment, supported by the Council of Europe. This research based on a collection of several hundred thousand examinations scripts written by learners from all over the world, combined with other materials such as course books, etc. resulted in English Profile including two innovative online tools English Vocabulary Profile Online and English Grammar Profile online. These databases give language educators free access to the finding on what English vocabulary and grammar is suitable for teaching and testing at each CEFR level (www.englishprofile.org).

The Study

The Slovak Curricula for English are based on the CEFR and learners, their parents and teachers or any stakeholders are transparently informed about learning outcomes expected at different levels of language education, for example, A1 in the fifth year of primary education, A2 in the ninth year of primary education (ISCED 2), and B1 for secondary technical or vocational schools and B2 for secondary grammar school leavers at the end of secondary education (ISCED 3). An exception to the rule is a group of those students who study at bilingual schools or bilingual sections of secondary schools and are required to achieve C1 (ISCED 3). In our context, English tends to be a foreign language most students choose for completing their foreign language education as more than 80% out of the total number of applicants for final language examinations are students who want to sit for one of the reference levels of external language examinations in English. While in school year 2016/2017, level C1 was chosen by 1,211 students out of 32,026 applicants for English tests, in the 2017/2018 school year, the total number of applicants for English was 36,376 out of which 1,579 students applied for C1 due to their bilingual studies.

Due to its popularity, English has been taught as the first foreign language since 2013/2014 and in most primary schools, young learners can start its learning from the very beginning despite the fact that it is obligatory from the third year of primary education. This tendency required intensive training of other language teachers to become English teachers, and a massive retraining process, launched in 2009, enabled primary school teachers to be retrained and teach English to their own students in the junior cycle of primary school. Apart from language acquisition, their five-year educational program included core subjects of the bachelor and master degree programs originally designed for those students whose major is English at faculties of education.

This shift towards teaching English quite early (since year 1 of primary education) initiated changes in teaching processes and methodologies that are relevant for young learners, for example, TPR, story-telling, drama activities, using nursery rhymes, etc. These alternative methods were emphasized in pre-service and in-service teacher training and required searching for proper teaching materials and experts who were ready to share their teaching experience. The fundamental concepts related to teaching English to young learners provide deeper insights into teaching those who have not mastered their mother tongue properly and recommend the steps necessary for successful acquisition of a target language, for example, listening and speaking precede reading and writing, vocabulary and grammar are presented in chunks, a large number of words are naturally learnt in their proper contexts, etc.

As mentioned before, the CEFR has an intense impact on language education in Slovakia. Course books used for teaching English are mostly those published in the United Kingdom, labelled by the reference levels. It inspired us to find out to what extent vocabulary used in the course books labelled by reference levels and words practiced in English class corresponds with information about which words and their meanings are used by learners at each level of the CEFR presented in the English Vocabulary Profile (EVP). In our study, we assume that words Slovak learners of English learn naturally in primary school do not correlate with reference levels assigned to words in the EVP and will be judged as lower levels of the CEFR than they are labelled in the Cambridge Advanced Learners Dictionary, based on the English Vocabulary Profile (EVP) with the recommendation that this information serves for language learners which words they need to prioritise in their vocabulary learning. The EVP has also been informed by the Cambridge English Corpus, a multi-billion word corpus of spoken and written current English.

The research sample contained 30 English words that were taken from the course books used in different years of English learning (Appendix A). Students start learning English in year 3 and in year 9 they have been learning English for 7 years. The words referring to our research were taken randomly. Table 1 shows an overview of the years in which the students learned the selected words from the course books published in the UK and the number of words taken from the research sample for an in-depth analysis.

Year	3	4	5	6	7	8
No of words	5	5	5	5	4	6

Table 1: The year of primary school and the number of words from the sample

The idea of presenting this overview is based on providing a clear picture that the words chosen for our research are not the words that belong to additional vocabulary provided by teachers, but vocabulary that is prescribed by English course books that officially claim to be compatible with the CEFR.

We addressed 28 students (19 females and 9 males) of the 8th and 9th year of primary education from one primary school located in the countryside. The students at their age of 13-15 were given the list of words (Appendix B)

and were asked to judge the CEFR level. Their judgement was supported by remembering them to take into account at which year of education they have learned those words. Years 3-5 are meant to match A1 and years 6-8 are to be linked to A2 as these are the two proficiency levels primary school students are expected to achieve in English. Later, the students were asked to translate the given words as our intention was to obtain evidence about their knowledge of the word.

Findings

The students' judgements of the presented words were based on their personal experience, significantly influenced by the year in which they were exposed to the word most frequently. From the respondents' answers (Appendix A), it is possible to conclude that only several students were not able to judge the given words. The most problematic word seems to be the expression *lettuce*, which students were expected to learn in year 6 when they started to move from reference level A1 towards A2. This word has not been judged by 7 students and it is assigned CEFR level B1 in the Cambridge Advanced Learners' Dictionary (McIntosh, 2013).

In Slovakia, reference level B1 is required to be achieved in either the second year of secondary grammar school education or in the end of vocational education (4 years). Level B2 is an obligatory level for those who decided to study at secondary grammar school and have to sit for an examination of one selected language. The table below shows a distribution of selected words assigned 4 particular CEFR levels by the English Vocabulary Profile and the Cambridge Advanced Learners' Dictionary (McIntosh, 2013).

CEFR levels	A1	A2	B1	B2
No of words	5	10	10	5

Table 2: CEFR levels assigned with selected words

While words such as *lion*, *monkey*, *rabbit* were naturally expected to be judged as words students would not have any problems with, the words such as *frog*, *shark*, *spider* were also decidedly judged as A1 by students who considered them easy and their familiarization with them supported their definite decisions. They could acquire their meanings from fairy-tales or films. Surprisingly, the CEFR level assigned to the latter words was B1. The expression *tiger* (B1 in the CALD) Slovak students learn in year 6 of their primary education was very easy for them as the same word exists in the students' mother tongue. On the other hand, words such as *sore throat*, *bleed* and *prescription* were judged A2 and the learners became familiar with them only in year 7. These words are assigned B1 and are frequently presented in the course books labelled that particular level. Six students did not estimate the word *prescription*.

The word *crocodile* is assigned level B2 according to the CALD (McIntosh, 2014), however, a very similar word in Slovak 'krokodíl' led students to estimate it suitable for level A1. Other B2 words (*spot*, *treatment*, *x-ray* and *infection*) were judged A2 as students could come across them in years 7 and 8. The words are related to the topic of health or medicine, which is usually dealt with later than more general topics such as family, everyday life and situations, shopping, etc.

As far as translation is concerned, it is not important to comment on the words the translation of which was achieved at 75%, which means the passkey for success was 21 correct answers. Only six words were significantly translated wrongly or students decided not to translate them at all. The most difficult word for the students was the word *treatment* (2 correct answers, 1 incorrect, 25 not answered). The word *spot* in the meaning of a small mark or lump on a person's skin was correctly translated by 4 students, while 9 wrong answers were completed by 15 empty answer sheets. Six students were not sure about estimating the word *spot*. While these two words are assigned level B2 according the EVP and the CALD, two words assigned level B1 make some problems to students as well. The word *bleed* was correctly translated by 9 students, 6 students translated it incorrectly and 13 students left their answers out (Appendix C). The word *prescription* belongs to the words called paronyms (false friends) as they have similar equivalents in Slovak but with different meaning. While *prescription* is translated into Slovak as 'recept', English *recipe* has the same translation 'recept'. So Slovak learners are frequently misled and use one English word *recipe* for both Slovak meanings. 14 students avoided translating the English word *prescription*, while 9 translations were correct and 5 incorrect.

This translation task was very useful as we could see that students had problems with some words and therefore they judged their difficulty by estimating their reference level as A2. However, these words belong to higher proficiency levels according to the English Vocabulary Profile and the Cambridge Advanced Learners' Dictionary (McIntosh, 2013).

Conclusions

Our research was aimed at finding out whether the words that are officially assigned a particular CEFR level in the EVP and the CALD are judged to be at the same levels by Slovak learners of English. It is obvious that learners' judgements were influenced by their English course books and all the chosen words were estimated in the range

between A1 and A2 as all of them were presented in those course books. 15 out of 30 words chosen for this study were assigned higher levels (10 B1 and 5 B2) according to the EVP and the CALD. Despite the fact that words are assigned higher levels, A2 learners had some problems with certain words, for example, the word *lettuce* was not translated by 11 students, which accounts about 39%. There is no any similarity with the Slovak expression 'šalát' and the students could not use any cues as the words were presented without context.

Despite the fact that the expression *sore throat* belongs to vocabulary recommended for B1 learners, it is presented to Slovak students in primary schools when they are expected to achieve level A2. This expression seemed to be quite difficult for them and was correctly translated by 19 students (67%). On the other hand, it is necessary to emphasize that students had serious problems only with four words: two words assigned level B1 (bleed and prescription) with 9 correct answers and two words assigned level B2 out of which the word *spot* was translated correctly four times and the word *treatment* only two times. The most surprising word was the English word *injection* used in Hutchinson's Project 4 in year 8, expected to be used at CEFR level C2 by the EVP, we decided to exclude this expression from our analysis.

The reasons for this research are based on our misgivings whether the words in any language might be assigned reference levels. What we miss in the EVP is the concept that supports the idea of language similarities. Language families play an important role in other language acquisition. If the mother tongue and a target language are from the same language family, for example Romance languages, it seems to be easier for Spanish learners to acquire Italian, mainly from the vocabulary perspective. On the other hand, it is significant to distinguish between passive acquisition of language and an active use of it.

Finally, it is necessary to express our gratitude to those who participated in the word collection that was used in the English Vocabulary Profile. Despite the fact that many words of the English formal lexicon are assigned C levels not taking into account that many Indo-European languages use the same specific words in their native languages and therefore they are not difficult for other speakers of languages than English (e.g. *injection* in English and 'injekcia' in Slovak), the English Vocabulary Profile is an invaluable source for curriculum development, course book writers, test developers, and last, but not least, teachers who wish to be guided which word or its individual meaning to use while presenting and practicing new materials at a particular CEFR level.

Lifelong Learning Program To Enhance Local Wisdom Conservation

Sumolnit Kerndnoonwong
Faculty of Education
Srinakharinwirot University
Thailand
sumolnit@g.swu.ac.th

Abstract

Local wisdom is closely related to survival skills of people which it was passed through generations to generations. Local wisdom is also considered as learning of the local people from their environments which are results on better quality of their lives. However, in the stream of the capitalism, young generation prefer leaving their hometowns in order to switch way of their lives. So, this situation is a barrier of sustainable development in community. Therefore, the local wisdom conservation should be restorative, particularly by the youths. From these contexts, the study was aimed to 1) analyze curriculum development process 2) analyze contexts of lifelong learning 3) analyze local wisdom conservation guidelines 4) develop lifelong learning program to enhance local wisdom. The documentary analysis was used to be the research instrument. The findings founded that on curriculum development process; 1) need analysis of community and learners; background, problems on economy, society and environment 2) objective setting; expectation on learners' behaviors 3) content Setting; consistent to the objectives and learners needs 4) learning activities setting; appropriate activities selection in order to fulfill the learning objectives 5) adoption; learning lesson plan and instructional media are adopted in practice 6) evaluation in three aspects; content, adoption and results on learners (behaviors, achievements, and characteristics). Results on lifelong learning concept analysis; 1) self-analysis, self-development and self-caring on rapid social transition; new skills, knowledge, attitudes with morality 2) learning flexibility; learning freedom to fulfill their need and blending to their lives 3) social responsibility; fulfillment to individual needs, community needs as well as social needs. Results on local wisdom conservation concept analysis; 1) understanding background and nature of each local wisdom 2) collecting data of the local wisdom, organize, classify, analyze and publicize the wisdom 3) action research in specific local wisdom 4) acceptance and encouragement local people on the value of their wisdoms 5) collaboration between public and private sectors to initiate the network the people neglect to inherit their local wisdoms due to lack of understanding on their local wisdoms' worth. The program was developed by the needs and the satisfaction results on the program were in highest level.

Introduction

New education challenges that countries in Asia and the Pacific are facing, in particular, in expanding participation beyond both ends of basic education, namely early childhood care and education (ECCE) and post basic education, including technical and vocational training and continuing education, and in focusing on learning for the individual to acquire the skills and competences needed for life and work. (UNESCO, 2014) Thus, lifelong education is used for successful development of many countries as well as the concept of lifelong learning is brought to be an instrument for development people. However, Thai society currently confronts with the unbalance of consuming resources of adult population which leads to be social problems. Therefore, lifelong learning concept should be blended for delivering sustainable development. The training courses or program are directly related to lifelong learning in order to encourage desired knowledge, skills and attitudes in a specific period. Lifelong learning is a continuously supportive process which stimulates and empowers individuals to acquire all the knowledge, values, skills and understanding they will require throughout their lifetimes and to apply them with confidence, creativity and enjoyment, in all roles circumstances, and environments (Watson 2003). In accordance with Sirichai Karnchanawasri (1995) which proposed that training is an Education for human resource development under rapid shift situations, training strengthen professional knowledge as well as skills based on their actual needs.

In each community, there are local wisdoms which refer to the knowledge of people or groups of people in one place. It was from the ancestors or from experiences, analysis and use to apply to their lives (Kowit Puangngam, 2010). The matter of using knowledge, skills, beliefs and behaviors represents a holistic relationship among people and people with the environment including other activities which related to their learning adaption as well as surviving of the person community and society. Therefore local wisdom is important and lead to survive of the person in the social economic. Local wisdom also demonstrates the ingenuity, creative thinking to make use of the environment and develop it for better quality and strong society (Phatthavadee Udommonkul, 2002). Wisdom of fundamental living with the ability to find food, house building, invention of fabric and sickness treatment helps the society peaceful (Kanokporn Chimphree,

2012). Refer to the importance of local wisdom, Constitution of the Kingdom of Thailand 2007, the importance of local wisdom is recognized. In Act 66, persons who are in a community have the right to preserve or restore traditional wisdom, arts and cultures of the local community as well as participate in manage, maintain, and utilize natural resources (Constitution of Thailand, 2015: Online). This shows that the conservation on cultural and local wisdom could support self-reliant in the community. In accordance with Thai government policy on local wisdom is consistent with the problem due to the current situations have to be solved, Thailand has entered into globalization and the cultural and technological advancement of the country. Therefore, it may presume that Thai society is currently under western wisdoms, capitalism, materialism and consumerism (Phra Dharmakote Poyutto, 1996). Moreover, Thai people are lacking of understanding and do not appreciate on their wisdoms.

It is essential to preserve local wisdom. And there are people who delight to conserve local wisdom. Elderly is the majority group that role to conserve local wisdoms. Conservation on local wisdom also involves several dimensions such as who wants to preserve, who should be a conservationist, what age should desire to conserve the wisdom, and the steps and strategies of conservation. The study of information obtained from the survey also benefits regarding the creation of training courses for conservation of local wisdom.

The development on lifelong learning program to enhance local wisdom conservation included training program development process and lifelong learning concept as well as local wisdom conservation as the content of the program. The young adults were the target in order to prolong the wisdom. In each community, the study on the priority of the wisdom need was surveyed and the training program was developed by considering on wisdom needs, target needs and community contexts as well as concept of conservation and lifelong learning.

The Study

Documentary analysis was used to study in order to develop framework of the program which analyzed in the topics of instructional curriculum, lifelong learning and local wisdom conservation. The next step was to synthesis to be the lifelong learning program to enhance local wisdom conservation into steps.

Findings

The findings were clarified from the study on the documentary review and analyzed in the form of concept and tables as following:

Results on curriculum analysis

Curriculum development process

1. Need analysis of community and learners; background, problems on economy, society and environment
2. Objective setting; expectation on learners' behaviors
3. Content Setting; consistent to the objectives and learners needs
4. Learning activities setting; appropriate activities selection in order to fulfill the learning objectives
5. Adoption; learning lesson plan and instructional media are adopted in practice.
6. Evaluation in three aspects; content, adoption and results on learners (behaviors, achievements, and characteristics)

Results on lifelong learning concept analysis

1. Self-analysis, self-development and self-caring on rapid social transition; new skills, knowledge, attitudes with morality
2. Learning flexibility; learning freedom to fulfill their need and blending to their lives
3. Social responsibility; fulfillment to individual needs, community needs as well as social needs

Results on local wisdom conservation concept analysis

1. Understanding background and nature of each local wisdom
2. Collecting data of the local wisdom, organize, classify, analyze and publicize the wisdom
3. Action research in specific local wisdom
4. Acceptance and encouragement local people on the value of their wisdoms
5. Collaboration between public and private sectors to initiate the network

The findings could be systematically analyzed in to the table of program framework as following:

Program process	Lifelong learning	Local wisdom conservation	Program content
1. Community education and survey	<ul style="list-style-type: none"> - lifelong development with morality on current transition - New skills practice for career security 	<ul style="list-style-type: none"> - Performance on conservation - Wisdom adoption in order to solve daily problems 	<ul style="list-style-type: none"> 1. Study on current contexts; economy, society, environment 2. Need analysis on local wisdom conservation for lifelong learning

Table 1: The program was designed by analyzing the three concepts; instructional curriculum, lifelong learning and local wisdom conservation (step 1).

Program process	Lifelong learning	Local wisdom conservation	Program content
2. Objective setting; expectation on learners' behaviors	<ul style="list-style-type: none"> 1. Ability to learn for their own benefits and social benefits 2. Ability to search useful information 3. Ability to add knowledge, skills and attitudes to fulfil their needs 	<ul style="list-style-type: none"> 1. Value of wisdom has been transferred to young generation 2. Public relation on local wisdom 3. Initiate local wisdom networks for strengthening the wisdom 	<ul style="list-style-type: none"> 1. Knowledge, skills and positive attitudes in lifelong learning for local conservation 2. Local conservation in practice; protection, learning and maintenance

Table 2: The program was designed by analyzing the three concepts; instructional curriculum, lifelong learning and local wisdom conservation (step 2).

Program process	Lifelong learning	Local wisdom conservation	Program content
3. Content Setting; consistent to the objectives and learners needs	<ul style="list-style-type: none"> 1. Individual learning; cognitive, affective and psychomotor domain 2. Self caring 3. Social responsibility 	<ul style="list-style-type: none"> 1. Wisdom for living; food, medicine and treatment 2. Wisdom for property; housing and career 3. Wisdom for creativity; ancient language, local language and literature 	<ul style="list-style-type: none"> Unit 1: Wisdom conservation Unit 2: Local wisdom Unit 3: Wisdom maintenance

Table 3: The program was designed by analyzing the three concepts; instructional curriculum, lifelong learning and local wisdom conservation (step 3).

Program process	Lifelong learning	Local wisdom conservation	Program content
4. Learning activities setting; appropriate activities selection in order to fulfil the learning objectives	1. Authentic practice, learner center, problem based learning 2. Technology enhancement 3. Flexibility and freedom to learn by desired needs and learning styles	1. Trainers select appropriate learning methods by learners' competency 2. Wisdom transfer by various methods; demonstration, inspection	1. Learning activities; learner center, practice, discussion, knowledge application 2. Media and resources; Local resource, journals, internet, assignments

Table 4: The program was designed by analyzing the three concepts; instructional curriculum, lifelong learning and local wisdom conservation (step 4).

Program process	Lifelong learning	Local wisdom conservation	Program content
5. Adoption; learning lesson plan and instructional media are adopted in practice.	1. Flexibility in learning time and location 2. Learning activities could be blended in their lives	-	<u>Roles of trainers</u> ; Well teaching preparation, multi teaching styles, positive learning atmosphere, connecting learning resources to learners' lives <u>Roles of learners</u> ; Participate in practice and search their own interests, delight to do the activities by their ability, self information searching

Table 5: The program was designed by analyzing the three concepts; instructional curriculum, lifelong learning and local wisdom conservation (step 5).

Program process	Lifelong learning	Local wisdom conservation	Program content
6. Evaluation in three aspects; (1) content, (2) adoption and (3) results on learners (behaviors, achievements, and characteristics)	1. Presentation and discussion 2. Accurate and precise evaluation target in order to measure learners' achievement 3. Evaluation on learners' project assignments	- Self evaluation on the skills by learners - Individual evaluation - Follow up on learners by giving advices continuously	1. Evaluation on the program be considering; suitability and compatible of the compositions of the program 2. Evaluation on learners' achievement

Table 6: The program was designed by analyzing the three concepts; instructional curriculum, lifelong learning and local wisdom conservation (step 6).

Conclusions

From the results of the study, the lifelong learning program have to be flexible and specify based on the contexts of the community and characteristics of the wisdom. It would be recommended that the effective program in Thailand should be recognized on the importance of “Human Capital” and “Society Capital” in order to drive sustainability as well as well-being of people in community. Thus, government policy and Thai National Economic and Social Development Plan are also necessary to be realized. The program should be depth studied by program manager regarding to provide the valuable and sustainable training program. So, the youths will retain their conscious as well as apply to their community. This may shift the attitude of the trained youths in order to conserve their wisdoms.

However the problems and needs of people in community reflect the necessary of the program development. The issue of local wisdom for community development which effects to people’s living directly always challenges for decades. Thus local wisdom conservation is the main point or instrument to be considered for applying to be lifelong learning program. The program would be adopted based on the real needs of them and community contexts, not only form their answers from the questionnaires, therefore the process of analysis and synthesize the data gathering should be recognized while the proposed program was developed by synthesizing on theories, concept and principles. So the program in practice needs to be tested for studying the generalization of the program.

Finally, the adoption of the program particularly, training for youths in their local community, the learning plan should be set systematically. The unit content as well as learning activities should be well organized by contexts and learners’ needs.

Abstract

The modern anthropocentric scientific paradigm actualizes the problem of developing a certain basic "coordinate system" for identifying and describing the basic values of representatives of different cultures. And the intensification of scientific research in this direction is explained by it. The results of these studies also make it possible to identify the features of the transformation and preservation of the basic values of the bearers of a particular language and culture, as well as the trends in intergenerational cultural transmission. One of the best ways of transferring culture from generation to generation is to use the linguo didactic potential of axiology as a science of values and evaluation. As it is known, the ultimate goal of linguo didactics is not only teaching a particular language, but also inculcating spiritual, moral and ethical values through the means of the language being taught to the students. It is obvious that the humanitarian culture includes value-orientation, norm-orienting, culture-identical, socially-consolidating and individualizing resources. Accordingly, there is no doubt that it is necessary to form a humanitarian culture in accordance with the gradual principle of education from the first years of study with its further deepening in the upper grades.

Based on this, this article analyzes the ways of forming a humanitarian culture in the teaching of the Russian language. If in the junior classes language learning is carried out on texts presented in textbooks, then, in our opinion, in high school it is advisable to use texts from other sources. As such, there can be artistic or newspaper texts, the students are more interested in the latter. This is due to a number of factors: informative and dynamic in accordance with the genre and the availability of background knowledge about the event described by the students. Regular analysis of newspaper texts with an axiological component allows us to identify the dominant spiritual and moral values of society and determine their scale. Proceeding from this, the actual material for analysis in this article are newspaper texts.

The article proposes an author's method of studying linguistic means and texts containing in their semantics an axiological component in explicit or implicit forms.

Introduction

At the present stage of the development of scientific knowledge all branches of science are permeated with anthropocentrism: all problems are linked to the person and are explained from the standpoint of the person – creator, carrier and researcher. While any person is the bearer of a specific ethnic culture and language, then certainly, and the world is perceived by him through the prism of his native culture. Accordingly, in the linguistic objectification of the realities of reality, in the division of the world, i.e. categorization mentality, perception of the world, the world view and categorization of that ethnos whose representative is a particular person is reflected. And in a modern globalizing world in which it is easy to lose its ethnic identity every member of society tries to identify himself with the native language and the centuries-old culture of his people. And the preservation of national identity is brought to the forefront which is possible only with the continuity of national culture. Its fundamental part is the spiritual, moral and ethical values passed down from generation to generation. And it is very important to form, preserve and develop national identity in the younger generation and at the same time tolerance towards the foreign languages and cultures. In this connection, it is necessary to look for various ways, one of which is humanitarian education through the subjects of the humanitarian cycle studied at school. Among them, of course, are language and literature. Since the study of language is based on texts of different genres, it is expedient to use their inexhaustible possibilities.

Adapted texts presented in school textbooks can be as one source of it. They are designed for their full study

within the program. Their inadequate appeal to the school pupil is its compulsoriness limited to typical programs and educational standards. Another source of extraction of axiological information is classical fiction, a "well" for education. However, it is well known that it is on the periphery of readers' interest of schoolchildren. The most acceptable, in our opinion, source is the online press because for modern children from a small age the most favorite source of information retrieval is gadgets with access to the World Wide Web. The task of the teacher of literature is to form at the student a steady interest in reading, and for this – a thoughtful approach to the selection of texts for reading able to gradually instill values, and thereby develop a scale of values. Therefore, in this article a great attention is paid to the formation of spiritual values through the correct selection of publicist texts.

The Study

The axiological component is one of the key ones in the formation and development of the linguistic personality, and as the primary component of the existence of man in society that's why it arises a great research interest, being an object of independent research in various branches of humanitarian disciplines. At the same time scientists study axiological problems from various perspectives: *axiological* – in philosophy, theology, art criticism, etc., *ontology* – cultural studies, linguistics, folklore, ethno linguistics, etc., *praxiological* – political science, sociology, pedagogy, psychology, etc., *art* – literature study, art criticism, etc. All these approaches are united by an attempt to explain the mechanisms of man's cognition of the world. As it can be seen, there is a close relationship between the subject areas of humanitarian culture and its potential impact on the individual and society. Thus, the axiological aspect includes value and socially-consolidating landmarks, praxeological aspect – normative, cultural-identification, individualizing, etc. [Mussatayeva M., Nussupbekova A. 2018].

As you know, all these guidelines are vital and necessary for a person for harmonious being in society, therefore, the humanitarian culture must be instilled in children from the first days of their schooling by the resources of all the without exception studied disciplines. A special place is given to the subjects of the philological cycle: Russian language and literature, Kazakh language and literature, foreign languages. However, the limited scope of typical programs, in accordance with the textbooks and materials which are attached to them, make this work somewhat difficult. In this regard, this task implicitly lies on textbooks in which this goal is achieved through the texts, the fulfillment of tasks and exercises by pupils, the use of various methods and innovative technologies by teachers [Mussatayeva M.Sh., Nussupbekova A.S. 2018].

Since the central place at all stages of education including language teaching is the textbook, much attention is paid to its content. In the *linguo didactic* literature there are many definitions of the textbook. One of the co-authors of this article, A.S. Nussupbekova defines the textbook as "a poly functional psycho didactical system reflecting the content of the studied subject compiled taking into account the psycho physiological characteristics of students and aimed at the formation of spiritual, moral and ethical values, and thereby – knowledge of the world" [Nussupbekova A. 2018, P. 349]. As it is known, the textbook realizes the general educational, developing and upbringing functions of pedagogy. The first two of these equip schoolchildren with theoretical knowledge of the subject, develop educational and cognitive activities, the latter forms the outlook of the students and fosters educates human values at them.

Proceeding from this, we think that the central place in textbooks should be occupied not only by texts in which the scientific, consistent, strictly and accurately stated content of the subject is presented, but also materials oriented toward cognition of both universal and cultural-marked values. So, Z.K. Akhmetzhanova and M.Sh. Mussatayeva describe the concepts of *man, state, cradle, generation, child, boy, girl*, etc., which are constants of the Kazakh mentality, the "permanent principle" of Kazakh culture, and verbalizing their lexemes refer to a stable layer of Kazakh vocabulary that defines wealth, "face" and the power of the Kazakh language [Akhmetzhanova Z., Mussatayeva M. 2013, P. 3]. For Kazakhstani researchers, it is of particular importance to identify the scale of values of the Kazakh society and the factors that contribute to its transformation with the aim of reconstructing the axiological sphere of various social groups and idiolects. In our opinion, the results of these studies should also be reflected in the training texts.

In addition, it seems that the text material in the textbook should take into account the achievements of modern linguistics, therefore it is advisable to introduce new concepts such as *concept, conceptual analysis, discourse* that allow a new look at the educational process and choose adequate pedagogical technologies and techniques for their implementation (for example, the concepts of *spirituality, education, culture*, etc.) Thus, the school textbook on the Russian language and literature is intended to be one of the sources of humanitarian culture at schoolchildren.

Axiological value categories are directly related to the *concept*. According to V.I. Karasik, "the value aspect of the concept is the basis for distinguishing the concept, it is namely through the analysis of concepts that value dominants can be identified that together form a certain type of culture, maintained and preserved in language" [Karasik V. 2009, P.29-30]. As one of the authors of this article, M.Sh. Mussatayeva points out "At the basis of any culture and ethnic identity is a system of values, that is, moral and ethical and spiritual and moral concepts, in a multinational, multicultural and poly confessional Kazakhstan, Kazakh identity is a consolidating resource and a guarantor of its sustainable and dynamic development. In Kazakhstani society along with universal concepts

reflecting universal spiritual and moral values, social and economically conditioned concepts are also dominant" [Mussatayeva M. 2017, P. 127]. Proceeding from this, it is difficult to overestimate the role of axiological competence in the formation of a full-fledged linguistic personality.

According to the theory developed by the Russian scientist Yu.N. Karaulov, the structure of the language personality includes 3 levels: *verbal-semantic* (encompassing a complex of grammatical-paradigmatic, semantic-syntactic and associative links of linguistic units which together form a single "verbal network"), *linguo cognitive* (the representatives of generalized concepts, ideas and concepts clad in descriptor status) and *motivational and pragmatic* (more individualized consisting of the same elements: units, relations and stereotypes). According to the scientist, the necessary key for the transition from one level to another can be "extra linguistic information supplied by the social component of the language and associated with the "history" of the language socialization of the individual, the "history" of its involvement in the stereotypes adopted in a given society in the vital concepts, ideas, the history of their assimilation and appropriation in the process of socialization" [Karaulov Yu. 2010, P. 45].

As it can be seen, in the formation of the verbal network, the generalized large concepts and their individualization in the language personality, the values and the evaluation reflected in the pedagogical discourse are implicitly "present". This is confirmed by V. Karasik's definition of the concept of *pedagogical discourse* is "an objectively existing dynamic system of value-semantic communication of subjects of the educational process, functioning in the educational environment. It includes participants in discourse, pedagogical goals, values and content component" [Karasik V. 2000].

Obviously, the role of extra linguistic information extracted from the media and contributing to the successful socialization of the language personality of the learner is important in the structure of the language personality in ensuring the transition from one level to another. A private, at first glance, issue of selecting publicist texts for educational purposes requires interrelation and correlation with such key aspects of education as the main goal with the tasks corresponding to it, the structural and content components of education that ensure successful interaction of participants in the educational process and mutual understanding. The effectiveness of the meanings of the concepts and images acquired by the students depend on these factors, in our case is the assimilation of the spiritual, moral and ethical values necessary for the formation of a harmoniously developed linguistic personality. As a rule, the system of values/antivalues is studied on the basis of a variety of texts, which is due to a rich set of components, including axiological ones, allow explicitly or implicitly in accordance with the author's conception and interpretation to realize this task.

The axiological component is most actively studied in the language of the media, since they are the most stable media carrier, fully reflecting the dynamics of linguistic changes. Among the various media genres, in most cases the source of the extraction of factual material is newspaper texts of informational orientation, since they do not need to be pre-recorded. Accordingly, there is no need for subsequent decoding, because they are more accessible and convenient for a linguistic description. The research interest in the language of newspapers is also conditioned by the fact that the newspaper is the oldest mass medium in which the basic stylistic devices and means characteristic of the language of mass communication as a whole were formed. Proceeding from this, the language of the newspaper is quite reasonably considered to be the basic component of the language of the media [Mussatayeva M., Kozhakhmetova A. 2018]. This circumstance serves as the basis for the use of newspaper texts for the purpose of teaching the language. In its turn, the didactic task of forming a steady interest in reading the newspaper as a valuable source of information contributing to the awareness of the involvement of the socium and its civil identity, is being actualized. In addition, the culture of reading newspapers and skills of extracting basic information is being instilled.

An indispensable condition for the use of journalistic texts in the educational process is their adaptation in accordance with the psychological and physiological characteristics of students. This means that in the learning texts of each of the links (primary, secondary and senior), a gradual principle, from simple to complex, must be realized. To realize it in textbook development should be used the theoretical bases for the compilation of educational texts, adaptation of artistic texts for educational purposes, and the scope and structure of the teaching texts [Nussupbekova A. 2018].

There is no doubt that the involvement of journalistic texts adapted for educational purposes will contribute to the full development of the individual student's language that suggests the presence of a multi-level set of language ability and willingness to perform communicative speech acts of varying difficulty on the verbal-semantic, cognitive and communicative-activity levels. Reading and comprehension of the content of the text, performance a set of learning tasks and exercises form the system of linguistic competence, which includes language and speech levels. While working on adapted journalistic texts students master communicative abilities in the four major types of speech activity – reading, speaking, listening, writing. In addition, this form of work increases the cognitive competence of students, forming specific skills, in particular:

- ✓ to operate with background knowledge of your culture and adequately interpret them in relation to reality;
- ✓ to identify the dominant concepts of linguistic culture of modern society;

- ✓ to perceive and comprehend the axiological stereotypes of society.

One of the unshakable constant values of Kazakhstanis is the family, as evidenced by the number of articles published in the Kazakh press. So, for the period from January 1 to July 1, 2018, the family problem was addressed in 186 articles of the daily central socio-political newspaper "Kazakhstanskaya Pravda". The fact that in Kazakhstan to family values are paid special attention is shown by a large number of publications in other publications. In this regard, it should be noted that in them the central place is given to the woman as the keeper of the family hearth.

It is obvious that values should not be merely declarative, they should be educated in the younger generation, for which this work should be permanent in both life and learning process. In implementing this task in the learning process, reliance on well-established methods is important, one of which can be the developed by us an algorithm for carrying out the content analysis of an artistic text and reflected in one of our works [Mussatayeva M.Sh., Kuatova G.A., etc. 2017]. This algorithm can be taken as a basis for work on the semantics of the publicist text and be used as follows:

- ✓ to specify the purpose and tasks of work on the text;
- ✓ to select text material;
- ✓ to identify the language units in the text;
- ✓ to analyze the semantic structure of identified linguistic units;
- ✓ to classify language units;
- ✓ to interpret;
- ✓ to formulate conclusions.

We will try to demonstrate the tasks developed with the use of the above said algorithm. *The purpose* of these tasks is the realization of the axiological component of journalistic texts in the educational process, and *the tasks* are aimed at achieving the stated goal:

- 1) formation of skills in the logical-semantic analysis of the text providing a deep understanding of the information contained in it;
- 2) identification of the nominee field of representatives representing the dominant ideas of the text;
- 3) formation of axiological competence of students;
- 4) provision of a cultural transmission, i.e. *continuity of traditional ethnic values and their transformation into a modern scale of values*;
- 5) the formation and development of linguistic competence through the analysis of linguistic units contained in the text, and also by the attraction of additional language tools that provide an expanded understanding of the axiological components.

Selected material is fragments of journalistic texts containing axiological information which are extracted from the socio-political Russian-language newspaper "Kazakhstanskaya Pravda" and other online publications. These texts correlate with the State Program of the Republic of Kazakhstan "Rukhani zhangu" ("Spiritual Revival") developed on the basis of the article of the Head of State "A Look into the Future: Modernization of Public Consciousness" dated April 12, 2017, aimed at reviving the spiritual values of Kazakhstanis with all modern risks and challenges of globalization. [<http://ruh.kz/ru>; <http://www.akorda.kz>].

Within the framework of this article we only outline the nature of assignments for comprehending three fragments of texts about the family and family values.

Task 1 Formulate the basic idea of each of the texts.

1) "In our society the family has always been and remains the link between different generations, the guardian of spiritual and cultural traditions. The family day will contribute to strengthening morality, spirituality, unconditional recognition in our society of the importance of responsible marriage ... Education got under shanyrak is the guarantee of a healthy and the successful future of all our people. Cultivation of family values, large families is one of the primary tasks of our state. For the years of Independence, more than 6 million of Kazakhstanis was born, and the total number of citizens of the country exceeded 17 million. This is a clear indication of the growth of the well-being of the people, the quality of family and demographic policy in the Republic of Kazakhstan", – points out Nazarbayev. <https://tengrinews.kz>

2) "In the middle of the 21st century the most developed countries will be those in which the absolute majority of families will live in peace and prosperity, educate children, give them quality education, take care of older generations, lead a healthy lifestyle," said the President of Kazakhstan Nursultan Nazarbayev <http://today.kz/news/kazakhstan/2015-09-13/626287> from the 13th of September. 2015 11:10 1219 0

3) "About family values, jubilee weddings were spoken under the arches of the new Palace of Marriage ... Spouses especially honor continuity, family traditions, spiritual and moral values. ... The institute of a strong, happy family is the guarantee of the well-being of the whole of Kazakhstan, "the Akimovs' spouses also firmly believe in it. ... The family is strong, if it is understood and respected, "say the Akimovs. "We have always lived a soul in the soul, honored the elders, worked tirelessly" ("... Golden, Emerald, Diamond" in the newspaper "Kazakhstanskaya Pravda" dated June 8, 2018) ..

Task2 Do you agree with the statements below? Motivate your answer.

The family has always been and remains the link between different generations, the guardian of spiritual and cultural traditions.

Education received under the family shanyrak is the guarantee of a healthy and successful future for all our people.

Cultivating family values, having many children is one of the primary tasks of our state.

The family is strong, if it is understood and respected for each other.

Task 3 Answer the following questions:

1. What theme unites these micro texts?
2. How do you understand the meaning of the phrase *family values*?
3. Explain the meaning of the combinations of *living the soul in the soul, to work tirelessly*?
4. What is the manifestation of caring for the older generations?
5. How do you think what is the *right way of life*?

Task 4 Select keywords.

Task 5 Give the phraseology units about the family.

Task 6 Give the proverbs and sayings about the family.

As you can see, the first four tasks are aimed at forming the semantic competence of students.

Tasks 5 and 6 are designed to inculcate axiological competence. It is well-known that to understand the meaning of phraseology and paremia, background knowledge is necessary: traditions and customs accompanying the bearers of ethnic culture and language throughout life and forming life values. It is obvious that life situations and certain patterns of behavior of the bearer of a particular national language and culture reflect the ethnic hierarchy of values, a certain influence on which is exerted by the confessional identity of the linguistic personality. In this case, Kazakh paremia will be accompanied by ethnographic comments which will allow us to understand its logical content. At the same time, in the meaningful and formal description of paremia in Kazakh and Russian languages, universality is noted irrespective of ethnic characteristics, which indicates a unified cognitive and logical structure of thinking of genetically diverse peoples. Family values and priorities, particularities of the way of life are vividly reflected in proverbs and sayings about the family, about the attitude to the elder members of the family and children, about upbringing. A person in a system of kinship ties occupies a certain place and, in accordance with this, he is endowed with specific rights and duties, a certain emotional relationship is formed towards him [Mussatayeva M.Sh., 2015].

Analysis of the semantic structure of linguistic units assumes the identification of semantic components. So, in axiological units, you can identify such components as *cognitive, emotional and behavioral*, which are especially shown in paremia. *The cognitive* component expresses the parents' attitudes and shapes the model of the future family at children (educate worthy children; do not give preference to any of the children; how to raise the elders, so will the younger ones be raised), *the emotional* component expresses the different attitude of parents towards children, and *the behavioral* component is clear in attitude towards representatives of the older generation. It should be noted that the senior generation is given a particularly honorable place in the Kazakh family. As a rule, in the Kazakh family, 2-3, sometimes 4 generations, traditionally live together which has a great educational effect: children, on the example of parents learn to take care of elderly people. The law in any Kazakh family goes without saying: elderly parents always live with children, until the end of their life, feeling the care of children, grandchildren and great-grandchildren. It is noteworthy that the idea of the arrangement of aged parents in boarding schools is inadmissible for Kazakhs [Mussatayeva M., 2015]. This unshakable constant of the Kazakh scale of values should be passed down from generation to generation. In connection with globalization processes, this problem becomes especially urgent, because it is obvious that the loss of this value is equal to the loss of Kazakh national identity.

Findings

From these fragments of the text it can be concluded about the role of today's Kazakhstani family in shaping the future of Kazakhstan's society. Keywords and phrases that characterize the future of Kazakhstan as a result of the culture of family values are: *tranquility, prosperity, quality education, raising children, caring for the older generation, a healthy lifestyle, a happy family, to live in perfect harmony, respect for elders, continuity, family traditions, spiritual and moral values, well-being*. The main tasks are promoting the most important human values in society, that, first of all – FAMILY, LOVE, LOYALTY, RESPECT, UNDERSTANDING. The family has no confessional boundaries. Family traditions of each nationality, religion are based on loyalty and love. BNews.kz. (Source: Almaty City Culture Department)

Examples similar to the following fragments of newspaper texts can be "dissolved" in exercises and assignments, the linguistic and semantic analysis of which at the subconscious level of students will contribute to a deep understanding and sustainable respect for family values as an axiological constant. It should also be noted that a high degree of authenticity of newspaper texts. So, in the educational process M. Breen clears out four types of authenticity: 1. authenticity of texts used in the learning process; 2. the authenticity of the perception of these texts by students; 3. authenticity of training tasks; 4. authenticity of the social situation in the classroom. [Breen 1985] Reliance on the basic provisions developed by this scientist will allow the teacher to develop a typology of tasks and on their basis a system of exercises.

Interpretation

Semantisation of newspaper texts used for educational purposes can be based on the Bloom taxonomy, which includes organically related levels: *knowledge*, *understanding*, *application*, *analysis*, *synthesis* and *evaluation*.

At the level of *knowledge*, when semantizing the newspaper text to identify the axiological component, the following knowledge is formed and developed: *conceptual* (the interaction between the basic elements in the integral structure of the language), *procedural* (skills of using task execution algorithms) and *meta cognitive* (awareness and knowledge of one's own knowledge in the process of working on text). Students discover new facets of the category of values in different cultural communities, identifying in them universal ones.

At the level of *understanding* students learn to recognize the meaning of linguistic units and interpretations, motivation of their responses, classification of the received information, comparison with other events from the life of society, generalization and formulation of conclusions. The indicator of *understanding* can be the transformation of material from one form of expression to another, the interpretation of the material.

At the *application* level trainees are trained to use the information obtained in specific conditions and new practical situations.

At the level of *analysis*, analytical skills are formed consisting in the classification of the basic concepts in the semantized text in such a way that it is possible to reveal the semantic structure of the described object. Mental actions consist of identifying the part of the whole, their interconnection, the principles of the organization of the whole, and also in distinguishing between facts and consequences.

At the *synthesis* level the skills of combining elements are formed in order to obtain a whole that has novelty. At this stage it is difficult to overestimate the role of the integrated use of audio-visual aids which contribute to a more visual representation of the synthesized components of the object.

At the *evaluation* level students should be able to make independent judgments and determine their own values, check them for compliance with generally accepted spiritual, moral and ethical values, identify gaps between them and work on their replenishment.

Conclusions

Thus, axiological linguistics has a huge linguo didactic potential, which contributes to the formation of a harmoniously developed personality with a stable scale of spiritual, moral and ethical values. It becomes obvious that in order to achieve this goal, it is not enough to restrict the learning of only the information contained in the textbooks. To do this, it is necessary to attract a variety of sources, one of which may be a journalistic text. As it is known, art texts adapted for educational purposes, with all their merits, have a number of shortcomings: the use of developed grammatical structures, even in dialogue or in answering questions; unnatural repetition of individual words or grammatical phenomena; text is often not an analogue of any real type or genre of text. The advantage of using publicist texts is their authenticity, which allows to develop tasks, simulate situations that are as close to natural as possible in accordance with three aspects of a methodically authentic text: methodical (accessibility, relevance to learning objectives, efficiency), structural (compositional and linguistic characteristics, composition, adequacy of linguistic means, cohesion, adhesion, etc.) and meaningful (the naturalness of the situation described, the presence of a cultural component, informative, ability to evoke interest and emotional perception et al.).

Abstract

Maria Gaetana Agnesi was born in Milan, on May 16, 1718. She was highly talented and excelled in the art of philosophical disputation. In 1738, Agnesi concluded her studies with the publication of her thesis *Propositiones philosophicae* (Philosophical Propositions), mimicking the academic path of male students in contemporary colleges. Profoundly interested in mathematics but still unclear about the nature of her possible contribution, Agnesi began by planning a commentary on Guillaume de l'Hospital's treatise on curves, to make it more accessible to students. Gradually, however, she worked on a much more ambitious project: an introduction to calculus that would guide the beginner from the rudiments of algebra to the new differential and integral techniques. This would be a great work of synthesis, aiming at a clear presentation of materials that were written for specialists, in Latin, French, or German and published in hard-to-find journals. During the making of her book, Agnesi interacted with leading Italian experts, such as Jacopo Riccati. At a time when the practice of calculus on the continent was moving away from its immediate geometrical meaning, Agnesi aimed to rediscover those techniques of Cartesian geometry designed to bridge the gap between the geometrical and analytical fields. Her teaching method can be still interesting. Maria Gaetana and her contemporaries do not care about logical rigour; they prefer to present the concept in an intuitive way. The question of giving a more formal and logical approach to the definition of limit was addressed by Augustine-Louis Cauchy and, later, by Karl Weierstrass. According to any scholars, this abstract approach can be didactically inefficient for the beginner student, observing that, among other things, a mathematics course uses different notions of limit for which it would be appropriate to introduce and define the limit so that applications come from a single concept. The question of the fundamentals of the analysis cannot be considered completely closed; indeed someone thinks that the system of axioms to be considered is even variable with the type of problems that are faced.

Keywords: *Mathematics, History, Differential Calculus*

Introduction

Maria Gaetana Agnesi was the first woman to publish a book of Mathematics in her own name, a treatise of Algebra and Calculus entitled *Istituzioni Analitiche ad uso della gioventù italiana* (Analytical Institutions for the use of Italian Youth). The book appeared in 1748 in Milan that in this time was under Austrian control. In the introduction, dedicated to Empress Maria Theresa of Austria, Maria Gaetana called for all women to contribute "to the glory of their sex" through the practice of the Arts, the Sciences and Politics.

The *Istituzioni* did not assume any previous knowledge of algebra and was the first attempt to provide an extensive and accessible introduction for the beginners to the new differential and integral techniques. This aim was reached by means a great work of synthesis because the materials were mostly written for specialists, in Latin, French or German and published in hard-to-find journals. Some results were even in writings that scholars addressed each other. During she made her book, Maria Gaetana interacted with leading Italian experts, such as Jacopo Riccati. In the correspondence with Riccati, Maria Gaetana claimed that she consciously excluded from her book the possible applications to Physics or other Sciences. This choice was unusual and at odds with the practice of most specialists, including Riccati. Her geometrical understanding of Algebra and Calculus was in disagreements with leading practitioners. This choice explains her interest in Newton's fluxions and the case with which *Istituzioni* was translated in English, for the British audience in 1801.

Agnesi claimed that she wanted to limit her book to the pure Analysis in order to preserve the simplicity, rigor and evidence proper to classical Geometry. This inclination was inspired by the Oratorian tradition in Mathematics, descending from Malebranche and Charles Reyneau, which, in particular, was the main source of inspiration for the *Istituzioni*. Maria Gaetana did not neglect the appeal of the Leibniz's *differences* method that she knew to be equivalent to Newton's method. In her book, she used the differential calculus both in tangent problems and in inverse tangent problems.

The Second Volume Of *Instituzioni Analitiche*

Maria Gaetana devoted the Second Volume to “*the analysis of the quantities infinitely small*”. In the Introduction, she wrote that the *Analysis of infinitely small Quantities*, which is otherwise called the *Differential Calculus*, or the *Method of Fluxions*, is that which is conversant about the differences of variable quantities, of whatever order those differences may be. This Calculus contains the methods of finding the Tangents of Curve-Lines, of the Maxima and Minima of Quantities, of Points of Contrary Flexure and of the Regression of Curves, of the Radii of Curvature, etc. The book is divided in several sections, as the nature of the several objects require. All translation of notations, definitions, theorems and demonstrations that follow in this paper are taken from the English translation made by Rev. John Colson (Colson, 1801).

In Volume II, Book II, Section I, Agnesi defines the *Variable Quantities* as the quantities that are capable of continual increase or decrease. They are to be conceived as *Flowing Quantities* or as generated by a continual motion (Agnesi, 1748).

Then she defines *Difference* or *Fluxion* as any infinitely little portion of a variable quantity, when it is so small that it has to the variable itself a less proportion that any that can be assigned and by which the same variable being either increased or diminished, it may still be conceived the same as at first.

In Table I, Fig.2,3 of the Volume II, Maria Gaetana clarifies the concept (Agnesi, 1748)

Figure 1. *Instituzioni Analitiche*, Volume II, Book II, Section I, Table I

Let AM be a curve whose axis or diameter is AP; and, if in AP produced, we take an infinitely little portion Pp, it will be the difference or fluxion of the abscissa AB, and therefore the two lines AP, Ap may still be considered as equal, there being no assignable proportion between the finite quantity AP and infinitely little portion Pp.

From the Points P, p if we raise the two parallel ordinates PM, pm in any angle and draw the chord mM produced to B, and the right line MR parallel to AP; then because the two triangles BPM, MRm are similar, it will be BP:PM=MR:Rm. But the two quantities BP, PM are finite and MR is infinitely little, the also Rm will be infinitely little and is therefore the fluxion of the ordinate PM. For the same reason the chord Mm will be infinitely small, but (as will be shown afterwards) the chord Mm does not differ from its little arch, and they may be taken indifferently for each other; therefore the arch Mm will be an infinitely little quantity, and consequently will be the fluxion or difference of the arch of the curve AM. Hence it may be plainly seen, that the space PMmp likewise, contained by the two ordinates PM, pm, by the infinitesimal Pp and by the infinitely little arch Mm, will be the fluxion of the area AMP, comprehended between the two co-ordinates AP, PM, and the curve AM. In addition, drawing the two chords AM, Am, the mixtilinear triangle AMm will be the fluxion of the segment AMS, comprehended by the chord AM and by the curve ASM.

The teaching method of Agnesi is truly remarkable, she always points straight to the concept, which she clarifies with many examples and figures. In the definition of difference or fluxion lies a crucial point: a positive infinitesimal should be a quantity greater than zero but less than any positive real number. There is therefore a contradiction with the Archimedes axiom which states that if a and b are two positive real numbers, then there exists a natural number n such that $an > b$.

The objection made by Berkeley, in his satirical book *The Analyst* (Berkeley, 2002) hits the mark: he does not dispute the validity of the results obtained with the new Calculus, but the logical rigor.

In fact, it is necessary to observe that, in the fervour of research and in the urgency of solving new problems, the preoccupation with regard to the foundational aspects of the infinitesimal calculus is left aside. The few books born for spreading the methods, such as that of de L'Hôpital, do not care much about clarifying the definitions.

Agnesi And Geometrical Loci

Agnesi's first mathematical effort was connected with De L' Hôpital 's *Traité des sections coniques* (De L' Hôpital, 1776); she wanted to write an introduction that made it accessible to students and designed a commented translation, but her mentor Count Carlo Belloni dissuaded her, considering the project too demanding. Maria

Problem III: *Given infinite parabolas of the same kind, we must find the curve, which cuts them all at right angles.*

If in the circle be taken an arch which is an infinitesimal of the first order, I say that its verted sine shall be an infinitesimal of the second order; and the difference between the right sine and the tangent shall be an infinitesimal of the third order.

Figure 3. Instituzioni Analitiche, Volume II, Book II, Section I

Let the arch DC be an infinitesimal of the first order, DB is the right sine, CE the tangent and let DF be drawn parallel to AC. From the nature of the circle, it is $GB:BD=BD:BC$. But GB is a finite quantity and BD an infinitesimal of the first order. Therefore, as GB is infinitely greater than BD, so BD will be infinitely greater than BC. Therefore, BC or DF will be an infinitesimal of the second order. By the similitude of the triangles ABD, DEF, it will be $AB:BD=DF:FE$. But AB, a finite quantity, is infinitely greater than BD, an infinitesimal of the first order, and therefore DF, an infinitesimal of the second order, will be infinitely greater than FE, which is therefore a third fluxion, or an infinitesimal of the third order.

Corollary I: And whereas the tangent is always greater than its arch, the arch greater than its chord, and the chord greater than the right sine, the tangent and the right sine may be assumed as equal, they not differing but by an infinitesimal of the third order. Also these following may be assumed as equal, the tangent, the arch, the chord, and the right sine.

Corollary II: If we conceive the radius of the circle AN to be an infinitesimal of the first order, the arch NO and its right sine OM will be an infinitesimal of the second order; and therefore the versed sine MN will be infinitesimal of the third order.

Agnesi proved by means of a geometrical approach the well-known infinitesimal properties of the function $\sin x$ and $1-\cos x$ for x tending to 0, with the advantage of obtaining the result with a very simple reasoning, which can also follow a beginner student.

The Foundational Question

In the nineteenth century, a great process of reorganizing knowledge affected Mathematics. New mathematical sectors are born, such as that of non-Euclidean geometries, and a rigorous theoretical arrangement of mathematical analysis is realized. The construction of coherent systems of geometries, characterized by postulates other than Euclidean ones, proved the limited mathematical value of the appeal to evidence. Even the situation of the Analysis stimulates a reflection: although it was decisive for the development of the sciences, it had made use of not clear notions, such as that of infinitesimal, and of unscrupulous procedures, so that D'Alembert said "Go ahead and faith will come to you". The question of giving a more formal and logical approach to the definition of limit was dealt with by Augustine-Louis Cauchy and, later, by Karl Weierstrass. In Cauchy's book *Cours d'Analyse* of (1821), he based the definition of infinitesimal and the definition of limit on the concept of variable quantity, which scholars generally believe is a succession of values.

When the successive numerical values of this variable diminish indefinitely, so as to fall below a given number, this variable becomes what we call infinitesimal, or an infinitely small quantity.

Weierstrass resumed the Cauchy's ideas and gave the definition ε - δ of limit that is still taught, which eliminates infinitesimal as separate subjects. Weierstrass applied the definition to the definition of continuity and convergence of a series of functions and produced the famous counterexample for which a function can be continuous but not derivable at any point. From Weierstrass onwards, Mathematical Analysis became the science we know.

According to some scholars, this abstract approach can be didactically not very effective for the beginner student; we observe that, among other things, in a mathematical course different notions of limit are used, in every situation the most opportune one: for example the limit of a succession, of a function, of a series, the definition of integral. Therefore, it would be appropriate to introduce and define the limit so that applications derive from a single concept.

In 1961, Abraham Robinson published an article in Dutch Academy of Sciences in which he presented his idea of a theory of infinitesimal and infinite, with the name of Non-Standard Analysis, entering the debate on how the definition of Weierstrass interprets the historical definition (Robinson, 1961).

Robinson's theory achieved great notoriety following the work he presented jointly to the American Mathematical Society and the Mathematical Association of America.

Robinson's theory consists in introducing a new numerical field, which constitutes an expansion of the real field, in which the axiom of Archimedes does not generally apply. The extra objects in the new numerical field are precisely the infinitesimals, called hyperreals.

The Robinson's theory is based essentially on mathematical logic, even though towards the end of the sixties the American mathematician H. Jerome Keisler managed to reformulate the whole Mathematical Analysis according to the infinitesimal principle of Robinson, following a path alternative that makes this method even accessible to university freshmen (Keisler, 2012).

Nowadays many researchers in Mathematical Teaching test the Nonstandard Analysis even at introductory level. They think that an intuition of infinitesimals can be oriented to lead to mathematical concepts. Pre-university students can acquire the fundamental ideas, which form the core of analysis through a nonstandard analysis; in particular, they present in class the ultrasmall numbers.

In these experiences in classroom, they propose again many examples and ideas that we find in Agnesi's *Instituzioni*.

Conclusions

The opinions on the didactic use of non-standard analysis and precisely on the advantage that would lead to the understanding of the arguments are still controversial, as well as those regarding the advantage that it would bring in the discovery of new analytical properties.

The question of the foundations of Analysis cannot be considered completely closed, indeed someone think that the system of axioms to be considered is even variable with the type of problems that must be addressed. It would be a terrible blow to Descartes' conception, according to which "Mathematical truths are immutable and eternal".

We think that pre-university students can acquire the fundamental ideas of differential calculus getting back the original formulation of Leibniz, based on infinitesimals. From this point of view, we can use many suggestions and examples, contained in Agnesi's Books. If we propose these arguments or problems by means of laboratory instruments, flipped classroom techniques, or by didactical methods that you prefer, we think that the media are different but the meaning is the same.

Abstract

Maria Gaetana Agnesi was born in Milan on May 16, 1718 so this year marks the 300th anniversary of his birth. She is "considered to be the first woman in the Western world to have achieved a reputation in mathematics." The most valuable result of her labours was the *Istituzioni analitiche ad uso della gioventù italiana*, (Analytical Institutions for the Use of Italian Youth) which was published in Milan in 1748 and "was regarded as the best introduction extant to the works of Euler." The goal of this work was, according to Agnesi herself, to give a systematic illustration of the different results and theorems of infinitesimal calculus. The *Istituzioni* did not assume any previous knowledge of algebra and was the first attempt to provide an extensive and accessible introduction for the beginners. In this article, we present two significant problems, which one can find in her book and that could even be put back into our high schools now. The two problems Maria Gaetana found in the Renaissance Mathematical tradition: the first is the famous problem about King Hiero's crown, that we find in Vitruvius and Galileo Galilei, and, after Maria Gaetana, in Paolo Romeo da Siderno. The four solutions are very different each other. The second problem is an application of logarithms to a problem of everyday life that we can find in more elementary form in Luca Pacioli's *De Viribus Quantitatis*.

Keywords: *Mathematics, History, Algebra, Differential Calculus*

Introduction

Profoundly interested in mathematics but still unclear about the nature of her possible contribution, Agnesi began by planning a commentary on Guillaume de l'Hospital's treatise on curves, to make it more accessible to students. Gradually, however, she came to believe she could work on a much more ambitious project: an introduction to calculus that would guide the beginner from the rudiments of algebra to the new differential and integral techniques. This would be a great work of synthesis, aiming at a clear presentation of materials that were written for specialists, in Latin, French, or German, and published in hard-to-find journals. During the making of her book, Agnesi interacted with leading Italian experts, such as Jacopo Riccati. Her correspondence with Riccati sheds light on some of the distinctive traits of Agnesi's mathematical style.

In marked disagreement with leading practitioners was Agnesi's geometrical style, which originated in her essentially geometrical understanding of algebra and calculus.

This explains, among other things, her interest in Newton's fluxions, and the ease with which her work was translated into English for a British audience. At a time when the practice of calculus on the continent was moving away from its immediate geometrical meaning, Agnesi aimed to rediscover those techniques of Cartesian geometry designed to bridge the gap between the two fields.

This inclination explains her interest for the Oratorian tradition in mathematics, and especially for authors like Malebranche and Charles Reyneau. The reference to Reyneau as her main source of inspiration for the *Institutions* has surprised many readers, as he was hardly considered a valuable resource for mid-eighteenth-century continental mathematicians, and was often described as a pedantic and obscure writer. To Agnesi, however, Reyneau offered an example of how to understand recent developments in calculus within an essentially Cartesian framework.

Agnesi believed that calculus was the most subtle branch of mathematics, and therefore that it required the highest level of concentration and the strongest intellect. Once one realizes that for Agnesi the preeminent role of calculus is precisely that of exercising the intellect, it becomes understandable why she decided to ignore completely its empirical and applicative dimension.

Maria Gaetana Agnesi's Short Biography

Maria Gaetana Agnesi was born in Milan, to a wealthy and literate family. Her father Pietro Agnesi, a wealthy silk merchant, wanted to elevate his family into the Milanese nobility. In order to achieve his goal, he had married Anna Fortunato Brivio in 1717. Her mother's death provided her the excuse to retire from public life. She took over management of the household. She was one of 21 children. Maria was recognized early on as a child prodigy; she could speak both Italian and French at five years of age. By her eleventh birthday, she had also learned Greek, Hebrew, Spanish, German, and Latin, and was referred to as the "Seven-Tongued Orator".

Figure 1. Maria Gaetana Agnesi

When she was fifteen, her father began to regularly gather in his house a circle of the most learned men in Bologna, before whom she read and maintained a series of theses on the most abstruse philosophical questions. Records of these meetings are given in Charles de Brosses' *Lettres sur l'Italie* and in the *Propositiones Philosophicae*, which her father had published in 1738 as an account of her final performance, where she defended 190 theses.

After having read in 1739 the *Traité analytique des sections coniques* of the Marquis Guillaume de l'Hôpital, she was fully introduced into the field in 1740 by Ramiro Rampinelli, an Olivetan monk who was one of the most notable Italian mathematicians of that time. During that time, Maria studied with him both differential and integral calculus. Her family was recognized as one of the wealthiest in Milan.

She is "considered to be the first woman in the Western world to have achieved a reputation in mathematics." The most valuable result of her labours was the *Instituzioni analitiche ad uso della gioventù italiana*, (Analytical Institutions for the Use of Italian Youth) which was published in Milan in 1748 and "was regarded as the best introduction extant to the works of Euler." The goal of this work was, according to Agnesi herself, to give a systematic illustration of the different results and theorems of infinitesimal calculus. The model for her treatise was *Le calcul différentiel et intégral dans l'Analyse* by Charles René Reyneau. In this treatise, she worked on integrating mathematical analysis with algebra. The first volume treats of the analysis of finite quantities and the second of the analysis of infinitesimals.

A French translation of the second volume by P. T. d'Antelmy, with additions by Charles Bossut (1730–1814), was published in Paris in 1775; and *Analytical Institutions*, an English translation of the whole work by John Colson (1680–1760), the Lucasian Professor of Mathematics at Cambridge, was published in 1801. The work was dedicated to Empress Maria Theresa, who thanked Agnesi with the gift of a diamond ring, a personal letter, and a diamond and crystal case. Many others praised her work, including Pope Benedict XIV, who wrote her a complimentary letter and sent her a gold wreath and a gold medal.

In writing this work, Agnesi was advised and helped by two distinguished mathematicians: her former teacher Ramiro Rampinelli and Jacopo Riccati.

Figure 2. Instituzioni Analitiche, Volume I

After the death of her father in 1752, she carried out a long-cherished purpose by giving herself to the study of theology, and especially of the Fathers and devoted herself to the poor, homeless, and sick, giving away the

gifts she had received and begging for money to continue her work with the poor. In 1783, she founded and became the director of the Opera Pia Trivulzio, a home for Milan's elderly, where she lived as the nuns of the institution did. On 9 January 1799, Maria Agnesi died poor and was buried in a mass grave for the poor with fifteen other bodies.

Instituzioni Analitiche: Clarity And Simplicity

In the Author's Preface to the readers, Maria Gaetana Agnesi wrote:

*I desire that the candid reader to consider that, as the Sciences are daily improving, and, since the publication of the aforementioned book, many important and useful discoveries have been made by many ingenious writers; as had happened likewise to those who had written before them: Therefore, to save students the trouble of seeking for these improvements, and newly-invented methods, in their several authors, I was persuaded that a new Digest of Analytical Principles might be useful and acceptable. The late discoveries have obliged me to follow a **new arrangement of the several parts**; and whoever has attempted any thing of this kind must be convinced, how difficult it is to hit upon such a method as shall have a **sufficient degree of perspicuity, and simplicity, omitting every thing superfluous, and yet retaining all that is useful and necessary**; such, in short, as shall proceed in that **natural order, in which consists the closest connexion, the strongest conviction, and the easiest instruction**. This **natural order** I have always had in view; but whether I have always been so happy as to attain it, must be left to the judgement of others. (English Translation by J. Colson, 1801).*

The opinions on the mathematical work of Maria Gaetana Agnesi is still controversial, mainly because she does not discovery new analytical properties.

The work does not excel in originality; ... but it is distinguished by clarity and rigor of style and by numerous and interesting applications; consequently... it was judged so favorably as to arouse the enthusiasm of some (Loria, G. 1950).

Maria Gaetana Agnesi was famous in her time, mainly as an isolated, unique, female prodigy, a marvel first of precocious learning, later of Catholic piety. Misty fame still clings to her memory, long nourished by the occasional curiosity of mathematicians and now revived by feminists. Whether or not she was as a mathematician important in any sense -discoverer, propagator, teacher- can be determined, but her brief and intense devotion to elementary mathematics cannot be separated from her strange circumstances and strange life, and as her story unfolds, a certain unity, at first unexpected, can be perceived in it. (Truesdell, J. 1989).

Luigi Pepe describes AGNESI'S book as an *exposition by examples rather than by theory*. (Pepe, L. 1982).

However, the same could be said of John Bernoulli's integral calculus, written in 1691 and 1692, published in 1742. All of Euler's books are full of examples.

Many elementary textbooks today, especially those used in courses for engineers, physicists, and economists, are of that kind as far as concerns mathematical thought, but they usually offer redeeming examples of how to apply calculus to problems suggested by natural or fancied phenomena. In our opinion, Maria Gaetana makes a more general vision of problems and contributes to favour the mathematical abstraction.

The First Volume Of Instituzioni Analitiche

Maria Gaetana devoted the First Volume to "*The Analysis of Finite Quantities*":

- I. Notions and Operations of the Analysis of Finite Quantities
- II. Equations and Plane Determinate Problems
- III. Construction of Loci, not exceeding the Second Degree
- IV. Solid Problems and their Equations
- V. Construction of Loci which exceed the Second Degree
- VI. Method *De Maximis et Minimis*, Tangents of Curves, Contrary Flexure and Regression making use only of *Common Algebra*

In this Volume, Maria Gaetana makes many examples and solve many problems, in order to teach to her readers how they can use the algebraic tools. Some problems belong to the Renaissance Italian Treatise; among them, we consider the famous Hiero's crown question.

Hiero's Crown Tale

For almost a hundred years, the ancient Greek city of Syracuse had been at war with Carthage. Until, in 275 BCE, the Syracusan troops, tired of the inefficiencies of their leaders, elected commanders from amongst themselves. One of these was a young general called Hiero. After a great battle in 265 BCE, in which Hiero led the Syracusans to victory against their enemies, the people of Syracuse chose Hiero to be their king.

Hiero was grateful to the gods for his success and good fortune, and to show his gratitude, he decided to place in a certain temple, a golden crown in their honour. The crown was to be shaped like a laurel wreath. Hiero weighed

out a precise amount of gold, and appointing a goldsmith, commanded him to fashion out of the gold a wreath worthy of the gods. The goldsmith did as he had been ordered, and he delivered to the king an exquisitely wrought crown. The wreath seemed to weight exactly as much as the gold that the king had given the goldsmith. Hiero prepared for the ceremony to place the wreath in the temple that he had chosen. However, a few days before the ceremony, he heard rumours that the goldsmith had cheated him, and given him a crown not of pure gold, but of gold that had silver mixed in it. Hiero was furious to learn that he might have been tricked and wished to determine the truth before he punished the goldsmith. Hiero believed there was only one man in Syracuse capable of discovering the truth and solving his problem. This was his cousin, Archimedes, a young man of 22, who was already renowned for his work in mathematics, mechanics and physics.

The story of Archimedes and the golden crown is found in *De Architectura* or *The Ten Books of Architecture*, written by the Roman architect Marcus Vitruvius Pollio some time during the first century BCE. This story is not found anywhere among the known works of Archimedes, though in his book, *On Floating Bodies*, he gives the principle known as Archimedes' Principle, which states that a body partially or completely immersed in a fluid is buoyed up by a force equal to the weight of the fluid displaced by the body.

What Archimedes had found was a method for measuring the volume of an irregularly shaped object. He realised that an object, when immersed in water, displaced a volume of water equal to its own volume, and that by measuring the volume of the displaced water, the volume of the object could be determined, regardless of the object's shape. Therefore, he could measure the volume of the crown by measuring the volume of the water spilled from a container filled with water to the brim when the crown was fully dipped in it.

In physics, when we speak of the density of an object, we are comparing its mass with its volume, or, in simpler words, considering how heavy it is in relation to its size. Archimedes knew that gold was denser than silver – so a piece of gold weighing a certain amount would be smaller than a piece of silver weighing the same. Thus, if the goldsmith had stolen some of the gold the king had given him, and replaced it with an equal weight of silver in the crown, then the total volume of the gold+silver crown would be greater than the volume of the original amount of gold. So now, all that remained for Archimedes to do was to compare the volume of the crown to the volume of the amount of gold that Hiero had given the goldsmith. The simplest method of determining the volume of the crown would have been to melt it down, shape it into a cube and measure its volume. However, Hiero had given strict instructions that the crown was not to be damaged in any way.

Archimedes took a lump of gold and a lump of silver, each weighing the same as the crown, and filled a large vessel with water to the brim, precisely measuring how much water was contained in the vessel. He then gently lowered the lump of silver into it. This caused as much water to spill out over the sides of the vessel as was equal in volume to the lump of silver. Archimedes took the lump of silver out of the water and carefully measured the amount of water left in the vessel, thus arriving at the amount of water that had been displaced by the silver. He again filled the vessel with water to brim, taking care to fill it with exactly the same amount of water as before. He then lowered the lump of gold into the water, and let the water displaced by it spill out over the sides. Then, doing as he had done with the lump of silver, Archimedes took out the lump of gold from the water, and arrived at the amount of water that had been displaced by the gold. He found that a smaller quantity of water had been displaced by the gold than the silver, and the difference was equal to the difference in volume between a lump of gold and a lump of silver of the same weight. He filled the bowl with water to the brim a final time, taking care to fill it with exactly the same amount of water as before. This time he lowered the crown into the water. He knew that if the crown was pure gold, its volume would be the same as that of the lump of gold and that it would displace the same amount of water as the gold. However, if the goldsmith had replaced some of the gold with silver, then the volume of the gold+silver crown would be greater than the volume of the gold, and so the crown would displace more water than the gold. Archimedes found that the crown did, in fact displace more water than the lump of gold of equal weight. Thus he concluded that the crown was not pure gold, and that the goldsmith had indeed mixed some silver (or other, lighter metal) into the gold in an attempt to cheat the king.

The method that Vitruvius says was used by Archimedes, though correct in theory, has been criticised by scientists as too difficult to implement with the amount of accuracy that would be needed to detect a component of silver or other lighter metal in the crown.

The largest known golden wreath from Archimedes' time is the one pictured from Vergina. It has a maximum rim diameter of 18.5 centimetres and a mass of 714 grams, although some of its leaves are missing. Let us assume that Hiero's wreath weighed 1000 grams and that a container with a circular opening of diameter 20 centimetres was used. The opening would then have a cross-sectional area of 314 square centimetres. Because gold has a density of 19.3 grams/cubic-centimetre, 1000 grams of gold would have a volume of $1000/19.3 = 51.8$ cubic-centimetres. Such a quantity of gold would raise the level of the water at the opening of the container by $51.8/314 = 0.165$ centimetres. Next, suppose the dishonest goldsmith replaced 30% (300 grams) of the gold in the wreath by silver. Silver has a density of 10.5 grams/cubic-centimetre and so the gold-silver crown would have a volume of $700/19.3 + 300/10.5 = 64.8$ cubic-centimetres. Such a crown would raise the level of the water at the opening by $64.8/314 = 0.206$ centimetres. The difference in the level of water displaced by the wreath and the gold is thus 0.206 minus 0.165 centimetres, or 0.41 millimetres. This is much too small a difference to accurately observe directly or

measure the overflow from considering the possible sources of error due to surface tension, water clinging to the gold upon removal, air bubbles being trapped in the lacy wreath, and so forth. Additionally, the change in water level would be even less than 0.41 millimetres if the wreath had a mass of less than 1000 grams, or if the diameter of the container opening were larger than 20 centimetres, or if less than 30% of the gold was replaced with silver.

Medieval Treatise On Density

A Latin treatise on determining the volume or density of an object or liquid entitled “Liber Archimedis de insidentibus in humidum” (“The Book of Archimedes on Floating Bodies”) circulated in the middle ages. However, it is generally believed that Archimedes did not write it, although his works on hydrostatics clearly underlie it. It possibly dates from the 12th or 13th century.

The treatise begins with fourteen definitions and six postulates, which set the stage for eight propositions. The fourth of the propositions explains how to determine the composition of an object that is an alloy of two metals by weighing the object in air and in water and weighing quantities of the two metals in air and in water. This proposition thus presents a solution to the Golden Crown problem, although no specific mention is made of the problem in the treatise.

IV. IN A BODY MIXED FROM TWO KINDS, TO DETERMINE HOW MUCH OF EACH KIND IS IN IT.

If there be given some body mixed from two known kinds of body, and if we wish to know how much of each kind is in it, we will weigh bodies of each kind, separately, in both air and water; and we will take the excesses of the weight of each body in air over its weight in water, and note them separately. Then we will weigh the mixed body in both air and water, and we will note the excess of its weight in air over its weight in water. Then the ratio of the quantity of light body present in the alloy, to the magnitude of the alloy itself, will be as the ratio of the excess weight of the alloy to the excess weight of the lighter body.

(The Medieval Science of Weights – Scientia de Ponderibus – Treatise ascribed to Euclid, Archimedes, Thabit ibn Qurra, Jordanus de Nemore and Blasius of Parma.)

Galileo Galilei And The Small Balance

In 1586 at the age of 22, Galileo (1564-1642) wrote a short treatise entitled La Bilancetta (“The Small Balance”). He was sceptical of Vitruvius’s account of how Archimedes determined the fraud in Hiero’s crown. The amounts of gold and silver in the case of a crown were so small that the difference in their volumes, and the consequent difference for water displaced, would be too small to measure with precision with the measurement methods available to Archimedes. In his treatise, Galileo presented his own theory based on Archimedes’ Law of the Lever and Law of Buoyancy. He also included a description of a hydrostatic balance that determined the precise composition of an alloy of two metals.

Figure 3. Galileo’s Small Balance- scheme

Let us then assume that weight b is gold and that when this is weighed in water, the counterpoise goes back to e; then we do the same with very pure silver and when we weigh it in water its counterpoise goes in f. This point will be closer to c [than is e], as the experiment shows us, because silver is lighter than gold. The difference between the distance af and the distance ae will be the same as the difference between the [specific] gravity of gold and that of silver. However, if we shall have a mixture of gold and silver it is clear that because this mixture is in part silver it will weigh less than pure gold, and because it is in part gold, it will weigh more than pure silver. If therefore we weigh it in air first, and if then we want the same counterpoise to balance it when immersed in water, we shall have to shift said counterpoise closer to the point of suspension c than the point e, which is the mark for gold, and farther than f, which is the mark of pure silver, and therefore will fall between the marks e and f. From the proposition in which the distance ef will be divided, we shall accurately obtain the proportion of the two metals composing the mixture. So, for instance, let us assume that the mixture of gold and silver is at b, balanced in air by d, and that his counterweight goes to g when the mixture is immersed in water. I now say that the gold and silver that compose the mixture are in the same proportion as the distances fg and ge. We must however note that the distance gf, ending in the mark for silver, will show the amount of gold, and the distance ge ending in the mark for gold will indicate the quantity of silver; so that, if fg will be twice ge, the said mixture will be of two [parts] of gold and one of silver. Thus, proceeding in this same order in the analysis of other mixtures, we shall accurately determine the quantities of the [component] simple metals.

In the Museum Galileo in Florence, Room VIII, there is a small, blown-glass hydrostatic balance that consists of an arm suspended on a fulcrum at its centre. A small sealed glass sphere hangs from one end of the arm; a small basket containing crystal fragments hangs at the other end. The balance measures the density of fluids. This is done by immersing the glass sphere in a fluid. To counterbalance the buoyancy of the fluid and keep the balance in equilibrium, it is necessary to place a weight (corresponding to a certain number of crystal fragments) in the basket. The denser the fluid, the fewer the crystal fragments needed to achieve equilibrium. The instrument combines the principles of Archimedean upward thrust and of Galileo's *bilancetta* (small balance).

In Galileo's opinion, Archimedes suspended the wreath from one end of a scale and balanced it with an equal mass of gold suspended from the other end. Then he immersed the suspended wreath and gold into a container of water. If the scale remained in balance then the wreath and the gold had the same volume, and so the wreath had the same density as pure gold. However, if the scale tilted in the direction of the gold, then the wreath had a greater volume than the gold, and so its density was less than that of gold. It must then be an alloy of gold and some lighter material.

To check the practicality of this technique let us again assume a 1000-gram wreath, which is an alloy of 70% gold and 30% silver. Because its volume is 64.8 cubic centimetres, it displaces 64.8 grams of water. (Water has a density of 1.00 gram/cubic-centimetre). Its apparent mass in water is thus 1000 minus 64.8 grams, or 935.2 grams. Next, 1000 grams of pure gold has a volume of 51.8 cubic centimetres, and so its apparent mass in water is 1000 minus 51.8 grams, or 948.2 grams. Thus, when both ends of the scale are immersed in water, there is an apparent mass of 935.2 grams at one end and an apparent mass of 948.2 grams at the other end, an imbalance of 13.0 grams. Scales from Archimedes' time could easily detect such an imbalance in mass. Additionally, sources of error arising with Vitruvius's method (surface tension and clinging water) would not arise with this scale method. It should be remarked that the scale method still works if the masses of the wreath and the gold are not equal. One simply adjusts their distances from the fulcrum of the scale until the scale balances before dipping them into the water.

Maria Gaetana Agnesi And Crown's Problem

In Volume I, Section I, Problem III, p.122, Agnesi introduced the question how to find the quantity of the gold and of the silver mixed in the Hiero's crown, if it is known the crown's mass and the density of the gold and of the silver.

Solution: let m be the crown's mass, p_c the crown's density, p_g the gold's density, p_s the silver's density. We suppose that $\frac{p_g}{p_s} = \frac{19}{10+\frac{1}{3}}$ and $\frac{p_g}{p_c} = \frac{19}{17}$. If x is the weight of the gold, the weight of the silver is $m-x$. Then, if we considers the volumes, we have

$$\frac{m}{17} = \frac{x}{19} + \frac{m-x}{10+\frac{1}{3}}. \text{ We solve: } \frac{(19-10-\frac{1}{3})x}{19(10+\frac{1}{3})} = \frac{(17-10-\frac{1}{3})m}{17(10+\frac{1}{3})} \text{ and then } x = \frac{190}{221}m.$$

If, for example, the mass of crown is 5 marks (about 1174.98 grams), x is about 1010.17 grams and $m-x$ is about 164.82 grams. Mark is the ancient weight measure's unity for the precious metals.

Father Paolo Romeo Da Siderno Solution

In 1842, Paolo Romeo da Siderno, published the book *Lezioni elementari di aritmetica propriamente dimostrativa* (Elementary lessons in demonstrative mathematics). In this book (Lecture XXXIX "About the problems solved with the rule of Alligation", p.191), he shows his solution of the Hiero's problem as a special case of the rule of alligation. The mathematical operation called "alligation", a term that means "tying together", was usually presented near the end of arithmetical texts, presupposing a knowledge of the rules of proportion.

There are two main types of alligation: "alligation medial" for simple problems and "alligation alternate" for use when varied quantities and elements are to be mixed. Most commonly, the examples used to explain alligation involved grains, metals, wines or spices.

Father Paolo says that we must produce two crowns similar to the Hiero's crown. The first is made of pure gold and the second made by pure silver.

Weight of the goldsmith crown= 15

Weight of the gold crown= 19

Weight of the silver crown= 10

Difference between the goldsmith crown and the silver crown=5

Difference between the goldsmith crown and the gold crown=4

Sum of the differences=9

Therefore, Padre Paolo concludes that in the goldsmith crown we have that $\frac{5}{9}$ are in gold and $\frac{4}{9}$ are in silver.

The Second Volume Of *Instituzioni Analitiche*

Maria Gaetana devoted the Book III of the Second Volume to "*Integral Calculus*":

- I. Rules of Integrations expressed by Finite Algebraical Formulae, or which are reduced to supposed Quadratures
- II. Rules of Integrations, having recourse to Infinite Series
- III. The Rules of the foregoing Sections applied to the Rectification of Curve-lines, the Quadratures of Curvilinear Spaces, the Complanation of Curve Surfaces, and Cubature of their Solids
- IV. The Calculus of Logarithmic and Exponential Quantities

Among the problem that Maria Gaetana solved in Section IV, we consider the application of logarithm to a problem of everyday life, that we can find in more elementary form in Luca Pacioli's *De Viribus Quantitatis*.

Application Of Logarithm

In Book III, p.244, Maria Gaetana introduced this problem:

A vessel being given of a known capacity, full of any liquor, suppose wine, out of which is drawn a draught of a given quantity and then the vessel is filled up with water. Of this mixture of wine and water another draught is drawn equal to the former, and the vessel is again filled up with water. Again of this mixed liquor another such draught is drawn out; and the same operation is continually repeated in the same manner. It is demanded how many such draughts may be drawn out, or how many times the operation must be repeated, that a given quantity of wine may be left in the vessel.

Solution

a = vessel capacity

b = quantity of each draught.

In the first draught, a quantity of wine equal to b is removed, and because we add a quantity of water equal to b , the quantity of wine in the vessel is equal to $a-b$.

In the second draught, will be drawn out the quantity b of the mixture, so that to have a quantity x of pure wine contained in the vessel, we must make this analogy: $a : b = (a - b) : x$. Then $x = \frac{ab-b^2}{a}$ is the quantity of pure wine that is drawn out at the second draught, and there remains in the vessel the quantity of pure wine

$$\frac{a^2-2ab+b^2}{a} = \frac{(a-b)^2}{a}.$$

In the third draught, will be drawn out the quantity b of the mixture, so that to have a quantity x of pure wine contained in the vessel, we must make this analogy: $a : b = \frac{(a-b)^2}{a} : x$. Then $x = \frac{b(a-b)^2}{a^2}$ is the quantity of pure wine that is drawn out at the third draught, and there remains in the vessel the quantity of pure wine

$$\frac{(a-b)^2}{a} - \frac{b(a-b)^2}{a^2} = \frac{(a-b)^3}{a^2}$$

Then, after n draughts, there will be left in the vessel the quantity of pure wine

$$\frac{(a-b)^n}{a^{n-1}}$$

Therefore if we want to know how many draughts must be taken so that there should remain in the vessel a given quantity of pure wine, for example $\frac{a}{m}$ part of the whole, we must solve the equation

$$\frac{(a-b)^n}{a^{n-1}} = \frac{a}{m}$$

Where, because n is an unknown number, will be an exponential quantity.

$$\frac{(a-b)^n}{a^{n-1}} = \frac{a}{m} \Rightarrow \log \frac{(a-b)^n}{a^{n-1}} = \log \frac{a}{m} \Rightarrow n \log(a-b) - (n-1) \log a = \log a - \log m \Rightarrow$$

$$n \log(a-b) = n \log a - \log m \Rightarrow n = \frac{\log m}{\log a - \log(a-b)}$$

Conclusions

We think that pre-university students can acquire the fundamental mathematical ideas using also everyday problems. From this point of view, we can use many suggestions and examples, contained in Agnesi's Books. If we propose these arguments or problems by means of laboratory instruments, flipped classroom techniques, or by didactical methods that you prefer, we think that the media are different but the meaning is the same.

Abstract

The purpose of this study is to explore a multicultural community of married immigrant women as an ethnographic case, and to discuss the cultural implications of this community for Korean society and immigrants. The research site for this study is a “peace room” which has a ten-year history as open community for married immigrant women. We visited the peace room every week from March to June 2016, and collected data through participatory observation and interviews. We interviewed twelve married immigrant women in the community. We found that cultural practices in the peace room were not focusing on overturning or resisting to the existing values or order. Instead, the married immigrant women who participated in cultural practices in the peace room positively understood, experienced, and utilized the value of the rural mainstream society. We found that the efforts of the multicultural community to adapt to Korean value and language have led to meaningful changes for both the village and the married immigrant women. This study suggests that married immigrant women can act as cultural agents in the society.

Keywords: *Daily cultural community, Rural, Married immigrant women, Ethnography, Peace room*

Introduction

This study considers a multicultural community in a rural area as a 'daily cultural community.' The purpose of this study is to present the characteristics of the multicultural community as an ethnographic case and to discuss its cultural implications in Korean society.

Until now, multicultural policy in Korea has focused on married immigrant women as a primary target and worked on educational programs for those women and their children. Particularly, for adaptation of married immigrant women to Korean society, Korean society has dealt mainly with their issues of adjustment, identity formation, and social interaction, based on the public education system such as 'Multicultural (Education) Center.' However, there is criticism that there is no multicultural in the curriculum (Joongang Sunday, April 9, 2017). It is said that the multicultural center should be called as 'Korean culture center', if foreigners merely learn how to learn Korean and how to make Kimchi in the center. Although cultural absorption rather than coexistence of culture has been sought as criteria to evaluate their adjustment or maladjustment, Korea should be aware of a reality that there are 2 million immigrants and about 140,000 married immigrants (7% of foreigners).

Many studies have focused on the cultural practices of everyday life, such as family life, food, language, and education, which are experienced by married immigrant women in their adaptation process to Korean society (Kim, 2014; Kim, 2014; Oh et al, 2014; Yoon, 2005). These studies assume that it may be danger of fixing a reality as a stereotyped image, if representation is based on those women's statements without considering patio-temporal contexts in their adaptation processes. Thus, it is also culturally significant since it focuses on those women's everyday cultural practices such as consciousness and emotion

Ethnography Site

Panorama of a open room

This study's research field is located in a home of a severely handicapped couple, who is living in a rural village in J-district, A city. This research field is referred as a “peace room.” The peace room started from an accidental meeting of a Philippine woman who lived in the village as a married immigrant woman in 2007 with another woman Su (pseudonym). At that time, Su took the role of friend and Korean teacher at her request, and B social welfare office in A city proposed to make a multicultural program together. As a result, they gathered married immigrant women in and out of their village to establish the peace room in 2008, and then work on the program with the social welfare center's administrative and financial support. It has a similar aspect to public programs such as multicultural centers. On the other hand, it has a similar character to 'self-help group'. As B social welfare center have been working their own multicultural programs since 2016, the support for the peace room has been discontinued.

The peace room is open on Tuesdays, and its programs consist of classes, communal meals, and other activities in this order. Class starts at 11:00 am and participants have lunch at 12:00 pm. After married immigrant women finish washing dishes, it is common to talk about classes and daily life while drinking tea for an hour. In the afternoon classes, a lot of intensive activities can be taught. For example, married immigrant women can receive kimchi or Korean soybean paste from kitchen or gardens. During this time, they can share clothes or children's toys, which are donated by cathedrals or individuals. They can visit the married immigrant women's farm and distribute the harvests, such as onions and potatoes. Table 1 shows a daily schedule of programs.

Researchers collected data by observing the peace room's classes from March to June 2016. We visited the peace room every week and collected data by participatory observation, individual and group interview. When it was difficult to visit due to the researcher's personal affair, a research assistant with field research experience conducted three observations.

Table 1. Daily schedule

Curriculum (11am-12pm)	Communal Meal (12-13pm)	Other activities (13pm-)
Making Korean soy sauce	Curry rice	sharing used clothes
entrance ceremony	Vietnamese spring rolls & noodles	
Visiting D community hall	Curry rice, pancake, white Kimchi, rice wine & beverage, fruits	Social welfare office paid all Singing contests
Making crafts with old stamps 1	black-bean-sauce noodles	exhibition
Video recording by KTV	BỘT BÁNH XÈO (Vietnamese festival food)	30th Anniversary of wedding
Cherry-blossom trip	Gimbap (Korean rolls)	
Group interview	Bibimbap, rice cake	rummage sale of used clothes
holiday		
Jang-Mul	black-bean-sauce noodles	
Making natural soap		
Teacher's day	Vietnamese noodles	Dutch payment
Visiting to Gumi		Su paid by herself
Making crafts with old stamps 2	Bibim noodle	exhibition
Making scrub brush	Soy noodles	Collecting mugwort
Studying English	Jab-chae rice	
Studying English	Soy noodles	Harvesting onions in D's farm
Visiting J community hall	Chicken soup, pancake, rice wine & beverage	Social welfare office paid all Collecting potatoes in F's farm
Studying English	Stir-fry of chicken	Collecting potatoes in D's farm
Closing ceremony & sweeping day	Curry rice	
Party at cafeteria	Duck & pork belly	Su paid by herself Karaoke bar

Complexity of position and adaptation problems of married immigrant women

Women who participated in the peace room have grown up in different environments and have lived in Korean society with various stories. Multicultural women are never homogeneous, and have a variety of personality and reality. Even if they are from the same nationality, there are significant individual differences such as childhood (raised) background, education level, health, personality, and relationship with family-in-law. Therefore, in order to fully understand the adaptation issues of those women, it is necessary to consider the position of each one of them in the Korean society and the socio-cultural practices.

Table 2. Participants' information

	Entrance year	Ethnic origin	Children	Occupation of husband	Matchmaking	Attendance	Reason to participate
A	2008	Vietnam	2boys	Agriculture	agency	50%	hearsay
B	2012	Vietnam	1boy 1girl	Agriculture	agency	50%	A's Introduction (3.3.2015)
C	2011	Vietnam	1boy	Agriculture	agency	60%	B's Introduction (5.2.2015)
D	2008	Vietnam	1boy	Agriculture	agency	occasion	Same village
E	2008	Vietnam	1boy 1girl	Agriculture	Agency	Occasion	Same village
F	2007	Cambodia	1girl	Agriculture	agency	occasion	Same village
G	2007	Philippine	1boy	Agriculture	Unification church	occasion	Same village
H	2008	Cambodia	none	Jobless	agency	50%	F's Introduction
I	1996	Japan	1boy 4girls	Jobless	Unification church	90%	Herself
J	1995	Vietnam	1boy 1girl	Business	agency	100%	Meeting in a cathedral (3.2012)
K	2010	Vietnam	1girl	Business	agency	100%	Friend's introduction (3.2012)
L	2008	Vietnam	1girl	Civil servant	agency	70%	Friend's introduction (3.2012)
M	2014	Vietnam	1girl	Business	agency	70%	K's introduction (3.15.2012)
N	2000	Vietnam	1boy 1girl	equipment operator	agency	40%	J's introduction (3.15.2012)

Table 2 is the overview of multicultural women who participated in the first semester of 2016 class. This gathering includes a large number of women from Vietnam, but they come from a variety of nationalities, including Cambodia, Philippine and Japan. It is always open to any participant woman regardless of the country of origin or the year of entry. It is different from the 'self-help group' organized by the country of origin.

Strategies and Cultural Practices to Live in Patriarchal Rural Society

The social pressures and expected role behaviors imposed on married immigrant women in multicultural family in Korean rural societies can be summarized as "obeying the husband and honoring the elders of the family". It is the same in the peace room.

I strongly recommend married immigrant women to behave good in family-in-law and obey husband. I cannot help but emphasize this, otherwise they will be the one who suffer (Su, April 12).

It is not appropriate, if the peace room is understood as being absorbed in the patriarchal dominant ideology of Korean rural society. We should consider a special situation that the person in charge of the peace room is handicapped couple and that married immigrant women are in the weakest position in the society. Considering their social situations, it is hard for them to assert or act on their rights. Although the peace room repeatedly emphasized honor to parents-in-law and obedience to husband, it also asked those women to be more active and aggressive in dealing with individual problems or situations.

Mrs. 00 told me that she was hit once, so I told her to report to the police. I kept telling her never to bear such a thing like that (Su, June 14).

Since my husband is a public official, my mother-in-law is holding the household economy. She does not give money to me. She says, "If I give you the money, you will leave the family." So I go work at the mushroom factory or farming house (L, April 12).

When a husband's violence occurs, Su advises active coping strategies such as "reporting to the police." And when a Korean mother-in-law puts severe economic constraints for the control of daughters-in-law, Su recommends married immigrant woman to build their own ability to have economic power. Main curriculum of the peace room is to visit community hall and senior center twice a semester, fourth a year. The purpose of this program is to provide an opportunity to learn the value and language of the mainstream group and use it as a tool of persuasion in everyday life. Filial piety by sharing the food with the seniors who live alone or visiting the town hall to talk to the elderly people, and the performances for married immigrant women's children is combined with the solidarity of local community, the welfare of the elderly people, and the awareness of married immigrant women. In other words, married immigrant women's activities are emerging as cultural practice with new meanings. This practice has been an important opportunity for positively changing the existence of those women and the peace room in villages and local communities.

The elderly people remind me of my grandparents in Vietnam. I believe that my children will take good care of me with love when I get old as I do it the same way to elderly people. I felt good because they enjoyed the food I made (A, June 14).

Married immigrant women can feel that they are getting better during involvement of activities that they mentioned. Their scope of activities are gradually expanding from one village hall to currently two town halls and two elderly halls. In this way, the peace room is creating interactions with local communities and emotional sympathy. In addition, as married immigrant women have served food in the village where they live, their own presence has been emerging. It is dangerous to misunderstand the change of perception of village residents as a result of program such as visits to the elderly halls. Apart from the activities of the peace room, it has been several years since married immigrant women entered the village, and it is possible to accompany natural change of village residents' perception. Nevertheless, it is clear that married immigrant women have the opportunity to show their presence inside and outside the village through these activities. Married immigrant women may have confidence to contribute to their village or community. These activities are noteworthy in terms of cultural studies, because it is related to the recovery of self-esteem and positive self-identity.

Conclusion

As a cultural experiment in microscopic and everyday unit, this study is to investigate the case of cultural practices in a community, the responses of the rural society to the multicultural coexistence, and thus the possibility of formation of new social order. The research does not focus on how married immigrant women were absorbed into a single culture, but how they shared and resolved the situation and conflicts encountered in daily life of individuals. Ten years history of the peace room has been marked by social conflict, exclusion, and prejudice in the relation of external groups. Cultural practice, which has been emphasized in this process, was not based on overturning or resistance to existing values or order. But rather, adaptation strategy sought by the peace room is a way of positively accepting and utilizing such values as 'filial piety' and 'traditional virtue' which were emphasized in the rural mainstream society.

However, it is unreasonable to understand those women as passive ones which their actions and practices are utilized by the dominant ideology. It should be taken into account that the disabled couple as the operators of the peace room, and the marriage immigrant women as main participants in the peace room were not in a position to positively express their rights in reality. However rather, they have sought cooperation with the villages and local communities through cultural practices such as accepting and utilizing the value and language of existing mainstream society. Typical activities are as follows: visiting community centers, serving food to the elderly, or playing with them. Thus these activities were forming exchanges and emotional bonds with the villages and communities. These cultural practices in daily life have actually led to meaningful changes in villages and communities. For example, attitude of the elderly who refused those women using or visiting the village hall from the beginning has changed to the approval of the existence of married immigrant women. It is also worth of taking note of cultural asset that married immigrant women have self-esteem and positive identity formation.

Massive Open Online Courses: Inspiration For Redesigning An Undergraduate Introductory Course In Mathematics

Jana GLIVICKÁ

Department of Mathematics University of Economics, Prague Czech Republic

jana.glivicka@vse.cz

Abstract

This paper deals with a possible redesign of the course *Mathematics for Economists*, a compulsory undergraduate introductory mathematics course taught at the University of Economics, Prague. As an inspiration for this redesign, we have chosen massive open online courses, due to their recent popularity and much discussion of their impact on traditional university teaching process. Although there are many vital aspect that have to be taken into account for a successful and meaningful redesign, in this paper we focus on the students' perspective – their learning experience, expectations and other aspects. The data needed for this research were collected using in-class observation during recitation sessions of the course by the author of this paper, a teaching assistant for the course, and using an anonymous paper survey conducted by distributing questionnaires to students enrolled in three of total twenty-nine recitation groups of the course in summer term 2017/2018. The main findings show that students spend, on average, 4.8 hours per week on the course, not including preparation for the interim test, final test, and oral exam, which amounts to additional 42 hours, on average; students attend recitations far more often than lectures; and they value most the interaction with teacher's assistant over particular problems encountered during their study, substantially more than revision of theory or methods used to solve problems. These basic findings, as well as results of an experiment of Massachusetts Institute of Technology allowing students to replace a traditional university course by its MOOC version, has lead us to a proposal of new course design. The core characteristics of this proposal are the usage of pre-recorded lectures and tutorials, compulsory online homework and recitations dedicated mostly to addressing particular difficulties encountered by students while engaging the former course components.

Brief History Of Moocs

The term *massive open online course* (MOOC) was probably first used [Cormier, 2008] by David Cormier from University of Prince Edward Island in a Skype conversation with George Siemens, one of the authors of the course *Connectivism and Connective Knowledge*. This course is now considered as one of the first cMOOCs, i.e. MOOCs based on the principles of connectivist pedagogy. Our interest, nevertheless, is in the so called xMOOCs, whose structure more closely follows the structure of traditional university courses – the syllabus of the course is given in advance, sometimes including deadlines for assignments and tests, and the backbone of the course usually consists of recorded lectures, followed by individual assignments, sometimes group activities, and moderated discussions.

Today, there are many providers of MOOCs, some commercial, other non-profit, some founded by universities, other by private companies established primarily for that purpose. Two of the most notable providers are edx.org, created in 2012 by Massachusetts Institute of Technology and Harvard University, and Coursera, founded also in 2012 by Stanford University professors Andrew Ng and Daphne Koller.

Since we are interested primarily in the possible use of MOOC principles and tools in redesigning traditional university courses, let us now focus more on edx.org, a platform founded and closely collaborating with universities from all over the world. As this day, edx.org offers over 2000 different courses in subjects as varied as architecture, computer science, ethics, food and nutrition, chemistry, law or physics, and provided by a growing number of institutional partners including MIT, Harvard University, Caltech, ETH Zurich or Kyoto University; as of today, it has now more than 14 million students from all over the world, with over 52 million individual enrollments across the courses it offers.

Introduction

A traditional undergraduate course in mathematics usually consists of two basic components – lectures and recitations. During the lectures, attended by a large number of students in one group, the lecturer presents the topic, explains theory, gives basic examples and solves a few typical problems related to that topic; students are usually expected to follow the lecture completely without or with only limited interaction between them and the lecturer. The lecture is then followed by recitations; students are divided into a larger number of smaller recitation groups and engage the topic being studied individually or in small groups under the observation and in interaction with teacher's assistant, solving problems, discussing challenging topics, recalling the theory they learned during the lecture.

The course *Mathematics for Economists* has been taught this way for more than 10 years. It is a one-semester undergraduate course offered to students of University of Economics in Prague both during the winter and summer

term. As a compulsory subject for various study programs, it is attended every year by a large number of students from five different faculties of the university. In the summer semester 2017/2018, 733 students were enrolled in the course; they were divided into 7 lecture groups and 29 recitation groups, so that every lecture group consisted of approximately 100 and every recitation group of approximately 25 students. Students are expected to spend 26+26 hours per semester attending lectures and recitations, 26+26 hours preparing for them, 13+13 hours preparing for the interim and final test and 26 hours preparing for the final oral exam; the expected workload makes this course worth 6 ECTS credits. The course covers basic topics in undergraduate mathematics – linear algebra and matrices, convergence, differentiation, integration, functions of two variables and differential equations. Apart from the lectures and recitations, another study resource is available to students – the textbook *Mathematics for University of Economics* [Klůfa, 2016], written especially for the course.

The main topic of this paper is the question whether and how such a course could be redesigned in the light of the experience gathered from courses run on MOOC platforms like edx.org. This, of course, is in no way a small matter, as various aspects play vital role in any possible new design of a compulsory university course – material and personal capacities of the department providing such a course, different requirements on the content of the course from all the faculties to whose students the course is offered, the role of the course in different accredited study programs et cetera. The scope on this paper does not allow us to address all the perspectives of this task; we have decided to focus here on the students' perspective – their learning experience, expectations, and the amount of knowledge attained.

Methodology

During the summer term 2017/2018, the author of this paper was a teacher's assistant for three recitations groups of the course *Mathematics for Economists*. Apart from occasional in-class observation during the recitations, the data for this paper were collected using an anonymous paper survey. In the twelfth of the thirteen weeks of the semester, the students present at the recitations (38 out of total 75 enrolled in the three recitation groups) were asked to fill out survey questionnaires. The questions and possible answer choices are presented below.

1. What percentage of the lectures have you attended to? (100-80%, 79-60%, 56-40%, 39-20%, 19-0%)
2. What percentage of the recitations have you attended to? (100-80%, 79-60%, 56-40%, 39-20%, 19-0%)
3. Have you or do you intend to pay a private tutor to help you study for this course? (yes, no)
4. With respect to your study program, do you understand why this course is compulsory for you? (yes, rather yes, don't know, rather no, no)
5. With respect to your study program, do you understand why you are to study the main topics of this course, i.e. vectors, matrices, derivatives, integrals, differential equations? (yes, rather yes, don't know, rather no, no)
6. How many hours per week on average have you spent preparing for the course during the semester? (open question)
7. How many hours have you spent preparing for the interim test? (open question)
8. How many hours do you expect to spend preparing for the final test and oral exam? (open question)
9. Do you find yourself to struggle with understanding the basic methods used to solve problems? (yes, rather yes, don't know, rather no, no)
10. Do you find yourself to struggle with solving problems on your own? (yes, rather yes, don't know, rather no, no)
11. Do you find yourself to struggle with understanding the theory? (yes, rather yes, don't know, rather no, no)
12. If parts of the lectures were video-recorded, would you use as a study resource the parts explaining the theory and basic notions? (yes, rather yes, don't know, rather no, no)
13. If parts of the lectures were video-recorded, would you use as a study resource the parts explaining how to solve typical problems? (yes, rather yes, don't know, rather no, no)
14. If parts of the recitation were video-recorded, would you use as a study resource the parts explaining how to solve typical problems? (yes, rather yes, don't know, rather no, no)
15. If parts of the lectures were video-recorded, would you use as a study resource the parts explaining how to solve untypical problems (unusual methods and “tricks”)? (yes, rather yes, don't know, rather no, no)
16. If it were possible to spend an hour with your teacher's assistant preparing for the final exam, would you like to revise the theory? (yes, rather yes, don't know, rather no, no)
17. If it were possible to spend an hour with your teacher's assistant preparing for the final exam, would you like to revise the basic methods used to solve problems? (yes, rather yes, don't know, rather no, no)
18. If it were possible to spend an hour with your teacher's assistant preparing for the final exam, would you like to consult particular difficulties you have encountered while studying the theory? (yes, rather yes, don't know, rather no, no)
19. If it were possible to spend an hour with your teacher's assistant preparing for the final exam, would you

like to consult particular difficulties you have encountered while solving problems? (yes, rather yes, don't know, rather no, no)

The questionnaire was designed to gather data not only for this paper, but for other research as well. That is why we will not include all of the questions in our analysis; nevertheless, for the sake of completeness, we present the questionnaire as a whole.

Data Analysis And Summary

The data gathered from the questionnaires show the following:

- Out of 38 students, 8 payed or intended to pay a private tutor to help them study for the course.
- On average, students spent 1.8 hours per week preparing for the course during the semester.
- On average, students spent 11.7 hours preparing for the interim test.
- On average, students expected to spend 30.3 hours preparing for the final test and oral exam.

During the semester, students are expected to spend 1.5 hours per week at lectures and 1.5 hours per week at recitations. Thus, spending 1.8 hours per week preparing for the course at home makes home-study more time-consuming activity then both attending lectures and recitations.

Figure 1 and Figure 2 summarize students attendance of lectures and recitations.

Figure 2

This data suggest that students clearly prefer recitations to lectures, yet it has to be mentioned that the data were collected at a recitation session. While data collected at a lecture might give a different picture, it is a general experience (although not supported by any measurement) that students of the course tend to attend recitations more often then lectures. Preference of recitations to lectures could be explained by the fact that students value direct interaction with teacher's assistant during recitations and the possibility to engage the topic being studied and related problems on their own, but with teacher's assistant present to help in real time. This explanation is supported by the students answers to the last four question in the survey. Figure 3, presenting the distribution of answers, clearly shows that students prefer consulting particular difficulties they have encountered while studying the theory

(consult theory column) or while solving problems (consult problems column) to revising theory (revise theory column) or methods used to solve problems (revise problems column).

Figure 3

As can be easily seen from Figure 3, students are more interested in teacher's assistant's help with problems than with theory.

The last piece of data relevant to our research interest, Figure 4, summarizes students' intentions to use potential video-recorded lectures as a study resource. In questions 12 to 15 students were asked whether they would use video-recorded parts of lectures explaining theory and basic notion (lecture theory column), explaining how to solve typical problems (lecture problems column), or recorded parts of recitations explaining how to solve typical (recitations typical column) or untypical problems (recitations untypical column).

Figure 4

Once more, Figure 4 shows students inclination to focus in their preparation for the final exam more on problems than on theory, yet this preference is not as much decided as in the previous set of questions; nevertheless, the rather high number (20 out of 38) of students who are not interested in revising theory with teacher's assistant is not paralleled here, the number of students who would not use video-recorded lectures explaining theory is very low.

An Experiment: Mooc For On-Campus Students

During the fall semester 2016, Massachusetts Institute of Technology (MIT) has decided to conduct an experiment – MIT students were allowed to enroll in the edX version of *Circuits and Electronics* course instead of the

traditional on-campus version of the same course; the outcomes of the experiment are summarized in a report [Marshall, 2017]. Although the key components of MOOC courses (video lectures, online discussions and quizzes, interactive learning environment) have been used in university education for decades, this was arguably the first time when resident university students could finish a compulsory course completely on-line, without ever meeting instructor of the course or teacher's assistant. This makes this experiment considerably different from other approaches to usage of communication and audio-visual technologies in education, such as the concept of flipped classroom, in which students are typically supposed to watch recorded lectures on their time outside of classroom and the work usually considered homework is performed in class under supervision and in interaction with teacher's assistant.

For our paper, the following findings of the report [Marshall, 2017] are of interest – the distribution of grades of students enrolled in the MOOC version of the course was comparable to that of students attending traditional lectures and recitations; although students of the MOOC version were encouraged to come to on-campus office hours, only few used that opportunity; online homework was seen as useful by students, since it allowed immediate feedback; the MOOC version of the course was rated by students as less stressful.

Redesigning The Course

As we have seen, a typical student of *Mathematics for Economists* spends, or is supposed to spend, 3 hours per week in lectures and recitations, and 1.8 hours by studying out of classroom; thus, in total 4.8 hours per week are dedicated to the course. As from the students' perspective it is clearly not desirable to increase the amount of time spent on the course, let us now try to envisage a possible redesign of the course that does not exceed the limit of 4.8 hours of expected studying per week. This new design should also take into account the students' preference to attend recitations rather than lectures, the fact that they are prepared to use video-recorded lectures in their out of classroom study, and the clear tendency to value more the possibility to consult particular difficulties they have encountered than presentation and revision of the material to be mastered.

It seems reasonable to use pre-recorded lectures, as studies show students find them more valuable than live lectures [Cardall, Krupat, Ulrich, 2008]. Experience shows [Kajimoto, 2016] that pre-recorded lectures tend to be less repetitive than traditional face-to-face lectures and therefore it takes less time to cover the same amount of material. Let us thus suppose that instead of 1.5 hours of traditional lecture the average amount of time for pre-recorded lecture material would be 1 hour per week. Pre-recording would also allow for the possibility of slightly prolonging or shortening the lecture depending on the topic being covered, an advantage to traditional lecture where the amount of time available is given by the schedule.

From the author's experience as teacher's assistant, about one third of time of a recitation session is spent in frontal delivery of content to students (usually solving typical problems and mentioning some tricks and untypical approaches), in the rest of the session, the students are working on problems themselves under teacher's assistant's supervision. The first part, frontal context delivery, could again be pre-recorded. In total, pre-recorded content would thus comprise of approximately 1.5 hours of audio-visual material – 1 hour of lecture and 0.5 hour of recitation/tutorial.

Thus, instead of attending lectures and recitations, students would be expected to watch this material out of class. Recitations session could then be fully dedicated to teacher-student interaction which is valued most. It does not seem reasonable to try to avoid recitations completely or to opt for shorter recitations; both our data and other studies [Griffiths, Mulhern, Spies, 2015] show high perceived value of interaction with lecturers or teacher's assistants. But, as we have seen, students are most interested in consulting particular difficulties they have encountered in their own preparation for the course, so it would indeed be helpful if they came to recitations after they first tried to solve some problems of their own. This could be arranged for by including some amount of online homework after the pre-recorded content. The homework should test basic understanding of theory and methods of problem solution, so that students would have a chance to identify fundamental misunderstanding or gaps in understanding of the concepts and methods they are expected to master that week and thus potentially come to recitation session with particular questions and challenging topics. Based again on in-class observation and experience, the expected time spent on such homework assignments should be between 0.5 and 1 hour, depending on the student's mastery of the subject.

This takes us to the following redesign proposal; a typical weekly workload should comprise of

- approximately 1 hour of pre-recorded lecture focused mainly on theory and concept mastery
- approximately 0.5 hour of pre-recorded recitation/tutorial focused on problem solutions
- online homework, between 0.5 and 1 hour, depending on student's mastery of the subject
- in-class recitation session of 1.5 hour
- possible self-study and office hours, depending on the student's consideration and needs

The total time demands of the first four points in our proposal are between 3.5 and 4 hours per week; having in mind that students of *Mathematics for Economists* nowadays spend 4.8 hours on average on the course, this still

leaves 0.8–1.3 hours for self-study and office hours while not increasing the amount of time students have to designate for their study. It might even be expected that students will not even need that much time for their own preparation, as the recitations are to be expected more effective, since the new course design leads the students to come to recitations more prepared than before.

As we have also already seen, students of *Mathematics for Economists* spend 42 hours on average in total preparing for the interim test, final test and oral exam. The pre-recorded lectures and recitations/tutorials are one more study resource the students would gladly use, as our survey clearly show. It can be argued that added value of such a material is the fact that it is the very same material from which the students learned the subject for the first time, thus making their recalling easier and more effective than in the case of real-time face-to-face lectures to which, of course, the students cannot return and thus rely solely on their own notes.

Another advantage from the perspective of students is the fact that the new design demands only 1.5 hour of in-class time per week, instead of 3 hours of the traditional design (1.5 hour of lecture and 1.5 hour of recitation). This makes it easier to fit the course into their schedule and allows more time for facultative courses and extracurricular activities.

The inspiration for this design by MOOCs is clear; it can even be said that the first three components of our course design (pre-recorded videos and online homeworks) could stand alone as a MOOC. The only crucial aspect of a MOOC that is missing is online discussion forum. There is clearly no need for that, as instead of online discussions there are weekly recitation sessions. It should also be noted that our concept does not really fit under the concept of a flipped classroom, as in a typical flipped classroom some of the content is delivered in-class, whereas in our design, all the content is already present in the pre-recorded lectures and tutorials and recitations serve more as group office hours, being dedicated primarily to addressing particular problems students have already encountered during their study for the course.

Conclusions

In this paper, we have tried to suggest a redesign of the course *Mathematics for Economists* based on the experience of usage of MOOCs in traditional university setting and on the data gathered from students of the course mentioned. The main guideline for this redesign was the perspective of students, thus all the other vital perspectives, that of the department providing the course, of demands of the faculties to whose students the course is offered, or of various study programs accreditations, were set aside. The resulted course design comprises of three core elements, duration given per week – about 1.5 hour of pre-recorded lecture and tutorial material, 0.5–1 hour of online homework, and 1.5 hour of in-class recitations.

Various possibilities for further research are clearly at hand. First of all, it would be necessary to take into account the other perspectives mentioned in the previous paragraph before a project of new course design could move to another phase. The next logical phase would be that of testing the new design, either some components of it separately, as add-ons to a traditional course, or as a whole, for a selected group of students. In this phase, possibilities for research would be numerous, yet as for now, this stage still lies, if it comes to that point at all, in a distant future.

Acknowledgment

This paper was processed with contribution of long term institutional support of research activities by Faculty of Informatics and Statistics, University of Economics, Prague.

Özet

Lisansüstü eğitimin temel felsefesi, bireylerin belli bir süre içerisinde geniş bir araştırma yapması ve araştırma yaptıkları konuda yeteneğini geliştirerek uzmanlaşmasıdır (Şahin vd., 2013). Ayrıca lisansüstü çalışmalarda bilimi üretme ve yayma faaliyetleri kapsamında araştırmacıların bilimsel rapor yazma becerilerini geliştirmek de hedeflenir. Lisansüstü eğitimini tamamlamış bireylerin bu yeterliklere ulaşabilmesi için 20 Nisan 2016 Tarih ve 29690 sayılı Lisansüstü Eğitim ve Öğretim Yönetmeliği'nde "...Bilimsel araştırma teknikleri ile araştırma ve yayın etiği konularını içeren en az bir dersin lisansüstü eğitim sırasında verilmesi zorunludur." hükmü getirilmiştir. Bu bağlamda lisansüstü eğitim gören öğrencilerin bilimsel bir araştırma gerçekleştirebilme ve bu araştırmayı rapor edebilme becerilerine sahip olmalarının ne denli önemli olduğu açıktır. Bu becerilerin öğrencilere kazandırılması için atılacak ilk adım ise lisansüstü öğrencilerin bilimsel araştırma raporlarında yaptıkları hataların tespit edilmesidir. Buradan hareketle gerçekleştirilen bu çalışmada, yüksek lisans öğrencilerine ödev niteliğinde verilen bilimsel araştırma raporlarındaki hatalarının incelenmesi amaçlanmıştır. Nitel araştırma metodolojisi ile gerçekleştirilen araştırmanın katılımcıları, İç Anadolu Bölgesi'nde bir üniversitenin Eğitim Bilimleri Enstitüsü'ne kayıtlı 28 yüksek lisans öğrencisidir. Araştırmada bulgular doküman analizi ile elde edilmiştir. Dokümanlar, araştırmacıların gözlem veya görüşme yapmadan veri toplayabildiği ve nitel araştırmalarda etkili bir şekilde kullanılan bilgi kaynaklarıdır (Yıldırım ve Şimşek, 2011). Bu çalışmada kullanılan dokümanlar, öğrencilerin bilimsel araştırma raporlarıdır. Öğrenciler, kendilerinin belirlediği bir konuda bir öğretim üyesi rehberliğinde bilimsel bir araştırma gerçekleştirmiş ve bunu rapor etmişlerdir. Dokümanların incelenmesi sonucunda ise yüksek lisans öğrencilerinin tamamının kaynak gösterimi konusunda sıkıntı yaşadıkları tespit edilmiştir. Katılımcılar, gerek metin içi alıntılarda gerekse kaynakça oluşturmada APA 6.0'ya uygun bir şekilde kaynak gösterimi yapamamaktadır ($f=28$). Bununla birlikte bu çalışmada; katılımcıların çalışma grubu seçiminde ve bu grubu tanımlamakta ($f=17$) da sorun yaşadıkları, deneysel veya yarı deneysel olmayan araştırma desenleriyle gerçekleştirdikleri araştırmalarda bağımlı-bağımsız değişken belirlemeye çalıştıkları ($f=14$), araştırmanın gerekçesini ve önemini açıklayamadıkları ($f=6$), araştırmalarının amacı doğrultusunda araştırma sorusu oluşturamadıkları ($f=5$) ve veri toplama araçlarını doğru seçemedikleri ($f=3$) ortaya çıkarılmıştır. Araştırmanın sonuçları doğrultusunda yüksek lisans öğrencilerinin lisansüstü eğitimlerinde bilimsel araştırma yöntemleri ile ilgili ders sayılarının artırılması veya ders saatinin artırılması önerilebilir. Ayrıca lisansüstü eğitimde öğrencilerin daha çok bilimsel araştırma yapabilecekleri bir öğrenme deneyimi ortamı sağlanması öğrencilere fayda sağlayabilir.

Masters Bring Business Benefits – Proved By Finnish Managers

Dr Maria JAKUBIK
 Head of the Master's Programme
 Haaga-Helia University of Applied Sciences
 Helsinki, Finland
 maria.jakubik@haaga-helia.fi

Abstract

In this empirical research paper, I seek to answer the question: *How does working life benefit from UAS master's theses?* My goal is to demonstrate how master's students of the Degree Programme in International Business Management (IBMA) at Haaga-Helia University of Applied Sciences (UAS) in Finland bring business benefits to organizations with their master's theses as work development projects. For this purpose, I collected and analyzed qualitative data from 91 organizations during the period of 2007-2016. This qualitative, thematic analysis shows that organizations benefit from UAS master's theses. The benefits proved by Finnish managers are very tangible ones, such as internationalization strategies, digital marketing plans, market research and analysis, training programs, communication plans, and so on. The empirical contribution of this paper is significant to employers of UAS master's graduates, UAS business educators, and educational policy makers. The findings increase the awareness and competitiveness of UAS master's graduates in the job market. Furthermore, they show how and why business and academic collaboration is critical.

Keywords: *Master's thesis, business benefits, business and academic collaboration, university of applied sciences*

Introduction

In the knowledge economy, the traditional university faces new challenges and opportunities because it cannot be considered anymore as the sole contributor to knowledge creation. 'For universities the question is not only how to create usable research knowledge or find the needed knowledge, but also how to become a partner, act in dynamic innovation networks, combine knowledge from several sources and co-create it with other organizations to contribute to industry innovation and society as a whole' (Laine et al. 2008, 9). Nowadays knowledge is perceived more broadly, i.e., epistemology of knowledge is extended to practical, empirical knowledge. While traditional universities play an important part in basic research as producers of theoretical knowledge, universities of applied sciences (UAS), by focusing on applied research, produce knowledge that brings practical benefits for businesses.

The topic of academic and business collaboration is not new, but it has become more important as the benefits of collaborative, social learning and knowing become imperative. Wenger (2005, 214) argues that communities of practice as living contexts are places not only for knowledge acquisition, but also for knowledge creation. Tulkki's view is that 'Universities of applied sciences are in a key position in guiding and enriching the flows of knowledge ... (they) act as the testers and forerunners of learning wisdom' (Tulkki 2008, in Laine et al. 2008, 124-5). The master's thesis in a UAS is an excellent example of social, collaborative learning in practice in a rich learning context, in an ecosystem where business problems are solved together (Jakubik 2017).

Since August 2005 in the Finnish higher education system, both traditional universities and universities of applied sciences (UAS) provide master's degrees. However, Ojala (2017) in her doctoral dissertation argues, 'Compared to the master's degree from traditional universities graduates of the UAS master's degree believed that the degree generates more competence than competitiveness.' Ojala surveyed UAS master's graduates and employers. Based on a survey of 72 employers in 2012 Ojala concludes, 'Employers indicated that the increased value of the UAS master's degree was its focus on work and practice, as well as increased specialist expertise.' She adds, 'Employers ... were satisfied with how the education responds to the requirements of working life.' My objective in this paper is to verify her cross-sectional (2012) results with an extended, longitudinal, 10-year qualitative data analyses based on feedback from 91 Finnish managers, employers of UAS master's graduates.

This research is needed because of the different status and competitiveness of master's degrees from traditional universities and universities of applied sciences on the labor market and because there is a need for more clarification of the business benefits for employers of the UAS master's degree and thesis. Furthermore, I strongly believe that there is a need for making the UAS master's degree better known to employers because it would increase the competitiveness of UAS master's graduates. Therefore, in this paper, I focus on the business contributions of the UAS master's theses. I seek to answer the question: *How does working life benefit from UAS master's theses?*

The paper has seven sections, including an introduction, appendices, and references. After presenting the need for this study in the introduction, I describe the goal and process of the master's thesis as part of the curriculum of the Master's Degree Programme in International Business Management (IBMA) of Haaga-Helia UAS, Helsinki, Finland. Next, I focus on the thesis assessment criteria. Then, I present my data collection and research approach. Next, I demonstrate the findings of the 91 Finnish managers' assessment of business benefits brought by UAS master's students. The contributions of the work development project as a thesis is based on ten years of feedback from employers. In the conclusions, I answer the research questions, highlight the business and educational implications of my longitudinal, qualitative research, indicate its limitations, and suggest future research areas. Finally, in the appendices, I present a summary of the immediate (table 1) and future (table 2) business benefits of the UAS master's thesis sought by Finnish managers.

The Goal And Process Of The Master's Thesis

The Master's Degree Programme in International Business Management (IBMA) of Haaga-Helia UAS in Helsinki started in autumn 2007. According to the Students' Guide (2018), 'The goal of IBMA is to develop students' international business management competences through variety of work development methods and tools, international business management courses, and through tutoring them in an applied research and work development project as their master's thesis.' Working on the thesis starts from the very beginning of studies. Students are expected to act as facilitators and leaders of change by applying in practice their international business knowledge that will make them and their organizations competitive players in international business.

The three main objectives of the IBMA Programme are as follows:

1. to satisfy the increased demand of organizations for employees with practical and current international business knowledge and competencies
2. to provide a career opportunity for bachelor's graduates by continuing and upgrading their education in international business management
3. to encourage students to apply their international business management skills and knowledge in their everyday work in order to create and extract value for their organizations' (Students' Guide 2018).

The master's thesis is a 30ECTS (810 hours) work development project. Its goal is 'to develop and demonstrate the ability to apply the selected research strategies and methods in the identification and solution of an authentic, work related, international business management problem. Furthermore, the objectives of the thesis are to develop international business management skills, competences, and qualities of students that would make them competitive in the global job market' (Master's Thesis 2018).

In this master's programme the emphasis is on cooperation with working life. 'Learning during the programme happens by addressing international business management problems in case studies, research, and in the master's degree thesis that is a work development project with international business dimensions. The thesis, as an applied research and development project, is a substantial part of the studies to be implemented in close collaboration between students, their workplaces and Haaga-Helia UAS' (Students' Guide 2018).

The master's thesis process in the IBMA has four phases: planning, implementing, assessing and developing (Master's Thesis Process 2018). In this paper, I focus on the assessment phase of the thesis process because my goal is to demonstrate how the master's brings business benefits to the organizations involved. This is the phase when employers, i.e. Finnish managers, are involved in the assessment. 'Here employers assess the learning of the student during the development project. They also indicate how the organization has benefitted from the thesis, what was implemented in practice, and what the possible long-term impact and value are for the organization' (Jakubik 2017, 55). Next, I will present the assessment criteria of the master's thesis.

Thesis Assessment Criteria

As its web-site states, 'The thesis will be assessed by the HAAGA-HELIA thesis tutor, the inspector, and by the company contact person for the work development project. The thesis assessment form and criteria are available in Moodle and MyNet. A thesis grade will be given after the maturity exam is completed. The self-assessment of learning does not have an impact on the grade and it will be used for developing the thesis process' (Master's Thesis 2018). This three-party assessment of the UAS master's thesis is necessary because in this way both academic and business contributions are evaluated. Work life assessment by Finnish managers ascertains the business benefits for the employer.

The same assessment form is used for master's programmes in English at Haaga-Helia. The six assessment criteria are as follows:

1. topic and objectives (significance and currency; objective and scope; work life orientation)

2. conceptual framework/theory (literature review; conceptual framework; definition of concepts)
3. methods (planning and implementing; evaluating outcomes)
4. outcomes (correspondence between objectives and outcomes; value contribution)
5. reporting (structure consistency; clarity and readability)
6. project management (planning; implementation; analysis and reflections)

Each criteria is assessed on a scale from satisfactory (1), through good (3), to excellent (5). To help the assessment there are statements developed for each criteria and each scale. For example, criterion 1 is assessed as excellent when: 'The topic involves innovative perspectives and it is important for the organization. The objective and scope have been defined excellently. The topic is strongly related to working life development.' Criterion 4 is weighted double and it is assessed as excellent when: 'The outcomes correspond to the objectives excellently. The value contribution of outcomes is excellent. The conclusions are justified excellently. Suggestions for further development are very valuable for the organization.' This UAS master's thesis assessment grid is very practical and it has proven to be useful in the assessment process.

In addition to the thesis assessment grid in the IBMA, the work life representative, i.e., the Finnish manager, is asked to fill out a feedback form. Next, I present the content of this form because it is the source of data collected for the purpose of this paper.

Data Collection And Research Approach

Employers of UAS master's students, i.e., Finnish managers, involved in the thesis assessment process answered the following five questions when they assessed the master's thesis (figure 1). The bold arrows on figure 1 indicate the focus and scope of this paper.

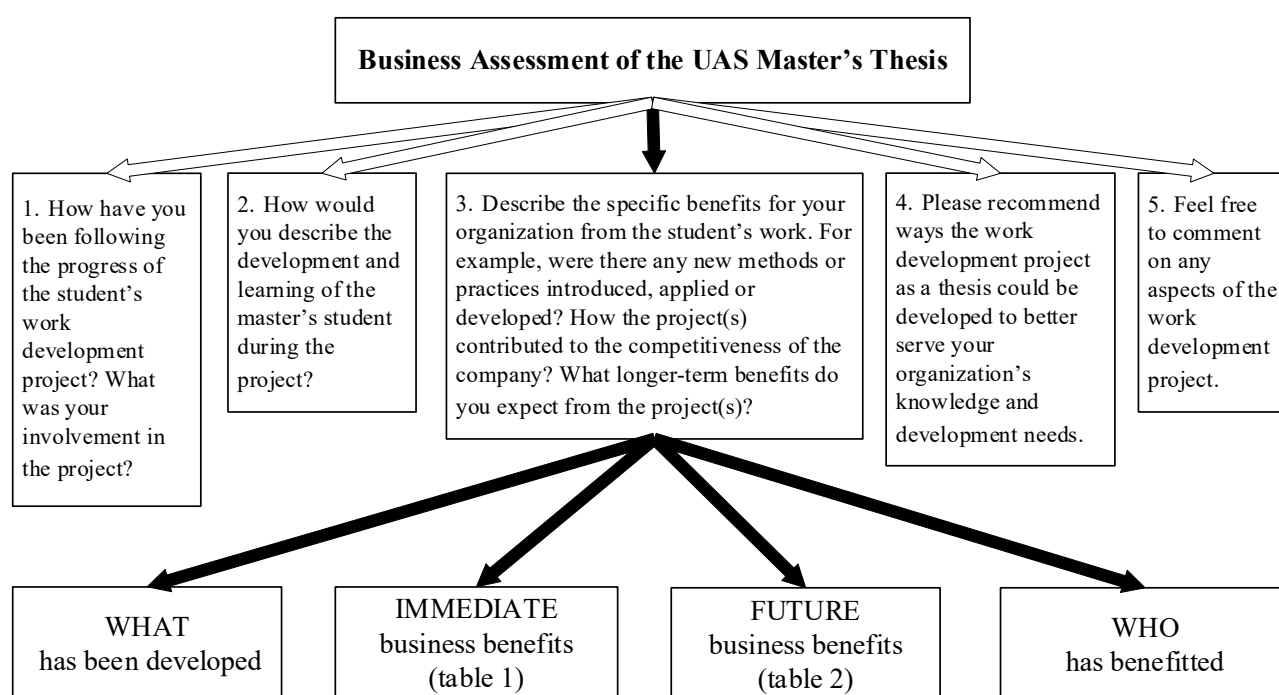

Figure 1: UAS master's thesis assessment (source: created by the author)

To answer the research question '*How does working life benefit from UAS master's theses?*' I analyzed the feedback on question 3 above provided by 91 managers from 2007-2016. The thesis feedback document is a secondary source of data for this paper because the feedback was primarily collected for thesis assessment and not specifically for the purpose of this paper. Following the ethical principles of research, I make sure that none of the organizations or managers could be identified and traced to the feedback they provided.

Feedback was given by different (international, domestic, small, and large) organizations from different business sectors. For example, managers from Accenture, Basware Oyj, Danone Finland Oy, Danske Bank Oyj, Ericsson Finland, Ernst & Young Oy, Fazer Food Services, Hartwall, Hewlet-Packard Oy, InterCall Sweden Ab, KONE Corporation, Nokia Oyj, Reaktor, Trawise Oy, and so on answered the feedback form.

Finnish managers who provided feedback have the following titles and positions: CEO, CFO, Director of Learning & Development, Global HR Line Manager, Head of Product Development, Information Manager, Managing Director, Process Development Leader, Program Manager, Sales and Customer Service Manager, Sales Manager Finland, Senior Account Manager, Senior Executive, Senior Manager People Advisory Services, Technical Director, and so on.

I applied the thematic analysis method for analyzing the feedback answers to question 3 above, because it is the most common, generic method when dealing with unstructured qualitative data. 'The essential purpose of this approach is to search for themes, or patterns, that occur across a data set' (Saunders, Lewis and Thornhill 2016, 579). According to Saunders et al. (2016) thematic analysis helps in the following areas:

1. to comprehend often large and disparate amounts of qualitative data
2. to integrate related data drawn from different transcripts and notes
3. to identify key themes or patterns from a data set for further exploration
4. to produce a thematic description of these data, and or
5. to develop and test explanations and theories based on apparent thematic patterns or relationships
6. to draw and verify conclusions (ibid.: 579).

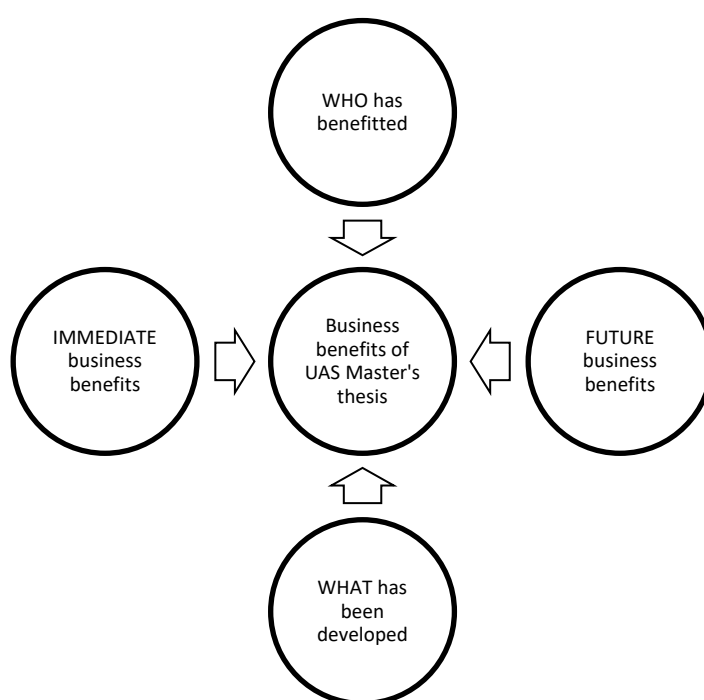

Figure 2: Four themes of the benefit analysis (source: created by the author)

My purpose in this paper is to produce a thematic description of the large amount of qualitative data collected over a 10-year period. First, I transcribed all 91 answers and then, I conducted a benefit analysis, based on the four themes identified in Finnish managers' feedback on the UAS master's thesis (figure 2).

In brief, I presented here the content of the master's thesis feedback form (cf. figure 1) answered by Finnish managers. Then, I briefly introduced the profile of the organizations, and the position of the manager who provided the feedback. Further, I argued for the selection of the qualitative data analysis method for thematic analysis. In the next section, based on the four themes identified (cf. figure 2), I will present my findings.

Findings

Here, I present the business benefits of the UAS master's thesis of the IBMA programme. I show the findings identified from the large data set of my analysis of 10-year qualitative data according to four themes (cf. figure 2).

Theme 1: *What has been developed - What product/service has been developed in the master's theses? What are the specific benefits for the organization?*

From the business world feedback, I identified 101 specific benefits provided by the UAS master's thesis to organizations. They could be grouped in the following way:

- market research and market entry:** a framework for the expanding of R&D activities to Russia, an internationalization framework, e-learning market potential, evaluating the most effective ways for entering the market, understanding the market and its different segments, a new intensive market study, risk analysis, market research, a market entry study to Russia, researching target markets, a foreign market analysis, a framework for evaluating expansion to new labor markets, SWOT and competitor analyses, an internationalization strategy for start-ups
- marketing:** marketing and customer support, a marketing strategy, a B2B marketing plan, marketing and branding development, defining the brand identity, a theoretical framework for global marketing campaigns, selecting distribution and promotional channels in marketing campaigns
- communication:** the change communication process, methods to improve communication, an IT system for reporting, developing business reporting, visualization and communication aids, the documentation of concepts, an overview of social media channels, strategies developed around audience engagement
- human resources:** training material, information about how personnel think, useful suggestions, questions for development discussions, an implementation plan for career counseling, a spirit of teamwork, respect and empathy, a framework for HR and change management, a framework for motivation, documenting an HR job satisfaction project, new ways of conducting performance reviews, analyzing the commitment of a unit's employees, a proposal for new training programs for salespeople and sales managers, using a new approach
- leadership and management:** the ten most important leadership features, guidelines for managers without authority, a survey on team leaders' working methods, exploring the difficulties in projects, a model promoting emotional intelligence
- organizational change and development:** an overview of the business, the current situation, suggestions for improving language courses for immigrants, new methods to develop processes and operations, new business models, creating a scorecard, a scorecard for the company, a strategy plan, up-to-date information, ideas for new digital ways of working, recommendations on how to increase our business value, business modeling tools, the Blue Ocean Strategy framework introduced as a tool, a comprehensive analysis of activities, a value network within the organization
- innovation:** recognizing intellectual capital, new ideas and knowledge, combining theory and practice, ways of developing knowledge transfer practices, a global study about how people see development
- sales and services:** information on consumers' buying processes, developing sales opportunities, development opportunities in sales practices, remote selling, workshops for sales teams, tools and ideas on how to change our mindset in sales processes, gathering customer feedback, collecting feedback from guests, factors influencing the service sector and customer satisfaction, conducting a user experience and expectations survey, subsequently analyzing the data, a customer experience survey, a service model, new service developments
- collaboration:** an implementation plan for partnerships, an outsourcing decision model, an online value proposition, collaboration, information about offshore resources, identifying the important factors in onshore and offshore cooperation, F2F interviews with key account customers, partner relationship management (PRM) theory and practice, a survey of international members' positions at universities and places of business in Finland, a new complaints and feedback process, new and valuable insight about the perception of the unit's internal customers, its role, performance, cooperative approach and ideas for further improvement, experts' views

Theme 2: Immediate business benefits - Have the findings of the master's thesis been implemented/used? What are the immediate benefits and impacts of the master's thesis for the organization?

The benefit analysis resulted in 153 immediate business benefits, which are summarized in table 1 in the appendices. Here, however, I present a few quotations from managers as illustrations.

- 'Benefits for the company are a greater understanding of the needs from the end-user of the CRM system and validating some of the directions already taken for the development of the system.'
- 'The most substantial benefit for the company has probably been the face-to-face interviews with strategic customers' key accounts.'
- 'The thesis provides interesting information on motivational themes and how the organization's personnel reflect on these motivational elements.'
- 'The main benefit of this work was to document an HR project, which was challenging and partly abstract.'
- 'The main benefits for our company are the global contacts that were created during his project.'
- 'Our performance review meetings are no longer just a chat, but rather a systematic discussion where all relevant issues are made compulsory to discuss.'
- 'Understanding the interdependencies between employee and customer satisfaction is very important in our

- organization.'
- 'The project has provided a new and a very valuable insight into the perception of the unit's main internal customers, its role, performance, cooperative approach, and areas for further improvement.'
- 'The thesis has been extremely helpful for the company in order to evaluate the most effective ways for entering the market, as well as understanding the territorial limitations, cultural and socio-economic aspects, and different segments.'
- 'This is a very important learning outcome for us and we already decided that at this stage we will just sell smaller modules and gradually build up the whole concept.'
- 'The thesis has been a useful leadership tool for global leaders in our organization.'
- 'The thesis gives an overview of suggestions on how to increase our business value.'
- 'It was very useful in thinking forward to remote selling in our company.'
- 'With this project we are able to share knowledge and most importantly, a customer service oriented attitude with other key persons in the company.'
- 'Developing internal practices, synchronizing operative processes, assessing the knowledge and training needs of personnel, and improving communication are the specific benefits for us.'
- 'We know the importance of HR and change management but we do not have a unified view of doing it. Now, we can use the framework as one of the tools to handle such situations.'
- 'The benefits for the organization are new ideas and knowledge.'
- 'The research results allowed us to better understand our market segment and find better ways to cooperate.'
- 'The research has fundamentally changed the way we engage with brands and developers.'
- 'Conclusions of the thesis about marketing strategy provide useful information about priorities in selecting distribution and promotional channels in our marketing campaigns.'
- 'The best thing is that the thesis includes eight themes and an implementation plan.'
- 'Thesis work helps us to understand the value networks within the organization and within specific projects.'
- 'It made visible the common issues between different business units.'
- 'It helped us to shape the project in a slightly different way and therefore it clearly influenced our onboarding process.'
- 'The work has increased the efficiency and cooperation between countries and shared services centers.'
- 'This project and its results are useful in our marketing and customer support.'
- 'The thesis helps in outsourcing decisions.'
- 'For the first time there is detailed information of how personnel think about the company.'
- 'The developed framework was the key input for two organizations in planning expansion of R&D activities to Russia.'
- 'The development project resulted in new job opportunities.'
- 'The marketing plan is written in a way that is easy to understand. We were especially pleased with our new online value proposition.'
- 'The thesis summarized the position and difficulties we have locally and how we need to change our mindset in the sales process to stay competitive in a challenging market place.'
- 'The thesis contributed to the development of the management system, with concrete opportunities and practical suggestions.'
- 'As a result of this project, we learned that operations are not prioritized as one of the key processes of the unit, and that the mutual understanding regarding ways of working are not shared. This has had a negative effect on the unit's efficiency.'
- 'Benefits to the organization include a crystalized and more explicitly articulated strategy when it comes to talent management.'
- 'The findings are interesting, especially now that digitalization and startup companies are hot topics in the Finnish marketplace.'
- 'The documentation of the concepts was useful because it has allowed us to revisit the concept for later business development.'
- 'There are some kinds of blind spots in a self-managed organization that could be improved, and this thesis has helped us to find them. When we recognized these blind spots, we can put more efforts into knowledge sharing, with both new and experienced employees.'
- 'Utilizing the different business modeling tools added value in local operations in Vietnam.'
- 'The practical suggestions gave our organization good ideas on how to approach the market, and how to better find potential partners.'
- 'The survey results of user experience and expectations were immediately utilized as inputs in the selection of chat-based collaboration tools.'

Theme 3: Future business benefits - Are there any plans for using the outcomes of master's theses in the future?

Finnish managers in their feedback on the master's thesis indicated 76 future business benefits, which are presented in table 2 in the appendices. To illustrate the findings I present here a few quotations from the feedback provided.

- 'We will use the findings from the thesis. Its findings will be communicated to all employees.'
- 'General management program is a very critical element in developing future leaders in our organization, so clearly this project work will be utilized in further program development.'
- 'As sales agents have the best possible help and have the tools at hand, this will evidently affect the competitiveness and profitability of the company.'
- 'It has fair value for our organization in the long run because it puts together a number of existing theories and creates an easily understandable and unambiguous model which can be used straight away.'
- 'After this thesis, we are able to assess brand functionality better and be more precise in giving instructions to co-operative companies (e.g., advertising companies).'
- 'As longer-term benefits, this work will be used when going through some developmental steps in the near future, when we develop our services.'
- 'For the longer term, the master's student has been able to develop a profound market study which will work as a framework for us in future developments.'
- 'Longer-term benefits come from the understanding of how important is to listen and involve employees in creating and maintaining job satisfaction.'
- 'It shows us important data in order to make our communication strategy in the future. It shows the subjects we have to consider when thinking about our communication strategy.'
- 'We could easier recognize the intellectual capital inside the organization and then be able to utilize it.'
- 'In long term, it will have meaning as a sales and support tool.'
- 'As a result we will be getting better ROI from partnerships, as consumers will appreciate and use the stored content more.'
- 'Based on this thesis we started to build our e-learning network and the findings may be used in the identification of new sales opportunities.'
- 'There are many good suggestions in the thesis that we will take into consideration.'
- 'We will change our development discussions according to the findings of the thesis.'
- 'The thesis will be used in leadership, management and work community training.'
- 'The ten most important leadership elements compiled by the student will be applied in our workshops for locally employed staff.'
- 'The next annual staff survey showed an increase of motivation in our service department, which we viewed as a success of master's students' activities.'
- 'Based on this thesis we started to build our e-learning network.'
- 'The thesis was the starting point for our company to develop a brand and marketing strategy, and to help us mature as an organization.'
- 'The information could benefit our organization and business by producing more accurate selection profiles and more qualified selections during the recruitment process.'

Theme 4: Who has benefitted - Who has benefitted from the master's theses? With whom have the findings been shared?

Inside the organization: employees, the management, business units, product developers, designers, brand managers, the marketing department, leadership, teachers, colleagues, new employees, team leaders, team members, subordinates, the HR manager, the career counseling team, CRM system users, project managers, the development team, the international office, internal customers, the research team, start-ups, salespeople, sales managers

Outside the organization: customers, consumers, partners, onshore partners, offshore partners, market segments, group companies, sales representatives, sales agents, the community, language learners, users, key accounts customers, network contacts, global contacts, advertising agencies, joint-venture partners, clients, international researchers, alumni, bloggers, market segments, experts, guests

The findings presented in this part of the paper provide evidence of business benefits from the UAS master's thesis. These findings are derived from the feedback of 91 Finnish managers involved in the thesis process. In this way, the research findings are validated and the business benefits of the UAS master's thesis are also ascertained by the business world.

Conclusions

The aim of this empirical research is to answer the research question: *How does working life benefit from the UAS master's theses?* As the findings of my analysis of the four themes (cf. figure 2) demonstrated, the master's thesis brings very specific, immediate (cf. table 1), and future (cf. table 2) business benefits to working life. These benefits are provided not only to internal, but also to external stakeholders of the organizations.

Another outcome from the research is that the paper clearly demonstrates why business and academic collaboration during the thesis process is necessary and valuable (cf. Jakubik 2017; Laine et al. 2008; Tulkki 2008; Wenger 2005). This paper shows the benefits of a collaborative learning approach. I see three value contributions of this paper:

1. It brings value to employers by making explicit the benefits that UAS master's students bring with their theses to their employers and the business world.
2. It increases the awareness *and* competitiveness of UAS master's graduates in the job market.
3. It brings value to educators of UAS and educational policy makers by demonstrating that working life values the contributions from the UAS master's thesis.

I would argue and disagree with Ojala's (2017) conclusion in her doctoral dissertation that 'Compared to the traditional university's master's degree the graduates of the UAS master's degree believed that their degree generates more competence than competitiveness.' My longitudinal, 10-year, qualitative research indicates that the UAS master's degree/thesis creates not only competences but also competitiveness for UAS master's students in the job market. Based on 91 Finnish managers' feedback about the business benefits of the UAS master's thesis I am confident that the competitiveness of UAS master's degree in the Finnish job market is strengthening.

My empirical paper has implications for managers, researchers, educators, and educational policy makers. The *managerial* implications are that the UAS master's thesis proved to be very useful and valuable, not only for students, but also for organizations as employers of master students. From the managers' feedback, it is obvious that they also learned and benefitted from this collaboration. Because this paper made very explicit the business benefits brought by the UAS master's thesis, managers are encouraged to be open to providing future developmental projects for master's students, to providing them career development opportunities, and to continuing close collaboration with UAS.

Implications for *researchers* are that they should continue working on promoting the benefits of the UAS master's thesis, and on increasing the awareness of the differences between master's degrees from traditional universities and universities of applied sciences. The scale of the research could be extended to other master's degree programmes and UAS in Finland and abroad.

Educators in UAS would need positive feedback of their master's thesis tutoring work and they need appreciation from the business world. *Educational policy makers* in Finland could consider if it is wise to have both the traditional university master's degree and the UAS master's degree in the future. The master's degrees of these two different kinds of universities are converging, and both make valuable contributions to knowledge. Policy makers need to make more clear distinctions between the degrees; they should think about how to increase the acceptance of UAS master's degrees in the job market.

As with every paper and research, this one also has limitations. The thesis feedback from businesses was analyzed only for one UAS master's degree programme, i.e., for the Degree Programme in International Business Management (IBMA) of one UAS, i.e., Haaga-Helia University of Applied Sciences, Helsinki, Finland. This limited scope makes it difficult to generalize the findings based on 91 Finnish managers' feedback. However, it provides opportunities for future research. Extending the research scope to other master's programmes and to other UAS could be one direction in research. Another limitation is that my empirical research paper has limited theoretical sources that could be improved by developing theories or by finding relevant existing theories to support the findings and answers to the research questions. In spite of these limitations, I am convinced that the findings are original, interesting, and valuable in academic research.

Appendices

Table 1: Immediate business benefits of the UAS master's thesis

IMMEDIATE BUSINESS BENEFITS			
has increased the efficiency and cooperation between the country and shared service centers	practical suggestions on how the organization will benefit	has started to build our e-learning network	having more systematic program follow-up and impact measurement
Has allowed us to better understand our market segment and find better ways to cooperate	impact on customer and user satisfaction	has started preparations for getting funding	a more systematic and coordinated process between talent management and leadership development
has fundamentally changed the way we engage with brands and developers	problem areas where the management system needs to be developed	helps in our marketing	increasing our international impact
we will be getting better ROI from partnerships	several development suggestions were implemented right away	we got new contacts already	we are able to provide a tool set to our project managers enabling them to better manage this challenging part of the project work
consumers will appreciate and use the store content more	how the organization and its practices need to be developed	new channels opened for promoting Finnish e-learning knowledge	we are able to better assess brand functionality
higher consumer satisfaction, retention, and sales	developing internal practices	new business model	we are able to give more precise instructions to advertising companies on how our company should be seen
help in outsourcing decisions	synchronizing operative processes	immense benefits of deploying a scorecard: articulating the value of the output and its delivery	has helped us to implement a thank you event
realizing that knowledge sharing must be extensively promoted	assessing knowledge and training needs of personnel	better understanding of what every individual does in order to contribute to the unit's strategy	new research topics have emerged

confirmed our planned marketing procedures	improving communication	implementing the suggested strategy plan into our work in Finland	gaining real research based data on the topic to support further development, tools and organizational decisions
knowing conditions when buying legal services	using the framework for HR and change management	new insights into our daily work and planning for the future	providing more experience to customers
helping to make our workshops more concrete and comprehensive	helping to understand entertainment industry challenges	making us act locally	we have gained more structure for our loose practices
changing our development discussions	information about motivational themes	starting phase two of the PRM strategy	has helped us to visualize the things we need to improve
have gained useful connections	information about personnel's reflections	having a short presentation about the CRM / PRM for our team members helped us to focus on essential things	has helped us to find the blind spots that need development
successful cooperation projects between Nokia and Russian universities	new method of marketing efficiency	the framework helps our business	understanding the rational and irrational divers on the potential target market
using the suggested internationalization framework	hearing team leaders' ideas, new ways of doing things to enhance communication and collaboration	huge efficiency gains	good ideas on how to approach the market and identifying potential partners
has resulted in new job opportunities	recognizing that we have effective teams	a better understanding the problems in our unit	we are able to re-evaluate the market, when and how to approach it
development of business reporting	getting extra benefits in our offshore projects	presenting the findings has been very positive and this has been a major asset to our company	the documentation of the concepts was useful because it has allowed us to revisit the concept for later business development
contributes to our competitiveness	using specific practices suggested by the thesis	the main benefits for our company are the global contacts that were created during this project	utilizing the different business modelling tools added value in local operations in Vietnam
knowing our brand image	improved sales results	showed us the potential of LinkedIn marketing	using the findings in our incentive design projects
starting point for developing our brand and marketing strategy	a focus on sales initiatives	suggestions support our company very well	have utilized it in our reward training
has increased awareness about our customers' experiences	a team-building exercise	helps to comprehend the overall business challenges of IoT	new knowledge about our international members
has generated discussions about the ways we conduct business	information about our position and difficulties	we benefited from the recommendations	has increased knowledge about our services
opportunity to enhance our organization and services	useful findings for the career counseling team	the findings influence our communication, streamline and simplify how often we communicate to teams about change	new international researchers joined us
service quality become a major goal for us	new information on working life topics was useful	realizing what needs to be done before we are ready to hit the market with this educational concept	has increased interest toward us

improving our offerings of language courses	support our every-day business operations and customer relations	we decided to sell small modules and gradually build up the whole concept	our performance review discussions become more systematic, relevant issues are made compulsory to discuss
improving interactions between learners and native speakers	sharing the knowledge and customer-service oriented attitude in the company	we gained a better picture about the factors influencing the service business and customer satisfaction	the new way helps preparation for performance meetings
helps immigrants to integrate faster	customers appreciated our interest in their feedback	better understanding of the interdependencies between employee and customer satisfaction is very important in our organization	new insights and views were developed
acting more professionally	greater understanding of the needs from the end-users of the CRM system	analyzing the survey results has been beneficial for us	have decided to open a new Facebook-page for our alumni
providing benefits for our customers	validating our development directions	motivating colleagues	the worked proved that our earlier decision to close our Facebook account was wrong
the model provides established theories that can be used straight away	concrete opportunities	increase in motivation in the service department	we are looking for bloggers and technical solutions for our communication
has developing the next round of general management programs	increased awareness of theories, customer needs, competitors' offerings	more articulated strategy of talent management	it has had a great impact on our actions
demonstrated that our company is interested in new service development and it actively listens customers' ideas and needs	we have now a more in-depth understanding of the new approach on contextual feedback	now our start-up has an internationalization strategy	because of the work, we are now aware of the lack of internal communication
some ideas the team were able to implement and set targets	it helped us to see the big picture of internationalization	we are already using some of the outputs of the thesis	we have already implemented new forms of communicating internally (e.g., SKYPE, new Intranet, internal weekly reports)
has been a great base for renewing our training framework	it is easy to implement the delivered strategy	the student has been an additional resource for us	differences among countries are especially interesting to us
has been a useful leadership tool for global leaders	we started to look for a business developer who would also take care of communication	we gained valuable input on what really worked and what did not with our previous approach	validated our assumptions
findings about the market potential and recommendations for future work	utilizing it when pitching or selling our services	it helped us to shape the project in a slightly different way and therefore it clearly influenced our onboarding process	got evidence of some weaknesses in our current approach to collecting feedback
it gave a possibility to the team to learn many new methods	it helped to crystallize our long-term focus	the framework has been applied to Bulgaria	currently we are developing a training program with the help of master's students
the recommendations have helped us to further	it has been a huge leap toward professional business	it helped us to look at our data differently	the most important benefit for us is the identified gaps

develop our export of education			that needed to be addressed
the results are valuable for us			

Table 2: Future business benefits of a UAS master's thesis

FUTURE BUSINESS BENEFITS			
using in creating training materials for employees	development trends in CRM systems in the future	it has helped us to expand our reward business	helps in identifying new business opportunities
considering the findings in developing communication strategy	promoting the export of Finnish education	improves the quality of daily project work	we will start looking into different ways to start promoting this new business opportunity
utilizing the value network explored	help in better understanding similar projects from personnel's point of view	planning to organize teambuilding workshops regularly	the market study developed will work as a framework for future developments
writing articles and publishing them on LinkedIn and Twitter	using LinkedIn marketing as part of our marketing strategy	publishing the findings in the organization's member magazine	information, methods and practices provided long term benefits to the team
using in our future projects	implementing suggestions in our new coming complaint process	bringing more positive credibility to us	we will be seriously considering developmental ideas as they support our current strategies
applying the model in our all group companies	implementing recommendations involves strategic challenges and will be discussed internally	strengthening the bond between the company and its existing strategic customers	using a market study when decisions are made about expansion to Russia
using in new sales opportunity identification	expecting that our communication about changes will be clearer and more straightforward	The outcome of this work will be published for management	recommendations of the thesis will save us a lot of time and help us to move in the right direction
using in planning promotions	believing in saving a lot of money	the work is a good basis for starting to act	using it for improving our employee commitment
introducing suggested practices	recommendations will be taken into account when planning future actions	we will apply the suggested actions	help us to improve our current approach
using implementation and change management processes presented	implementing the same survey on a yearly basis	using the outcomes of the work in planning future events	helps us to systematically further develop our activities
using in leadership, management and work community training	important in developing future leaders in our organization	using it in streamlining the organization's working methods to achieve efficiency and effectiveness of our work	after reviewing the recommendations, our team will consider possibilities for implementation
applying in workshops for locally employed staff	utilizing it in future program development	helps identify possible improvement opportunities	the idea of internship is great and it will be implemented in the short term
extending the framework to other countries (India, China)	supports internationalization of the field and assessment of its impacts	using when planning the marketing budget	launching a full new process in the next few weeks

impacting the financial side of future projects	utilizing in developing our business	next step is to code the working prototype	we will continue to use the findings for the next 12 months
using development suggestions	Actively using change management tools	increase in the effectiveness of daily work	we intend to use the framework when expanding into new markets
using when developing our services	material business benefits by using the change management model	impact on the competitiveness and profitability of the company	the framework will be used for the USA this year
helps in the recruitment process in selecting more qualified applicants	we can apply the same event framework outside Finland all over the world	recognizing the importance of listening and involving employees to create and maintain job satisfaction	we will soon pilot the new training program
we will continue to use the renewed structure of performance meetings in the future	we could put more effort into knowledge sharing between new and experienced employees	planning to develop a proposal for improving the follow up of our members' interests	the new training program will improve the competencies of salespeople that will result in better performance
helps to evaluate activities	expecting an increase in sales	using it as a sales and support tool	gaining better sales results

The Impact of society and Technology in Enhancing the Teaching / Learning of the English Language. Case Study: English Teachers (Civilisation in particular) at the University of Oran 2.

Souheila DJEKOUNE
Linguistique, Dynamique du Langage et Didactique (LDLD)
Université of Oran 2, Algeria
s-djekoun@hotmail.fr

Abstract

The impact of teacher training for an effective teaching process and an efficient learning outcome depend on many environmental factors, for instance the social and technological ones. Within the Algerian university, English teachers, civilization in particular, are enrolled in a teaching experience that requires more than only pedagogical or linguistic skills. They have needs in terms of training, so that to take the teaching /learning process to better levels.

The present study is about this triangular relation linking English teaching/learning, society and technology. The starting part is about the motives behind the need for a training in the learning environment. In the second part, it is essential to deal with an overview of the different objectives of the training of the English teachers on the short/long term as well as a distinction between their needs. In the third part, the core issues facing the Algerian English teachers in terms of whether their teaching occur efficiently. It is also necessary to deal with issues affecting the teaching/learning process, i.e. to what extent do society and technology enhance the efficiency of their teaching and the outcome of their learners, especially in civilization subject. Eventually, the shortcomings concerning their needs in terms of training will be underlined. This point will provide some potential solutions to overcome these issues.

The necessity of the English teachers' training, of civilisation in particular, is beneficial for a better learners' outcome; and its contribution in the development of the teaching/learning process is positively affected by some societal and technological factors. This impact may facilitate establishing a permanent effective training programme.

Introduction

This changing time of globalization has increased the need for technology in our society since people everywhere have access to communication means all over the world. This growing and extending need leads to the advance in the Foreign Language teaching profession. However, the use of technology has been neglected in Foreign Language education, resulting in students' lack of effective knowledge which is one of the significant problems that need careful consideration.

Thus, based on the assumption that promoting social and technological integration within Foreign Language teaching may provide students with insights into their academic achievement, and which may foster better teaching / learning environment, this work tackles the impact of society and technology in enhancing the teaching / learning of the English language.

To achieve this objective, it is believed that the role of the Algerian university teachers is very important. The impact of their training for an effective teaching process and an efficient learning outcome depends on the social and technological factors. Within the Algerian university, English teachers, those teaching civilization in particular, are enrolled in a teaching experience that requires more than only pedagogical or linguistic skills. They have needs in terms of training, so that to take the teaching /learning process to better levels.

These two elements will provide some potential solutions to overcome those issues.

Objectives

This research is a trial to acknowledge the impact of society and technology in enhancing the teaching / learning of the English Language since the contribution of both of society and technology affects teacher's training leading to an effective teaching process and an efficient learning outcome.

The choice of this theme is motivated by the fact that in the Algerian university ; where English teachers, civilization in particular, are enrolled in a teaching experience that requires more than only pedagogical or linguistic skills, the English teacher has needs in terms of training, so that to take the teaching /learning process to a higher level.

That is why it is essential to establish this triangular relation linking English teaching/learning, society and technology in our educational environment.

Teaching / Learning Approach

English is learnable in different ways and in a variety of contexts withon different levels of study.

Learners at primary and middle school level apprehend English for standard objectives ; they learn appellations and tenses in order to be able to construct relatively basic and meaningful sentences. At these levels, the learner cannot have an easily recognizable reason to learn the language. Through the evolution of language, linguists used the abbreviation TENOR to refer to Teaching English for No Obvious Reason or EGP. The higher academic level they achieve, the more competences they acquire and the more skills they need, particularly at the level of vocational and secondary school or at university.

The approach to the teaching / learning process is that it has its own methodology in terms of materials, syllabus and teacher/learner interaction. The teacher has less burden, since he experiences a relatively equal status as the learner; he has the right to step out of the learning circle from time to time, especially when the learner excels in the subject matter. In this case the teacher becomes a consultant or help provider rather than a major source of information.

In this way, students may develop an ability to be users of technological devices as a means of gathering knowledge in many fields.

Motives Behind The Need For A Training In The Learning Environment

All factors are favoured to serve the knowledge seeker, i.e the learner. Hence, all conditions should be well adapted to serve her/him.

The English teachers struggle to achieve better results, and they are in constant pursuit of updates, new techniques and methodology in their teaching. However, our institutions lack high quality supervision and tools to enrich the teaching / learning environment.

Even the training received at graduate level can barely serve the needs of Foreign Languages teaching, especially the English teachers teaching civilization in this context. That is why, unexperienced teachers ought to be trained enough to teach general or specific English.

According to Hutchinson & waters (1987) , within the ELT tree, EGP branches are different from that of ESP in terms of ends. They belong to the same decision but expands in a variety of directions based on objectives. Therefore, the specifications in needs and ends led to specifications in language approaches. The solution may be the teaching of a particular English for each particular need, i.e the way general English is taught differs from the way business English is taught in terms of register, materials and methods, especially when integrating the available technological means.

An Overvien Of The Objectives Of The English Teachers Training (Civilisation In Particular) On The Short / Long Term

The perception of English teaching sphere was made by a group of English teachers, including civilization teachers, who were asked to evaluate the English teaching in Algeria whether bad or good ; 40% of them said they do not know, whereas 30% assume it to be bad, the other 30% said it is good. This question cannot provide us with a glimpse of how is the English teaching perceived.

The participants may not be well informed about the English teaching context in Algeria, or they do not have the necessary knowledge about the real or outstanding English classes so that to base their choice.

Then, the participants were asked to give additional comments to describe their experience as English teachers (They may have taught civilization module to university students, or else, they may be future teachers to this subject). The answers can be categorised into two parts, rights and duties of English teachers. The former includes

availability of time and materials in teaching methods especially for beginner teachers as well wider training opportunities on international scale. Duties, however, are based around the idea that teachers should improve their capacities, attend specialized classes occasionally, know what they teach beforehand and trace long term objectives in mind.

Finally, the effectiveness of the teacher's duties plays a major role in increasing motivation of the learner, and his eagerness to learn has a share in the success of an English class.

To What Extent Do Society And Technology Enhance The Efficiency Of The Teachers Teaching And The Outcome On Their Learners

The goal of the electronic questionnaire designed in this study is to know how does the English teacher perceive the idea of being trained to teach General or even Specific English; and to see to what extent it is important to achieve effective learning outcomes, especially in civilization classes. Eventually, preliminary solutions are provided to some issues related to the impact of social and technological factors in the embetterment of the teaching / learning process.

The results demonstrate that lesson preparation, assessment of objectives and methods, evaluate learner's achievements; and setting teaching strategies are ranked amongst top five activities within GE teaching.

Moreover, motivation is judged to be important (80%) since most participants agreed on the fact that it is required to attract learner's attention to language learning. They have pointed out the factors of analysing language, material selection and evaluation (the lack of suitable material is pointed out by 55% of the participants, especially civilization teachers).

In order to remedee to this deficiency, teachers were asked what most suitable period of training would fit their needs, high percentage (55%) have chosen a period from six (6) months to one (1) year training. The same participants were given the choice to pick aspects on which they wish to receive training on, the majority have chosen to be trained on methodology, the material selection and procedures of course design.

Solutions To Promote A Durable Training And Overcome Its Shortcomings With Regard To Fl Teachers

In the same segment of training, teachers were asked to choose five paramount solutions to overcome common issues that occur in GE teaching. The majority of the participants (60%) pointed out training as step because it is not enough to teach English courses, especially civilization courses, based on the previous knowledge about the area. 55% mentioned the aspect of autonomous learner as well as knowing the terminology related to the field taught, whereas task-related projects are considered to make the learner able to perform his own professional roles in a Foreign Language context authentically.

Others emphasized needs analysis is obligatory for courses design and the selection of materials (55%). Only 25% of the participants gave consideration to genuine real-life material (related to their social environment), since most English teachers in Algeria do rarely use authentic material in their classes, not even civilization classes. This is due to the lack of resources, time limits and, methodology.

It is noticed that the actual or real role of the English teacher within the English class is depicted by himself. The majority of the questioned teachers said that they start their teaching with an evaluation of their students' level and needs in a GE course. This step helps the teacher to select the right material and design a convenient course for the right level, since 45 % of all the participants prepare their own English courses and 25 % said that they consider authenticity in their selection of content and material using technology; 35% depend on the internet, and other 40% use the textbook; whereas civilization sources are lacking.

Conclusion

Globalisation is affecting every part of our life as the world, now, is full of webs of telecommunication networks, both personal and electronic.

Confirming the immense impact of globalization on people's communication, the more successful individuals become in their careers, the more they deal with a variety of technological means within many social backgrounds.

Moreover, integrating the social backgrounds has become an everyday experience for many reasons including the development of an integrated global economy, sophisticated communication and technologies, migration, traveling and education.

So, it is suggested to develop in the teachers an awareness in the context of training in Foreign Languages in order to enrich their knowledge of the technological means available for education. In the Algerian teaching context, the teachers as well are compelled to try to understand, then establish a training programmes that allow their enrichment in the matter of technology.

To conclude with, there is a widespread agreement that being an English teacher requires previous and additional training. The teacher hence, has to pave the way towards effective results which fits each social situation; he invests in the material he has and invents new ones. Eventually, he has to manage the use of different technological materials according to his learners' social needs.

Abstract

From 2009, Sakarya University has started hosting an increasing number of black African students for its various academic programs. Most of these students come from developing countries or underprivileged families and socio-economic backgrounds. Once in Sakarya, numerous are the socio-cultural, academic, financial, environmental and psychological challenges faced by those students and also huge are the different advantages they benefit from this new area and its dynamic social and educational system. The main objective of this study is to find out and analyze these students' views and opinions on the education system of Sakarya University and their social and inter-cultural experiences in and outside the university environment while interacting with people. To achieve it, a survey was applied to a sample group made of 35 black African students from different countries, departments and programs (bachelor, master, PhD) studying from 2012 to 2017 at Sakarya University. Besides, some isolated and informal interviews have been made to shape the area of investigation. The data have been processed and analyzed with relevant computer software. And it comes out as result that the targeted students have in general a positive view on Sakarya University educational system even if they were not used to it with the additional linguistic difficulty. Besides, some inter-cultural problems that influence their state of mind have been raised and are relevant to be discussed.

Keywords: Black African students, education, Sakarya University, socio-cultural.

Introduction

Sakarya University, frequently referred to simply as SAU, is a public research university located in the city of Adapazarı, the capital of the Turkish province of Sakarya. Established according to the Law No. 3837 dated July 3, 1992, it has formerly been known as School of

Engineering and Architecture founded (1970) affiliated with Istanbul Technical University. In 1971 it has turned into the State Academy of Engineering and Architecture and served as a faculty from 1982 to 1992. As a modern university, SAU forced admiration with its success in completion of academic units and technical infrastructures and its advances in laboratories, educational and social services, Internet infrastructures and informatics. SAU is the first and only state university receiving the ISO-2002 Quality Certificate and "the EFQM Excellence Quality Certificate of Competency Level". Up to date, SAU is proud of its 18 faculties, 5 institutes, a great number of Schools, vocational Schools and departments of studies, and a total enrollment of 89,908 students in 2017¹.

From 2009, Sakarya University has started hosting an increasing number of black African students in its various academic programs. Up to date, there are around 246 black African students at SAU². Most of these students come from developing countries of Africa. Once in Sakarya, numerous are the socio-cultural, academic, financial, environmental and psychological challenges faced by those students and also huge are the different advantages they benefit from this new area and its dynamic social and educational system.

We have decided to carry out this study with the purpose of finding and analyze these students' views and opinions on the education system of Sakarya University and their social and intercultural experiences in the University environment while interacting with people (Teachers, Staff, Turkish mates...). To achieve our goal, a questionnaire survey has been done as well as some interviews and documentary researches on related topics. The survey has been done on a sample made of 35 black African students from different countries, departments and programs (bachelor, master, PhD) studying from 2012 to 2017 at Sakarya University. The questions were mainly oriented on their opinions on how good was the education system, how pleased they were to be here, how were their relations with Turkish and comparing Sakarya University to their home town university in term of facilities and performance.

Methodology

Every scientific research cannot be validated without at least a minimum respect of a rigorous methodology in the process of data collection and assessment. In our case, our methodology was comprised of Interviews made in order to shape the area of investigation and define exactly

¹According to the official website of Sakarya University consulted on December, 8, 2017.

²According to statistics from AfroKarya, the association of African students at the University of Sakarya

which axis deserve to be investigated on. Then questionnaire survey was applied to a sample group made of 35 black African students from different countries, departments and programs (bachelor, master, PhD) studying from 2012 to 2017 at Sakarya University. The respond rate to the survey was 100%. This helped us to get a lot of relevant information directly coming from the students and related to our topic. It is noteworthy to remind that all these were preceded by a documentary research so as to be aware of other researches made by scholars on the topic or related topics and theirs findings. The information from interviews and survey was collected with the consent the students in absolute confidentiality, and made anonymous and coded. The data have been processed and analyzed with relevant computer software.

FINDINGS AND DISCUSSION

Our sample made of 35 students studying at Sakarya University and all coming from Sub-Saharan Africa is comprised of 25 males and 10 females. They are stratified in the following way as showed in the Table 1: 16 undergraduate students, 13 master students and 6 PhD students.

Table 1: Sample for the survey

Program \ Sex	Male	Female	Total
Bachelor	12	4	16
Master	9	4	13
PhD	4	2	6
Total	25	10	35

In table 2 we tried to understand the motivations that made the students to choose Turkey in general and Sakarya University in particular as their destination for their education. The results show that been awarded scholarship by the Turkish government is the major reason (33 of them) that brought them here. Followed by the desire of meetings new people and after come closely career plans, cultural experience and living abroad. It is obvious that discovering a new area and interacting with people has always motivated human being who is by nature curious. Turkish education system and higher education infrastructures have also given good echo during the last years all around the world. All these combined with the opportunity of a scholarship is irresistible and can justify the above cited factors been the first motivators for

coming to Sakarya university. Besides learning a new language and religious reasons motivated less our subjects,

Table 2: Motivations for coming to Sakarya University

Indicators	Rate
Scholarship	33
Meeting new people	13
Career Plans	12
Cultural experience	11
Living abroad	10
Better education system	7
Learning a foreign language	4
Religious reasons	2
Others	0

Motivations / reasons for coming to SAÜ

While questioning them on how they heard about Sakarya University (Table 3) and chosen it, the majority of 57,14% (20/35) asserted that it has been assigned to them by the scholarship office. But it is interesting that some almost 29% (10/35) of them have been positively advised by friend about Sakarya University before coming here. And only 20% knew about it from the internet.

Table 3: How did you hear about Sakarya University?

Indicators	Rate
Scholarship choice	20
Advised by from a friend	10
From internet	7
No ideas before	4
Personal choice	2
Others	0

We assessed the general satisfaction of the students by rating the question on “*pleased*”, “*quite pleased*” and “*not pleased*”. The results show that 82, 86% were pleased, 14, 28% were quite pleased and only 2, 86% were not pleased.

Table 4: General satisfaction of students about Sakarya University

Indicators	Rate
Pleased	29
Quite please	5
Not please	1

When asked to compare Sakarya University to their hometown Universities (Table 5) in general terms of education system and other facilities and services offered, around 66, 67% find Sakarya University better than their hometown university. Almost 7% assert that it is worse and around 28 % stay neutral on this important question.

Table 5: General comparison between Sakarya University and Hometown University

General comparaisn between SAÜ and hometown University				
	Worse	Neutral	Better	
	7	28	70	

Let's now have a deeper look at their opinions on the quality of the education system and its impacts. As presented in the table 6 below, Teachers and Staff's qualification is not questioned (0% of negative response). Nobody said the diploma are not recognized in their home countries and even their professional insertion back home is not a big deal (only 2, 85 % of negative answer). However, it is noteworthy to point out that 48, 57% answer are neutral on the examination/evaluation system while 14, 28% state that it is not a good one. This is possibly related to the fact that some of the students claim the multiple choice questions during exams are not applicable to a lot of subjects and courses where students should normally be put in a

thinking position. This means dissertation, essays and others in order to oblige and allow them to exert their critical thinking abilities.

Table 6: Quality of education system and its impacts

	Strongly negative	Negative	Neutral	Positive	Strongly positive
Courses content, variety and relevancy	4,3	7,14	8,57	64,28	15,71
Examination system	5,71	8,57	48,57	31,42	5,71
Knowledge and skills improvement	0	5,71	20	54,28	22,85
Teachers and staff qualification	0	0	14,28	62,85	22,85
Diploma are recognised in your country	0	0	28,57	51,42	22,85
Easy professional insertion	0	2,85	45,71	31,42	17,14

As far as the socio cultural adaptation of these students is concerned, questions have been directed on their interpersonal relations with human resources at Sakarya University (Table 7). Fortunately, the general opinion is positive on the teachers, Staff and classmates kindness and helpfulness towards black African students (88, 57% and 65, 70%). But even if racism and discrimination cases are faced by only 11, 42% of them it is still a lot when considering that we are in an intellectual environment full of scholars and educated persons who are supposed to be above the common people manners and way of thinking and behaving.

Table 7: Interpersonal relations with human resources

	Strongly negative	Negative	Neutral	Positive	Strongly positive
Staff and teachers are understanding and helpful	0	2,8	8,57	60	28,57
Classmates are understanding and helpful	0	5,71	28,57	42,85	22,85
You faced racism or discrimination	0	0	0	0	0

We have also been through their opinions on other facilities at Sakarya University such as library services, internet, medical services, security, and foods. It comes out that the campus is secured for them (0% negative response), the internet services are appreciated by 60% of them, library services are said to be appreciated by almost 77% and 11,42% have a negative impression on foods and restaurants services. The details are presented in the following table

Table 8: Other facilities and services

	Strongly negative	Negative	Neutral	Positive	Strongly positive
Housing/ hostels conditions are good	0	8,57	17,14	60	14,28
Library services are good	2,8	2,8	14,28	68,57	8,57
Internet services are good	11,42	14,28	14,28	40	20
Medical services are good	2,8	2,8	45,71	37,14	11,42
Security inside the campus is assured	0	0	11,42	60	28,57
Socio-cultural activities impact on students emancipation	2,8	11,42	48,57	40	2,8
Restaurants and food services are good	0	11,42	34,28	40	11,42

The big issue concerns the Turkish language both the learning process at the language center and the fact that university programs are in Turkish. In fact Sakarya university students must have a proficiency (at least B1 level) in Turkish language before getting registration at the faculty. Therefore, at their arrival, black African students should study at *Sakarya Tömer* the Turkish language center for a period of one year. They all pass by there and complain about some features. All the students state that Turkish language is a big issue to deal with for them and this reduce their capacity and potential in research, while in *Tömer* the methodology of learning is questioned at 31,42%. During the interviews, they suggest that:

- Students at the beginning should be separated according to their departments.
- Turkish language teachers should be encouraged to learn English at least to allow exchanges between them and new students.

- Too much time (9 months) should not be spent only on general Turkish.
- The university should insert a kind of continuous program of learning academic Turkish in faculties (being like a subject)
- Different language skills (speaking, reading, writing, listening) should be taught by different teachers
- Language in function programs should be organized outside the Tömer (in real life situation like restaurant, companies, markets...).

Table 9: Opinion about Turkish language learning

	Strongly negative	Negative	Neutral	Positive	Strongly positive
Quality of methodology	8,57	22,85	28,57	31,42	8,57
Teachers qualification	2,8	5,71	28,57	48,57	14,28
Teachers level of understanding foreign students and aid in solving their difficulties	0	8,57	28,57	42,85	20
Tömer staff level of understanding foreign students and aid in solving their difficulties	0	8,57	40	42,85	8,57

Conclusion

We carried out this research entitled ‘‘Education and socio-cultural view of black African foreign students at Sakarya University’’ with the main purpose of finding out what black African students learning at Sakarya University think about the education system, the socio-cultural environment and other facilities and services offered by the University. We hope by doing so to help the persons in charge to take decisions and actions that will improve the whole system and make the university one of the best in Turkey and the world and a better destination for foreign students. In order to achieve this, we conducted interviews, and surveys on a sample of 35 students. Our analysis of the results, led us to the following recommendations in addition to the above mentioned:

- More programs in English language should be implemented because of its universalism and also because it will allow Turkish students and teachers to benefit from foreign students knowledge and experience

- Multiple choice system is to be reduced in the profit of full expression exams because it limits student's productivity especially in some departments.
- Facing the racism cases, Sakarya University through communication means should inform and sensitize staff, teachers and Turkish students on the fact that we are all equal and organize cultural activities to open up Turkish people mind to tolerance
- And finally make it possible for students to report such cases if they happen and take relevant actions against the authors.
